Get Started with the CLI

Every Palo Alto Networks device includes a command-line interface (CLI) that allows you to monitor and configure the device. Although this guide does not provide detailed command reference information, it does provide the information you need to learn how to use the CLI. It includes information to help you find the command you need and how to get syntactical help after you find it. It also explains how to verify the SSH connection to the firewall when you access the CLI remotely, and how to refresh the SSH keys and configure key options when connecting to the management interface.

- Access the CLI
- Verify SSH Connection to Firewall
- Refresh SSH Keys and Configure Key Options for Management Interface Connection
- Give Administrators Access to the CLI
- Change CLI Modes
- Navigate the CLI
- Find a Command
- Get Help on Command Syntax
- Customize the CLI

Access the CLI

Use a terminal emulator, such as PuTTY, to connect to the CLI of a Palo Alto Networks device in one of the following ways:

- **SSH Connection**—To ensure you are logging in to your firewall and not a malicious device, you can verify the SSH connection to the firewall when you perform initial configuration. After you have completed initial configuration, you can establish a CLI connection over the network using a secure shell (SSH) connection.

- **Serial Connection**—If you have not yet completed initial configuration or if you chose not to enable SSH on the Palo Alto Networks device, you can establish a direct serial connection from a serial interface on your management computer to the Console port on the device.

STEP 1 | Launch the terminal emulation software and select the type of connection (Serial or SSH).

- To establish an SSH connection, enter the hostname or IP address of the device you want to connect to and set the port to **22**.

- To establish a Serial connection, connect a serial interface on management computer to the Console port on the device. Configure the Serial connection settings in the terminal emulation software as follows:

  - Data rate: **9600**
  - Data bits: **8**
  - Parity: **none**
  - Stop bits: **1**
  - Flow control: **none**

STEP 2 | When prompted to log in, enter your administrative username.

The default superuser username is **admin**. To set up CLI access for other administrative users, see Give Administrators Access to the CLI.

If prompted to acknowledge the login banner, enter **Yes**.

STEP 3 | Enter the administrative password.

The default superuser password is **admin**. However, for security reasons you should immediately change the admin password.

After you log in, the message of the day displays, followed by the CLI prompt in Operational mode:

```
username@hostname>
```

You can tell you are in operational mode because the command prompt ends with a >.

Verify SSH Connection to Firewall

Palo Alto Networks firewalls come with Secure Shell (SSH) preconfigured; firewalls can act as both an SSH server and an SSH client. You can verify your SSH connection to the management port of the firewall during remote access to ensure that, when you log in remotely, you are logging in to the firewall. You can also refresh the SSH keys and specify other options for the keys.

After you initially log in through the console to the command-line interface (CLI), the firewall boots up and displays six fingerprints (hashed SSH keys). When you then remotely access the management port on the firewall for the first time, the SSH client presents a fingerprint to you and it must match one of the fingerprints you noted from the console login. This match verifies that the firewall you access remotely is your firewall and that there is no malicious device between your device and the firewall intercepting Hello packets or presenting a false fingerprint.

You can also Refresh SSH Keys and Configure Key Options for Management Interface Connection.

To ensure you are logging in to your firewall, perform this task when you first access your firewall remotely (when you Perform Initial Configuration) and whenever you change the default host key type or regenerate the host keys for the management port.

STEP 1 | Perform Initial Configuration and note the fingerprints that the firewall displays upon booting up.

When you connect to the console port (Step 3 of Perform Initial Configuration), the firewall boots up and displays SSH fingerprints. Make note of these fingerprints.

If the firewall is in FIPS-CC mode, it displays the fingerprints in sha1 hash in base64 encoding, as in the following example:

```
SSH Fingerprints

------------------

256 +nvDTw9G6FpjVRYCN7qYWMmZxB0 (ECDSA)

384 Slx984ndSKeRU+YOkNh9R/4u8IM (ECDSA)

521 sph8wuC3Y/p6zvFr0sGnrzim3wo (ECDSA)

2048 kK3+bBRaJpJQOM+qE8Bl9SKCQPg (RSA)

3072 gtFBWm65/+D7dqUdDDc3P6hJu1g (RSA)

4096 CQnLFnMF1BfBwV7y5bhYQyawpcc (RSA)
```

If the firewall is in non-FIPS-CC mode, it displays the fingerprints in md5 hash in hex encoding, as in the following example:

```
SSH Public key fingerprints:

256 5c:73:5c:88:ea:ba:04:f7:9a:72:07:67:74:20:0c:09 (ECDSA)

384 f2:69:5c:0b:e2:26:e1:39:ca:2f:46:00:df:d5:aa:c0 (ECDSA)

521 8f:00:fa:d0:b9:a5:c5:4d:9d:f5:cd:0d:2c:86:99:25 (ECDSA)

2048 0c:01:69:54:1e:21:08:9d:65:37:3b:50:4a:03:70:d6 (RSA)

3072 1f:ae:d8:1a:b6:8d:9a:4b:c2:fd:74:ca:dc:4f:ca:19 (RSA)

4096 38:88:fb:62:07:19:cf:89:88:a0:6d:22:4b:fa:f4:23 (RSA)
```

STEP 2 | (Optional) Display fingerprints from the SSH server (the firewall).

Display the fingerprints using the CLI if you forgot to note the fingerprints that the SSH server displayed upon boot up or if you regenerated a host key or changed your default host key type. To effectively compare fingerprints, specify the same format that your SSH client uses

(the device from which you will remotely log in): either **base64** or **hex** format, and hash-type format of **md5**, **sha1**, or **sha256**.

> *There is no md5 hash type in FIPS-CC mode.*

The following example displays SSH server fingerprints in hex format and md5 hash type.

admin@PA-3060> **show ssh-fingerprints format hex hash-type md5**

SSH Public key fingerprints:

256 5c:73:5c:88:ea:ba:04:f7:9a:72:07:67:74:20:0c:09 (ECDSA)

384 f2:69:5c:0b:e2:26:e1:39:ca:2f:46:00:df:d5:aa:c0 (ECDSA)

521 8f:00:fa:d0:b9:a5:c5:4d:9d:f5:cd:0d:2c:86:99:25 (ECDSA)

2048 0c:01:69:54:1e:21:08:9d:65:37:3b:50:4a:03:70:d6 (RSA)

3072 1f:ae:d8:1a:b6:8d:9a:4b:c2:fd:74:ca:dc:4f:ca:19 (RSA)

4096 38:88:fb:62:07:19:cf:89:88:a0:6d:22:4b:fa:f4:23 (RSA)

STEP 3 | Continue to Perform Initial Configuration on the firewall so that you assign an IP address to the management interface and commit your changes.

STEP 4 | Disconnect the firewall from your computer.

STEP 5 | Initiate remote access to the firewall and view the fingerprint.

Using terminal emulation software, such as PuTTY, launch an SSH management session to the firewall using the IP address you assigned to it.
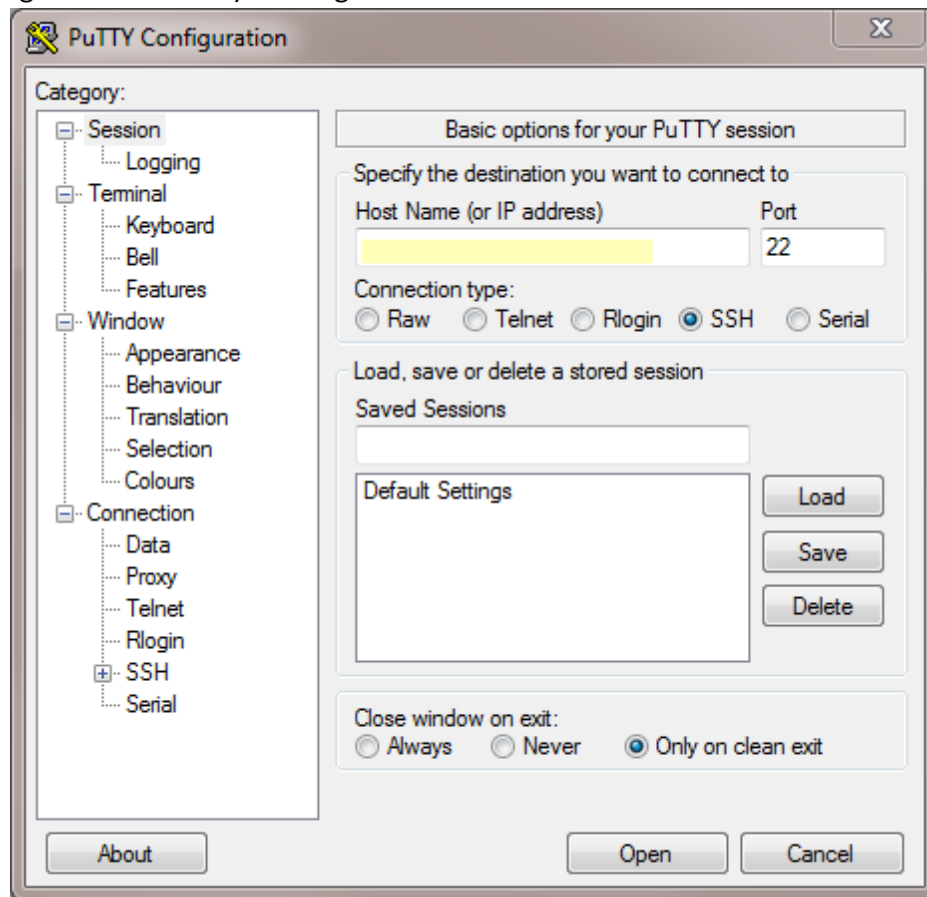

Before you can proceed with the connection, the SSH client presents a fingerprint as in the following example:
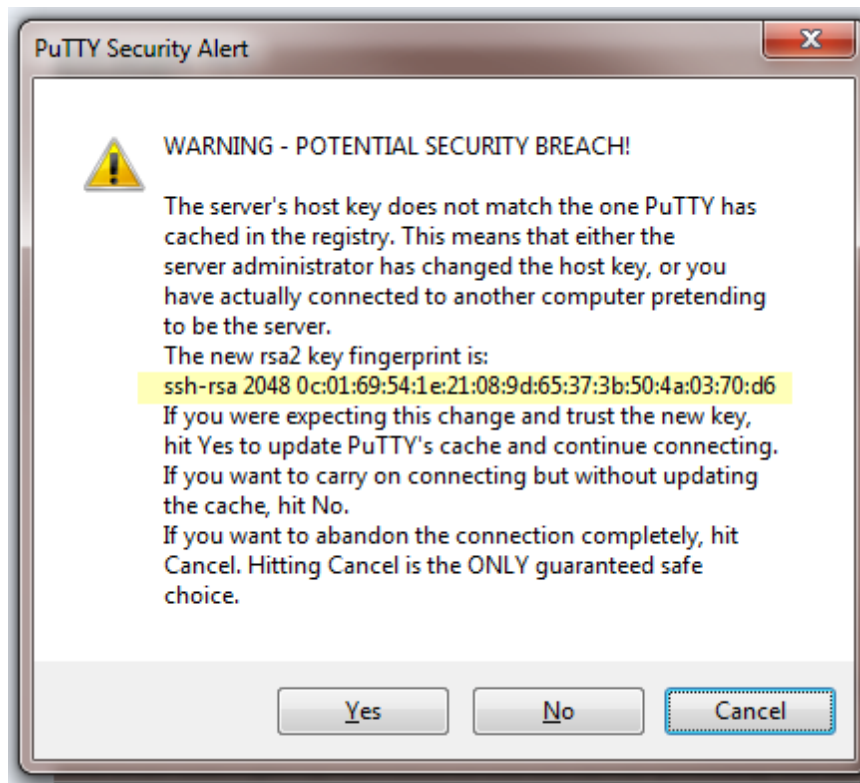

📋 *If you have already logged in to the firewall (and have not changed the key), the SSH client already has the key stored in its database and therefore doesn't present a fingerprint.*

STEP 6 | Verify matching fingerprints.

