Contents

| | |
|--|-----------|
| Chapter 1: Overview..... | 1 |
| 1.1 Command-Line Interface (CLI)..... | 1 |
| 1.1.1 Accessing the EOS CLI..... | 2 |
| 1.1.2 Processing Commands..... | 2 |
| 1.1.3 Kernel-based Virtual Machine Commands and Configuration..... | 9 |
| 1.1.4 Switch Platforms..... | 14 |
| 1.1.5 Command Modes..... | 22 |
| 1.1.6 Managing Switch Configuration Settings..... | 25 |
| 1.1.7 Other Command-Line Interfaces..... | 27 |
| 1.1.8 Directory Structure..... | 28 |
| 1.1.9 Command-Line Interface Commands..... | 28 |
| Chapter 2: Booting the Switch..... | 76 |
| 2.1 Boot Loader Aboot..... | 76 |
| 2.2 Configuration Files..... | 76 |
| 2.2.1 boot-config..... | 77 |
| 2.2.2 running-config..... | 81 |
| 2.2.3 startup-config..... | 81 |
| 2.3 Supervisor Redundancy..... | 81 |
| 2.3.1 Redundancy Supervisor Protocols..... | 81 |
| 2.3.2 Configuring Supervisor Redundancy..... | 82 |
| 2.4 System Reset..... | 83 |
| 2.4.1 Typical Reset Sequence..... | 83 |
| 2.4.2 Switch Recovery..... | 84 |
| 2.4.3 Display Reload Cause..... | 85 |
| 2.4.4 Configuring Zero Touch Provisioning..... | 85 |
| 2.4.5 Configuring the Networks..... | 87 |
| 2.5 Aboot Shell..... | 87 |
| 2.5.1 Aboot Shell Operation..... | 87 |
| 2.5.2 Accessing the Aboot Shell..... | 88 |
| 2.5.3 Aboot File Structure..... | 89 |
| 2.5.4 Booting From the Aboot Shell..... | 90 |
| 2.5.5 Aboot Commands..... | 90 |
| 2.6 Aboot Configuration Commands..... | 91 |
| 2.6.1 CONSOLESPEED..... | 92 |
| 2.6.2 NET Commands..... | 93 |
| 2.6.3 install bios source..... | 94 |
| 2.6.4 PASSWORD (ABOOT)..... | 95 |
| 2.6.5 SWI..... | 96 |
| 2.7 Switch Booting Commands..... | 96 |
| 2.7.1 boot console..... | 97 |
| 2.7.2 boot secret..... | 98 |
| 2.7.3 boot system..... | 100 |
| 2.7.4 delete startup-config..... | 101 |
| 2.7.5 protocol..... | 102 |
| 2.7.6 redundancy..... | 103 |
| 2.7.7 redundancy manual switchover..... | 104 |
| 2.7.8 reload..... | 105 |

| | |
|--|-----|
| 2.7.9 reload (scheduled)..... | 107 |
| 2.7.10 show platform bios..... | 109 |
| 2.7.11 show redundancy file-replication..... | 110 |
| 2.7.12 show redundancy status..... | 111 |
| 2.7.13 show redundancy switchover sso..... | 112 |
| 2.7.14 show reload..... | 113 |
| 2.7.15 show reload cause..... | 114 |
| 2.7.16 show reload fast-boot..... | 115 |

Chapter 3: Initial Configuration and Recovery.....116

| | |
|--|-----|
| 3.1 Initial Switch Access..... | 116 |
| 3.1.1 Zero Touch Provisioning..... | 116 |
| 3.1.2 Manual Provisioning..... | 117 |
| 3.2 Connection Management..... | 121 |
| 3.3 Securely Erasing a Switch Storage Device..... | 122 |
| 3.4 Configuration Sessions Overview..... | 123 |
| 3.4.1 Configuration Session..... | 123 |
| 3.4.2 Replacing the Configuration..... | 124 |
| 3.4.3 Configuration CLI..... | 124 |
| 3.5 Recovery Procedures..... | 125 |
| 3.5.1 Removing the Enable Password from the Startup Configuration..... | 125 |
| 3.5.2 Reverting the Switch to the Factory Default Startup Configuration..... | 126 |
| 3.5.3 Restoring the Factory Default EOS Image and Startup Configuration..... | 127 |
| 3.5.4 USB Support for ZeroTouch Provisioning..... | 128 |
| 3.5.5 Restoring the Configuration and Image from a USB Flash Drive..... | 129 |
| 3.6 Session Management Commands..... | 129 |
| 3.6.1 commit timer..... | 131 |
| 3.6.2 configure replace..... | 132 |
| 3.6.3 configure session..... | 134 |
| 3.6.4 domain (XMPP Management)..... | 135 |
| 3.6.5 idle-timeout (Console Management)..... | 136 |
| 3.6.6 idle-timeout (SSH Management)..... | 137 |
| 3.6.7 idle-timeout (Telnet Management)..... | 138 |
| 3.6.8 management api eos-sdk-rpc..... | 139 |
| 3.6.9 management api external-services..... | 140 |
| 3.6.10 management api gnm..... | 141 |
| 3.6.11 management api gnsi..... | 142 |
| 3.6.12 management api gribi..... | 143 |
| 3.6.13 management api http-commands..... | 144 |
| 3.6.14 management api models..... | 145 |
| 3.6.15 management api netconf..... | 146 |
| 3.6.16 management api restconf..... | 147 |
| 3.6.17 management console..... | 148 |
| 3.6.18 management ssh..... | 149 |
| 3.6.19 management telnet..... | 150 |
| 3.6.20 management xmpp..... | 151 |
| 3.6.21 protocol http (API Management)..... | 152 |
| 3.6.22 protocol https (API Management)..... | 153 |
| 3.6.23 protocol https certificate (API Management)..... | 154 |
| 3.6.24 reset system storage secure..... | 155 |
| 3.6.25 server (XMPP Management)..... | 156 |
| 3.6.26 session privilege (XMPP Management)..... | 157 |
| 3.6.27 show inventory..... | 158 |
| 3.6.28 show xmpp neighbors..... | 159 |
| 3.6.29 show xmpp status..... | 160 |