1. Verify that the fingerprint that the SSH client (PuTTY) presented matches one of the fingerprints you noted from logging in to the console port in the first step.

2. A match verifies that the firewall you remotely accessed is the same firewall you connected to on the console port. You typically want the SSH client to update its cache, so respond to the warning with **Yes** to continue connecting. In this example, the fingerprint in the preceding graphic matches the RSA 2048 fingerprint from the SSH server (firewall) in Step 1 (and Step 2) of this procedure.

   If there is no match or you receive a mismatch warning, you aren't connecting to the expected device; **Cancel** the connection attempt.

   If you see a match but you don't want the SSH client to update its cache, respond with **No**, which allows you to continue connecting. Respond with **No** if the firewall is

configured with multiple default host keys and you want to connect using a specific host key without updating the SSH client cache.

To verify your SSH connection to the firewall after you have regenerated a host key or changed the default host key type, perform a procedure similar to this one, starting with logging in to the console port. In this case, Step 2 is required; execute the **`show ssh-fingerprints`** *CLI command (with the applicable format and hash-type) and note the one fingerprint that displays. Omit Step 3 and continue with Step 4, finishing the rest of the procedure. Verify that the fingerprint from the SSH client matches the fingerprint you noted from Step 2.*

Refresh SSH Keys and Configure Key Options for Management Interface Connection

When you verify your Secure Shell (SSH) connection to the firewall, the verification uses SSH keys. To change the default host key type, generate a new pair of public and private SSH host keys, and configure other SSH settings, create an SSH service profile.

The following examples show how to configure various SSH settings for a management SSH service profile after you access the CLI. The settings marked as recommended provide a stronger security posture. (See Refresh HA1 SSH Keys and Configure Key Options for SSH HA profile examples.)

🚫 *If you are using SSH to access the CLI of the firewall in FIPS-CC mode, you must set automatic rekeying parameters for session keys.*

📋 *Palo Alto Networks allows you to specify only recommended ciphers, key exchange algorithms, and message authentication algorithms for the SSH configurations below.*

Also note that, to use the same SSH connection settings for each Dedicated Log Collector (M-Series or Panorama™ virtual appliances in Log Collector mode) in a Collector Group, you must configure an SSH service profile from the Panorama management server, Commit the changes to Panorama, and then Push the configuration to the Log Collectors. You can use the `set log-collector-group <name> general-setting management ssh` *commands.*

💡 *Each of the following configuration steps includes a commit and an SSH service restart if you perform only one step (except when you create a profile without configuring any settings). Otherwise, you can set multiple SSH options and then commit your changes and restart SSH when you're done.*

◉ Create an SSH service profile to exercise greater control over SSH connections to your management interface.

This example creates a Management - Server profile without configuring any settings.

1. admin@PA-3260> `configure`
2. admin@PA-3260# `set deviceconfig system ssh profiles mgmt-profiles server-profiles <name>`
3. admin@PA-3260# `commit`
4. admin@PA-3260# `exit`
5. To verify that the new profile has been created and view the settings for any existing profiles:

   admin@PA-3260> `configure`

   admin@PA-3260# `show deviceconfig system ssh profiles`

⦿ (Optional) Set the SSH server to use only the specified encryption ciphers.

By default, SSH allows all supported ciphers for encryption of CLI management sessions. When you set one or more ciphers in an SSH service profile, the SSH server advertises only those ciphers while connecting and, if the SSH client tries to connect using a different cipher, the server terminates the connection.

1. admin@PA-3260> **configure**

2. admin@PA-3260# **set deviceconfig system ssh profiles mgmt-profiles server-profiles <name> ciphers <cipher>**

   aes128-cbc—AES 128-bit cipher with Cipher Block Chaining

   aes128-ctr—AES 128-bit cipher with Counter Mode

   aes128-gcm—AES 128-bit cipher with GCM (Galois/Counter Mode)

   aes192-cbc—AES 192-bit cipher with Cipher Block Chaining

   aes192-ctr—AES 192-bit cipher with Counter Mode

   aes256-cbc—AES 256-bit cipher with Cipher Block Chaining

   aes256-ctr—(Recommended) AES 256-bit cipher with Counter Mode

   aes256-gcm—(Recommended) AES 256-bit cipher with GCM

3. admin@PA-3260# **commit**

4. admin@PA-3260# **exit**

5. admin@PA-3260> **set ssh service-restart mgmt**

6. To verify the ciphers have been updated:

   admin@PA-3260> **configure**

   admin@PA-3260# **show deviceconfig system ssh profiles mgmt-profiles server-profiles ciphers**

⦿ (Optional) Set the default host key type.

The firewall uses a default host key type of RSA 2048 unless you change it. The SSH connection uses only the default host key type (not other host key types) to authenticate the firewall. You can change the default host key type; the choices are ECDSA (256, 384, or 521) or RSA (2048, 3072, or 4096).

Change the default host key type if you prefer a longer RSA key length or if you prefer ECDSA rather than RSA. This example sets the default host key type for a management profile to the

recommended ECDSA key of 256 bits. It also restarts SSH for the management connection so the new key type takes effect.

1. admin@PA-3260> **`configure`**

2. admin@PA-3260# **`set deviceconfig system ssh profiles mgmt-profiles server-profiles <name> default-hostkey key-type ECDSA 256`**

3. admin@PA-3260# **`commit`**

4. admin@PA-3260# **`exit`**

5. admin@PA-3260> **`set ssh service-restart mgmt`**

6. To verify the host key has been updated:

   admin@PA-3260> **`configure`**

   admin@PA-3260# **`show deviceconfig system ssh profiles mgmt-profiles server-profiles <name> default-hostkey`**

◉ (Optional) Delete a cipher from the set of ciphers you selected to encrypt your CLI sessions.

   This example deletes the AES CBC cipher with 128-bit key.

1. admin@PA-3260> **`configure`**

2. admin@PA-3260# **`delete deviceconfig system ssh profiles mgmt-profiles server-profiles <name> ciphers aes128-cbc`**

3. admin@PA-3260# **`commit`**

4. admin@PA-3260# **`exit`**

5. admin@PA-3260> **`set ssh service-restart mgmt`**

6. To verify the cipher has been deleted:

   admin@PA-3260> **`configure`**

   admin@PA-3260# **`show deviceconfig system ssh profiles mgmt-profiles server-profiles <name> ciphers`**

◉ (Optional) Set the session key exchange algorithms the SSH server will support.

By default, the SSH server advertises all the key exchange algorithms to the SSH client.

> 🏵 *If you are using an ECDSA default key type, best practice is to use an ECDH key algorithm.*

1. admin@PA-3260> **configure**
2. admin@PA-3260# **set deviceconfig system ssh profiles mgmt-profiles server-profiles *<name>* kex *<value>***

   diffie-hellman-group14-sha1—Diffie-Hellman group 14 with SHA1 hash

   ecdh-sha2-nistp256—(Recommended) Elliptic-Curve Diffie-Hellman over National Institute of Standards and Technology (NIST) P-256 with SHA2-256 hash

   ecdh-sha2-nistp384—(Recommended) Elliptic-Curve Diffie-Hellman over NIST P-384 with SHA2-384 hash

   ecdh-sha2-nistp521—(Recommended) Elliptic-Curve Diffie-Hellman over NIST P-521 with SHA2-521 hash

3. admin@PA-3260# **commit**
4. admin@PA-3260# **exit**
5. admin@PA-3260> **set ssh service-restart mgmt**
6. To verify the key exchange algorithms have been updated:

   admin@PA-3260> **configure**

   admin@PA-3260# **show deviceconfig system ssh profiles mgmt-profiles server-profiles**

◉ (Optional) Set the message authentication codes (MAC) the SSH server will support.

By default, the server advertises all of the MAC algorithms to the client.

1. admin@PA-3260> **configure**
2. admin@PA-3260# **set deviceconfig system ssh profiles mgmt-profiles server-profiles *<name>* mac *<value>***

   hmac-sha1—MAC with SHA1 cryptographic hash

   hmac-sha2-256—(Recommended) MAC with SHA2-256 cryptographic hash

   hmac-sha2-512—(Recommended) MAC with SHA2-512 cryptographic hash

3. admin@PA-3260# **commit**
4. admin@PA-3260# **exit**
5. admin@PA-3260> **set ssh service-restart mgmt**
6. To verify the MAC algorithms have been updated:

   admin@PA-3260> **configure**

   admin@PA-3260# **show deviceconfig system ssh profiles mgmt-profiles server-profiles**

◉ (Optional) Regenerate ECDSA or RSA host keys for SSH to replace the existing keys.

The remote device uses the host keys to authenticate the firewall. Regenerate your default host key at the frequency you determine necessary for security purposes. This example regenerates the ECDSA 256 default host key because that is the default host key type set in an earlier step.

> 📋 *Regenerating a host key does not change your default host key type. To regenerate the default host key you are using, you must specify your default host key type and length when you regenerate. Regenerating a host key that isn't your default host key type simply regenerates a key that you aren't using and therefore has no effect.*

1. admin@PA-3260> `configure`
2. admin@PA-3260# `set deviceconfig system ssh regenerate-hostkeys mgmt key-type ECDSA key-length 256`
3. admin@PA-3260# `commit`
4. admin@PA-3260> `exit`
5. admin@PA-3260> `set ssh service-restart mgmt`

◉ (Optional) Set rekey parameters to establish when automatic rekeying of the session keys occurs.

The session keys are used to encrypt traffic between the remote device and the management interface. The parameters you can set are data volume (in megabytes), time interval (seconds), and packet count. After any one rekey parameter reaches its configured value, SSH initiates a key exchange.

You can set a second or third parameter if you aren't sure the parameter you configured will reach its value as fast as you want rekeying to occur. The first parameter to reach its configured value will prompt a rekey, then the firewall will reset all rekey parameters.

1. admin@PA-3260> `configure`
2. admin@PA-3260# `set deviceconfig system ssh profiles mgmt-profiles server-profiles <name> session-rekey data 32`

   Rekeying occurs after the volume of data (in megabytes) is transmitted following the previous rekey. The default is based on the cipher you use and ranges from 1GB to 4GB. The range is 10MB to 4,000MB. Alternatively, you can enter `set deviceconfig system ssh profiles mgmt-profiles server-profiles`

<*name*> session-rekey data default, which sets the data parameter to the default value of the individual cipher you are using.

3. admin@PA-3260# **set deviceconfig system ssh profiles mgmt-profiles server-profiles <*name*> session-rekey interval 3600**

   Rekeying occurs after the specified time interval (in seconds) passes following the previous rekey. By default, time-based rekeying is disabled (set to none). The range is 10 to 3,600.

   > 📋 *If you are configuring the management interface in FIPS-CC mode, you must set a time interval within the range; you cannot leave it disabled.*

4. admin@PA-3260# **set deviceconfig system ssh profiles mgmt-profiles server-profiles <*name*> session-rekey packets 27**

   Rekeying occurs after the defined number of packets (2^n) are transmitted following the previous rekey. For example, 14 configures that a maximum of 2^{14} packets are transmitted before a rekey occurs. The default is 2^{28}. The range is 12 to 27 (2^{12} to 2^{27}). Alternatively, you can enter **set deviceconfig system ssh profiles mgmt-profiles server-profiles <*name*> session-rekey packets default**, which sets the packets parameter to 2^{28}.

   > 📋 *Choose rekeying parameters based on your type of traffic and network speeds (in addition to FIPS-CC requirements if they apply to you). Don't set the parameters so low that they affect SSH performance.*

5. admin@PA-3260# **commit**

6. admin@PA-3260# **exit**

7. admin@PA-3260> **set ssh service-restart mgmt**

8. To verify the changes:

   admin@PA-3260> **configure**

   admin@PA-3260# **show deviceconfig system ssh profiles mgmt-profiles server-profiles <*name*> session-rekey**

◉ Activate the profile by selecting the profile and restarting SSH service.

1. admin@PA-3260> **configure**

2. admin@PA-3260# **set deviceconfig system ssh mgmt server-profile <*name*>**

3. admin@PA-3260# **commit**

4. admin@PA-3260# **exit**

5. admin@PA-3260> **set ssh service-restart mgmt**

6. To verify the correct profile is in use:

   admin@PA-3260> **configure**

   admin@PA-3260# **show deviceconfig system ssh mgmt**

Give Administrators Access to the CLI

Administrative accounts specify roles and authentication methods for the administrators of Palo Alto Networks firewalls. Every Palo Alto Networks firewall has a predefined default administrative account (admin) that provides full read-write access (also known as superuser access) to the firewall. As a best practice, create an administrative account for each person who will be performing configuration tasks on the firewall or Panorama so that you have an audit trail of changes.

- Administrative Privileges
- Set Up a Firewall Administrative Account and Assign CLI Privileges
- Set Up a Panorama Administrative Account and Assign CLI Privileges

Administrative Privileges

Privilege levels determine which commands an administrator can run as well as what information is viewable. Each administrative role has an associated privilege level. You can use dynamic roles, which are predefined roles that provide default privilege levels. Or, you can create custom firewall administrator roles or Panorama administrator roles and assign one of the following CLI privilege levels to each role:

> *You must follow the Best Practices for Securing Admin Access to ensure that you are securing access to your management network in a way that will prevent successful attacks.*

Privilege Level	Description
superuser	Has full access to the Palo Alto Networks device (firewall or Panorama) and can define new administrator accounts and virtual systems. You must have superuser privileges to create an administrative user with superuser privileges.
superreader	Has complete read-only access to the device.
vsysadmin	Has access to selected virtual systems (vsys) on the firewall to create and manage specific aspects of virtual systems. A virtual system administrator doesn't have access to network interfaces, VLANs, virtual wires, virtual routers, IPSec tunnels, GRE tunnels, DHCP, DNS Proxy, QoS, LLDP, or network profiles.
vsysreader	Has read-only access to selected virtual systems on the firewall and specific aspects of virtual systems. A virtual system administrator with read-only access doesn't have access to network interfaces, VLANs, virtual wires, virtual routers, IPSec tunnels, GRE tunnels, DHCP, DNS Proxy, QoS, LLDP, or network profiles.

Privilege Level	Description
deviceadmin	Has full access to all firewall settings except for defining new accounts or virtual systems.
devicereader	Has read-only access to all firewall settings except password profiles (no access) and administrator accounts (only the logged in account is visible).
panorama-admin	Has full access to Panorama except for the following actions: • Create, modify, or delete Panorama or device administrators and roles. • Export, validate, revert, save, load, or import a configuration. • Schedule configuration exports.

Set Up a Firewall Administrative Account and Assign CLI Privileges

To set up a custom firewall administrative role and assign CLI privileges, use the following workflow:

STEP 1 | Configure an Admin Role profile.

1. Select **Device** > **Admin Roles** and then click **Add**.
2. Enter a **Name** to identify the role.
3. For the scope of the **Role**, select **Device** or **Virtual System**.
4. Define access to the **Command Line**:

   - **Device** role—**superuser**, **superreader**, **deviceadmin**, **devicereader**, or **None**.
   - **Virtual System** role—**vsysadmin**, **vsysreader**, or **None**.

5. Click **OK** to save the profile.

STEP 2 | Configure an administrator account.

1. Select **Device** > **Administrators** and click **Add**.
2. Enter a user **Name**. If you will use local database authentication, this must match the name of a user account in the local database.
3. If you configured an **Authentication Profile** or authentication sequence for the user, select it in the drop-down. If you select **None**, you must enter a **Password** and **Confirm Password**.
4. If you configured a custom role for the user, set the **Administrator Type** to **Role Based** and select the Admin Role **Profile**. Otherwise, set the **Administrator Type** to **Dynamic** and select a dynamic role.
5. Click **OK** and **Commit**.

Set Up a Panorama Administrative Account and Assign CLI Privileges

To set up a custom Panorama administrative role and assign CLI privileges, use the following workflow:

STEP 1 | Configure an Admin Role profile.

1. Select **Panorama** > **Admin Roles** and then click **Add**.

2. Enter a **Name** to identify the role.

3. For the scope of the **Role**, select **Panorama**.

4. Select the **Command Line** tab and select an access level: **superuser**, **superreader**, **panorama-admin**, or **None**.

5. Click **OK** to save the profile.

STEP 2 | Configure an administrator account.

1. Select **Panorama** > **Administrators** and click **Add**.

2. Enter a user **Name**.

3. If you configured an **Authentication Profile** or authentication sequence for the user, select it in the drop-down. If you select **None**, you must enter a **Password** and **Confirm Password**.

4. If you configured a custom role for the user, set the **Administrator Type** to **Custom Panorama Admin** and select the Admin Role **Profile**. Otherwise, set the **Administrator Type** to **Dynamic** and select a dynamic **Admin Role**.

5. Click **OK** and **Commit**, for the **Commit Type** select **Panorama**, and click **Commit** again.

Change CLI Modes

The CLI provides two command modes:

- **Operational**—Use operational mode to view information about the firewall and the traffic running through it or to view information about Panorama or a Log Collector. Additionally, use operational mode commands to perform operations such as restarting, loading a configuration, or shutting down. When you log in, the CLI opens in operational mode.

- **Configuration**—Use configuration mode to view and modify the configuration.

You can switch between operational and configuration modes at any time, as follows:

◉ To switch from operational mode to configuration mode:

```
username@hostname> configure
Entering configuration mode
[edit]
username@hostname#
```

Notice that the command prompt changes from a > to a #, indicating that you successfully changed modes.

◉ To switch from configuration mode to operational mode, use either the **quit** or **exit** command:

```
username@hostname# quit
Exiting configuration mode
username@hostname>
```

◉ To enter an operational mode command while in configuration mode, use the **run** command, for example:

```
username@hostname# run ping host 10.1.1.2
PING 10.1.1.2 (10.1.1.2) 56(84) bytes of data
...
username@hostname#
```

Navigate the CLI

CLI commands are organized in a hierarchical structure. To display a segment of the current hierarchy, use the **show** command. Entering **show** displays the complete hierarchy, while entering **show** with keywords displays a segment of the hierarchy.

For example, the following command displays the configuration hierarchy for the Ethernet interface segment of the hierarchy:

```
username@hostname>
    configure
    Entering configuration mode
    [edit]
    username@hostname#
    show network interface ethernet
    ethernet {
      ethernet1/1 {
        virtual-wire;
      }
      ethernet1/2 {
          virtual-wire;
      }
      ethernet1/3 {
        layer2 {
          units {
            ethernet1/3.1;
          }
        }
      }
      ethernet1/4;
    }
    [edit]
    username@hostname#
```
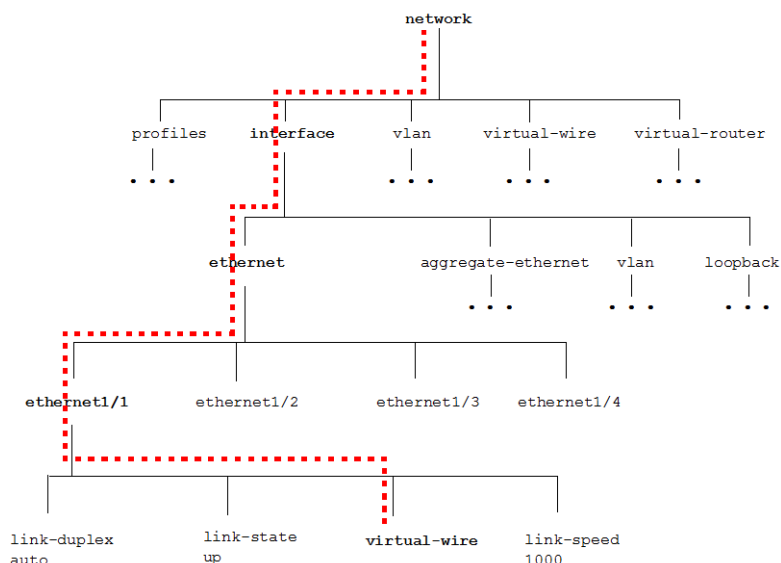

Find a Command

The **find command** helps you find a command when you don't know where to start looking in the hierarchy. The command—which is available in all CLI modes—has two forms. Used alone, **find command** displays the entire command hierarchy. Used with the **keyword** parameter, find command keyword displays all commands that contain the specified keyword.

> *You can also view a complete listing of all* Operational Commands *and* Configure Commands *or view the* CLI Changes in PAN-OS 10.1.

- View the Entire Command Hierarchy
- Find a Specific Command Using a Keyword Search

View the Entire Command Hierarchy

Use **find command** without any parameters to display the entire command hierarchy in the current command mode. For example, running this command from operational mode on a VM-Series Palo Alto Networks device yields the following (partial result):

```
username@hostname> find command
target set <value>
target show
schedule uar-report user <value> user-group <value> skip-detailed-
browsing <yes|no> title <value> period <value> start-time <value>
 end-time <value> vsys <value>

:
```

Find a Specific Command Using a Keyword Search

Use **find command keyword** to locate all commands that have a specified keyword.

```
username@hostname# find command keyword <keyword>
```

For example, suppose you want to configure certificate authentication and you want the Palo Alto Networks device to get the username from a field in the certificate, but you don't know the command. In this case you might use **find command keyword** to search for commands that contain username in the command syntax.

```
username@hostname > configure
```

```
Entering configuration mode
[edit]
username@hostname # find command keyword username
show shared certificate-profile <name> username-field
set deviceconfig system log-export-schedule <name> protocol ftp
 username <value>
set deviceconfig system log-export-schedule <name> protocol scp
 username <value>
set deviceconfig setting wildfire session-info-select exclude-
username <yes|no>
set mgt-config password-complexity block-username-inclusion <yes|no>
set network interface ethernet <name> layer3 pppoe username <value>
```

```
set shared authentication-profile <name> username-modifier <value>|
<validate>|<%USERINPUT%|%USERINPUT%@%USERDOMAIN%|%USERDOMAIN%\
%USERINPUT%>
set shared certificate-profile <name> username-field
set shared certificate-profile <name> username-field subject <common-
name>
set shared certificate-profile <name> username-field subject-alt
 <email|principal-name>
set vm-info-source <name> VMware-ESXi username <value>
set vm-info-source <name> VMware-vCenter username <value>
set user-id-collector setting ntlm-username <value>
set user-id-collector syslog-parse-profile <name> regex-identifier
 username-regex <value>
set user-id-collector syslog-parse-profile <name> field-identifier
 username-prefix <value>
set user-id-collector syslog-parse-profile <name> field-identifier
 username-delimiter <value>
[edit]
username@hostname #
```

From the resulting lists of commands, you can identify that the command you need is:

```
username@hostname # set shared certificate-profile <name> username-
field
```

If you're not sure exactly what to enter in the command line, you can then Get Help on Command Syntax.

Get Help on Command Syntax

After you Find a Command you can get help on the specific command syntax by using the built-in CLI help. To get help, enter a **?** at any level of the hierarchy.

- Get Help on a Command
- Interpret the Command Help

Get Help on a Command

For example, suppose you want to configure the primary DNS server settings on the Palo Alto Networks device using **find command keyword** with **dns** as the keyword value, you already know that the command is **set deviceconfig system dns-setting**, but you're not exactly sure how to use the command to set the primary DNS server setting. In this case, you would enter as much of the command as you know (or start typing it and press Tab for automatic command completion), and then add a question mark at the end of the line before pressing Enter, like this:

```
username@hostname# set deviceconfig system dns-setting ?
> dns-proxy-object Dns proxy object to use for resolving fqdns
> servers Primary and secondary dns servers
<Enter> Finish input
```

Notice that the question mark doesn't appear in the command line when you type it, but a list of the available commands appears. You can continue getting syntactical help all through the hierarchy:

```
username@hostname# set deviceconfig system dns-setting servers ?
+ primary Primary DNS server IP address
+ secondary Secondary DNS server IP address
  <Enter> Finish input

username@hostname# set deviceconfig system dns-setting servers
 primary ?
<ip> <ip>
```

> 💡 *Use the Tab key in the middle of entering a command and the command will automatically complete, provided there are no other commands that match the letters you have typed thus far. For example, if you type **set dev** and then press Tab, the CLI will recognize that the command you are entering is **deviceconfig** and automatically finish populating the command line.*

Interpret the Command Help

Use the following table to help interpret the command options you see when you use the **?** to get help.

Symbol	Description

*	Indicates that the option is required.
	
	For example, when importing a configuration over secure copy (SCP), specifying the **from** parameter is required, as indicated by the ***** from notation.
	
	<pre>username@hostname#> scp import configuration ?
	+ remote-port SSH port number on remote host
	+ source-ip Set source address to specified i
	nterface address
	* from Source (username@host:path)</pre>

>	Indicates that there are additional nested commands.
	
	For example, when configuring DNS settings, there are additional nested commands for configuring a DNS proxy object and for specifying primary and secondary DNS servers:
	
	<pre>username@hostname# set deviceconfig system dns-se
	tting ?
	> dns-proxy-object Dns proxy object to use for
	resolving fqdns
	> servers Primary and secondary dns se
	rvers
	  <Enter> Finish input</pre>

+	Indicates that the option has an associated value that you must enter.
	
	For example, when setting up a high availability configuration, notice that the **+** enabled notation indicates that you must supply a value for this option:
	
	<pre>username@hostname# set deviceconfig high-availabi
	lity ?
	+ enabled enabled
	> group HA group configuration
	> interface HA interface configuration
	  <Enter> Finish input
	Getting help for the enabled option shows that yo
	u must enter a value of yes or no:
	admin@PA-3060# set deviceconfig high-availability
	 enabled ?
	  no no
	  yes yes</pre>

|	Allows you to filter command output. You can either specify a **match** value, which will only show command output that matches the value

Symbol	Description
	you specify, or you can specify an **except** value, which will only show command output except for the value you specify.
	For example, use the **| match** option to display only the app-version in the output of the show system info command:

	<pre>username@hostname> **show system info | match app-v**
	ersion
	app-version: 8087-5126</pre>

	Similarly, to show all users in your group lists who are not part of your organization, you should show the user group list, but exclude the organizational unit (ou) for your organization. Notice that, although there are a total of 4555 user-to-group mappings, with the **| except** filter you can easily see the small list of users who are part of external groups:

	<pre>username@hostname> **show user group list | except**
	ou=acme
	
	cn=sap_globaladmin,cn=users,dc=acme,dc=local
	cn=dnsupdateproxy,ou=admin groups,ou=administrato
	r accounts,dc=acme,dc=local
	cn=dhcp administrators,ou=admin groups,ou=adminis
	trator accounts,dc=acme,dc=local
	cn=helpservicesgroup,cn=users,dc=acme,dc=local
	cn=exchange domain servers,cn=users,dc=acme,dc=lo
	cal
	cn=network configuration operators,cn=builtin,dc=
	acme,dc=local
	cn=dhcp users,ou=admin groups,ou=administrator ac
	counts,dc=acme,dc=local
	cn=exchange windows permissions,ou=microsoft exch
	ange security groups,dc=acme,dc=local
	cn=wins users,cn=users,dc=acme,dc=local
	cn=enterprise read-only domain controllers,cn=use
	rs,dc=acme,dc=local
	cn=print-server-admins,ou=admin groups,ou=adminis
	trator accounts,dc=acme,dc=local
	cn=telnetclients,cn=users,dc=acme,dc=local
	cn=servicenowpasswordreset,ou=admin groups,ou=adm
	inistrator accounts,dc=acme,dc=local
	cn=delegated setup,ou=microsoft exchange security
	 groups,dc=acme,dc=local
	Total: 4555
	* : Custom Group
	</result></response>
	username@hostname></pre>

Customize the CLI

● Specify how long an administrative session to the management interface (CLI or web interface) can remain idle before logging the administrator out:

```
username@hostname# set deviceconfig setting management idle-
timeout ?
  0        never
  <value>  <1-1440>
```

> 💡 *If you want to set the CLI timeout value to a value different from the global* ***management idle-timeout*** *value, use the* ***set cli timeout*** *command in operational mode.*

● Specify the format for command output:

```
username@hostname> set cli config-output-format ?
  default   default
  json      json
  set       set
  xml       xml
```

For example, in the default setting the config-output-format looks like this:

```
username@hostname# show deviceconfig system dns-setting servers
servers {
  primary 1.2.3.4;
  secondary 1.2.3.5;
}
```

Changing the setting to **set** results in output that looks like this:

```
username@hostname# show deviceconfig system dns-setting servers
set deviceconfig system dns-setting servers primary 1.2.3.4
set deviceconfig system dns-setting servers secondary 1.2.3.5
[edit]
[edit]
```

Changing the setting to **xml** results in output that looks like this:

```
username@hostname# show deviceconfig system dns-setting servers
<response status="success" code="19">
  <result total-count="1" count="1">
    <servers>
      <primary>1.2.3.4</primary>
      <secondary>1.2.3.5</secondary>
    </servers>
```

```
      </result>
</response>
```

◉ Switch to scripting mode. In scripting mode, you can copy and paste commands from a text file directly into the CLI. Although you can do this without scripting-mode enabled (up to 20 lines). If you cut-and-paste a block of text into the CLI, examine the output of the lines you pasted. If you see lines that are truncated or generate errors, you may have to re-paste a smaller section of text, or switch to **scripting-mode**:

```
username@hostname> set cli scripting-mode on
```

> *When in scripting-mode, you cannot use Tab to complete commands or use **?** to get help on command syntax. When you are done pasting commands, switch back to regular mode using the* **set cli scripting-mode off** *command.*

Use the CLI

Now that you know how to Find a Command and Get Help on Command Syntax, you are ready to start using the CLI to manage your Palo Alto Networks firewalls or Panorama. The following topics describe how to use the CLI to view information about the device and how to modify the configuration of the device. In addition, more advanced topics show how to import partial configurations and how to use the test commands to validate that a configuration is working as expected.

- View Settings and Statistics
- Modify the Configuration
- Commit Configuration Changes
- Test the Configuration
- Load Configurations
- Use Secure Copy to Import and Export Files
- CLI Jump Start

View Settings and Statistics

Use **show** commands to view configuration settings and statistics about the performance of the firewall or Panorama and about the traffic and threats identified on the firewall. You can use **show** commands in both Operational and Configure mode. For example, the **show system info** command shows information about the device itself:

```
admin@PA-850> show system info

hostname: PA-850
ip-address: 10.10.10.23
public-ip-address: unknown
netmask: 255.255.255.0

-----------------------------------------------------------------------
        Max pending queued mcast packets per session  : 0

-----------------------------------------------------------------------
```

Modify the Configuration

You can also modify the device configuration from the CLI using the **set**, **delete**, and **edit** commands (if your administrative role has a Privilege Level that allows you to write to the configuration). In most cases you must be in Configure mode to modify the configuration.

- To change the value of a setting, use a **set** command. For example, to configure an NTP server, you would enter the complete hierarchy to the NTP server setting followed by the value you want to set:

```
admin@PA-3060# set deviceconfig system ntp-servers primary-ntp-
server ntp-server-address pool.ntp.org
```

> *To target a command to a specific virtual system (vsys), enter the following operational mode command:* **set system setting target-vsys <vsys-name>**. *To go back to issuing commands that apply to the firewall instead of the targeted vsys, use* **set system target-vsys none**.

- To change to a different location in the configuration hierarchy and/or to modify a setting, use the **edit** command. The **edit** commands are very similar to the **set** commands, except that when you enter an **edit** command, you switch context to the corresponding node in the command hierarchy. This can be useful if you need to enter several commands in a node that is nested far down in the command hierarchy. For example, if you want to configure all of the NTP server settings, instead of entering the full command syntax each time using the **set** command, you could use the **edit** command to move to the **ntp-servers** node as follows:

```
[edit]
admin@PA-3060# edit deviceconfig system ntp-servers
[edit deviceconfig system ntp-servers]
admin@PA-3060#
```

Notice that when you enter the command, your new location in the command hierarchy is displayed. You can now use the **set** command to configure the NTP server settings without entering the entire command hierarchy:

```
admin@PA-3060# set secondary-ntp-server ntp-server-address 10.1.2.3
```

> *Use the **up** command to move up a level in the command hierarchy. Use the **top** command to move back to the top of the command hierarchy.*

- To delete an existing configuration setting, use a `delete` command. For example, to delete the secondary NTP server address, you would enter the following command:

```
admin@PA-3060# delete deviceconfig system ntp-servers secondary-
ntp-server ntp-server-address
```

> *When deleting configuration settings or objects using the CLI, the device does not check for dependencies like it does in the web interface. Therefore, when you use* `delete` *from the CLI, you must manually search the configuration for other places where the configuration object might be referenced. For example, before you delete an application filter group named browser-based business, you should search the CLI for that value to see if it is used anywhere in profiles or policies, using the following command:*
>
> ```
> admin@PA-3060> show config running | match "browser-based
>  business"
> ```
>
> *Notice that because the object you are matching on has a space in it, you must enclose it in quotation marks.*

Commit Configuration Changes

Any change in the Palo Alto Networks device configuration is first written to the candidate configuration. The change only takes effect on the device when you commit it. Committing a configuration applies the change to the running configuration, which is the configuration that the device actively uses. Upon commit, the device performs both a syntactic validation (of configuration syntax) and a semantic validation (whether the configuration is complete and makes sense). As a best practice, **validate** configuration changes prior to committing so that you can fix any errors that will cause a commit failure, thereby ensuring that the commit will succeed. This is particularly useful in environments with a strict change window.

The firewall and Panorama queue commit operations so that you can initiate a new commit while a previous commit is in progress. The firewall and Panorama perform commits in the order you and other administrators initiate them but prioritize automatic commits such as content database installations and FQDN refreshes. If the queue already has the maximum number of administrator-initiated commits (this varies by appliance model), the firewall or Panorama must begin processing a commit (remove it from the queue) before you can initiate a new commit.

> 💡 *To see details (such as queue positions or Job-IDs) about commits that are pending, in progress, completed, or failed, run the operational command **show jobs all**. To see the messages and description for a particular commit, run **show jobs id <job-id>**.*

STEP 1 | (Optional but recommended) Validate the configuration:

1. Enter the validate command:

   ```
   admin@PA-3060> configure
   admin@PA-3060# validate full
   Validate job enqueued with jobid 3041
   3041
   ```

2. View the validation results using the job ID that was displayed when you entered the validate command. Verify that the job finished (FIN) and that the configuration is valid as shown in the following example:

   ```
   [edit]
   admin@PA-3060# exit
   Exiting configuration mode
   admin@PA-3060> show jobs id 3041

   Enqueued                Dequeued        ID              Type     Status Result
   ------------------------------------------------------------------------
   2015/05/18
    14:00:40    14:00:40     3041          Validate       FIN      OK  14:01:11

   vsys1 (vsys1)
       vsys1: Rule 'rule1' application dependency warning:
           Application 'propalms' requires 'web-browsing' be
    allowed
           Application 'open-vpn' requires 'ssl' be allowed
   ```

```
        Application 'open-vpn' requires 'web-browsing' be
    allowed
        Application 'files.to' requires 'web-browsing' be
    allowed
        Application 'gigaup' requires 'ftp' be allowed
        Application 'dazhihui' requires 'web-browsing' be
    allowed
        Application 'fasp' requires 'ssh' be allowed
        Application 'vidsoft' requires 'web-browsing' be
    allowed
        Application 'ipp' requires 'web-browsing' be allowed
        Application 'flexnet-installanywhere' requires 'web-
browsing' be allowed
(Module: device)
Details:Configuration is valid
```

3. If the validation fails, fix any errors and then repeat steps 1 and 2.

STEP 2 | After successfully validating the configuration, save it to the running configuration by performing a commit of all or a portion of the configuration:

- Commit the entire configuration:

```
admin@PA-3060> configure
admin@PA-3060# commit
```

- Commit part of the configuration on a firewall with multiple virtual systems:

```
admin@PA-3060# commit partial ?
+ description           Enter commit description
+ device-and-network    device-and-network
+ shared-object         shared-object
> admin                 admin
> no-vsys               no-vsys
> vsys                  vsys
  <Enter>               Finish input
```

When doing a partial commit from the CLI, you must specify what part of the configuration to exclude from the commit. You can also filter the configuration changes by administrator. For example, the following command commits only the changes that an administrator with the username jsmith made to the vsys1 configuration and to shared objects:

```
admin@PA-3060# commit partial admin jsmith vsys vsys1 device-and-
network excluded
```

- Commit part of the configuration on a firewall that does not have multiple virtual systems mode enabled:

```
admin@PA-220# commit partial ?
+ description           Enter commit description
+ device-and-network    device-and-network
+ policy-and-objects    policy-and-objects
+ shared-object         shared-object
```

```
> admin                    admin
<Enter>                    Finish input
```

For example, if you made a change in the Security policy only, you might want to commit just the policy and objects portion of the configuration as follows:

```
admin@PA-220# commit partial device-and-network excluded
```

If the commit takes a long time, you can press Ctrl+C to access the command line while the commit continues as a background process.

Test the Configuration

Use the CLI-only **test** commands to test that your configuration works as expected. For example, you can test that your policy rulebases are working as expected, that your authentication configuration will enable the Palo Alto Networks device to successfully connect to authentication services, that a custom URL category matches expected sites, that your IPSec/IKE VPN settings are configured properly, that your User-ID syslog parsing profiles are working properly, and many more things.

The following sections show examples of how to use some of the **test** commands:

- Test the Authentication Configuration
- Test Policy Matches

Test the Authentication Configuration

Use the **test authentication** command to determine if your firewall or Panorama management server can communicate with a back-end authentication server and if the authentication request was successful. You can additionally test authentication profiles used for GlobalProtect and Captive Portal authentication. You can perform authentication tests on the candidate configuration, so that you know the configuration is correct before committing.

Connectivity testing is supported for local database authentication and for external authentication servers that use multi-factor authentication (MFA), RADIUS, TACACS+, LDAP, Kerberos, or SAML.

STEP 1 | (Vsys-specific authentication profiles only) Specify which virtual system contains the authentication profile you want to test. This is only necessary if you are testing an authentication profile that is specific to a single virtual system (that is, you do not need to do this if the authentication profile is shared).

```
admin@PA-3060> set system setting target-vsys <vsys-name>
```

For example, to test an authentication profile in vsys2 you would enter the following command:

```
admin@PA-3060> set system setting target-vsys vsys2
```

> The **set system setting target-vsys** command is not persistent across sessions.

STEP 2 | Test an authentication profile by entering the following command:

```
admin@PA-3060> test authentication authentication-
profile <authentication-profile-name> username <username> password
```

You will be prompted for the password associated with the user account.

> *Profile names are case-sensitive. Also, if the authentication profile has a username modifier defined, you must enter it with the username. For example, if the username modifier is %USERINPUT%@%USERDOMAIN%, for a user named bzobrist in domain acme.com, you would need to enter* **bzobrist@acme.com** *as the username.*

For example, run the following command to test connectivity with a Kerberos server defined in an authentication profile named Corp, using the login for the LDAP user credentials for user bzobrist:

```
admin@PA-3060> test authentication authentication-profile Corp
 username bzobrist password
Enter password :

Target vsys is not specified, user "bzobrist" is assumed to be
 configured with a
shared auth profile.

Do allow list check before sending out authentication request...
name "bzobrist" is in group "all"

Authentication to KERBEROS server at '10.1.2.10' for user
 'bzobrist'
Realm: 'ACME.LOCAL'
Egress: 10.55.0.21
KERBEROS configuration file is created
KERBEROS authcontext is created. Now authenticating ...
Kerberos principal is created
Sending authentication request to KDC...
Authentication succeeded!

Authentication succeeded for user "bzobrist"
```

Test Policy Matches

You can use **test** commands to verify that your policies are working as expected.

⦿ Test a security policy rule.

Use the **test security-policy-match** command to determine whether a security policy rule is configured correctly. For example, suppose you have a user mcanha in your marketing department who is responsible for posting company updates to Twitter. Instead of adding a new rule just for that user, you want to test whether twitter will be allowed via an existing rule.

By running the following test command, you can see that the user mcanha is indeed allowed to post to twitter based on your existing Allowed Personal Apps security policy rule:

```
admin@PA-3060> test security-policy-match application twitter-
posting source-user acme\mcanha destination 199.59.150.7
 destination-port 80 source 10.40.14.197 protocol 6

"Allowed Personal Apps" {
        from trust;
        source any;
        source-region none;
        to untrust;
        destination any;
        destination-region none;
        user any;
        category any;
        application/service [ twitter-posting/tcp/any/80 twitter-

 stun/udp/any/any web-browsing/any/any/any web-browsing/tcp/any/any
 web-browsing/tcp/any/80          action allow;
        icmp-unreachable: no
        terminal yes;
}
```

◉ Test an Authentication policy rule.

Use the **test authentication-policy-match** command to test your Authentication policy. For example, you want to make sure that all users accessing Salesforce are authenticated. You would use the following **test** command to make sure that if users are not identified using any other mechanism, the Authentication policy will force them to authenticate:

```
admin@PA-3060> test authentication-policy-match from trust to
 untrust source 192.168.201.10 destination 96.43.144.26

Matched rule: 'salesforce' action: web-form
```

◉ Test a Decryption policy rule.

Use the **test decryption-policy-match category** command to test whether traffic to a specific destination and URL category will be decrypted according to your policy rules. For

example, to verify that your no-decrypt policy for traffic to financial services sites is not being decrypted, you would enter a command similar to the following:

```
admin@PA-3060> test decryption-policy-match category financial-
services from trust source 10.40.14.197 destination 159.45.2.143

Matched rule: 'test' action: no-decrypt
```

Load Configurations

- [Load Configuration Settings from a Text File](#)
- [Load a Partial Configuration](#)

Load Configuration Settings from a Text File

In scripting mode, you can copy and paste commands from a text file directly into the CLI. This is a quick and easy way to copy several configuration settings from one Palo Alto Networks device to another.

STEP 1 | On the device from which you want to copy configuration commands, set the CLI output mode to set:

```
admin@fw1> set cli config-output-format set
```

STEP 2 | Show the part of the configuration you want to copy. For example, to copy the SNMP configuration you would enter the following command:

```
admin@fw1# show deviceconfig system snmp-setting
set deviceconfig system snmp-setting snmp-system location
 Headquarters
set deviceconfig system snmp-setting snmp-system contact snmp-
admin@acme.com
set deviceconfig system snmp-setting access-setting version v2c
 snmp-community-string public
```

⊖ *When pasting commands into the command line, make sure you are entering them in the proper order to avoid errors. Sometimes commands shown in the CLI are not the order in which they must be configured on the device (for example, if you are pasting a configuration from a firewall into Panorama). If you see errors, check whether the command that generated the error is dependent on a later command. In these cases, you can usually just reenter the command. Also make sure you are pasting sections of a configuration in a logical order. For example, you should not copy security policy rules if you have not yet configured the objects the rules rely on, such as zones, security profiles, or address groups.*

STEP 3 | Copy the commands to a text editor such as Notepad and edit the settings as desired.

STEP 4 | On the second device, paste the commands into the command line.

📋 *There is a limit to the amount of text that can be copied into the SSH buffer (approximately 20 lines). If you cut-and-paste a large block of text into the CLI, examine the output of the lines you pasted. If you see lines that are truncated or generate errors, you may have to re-paste a smaller section of text, or switch to scripting mode using the* **set cli scripting-mode on** *operational mode command, which increases the buffer significantly.*

STEP 5 | Commit Configuration Changes.

Load a Partial Configuration

Use the **load config partial** command to copy a section of a configuration file in XML. The configuration can be:

- A saved configuration file from a Palo Alto Networks firewall or from Panorama

- A local configuration (for example, running-confg.xml or candidate-config.xml)

- An imported configuration file from a firewall or Panorama

To load a partial configuration, you must identify the configuration file you want to copy from and, if it is not local, import it onto the device (see Use Secure Copy to Import and Export Files for an example of how to import a saved configuration).

If you are managing more than two or three firewalls, consider using Panorama for central management and monitoring of your firewalls.

To specify what part of the configuration to load, you must find the xpath location, which specifies the XML node in the configuration file you are loading from and the node in the local candidate configuration you are loading to.

The format of the command is:

```
admin@PA-3060# load config partial mode [append|merge|replace] from-
xpath <source-xpath> to-xpath <destination-xpath> from <filename>
```

Use the information in the following topics to determine the appropriate Xpath location formats and use them to load a configuration object from one configuration to another:

- Xpath Location Formats Determined by Device Configuration

- Load a Partial Configuration into Another Configuration Using Xpath Values

Xpath Location Formats Determined by Device Configuration

You specify the source and destination of the **load partial** command using xpath locations, which specify the XML node in the configuration you are copying from (**from-xpath**) and the XML node in the candidate configuration you are copying to (**to-xpath**). Determining the correct xpath is a critical part of using this command. The following table shows the format for the **from-xpath** and **to-xpath** on different types of devices. Notice that the **from-xpath** begins at devices or shared, whereas the **to-xpath** begins with /config.

Type of Device Configuration	Xpath Formats
Multi-vsys Firewall	**from-xpath**

Type of Device Configuration	Xpath Formats
	`devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys-ID']/<object>`
	to-xpath
	`/config/devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys-ID']/<object>`
Single-vsys Firewall	**from-xpath**
	`devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys1']/<object>`
	to-xpath
	`/config/devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys1']/<object>`
Panorama Shared Object	**from-xpath**
	`shared/<object>`
	to-xpath
	`/config/shared/<object>`
Panorama Device Group Object	**from-xpath**
	`devices/entry[@name='localhost.localdomain']/device-group/entry[@name='device-group-name']/ <object>`
	to-xpath
	`/config/devices/entry[@name='localhost.localdomain']/device-group/entry[@name='device-group- name']/<object>`

Load a Partial Configuration into Another Configuration Using Xpath Values

STEP 1 | Find the xpath values to use to load the partial configuration.

1. Log in to the web interface on the device and go to the following URL:

   `https://<device-ip-address>/api`
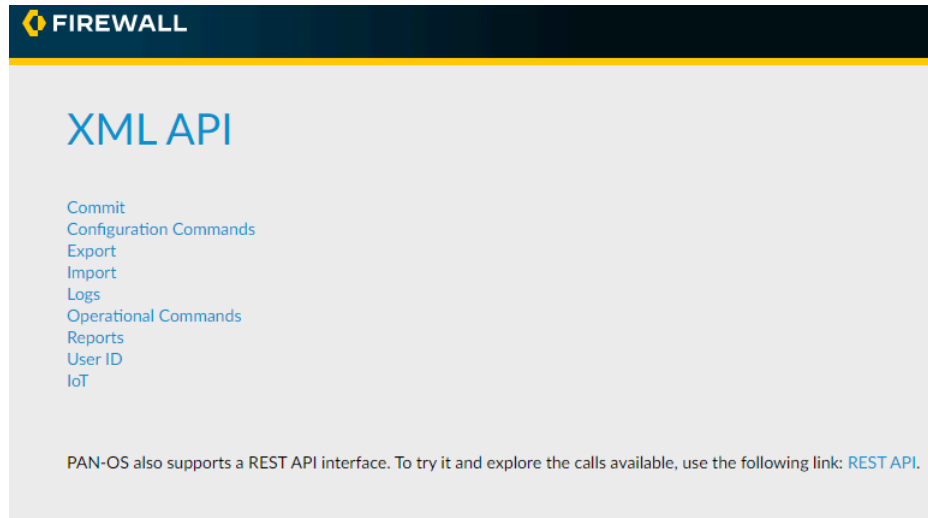

2. Select **Configuration Commands**.

3. Drill down until you find the configuration object you want to load from one configuration to another.

   For example, to find the application group xpath on a multi-vsys firewall, you would select **Configuration Commands** > **devices** > **localhost.localdomain** > **vsys** > *<vsys-*

name> > **application-group**. After you drill down to the node you want to load, make note of the XPath that is displayed in the text box.

⬡ **FIREWALL**

XML API ⟩ Configuration
Commands ⟩ devices ⟩ entry[@name='localhost.localdomain'] ⟩ vsys ⟩ entry[@name='vsys1'] ⟩ application-group

XPath

/config/devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys1']/application-group

Submit

XML API Url

/api/?type=config&action=get&xpath=/config/devices/entry[@name='localhost.localdomain']/vsys/entry[@name='vsys1']/application-group

💡 *You can also find the xpath from the CLI debug mode (use the operational mode command* **debug mode on** *to enable this), and then enter the configuration mode* show *command that shows the object you are interested in copying. For example, to see the xpath for the application object configuration in vsys1, you would enter the* **show vsys vsys1 application** *command. Look for the section of the output that begins with* <request cmd="get" obj=". *This signals the beginning of the xpath. In the following example, the highlighted section is the xpath for the application objects in vsys1:*

```
admin@PA-3060# show vsys vsys1 application
(container-tag: vsys container-tag: entry key-tag:
 name value: vsys1 container-tag: application)
((eol-matched: . #t) (eol-matched: . #t) (eol-
matched: . #t) (xpath-prefix: . /config/devices/
entry[@name='localhost.localdomain']) (context-
inserted-at-end-p: . #f))
/usr/local/bin/pan_ms_client --config-
mode=default --set-prefix='set vsys vsys1 ' --
cookie=2588252477840140 <<'EOF' |/usr/bin/less -X -E
 -M
<request cmd="get" obj="/config/devices/
entry[@name='localhost.localdomain']/vsys/
entry[@name='vsys1']/application"></request>
EOF
```

4. After you find the xpath for the node you want to load, identify the appropriate from- and to- Xpath Location Formats Determined by Device Configuration to load the partial configuration.

STEP 2 | Use the **load config partial** command to copy sections of the configuration you just imported. For example, you would use the following command to load the application filters you configured on fw1 from a saved configuration file, fw1-config.xml, you imported from fw1 (a single-vsys firewall) to vsys3 on fw2. Notice that even though fw1 does not have

multiple virtual system support, the xpath still points to the vsys1 (the default vsys ID on single-vsys firewalls):

```
admin@fw2# load config partial mode merge from-xpath
 devices/entry[@name='localhost.localdomain']/vsys/
entry[@name='vsys1']/application-filter to-xpath/config/devices/
entry[@name='localhost.localdomain']/vsys/entry[@name='vsys3']/
application-filter from fw1-config.xml
```

The quotation marks around the hostname and the vsys name (if applicable) must be neutral. The command will fail if there are opened or closed quotation marks.

STEP 3 | Commit Configuration Changes.

Use Secure Copy to Import and Export Files

Secure Copy (SCP) is a convenient way to import and export files onto or off of a Palo Alto Networks device. For, example, you can use SCP to upload a new OS version to a device that does not have internet access, or you can export a configuration or logs from one device to import on another. The SCP commands require that you have an account (username and password) on the SCP server.

> *Because the file for the entire log database is too large for an export or import to be practical on the following models, they do not support the* **scp export logdb** *or* **scp import logdb** *commands: Panorama virtual appliance running Panorama 6.0 or later releases, Panorama M-Series appliances (all releases), and PA-7000 Series firewall (all releases).*

- Export a Saved Configuration from One Firewall and Import it into Another
- Export and Import a Complete Log Database (logdb)

Export a Saved Configuration from One Firewall and Import it into Another

After you import the saved configuration, you can then Load a Partial Configuration from the first firewall onto the second firewall.

STEP 1 | On the first firewall, save the current configuration to a named configuration snapshot using the **save config to <filename>** command in configuration mode. For example:

```
admin@PA-fw1# save config to fw1-config
```

STEP 2 | Export the named configuration snapshot and log database to an SCP-enabled server using the **scp export** command in operational mode. When prompted, enter the password for your SCP server account.

```
admin@fw1> scp export configuration from <named-config-file>
 to <username@host:path>
```

For an SCP server running on Windows, the destination folder/filename path for both the export and import commands requires a drive letter followed by a colon. For example:

```
admin@fw1> scp export configuration from fw1-config.xml to
 ccrisp@10.10.10.5:c:/fw-config
```

STEP 3 | Log in to the firewall to which you want to copy the configuration and logs, and then import the configuration snapshot and log database. When prompted, enter the password for your SCP server account.

```
admin@fw2> scp import configuration
 from <username@host:path_to_named-config-file>
```

For example (on a Windows-based SCP server):

```
admin@fw2> scp import configuration from ccrisp@10.10.10.5:c:/fw-
configs/fw1-config.xml
```

Export and Import a Complete Log Database (logdb)

Because the file for the entire log database is too large for an export or import to be practical on the following models, they do not support the **scp export logdb** *or* **scp import logdb** *commands:*

- *Panorama virtual appliance running Panorama 6.0 or later releases.*
- *Panorama M-Series appliances (all releases).*
- *PA-7000 Series firewall (all releases).*

STEP 1 | Export a log database to an SCP-enabled server using the **scp export** command in operational mode. When prompted, enter the password for your SCP server account.

```
admin@fw1> scp export logdb
 to <username@host:path_to_destination_filename>
```

For an SCP server running on Windows, the destination folder/filename path for both the export and import commands requires a drive letter followed by a colon. For example:

```
admin@fw1> scp export logdb to ccrisp@10.10.10.5:c:/fw-logs/fw1-
logdb
```

STEP 2 | Log in to the firewall on which to import a log database, and then enter the import command. When prompted, enter the password for your SCP server account.

```
admin@fw2> scp import logdb
 from <username@host:path_to_destination_filename>
```

For example (on a Windows-based SCP server):

```
admin@fw2> scp import logdb from ccrisp@10.10.10.5:c:/fw-logs/fw1-
logdb
```

CLI Jump Start

The following table provides quick start information for configuring the features of Palo Alto Networks devices from the CLI. Where applicable for firewalls with multiple virtual systems (vsys), the table also shows the location to configure shared settings and vsys-specific settings.

To configure...	Start here...
MGT interface	`# set deviceconfig system ip-address`
admin password	`# set mgt-config users admin password`
DNS	`# set deviceconfig system dns-setting servers`
NTP	`# set deviceconfig system ntp-servers`
Interfaces	`# set network interface`
System settings	`# set deviceconfig system`
Zones	`# set zone <name>` `# set vsys <name> zone <name>`

Security Profiles
 	
HIP Objects/
Profiles
 	
URL Filtering
Profiles
 	
WildFire Analysis
Profiles
	`# set profiles`
	`# set vsys <name> profiles`
	`# set shared profiles`

Server Profiles	`# set server-profile`
	`# set vsys <name> server-profile`
	`# set shared server-profile`

To configure...	Start here...

Authentication Profiles	`# set authentication-profile`
	`# set vsys <name> authentication-profile`
	`# set shared authentication-profile`

Certificate Profiles	`# set certificate-profile`
	`# set vsys <name> certificate-profile`
	`# set shared certificate-profile`

Policy	`# set rulebase` `# set vsys vsys1 rulebase`
Log Quotas	`# set deviceconfig setting management quota-settings`

User-ID	`# set user-id-agent`
	`# set vsys <name> user-id-agent`
	`# set user-id-collector`
	`# set vsys <name> user-id-collector`

HA	`# set deviceconfig high-availability`
AutoFocus Settings	`# set deviceconfig setting autofocus`
WildFire Settings	`# set deviceconfig setting wildfire`
Panorama	`# set deviceconfig system panorama-server`
Restart	`> request restart system`

CLI Cheat Sheets

- CLI Cheat Sheet: Device Management
- CLI Cheat Sheet: User-ID
- CLI Cheat Sheet: Networking
- CLI Cheat Sheet: VSYS
- CLI Cheat Sheet: Panorama
- CLI Cheat Sheet: CTD Evasion Detection

CLI Cheat Sheet: Device Management

Use the following table to quickly locate commands for common device management tasks:

If you want to...	Use...
• Show general system health information.	`> show system info`
• Show percent usage of disk partitions. Include the optional **files** parameter to show information about inodes, which track file storage.	`> show system disk-space files`
• Show the maximum log file size.	`> show system logdb-quota`
• Show running processes.	`> show system software status`
• Show processes running in the management plane.	`> show system resources`
• Show resource utilization in the dataplane.	`> show running resource-monitor`
• Show the licenses installed on the device.	`> request license info`
• Show when commits, downloads, and/or upgrades are completed.	`> show jobs processed`
• Show session information.	`> show session info`
• Show information about a specific session.	`> show session id <session-id>`
• Show the running security policy.	`> show running security-policy`

If you want to...	Use...
• Show the authentication logs.	`> less mp-log authd.log`
• Restart the device.	`> request restart system`
• Show the administrators who are currently logged in to the web interface, CLI, or API.	`> show admins`
• Show the administrators who can access the web interface, CLI, or API, regardless of whether those administrators are currently logged in. When you run this command on the firewall, the output includes local administrators, remote administrators, and all administrators pushed from a Panorama template. Remote administrators are listed regardless of when they last logged in.	`> show admins all`
• Configure the management interface as a DHCP client. For a successful commit, you must include each of the parameters: **accept-dhcp-domain**, **accept-dhcp-hostname**, **send-client-id**, and **send-hostname**.	`# set deviceconfig system type dhcp-client accept-dhcp-domain <yes|no> accept-dhcp-hostname <yes|no> send-client-id <yes|no> send-hostname <yes|no>`

CLI Cheat Sheet: User-ID

Use the following commands to perform common User-ID configuration and monitoring tasks.

💡 *To see more comprehensive logging information enable debug mode on the agent using the* **debug user-id log-ip-user-mapping yes** *command. When you are done troubleshooting, disable debug mode using* **debug user-id log-ip-user-mapping no**.

CLI Cheat Sheet: User-ID

View all User-ID agents configured to send user mappings to the Palo Alto Networks device:

- To see all configured Windows-based agents:

```
> show user user-id-agent state all
```

- To see if the PAN-OS-integrated agent is configured:

```
> show user server-monitor state all
```

View how many log messages came in from syslog senders and how many entries the User-ID agent successfully mapped:

```
> show user server-monitor statistics
```

View the configuration of a User-ID agent from the Palo Alto Networks device:

```
> show user user-id-agent config name <agent-name>
```

View group mapping information:

```
> show user group-mapping statistics
> show user group-mapping state all
> show user group list
> show user group name <group-name>
```

View all user mappings on the Palo Alto Networks device:

```
> show user ip-user-mapping all
```

Show user mappings filtered by a username string (if the string includes the domain name, use two backslashes before the username):

CLI Cheat Sheet: User-ID

```
> show user ip-user-mapping all | match <domain>\\<username-string>
```

Show user mappings for a specific IP address:

```
> show user ip-user-mapping ip <ip-address>
```

Show usernames:

```
> show user user-ids
```

View the most recent addresses learned from a particular User-ID agent:

```
> show log userid datasourcename equal <agent-name> direction equal
  backward
```

View mappings from a particular type of authentication service:

```
> show log userid datasourcetype equal <authentication-service>
```

where *<authentication-service>* can be **authenticate**, **client-cert**, **directory-server**, **exchange-server**, **globalprotect**, **kerberos**, **netbios-probing**, **ntlm**, **unknown**, **vpn-client**, or **wmi-probing**.

For example, to view all user mappings from the Kerberos server, you would enter the following command:

```
> show log userid datasourcetype equal kerberos
```

View mappings learned using a particular type of user mapping:

```
> show log userid datasource equal <datasource>
```

where *<datasource>* can be **agent**, **captive-portal**, **event-log**, **ha**, **probing**, **server-session-monitor**, **ts-agent**, **unknown**, **vpn-client**, or **xml-api**.

For example, to view all user mappings from the XML API, you would enter the following command:

```
> show log userid datasourcetype equal xml-api
```

Find a user mapping based on an email address:

```
> show user email-lookup
```

CLI Cheat Sheet: User-ID

```
+ base              Default base distinguished name (DN) to use fo
r searches
+ bind-dn           bind distinguished name
+ bind-password     bind password
+ domain            Domain name to be used for username
+ group-object      group object class(comma-separated)
+ name-attribute    name attribute
+ proxy-agent       agent ip or host name.
+ proxy-agent-port  user-id agent listening port, default is 5007
+ use-ssl           use-ssl
* email             email address
> mail-attribute    mail attribute
> server            ldap server ip or host name.
> server-port       ldap server listening port
```

For example:

```
> show user email-lookup base "DC=lab,DC=sg,DC=acme,DC=local" bind-
dn "CN=Administrator,CN=Users,DC=lab,DC=sg,DC=acme,DC=local" bind-p
assword acme use-ssl no email user1@lab.sg.acme.local mail-attribut
e mail server 10.1.1.1 server-port 389 labsg\user1
```

Clear the User-ID cache:

```
clear user-cache all
```

Clear a User-ID mapping for a specific IP address:

```
clear user-cache ip <ip-address/netmask>
```

CLI Cheat Sheet: HA

Use the following table to quickly locate commands for HA tasks.

If you want to ...	Use ...
• View all HA cluster configuration content.	`> show high-availability cluster all`
• View HA cluster flap statistics. 📋 *Cluster flap count is reset when the HA device moves from suspended to functional and vice versa. Cluster flap count also resets when non-functional hold time expires.*	`> show high-availability cluster flap-statistics`
• View status of the HA4 interface.	`> show high-availability cluster ha4-status`
• View status of the HA4 backup interface.	`> show high-availability cluster ha4-backup-status`
• View information about the type and number of synchronized messages to or from an HA cluster.	`> show high-availability cluster session-synchronization`
• View HA cluster state and configuration information.	`> show high-availability cluster state`
• View HA cluster statistics, such as counts received messages and dropped packets for various reasons.	`> show high-availability cluster statistics`
• Clear HA cluster statistics.	`> clear high-availability cluster statistics`

If you want to ...	Use ...
• Clear session cache.	``` > request high-availability clus ter clear-cache ```
• Request full session cache synchronization.	``` > request high-availability clus ter sync-from ```

CLI Cheat Sheet: Networking

Use the following table to quickly locate commands for common networking tasks:

If you want to . . .	Use . . .
General Routing Commands	
• Display the routing table	`> show routing route`
• Look at routes for a specific destination	`> show routing fib virtual-router <name> | match <x.x.x.x/Y>`
• Change the ARP cache timeout setting from the default of 1800 seconds.	`> set system setting arp-cache-timeout <60-65536>`
• View the ARP cache timeout setting.	`> show system setting arp-cache-timeout`
AE Interfaces	
• On PA-7050 and PA-7080 firewalls that have an aggregate interface group of interfaces located on different line cards, implement proper handling of fragmented packets that the firewall receives on multiple interfaces of the AE group.	`> set ae-frag redistribution-policy hash`
NAT	
• (PAN-OS 10.1.7 and later 10.1 releases) Enable persistent NAT for DIPP	`> set system setting persistent-dipp enable yes`
• Show the NAT policy table	`> show running nat-policy`

If you want to . . .	Use . . .
• Test the NAT policy	`> test nat-policy-match`
• Show NAT pool utilization	`> show running ippool` `> show running global-ippool`
IPSec	
• Show IPSec counters	`> show vpn flow`
• Show a list of all IPSec gateways and their configurations	`> show vpn gateway`
• Show IKE phase 1 SAs	`> show vpn ike-sa`
• Show IKE phase 2 SAs	`> show vpn ipsec-sa`
• Show a list of auto-key IPSec tunnel configurations	`> show vpn tunnel`
LSVPN (PAN-OS 10.1.7 and later 10.1 releases)	
• (Portal) Change the current satellite cookie expiration time	`> request global-protect-portal set-satellite-cookie-expiration value <0-5>`
• (Portal) Show current satellite cookie expiration time	`> show global-protect-portal satellite-cookie-expiration`
• (Satellite) Display current satellite authentication cookie's generation time	`> show global-protect-satellite satellite`
BFD	

If you want to . . .	Use . . .
• Show BFD profiles	`> show routing bfd active-profile [<name>]`
• Show BFD details	`> show routing bfd details [interface <name>] [local-ip <ip>] [multihop][peer-ip <ip>] [session-id] [virtual-router <name>]`
• Show BFD statistics on dropped sessions	`> show routing bfd drop-counters session-id <session-id>`
• Show counters of transmitted, received, and dropped BFD packets	`> show counter global	match bfd`
• Clear counters of transmitted, received, and dropped BFD packets	`> clear routing bfd counters session-id all	<1-1024>`
• Clear BFD sessions for debugging purposes	`> clear routing bfd session-state session-id all	<1-1024>`

PVST+

• Set the native VLAN ID	`> set session pvst-native-vlan-id <vid>`
• Drop all STP BPDU packets	`> set session drop-stp-packet`
• Verify PVST+ BPDU rewrite configuration, native VLAN ID, and STP BPDU packet drop	`> show vlan all`
• Show counter of times the 802.1Q tag and PVID fields in a PVST+ BPDU packet do not match	`> show counter global` Look at the `flow_pvid_inconsistent` counter.

Troubleshooting

If you want to . . .	Use . . .
• Ping from the management (MGT) interface to a destination IP address	`> ping host <destination-ip-address>`
• Ping from a dataplane interface to a destination IP address	`> ping source <ip-address-on-dataplane> host <destination-ip-address>`
• Show network statistics	`> show netstat statistics yes`

CLI Cheat Sheet: VSYS

Use the following commands to administer a Palo Alto Networks firewall with multiple virtual system (multi-vsys) capability. You must have superuser, superuser (read-only), device administrator, or device administrator (read-only) access to use these commands. These commands are not available for virtual system administrator or virtual system administrator (read-only) roles.

If you want to . . .	Use . . .
• Find out if the firewall is in multi-vsys mode	```admin@PA> show system info | match vsys multi-vsys: on```
• View a list of virtual systems configured on the firewall 📋 *After adding a new virtual system from the CLI, you must log out and log back in to see the new virtual system within the CLI.*	```admin@PA> set system setting target-vsys ? none none vsys1 vsys1 vsys2 vsys2 <value> <value>```

• Switch to a particular vsys so that you can issue commands and view data specific to that vsys	```admin@PA> set system setting target-vsys <vsys-name>```
	
	For example, use the following command to switch to vsys2; note that the vsys name is case sensitive:
	
	```> set system setting target-vsys vsys2 Session target vsys changed to vsys2 admin@PA-vsys2>```
	
	Notice that the command prompt now shows the name of the vsys you are now administering.

• View the maximum number of sessions allowed, in use, and throttled	```admin@PA> show session meter```
	
	Example output:
	
	```VSYS Maximum Current Throttled```

If you want to . . .	Use . . .
	`1        10        30        1587`
	Maximum indicates the maximum number of sessions allowed per dataplane, Current indicates the number of sessions being used by the virtual system, and Throttled indicates the number of sessions denied for the virtual system because the sessions exceeded the Maximum number multiplied by the number of dataplanes in the system. 📋 *As shown in this example, on a PA-5200 Series or PA-7000 Series firewall, the Current number of sessions being used can be greater than the Maximum configured for Sessions Limit (Device > Virtual Systems > Resource) because there are multiple dataplanes per virtual system. The Sessions Limit you configure on a PA-5200 or PA-7000 Series firewall is per dataplane, and will result in a higher maximum per virtual system.*
• View the User-ID mappings in the vsys	`admin@PA-vsys2> show user ip-user-map` `ping all`

• Return to configuring the firewall globally	`admin@PA-vsys2> set system setting ta`
	`rget-vsys none`
	`admin@PA>`

CLI Cheat Sheet: Panorama

Use the following commands on Panorama to perform common configuration and monitoring tasks for the Panorama management server (M-Series appliance in Panorama mode), Dedicated Log Collectors (M-Series appliances in Log Collector mode), and managed firewalls.

> *To view system information about a Panorama virtual appliance or M-Series appliance (for example, job history, system resources, system health, or logged-in administrators), see CLI Cheat Sheet: Device Management.*
>
> *A Dedicated Log Collector mode has no web interface for administrative access, only a command line interface (CLI).*

If you want to . . .	Use . . .
M-Series Appliance Mode of Operation (Panorama, Log Collector, or PAN-DB Private Cloud Mode)	

> *Switching the mode reboots the M-Series appliance, deletes any existing log data, and deletes all configurations except the management access settings.*

If you want to . . .	Use . . .
• Display the current operational mode.	`>` `show system info	match system-mode`
• Switch from Panorama mode to Log Collector mode.	`>` `request system system-mode logger`
• Switch from Panorama mode to PAN-DB private cloud mode (M-500 appliance only).	`>` `request system system-mode panurldb`
• Switch an M-Series appliance from Log Collector mode or PAN-DB private cloud mode (M-500 appliance only) to Panorama mode.	`>` `request system system-mode panorama`
• Switch the Panorama virtual appliance from Legacy mode to Panorama mode.	`>`

If you want to . . .	Use . . .
	`request system system-mode panorama`

• Switch the Panorama virtual appliance from Panorama mode to Legacy mode.	`>`
	
	`        request system system-mode legacy`

Panorama Management Server

• Change the output for **show** commands to a format that you can run as CLI commands.	`>`
	
	`        set cli config-output-mode set`
	
	The following is an example of the output for the **show device-group** command after setting the output format:
	
	`#`
	`        show device-group branch-offices`
	`        set device-group branch-offices devices`
	`        set device-group branch-offices pre-rulebase`
	`        ...`

• Enable or disable the connection between a firewall and Panorama. You must enter this command from the firewall CLI.	`>`
	
	`        set panorama [off | on]`

• Synchronize the configuration of M-Series appliance high availability (HA) peers.	`>`
	
	`        request high-availability sync-to-remote [running-config | candidate-config]`

If you want to . . .	Use . . .
• Reboot multiple firewalls or Dedicated Log Collectors.	`>` `request batch reboot [devices	log-collectors]`   `<serial-number>`
• Change the interval in seconds (default is 10; range is 5 to 60) at which Panorama polls devices (firewalls and Log Collectors) to determine the progress of software or content updates. Panorama displays the progress when you deploy the updates to devices. Decreasing the interval makes the progress report more accurate but increases traffic between Panorama and the devices.	`>` `set dlsrvr poll-interval` `<5-60>`

Device Groups and Templates

• Show the history of device group commits, status of the connection to Panorama, and other information for the firewalls assigned to a device group.	`>` `show devicegroups name` `<device-group-name>`
• Show the history of template commits, status of the connection to Panorama, and other information for the firewalls assigned to a template.	`>` `show templates name` `<template-name>`
• Show all the policy rules and objects pushed from Panorama to a firewall. You must enter this command from the firewall CLI.	`>` `show config pushed-shared-policy`
• Show all the network and device settings pushed from Panorama to a firewall. You must enter this command from the firewall CLI.	`>` `show config pushed-template`

If you want to . . .	Use . . .
Log Collection	
• Show the current rate at which the Panorama management server or a Dedicated Log Collector receives firewall logs.	`> debug log-collector log-collection-stats show incoming-logs`
• Show the quantity and status of logs that Panorama or a Dedicated Log Collector forwarded to external servers (such as syslog servers) as well as the auto-tagging status of the logs. Tracking dropped logs helps you troubleshoot connectivity issues.	`> debug log-collector log-collection-stats show log-forwarding-stats`
• Show status information for log forwarding to the Panorama management server or a Dedicated Log Collector from a particular firewall (such as the last received and generated log of each type). When you run this command at the firewall CLI (skip the **device *<firewall-serial-number>*** argument), the output also shows how many logs the firewall has forwarded.	`> show logging-status device <firewall-serial-number>`
• Clear logs by type. Running this command on the Panorama management server clears logs that Panorama and Dedicated Log Collectors generated, as well as any firewall logs that the Panorama management server collected. Running this command on a Dedicated Log Collector clears the logs that it collected from firewalls.	`> clear log [acc	alarm	config	hipmatch	system]`

CLI Cheat Sheet: CTD Evasion Detection

Use the following table to quickly locate commands for CLI commands related to CTD (content and threat detection engine) fail-close behavior.

These CLI commands are typically used for internal testing purposes or under the guidance of Palo Alto Networks Support.

If you want to ...	Use ...
• Block the session if decoding errors occur while decoding Base64 encoded traffic.	`> set system setting ctd block-on-base64-decode-error enable`
• Block the session if decoding errors occur while decoding BDAT-Chunk traffic.	`> set system setting ctd block-on-bdat-chunk-decode-error enable`
• Block the session if decoding errors occur while decoding chunked transfer encoded traffic.	`> set system setting ctd block-on-chunk-decode-error enable`
• Block the session if decoding errors occur while decoding quoted-printable encoded traffic.	`> set system setting ctd block-on-qp-decode-error enable`
• Block the session if decoding errors occur while decoding UTF encoded traffic.	`> set system setting ctd block-on-utf-decode-error enable`
• Block the session if decoding errors occur while decoding uuencoded traffic.	`> set system setting ctd block-on-uu-decode-error enable`
• Block the session if decoding errors occur while decoding zip encoded traffic.	`> set system setting ctd block-on-zip-decode-error enable`

76

CLI Changes in PAN-OS 10.1

This chapter identifies the PAN-OS 10.1 CLI configure commands changed since the PAN-OS 10.1 release:

- New Set Commands
- Changed Set Commands
- Removed Set Commands
- New Show Commands
- Changed Show Commands
- Removed Show Commands

Set Commands Introduced in PAN-OS 10.1

The following commands are new in the 10.1 release:

```
set deviceconfig system non-ui-authentication-profile <value>

set deviceconfig system hsm-settings provider ncipher-nshield-connect

set deviceconfig system hsm-settings provider ncipher-nshield-connect
 hsm-server

set deviceconfig system hsm-settings provider ncipher-nshield-connect
 hsm-server <name>

set deviceconfig system hsm-settings provider ncipher-nshield-connect
 hsm-server <name> server-address <ip/netmask>

set deviceconfig system hsm-settings provider ncipher-nshield-connect
 rfs-address <ip/netmask>

set deviceconfig system snmp-setting access-setting version v3 users
 <name> authproto <SHA|SHA-224|SHA-256|SHA-384|SHA-512>

set deviceconfig system snmp-setting access-setting version v3 users
 <name> privproto <AES|AES-192|AES-256>
```

```
set deviceconfig setting hawkeye

set deviceconfig setting hawkeye public-cloud-server <value>

set deviceconfig setting ctd cloud-dns-privacy-mask <yes|no>

set deviceconfig setting ctd cloudapp-implicit-policy-enforce <yes|
no>

set deviceconfig setting ctd shm-quota-threshold <50-80>

set deviceconfig setting ctd shared-memory-quota-dlp <0-100>

set deviceconfig setting ctd shared-memory-quota-iot <0-100>

set deviceconfig setting ctd shared-memory-quota-ace <0-100>

set deviceconfig setting ssl-decrypt scan-handshake <yes|no>

set deviceconfig setting management admin-session max-session-count
 <0-4>

set deviceconfig setting management audit-tracking

set deviceconfig setting management audit-tracking op-commands <yes|
no>
```

```
set deviceconfig setting management audit-tracking ui-actions <yes|
no>

set deviceconfig setting management audit-tracking send-syslog
 <value>

set deviceconfig setting cloudapp

set deviceconfig setting cloudapp disable <yes|no>

set deviceconfig setting cloudapp cloudapp-srvr-addr

set deviceconfig setting cloudapp cloudapp-srvr-addr address <ip/
netmask>|<value>
```

```
set network interface ethernet<name> layer3 bonjour

set network interface ethernet <name> layer3 bonjour enable <yes|no>

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat enable <yes|no>

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat static-ip

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat static-ip ip-address <value>|<ip/netmask>

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat static-ip fqdn <value>

set network interface ethernet <name> layer3 sdwan-link-settings
 upstream-nat ddns

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings enable <yes|no>

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings sdwan-interface-profile <value>

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat enable <yes|no>
```

```
set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat static-ip

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat static-ip ip-address <value>|<ip/netmask>

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat static-ip fqdn <value>

set network interface ethernet <name> layer3 units <name> sdwan-link-
settings upstream-nat ddns

set network interface ethernet <name> layer3 units <name> bonjour

set network interface ethernet <name> layer3 units <name> bonjour
 enable <yes|no>

set network interface ethernet <name> layer3 units <name> ip <name>
 sdwan-gateway <ip/netmask>
```

```
set network interface aggregate-ethernet <name> layer3 bonjour

set network interface aggregate-ethernet <name> layer3 bonjour enable
 <yes|no>

set network interface aggregate-ethernet <name> layer3 ip <name>
 sdwan-gateway <ip/netmask>

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings enable <yes|no>

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings sdwan-interface-profile <value>

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat enable <yes|no>

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat static-ip

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat static-ip ip-address <value>|<ip/netmask>

set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat static-ip fqdn <value>
```

```
set network interface aggregate-ethernet <name> layer3 sdwan-link-
settings upstream-nat ddns
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 bonjour
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 bonjour enable <yes|no>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 ip <name> sdwan-gateway <ip/netmask>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings enable <yes|no>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings sdwan-interface-profile <value>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat enable <yes|no>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat static-ip
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat static-ip ip-address <value>|<ip/
netmask>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat static-ip fqdn <value>
```

```
set network interface aggregate-ethernet <name> layer3 units <name>
 sdwan-link-settings upstream-nat ddns
```

```
set network interface loopback df-ignore <yes|no>
```

```
set network interface sdwan units <name> link-tag <value>
```

```
set network tunnel ipsec<name> anti-replay-window <64|128|256|512|
1024|2048|4096>
```

```
set network virtual-router <name> routing-table ip static-route
 <name> path-monitor monitor-destinations <name> source <value>|
<DHCP|PPPOE>
```

```
set network logical-router <name> vrf <name> routing-table ip static-
route <name> path-monitor monitor-destinations <name> source <value>|
<DHCP|PPPOE>

Set Commands Changed in PAN-OS 10.1

The following commands are modified in the 10.1 release.

Added category-of-app, subcategory-of-app, technology-of-app, container-of-app, and risk-of-app filters to the following commands:

```
set shared reports <name> type decryption group-by <serial|
time_generated|src|dst|natsrc|natdst|rule|srcuser|dstuser|srcloc|
dstloc|app|vsys|from|to|inbound_if|outbound_if|sport|dport|natsport|
natdport|proto|action|tunnel|rule_uuid|s_encrypted|category-of-
app|subcategory-of-app|technology-of-app|container-of-app|risk-of-
app|vsys_name|device_name|tls_version|tls_keyxchg|tls_enc|tls_auth|
ec_curve|err_index|root_status|proxy_type|policy_name|cn|issuer_cn|
root_cn|sni|error|src_dag|dst_dag|src_edl|dst_edl|container_id|
pod_namespace|pod_name|src_category|src_profile|src_model|src_vendor|
src_osfamily|src_osversion|src_host|src_mac|dst_category|dst_profile|
dst_model|dst_vendor|dst_osfamily|dst_osversion|dst_host|dst_mac|day-
of-receive_time|hour-of-receive_time|quarter-hour-of-receive_time>
```

```
set shared reports <name> type desum group-by <serial|time_generated|
vsys_name|device_name|category-of-app|subcategory-of-app|technology-
of-app|container-of-app|risk-of-app|app|src|dst|srcuser|dstuser|
vsys|tls_version|tls_keyxchg|tls_enc|tls_auth|sni|error|err_index|
src_edl|dst_edl|container_id|pod_namespace|pod_name|src_category|
src_profile|src_model|src_vendor|src_osfamily|src_osversion|src_host|
src_mac|dst_category|dst_profile|dst_model|dst_vendor|dst_osfamily|
dst_osversion|dst_host|dst_mac|src_dag|dst_dag|day-of-receive_time|
hour-of-receive_time|quarter-hour-of-receive_time>
```

```
set shared reports <name> type threat group-by <serial|
time_generated|src|dst|natsrc|natdst|rule|srcuser|dstuser|srcloc|
dstloc|app|vsys|from|to|inbound_if|outbound_if|sport|dport|natsport|
natdport|proto|action|tunnel|rule_uuid|s_encrypted|category-of-app|
subcategory-of-app|technology-of-app|container-of-app|risk-of-app|
vsys_name|device_name|parent_session_id|parent_start_time|threatid|
category|severity|direction|http_method|nssai_sst|filedigest|
filetype|http2_connection|xff_ip|threat_name|src_edl|dst_edl|
dynusergroup_name|hostid|partial_hash|src_category|src_profile|
src_model|src_vendor|src_osfamily|src_osversion|src_host|src_mac|
dst_category|dst_profile|dst_model|dst_vendor|dst_osfamily|
dst_osversion|dst_host|dst_mac|container_id|pod_namespace|pod_name|
misc|src_dag|dst_dag|day-of-receive_time|hour-of-receive_time|
quarter-hour-of-receive_time|pbf-s2c|pbf-c2s|flag-nat|flag-pcap|
subtype|transaction|captive-portal|flag-proxy|non-std-dport|tunnelid|
monitortag|users|category-of-threatid|threat-type>
```

The following command range changed from 1-3600 to 1-60:

```
set vsys <name> profiles sdwan-saas-quality <name> monitor-mode
 static-ip fqdn probe-interval <1-60>
```

The following command changed transmit-hold-timer to recovery-duration:

```
set vsys <name> profiles sdwan-error-correction <name> mode forward-
error-correction recovery-duration <1-5000>
```

All commands following `set vsys <name> profiles forwarding` options changed to `set vsys <name> profiles packet-broker`.

Set Commands Removed in PAN-OS 10.1

The following commands are no longer available in the 10.1 release.

```
set deviceconfig system hsm-settings provider thales-nshield-connect

set deviceconfig system hsm-settings provider thales-nshield-connect