| | |
|--|-----|
| 3.6.30 show xmpp switch-group..... | 161 |
| 3.6.31 shutdown (API Management)..... | 162 |
| 3.6.32 shutdown (Telnet Management)..... | 163 |
| 3.6.33 shutdown (XMPP Management)..... | 164 |
| 3.6.34 switch-group (XMPP Management)..... | 165 |
| 3.6.35 username (XMPP Management)..... | 166 |
| 3.6.36 vrf (API Management)..... | 167 |
| 3.6.37 vrf (XMPP Management)..... | 168 |
| 3.6.38 xmpp send..... | 169 |
| 3.6.39 xmpp session..... | 170 |

Chapter 4: Administering the Switch..... **171**

| | |
|--|-----|
| 4.1 Managing the Switch Name..... | 171 |
| 4.1.1 Assigning a Name to the Switch..... | 171 |
| 4.1.2 Specifying DNS Addresses..... | 172 |
| 4.2 System Clock and Time Protocols..... | 173 |
| 4.2.1 Configuring the Time Zone..... | 173 |
| 4.2.2 Setting the System Clock Manually..... | 174 |
| 4.2.3 Displaying the Time..... | 174 |
| 4.2.4 Network Time Protocol (NTP)..... | 174 |
| 4.3 Managing Display Attributes..... | 177 |
| 4.3.1 Banners..... | 177 |
| 4.3.2 Configuring the CLI Prompt..... | 178 |
| 4.4 Logging of Event Notifications..... | 179 |
| 4.4.1 Managing TCAM Capacity Warnings..... | 179 |
| 4.4.2 Layer 2 MAC Learn Failure Detection..... | 179 |
| 4.5 Event Monitor..... | 180 |
| 4.5.1 Description..... | 180 |
| 4.5.2 Configuring the Event Monitor..... | 181 |
| 4.5.3 Querying the Event Monitor..... | 183 |
| 4.5.4 Accessing Event Monitor Database Records..... | 183 |
| 4.6 Managing EOS Extensions..... | 184 |
| 4.6.1 Installing EOS Extensions..... | 184 |
| 4.6.2 Installing EOS Extensions on a Dual-Supervisor Switch..... | 184 |
| 4.6.3 Verifying EOS Extensions Installation..... | 185 |
| 4.6.4 Uninstalling an EOS Extension..... | 185 |
| 4.7 Switch Administration Commands..... | 186 |
| 4.7.1 banner login..... | 188 |
| 4.7.2 banner motd..... | 189 |
| 4.7.3 clear ptpt interface counters..... | 190 |
| 4.7.4 clock set..... | 191 |
| 4.7.5 clock timezone..... | 192 |
| 4.7.6 dns domain..... | 193 |
| 4.7.7 email..... | 194 |
| 4.7.8 event-monitor backup max-size..... | 195 |
| 4.7.9 event-monitor backup path..... | 196 |
| 4.7.10 event-monitor buffer max-size..... | 197 |
| 4.7.11 event-monitor clear..... | 198 |
| 4.7.12 event-monitor sync..... | 199 |
| 4.7.13 event-monitor..... | 200 |
| 4.7.14 hostname..... | 202 |
| 4.7.15 ip domain lookup..... | 203 |
| 4.7.16 ip domain-list..... | 204 |
| 4.7.17 ip host..... | 205 |
| 4.7.18 ip name-server..... | 206 |

| | |
|--|-----|
| 4.7.19 ipv6 host..... | 207 |
| 4.7.20 logging format..... | 208 |
| 4.7.21 logging persistent..... | 210 |
| 4.7.22 logging repeat-messages..... | 211 |
| 4.7.23 no event-monitor..... | 212 |
| 4.7.24 ntp authenticate..... | 213 |
| 4.7.25 ntp authentication-key..... | 214 |
| 4.7.26 ntp local-interface..... | 215 |
| 4.7.27 ntp serve all..... | 216 |
| 4.7.28 ntp serve..... | 217 |
| 4.7.29 ntp server..... | 218 |
| 4.7.30 ntp trusted-key..... | 220 |
| 4.7.31 power enable module..... | 221 |
| 4.7.32 prompt..... | 222 |
| 4.7.33 show banner..... | 224 |
| 4.7.34 show clock..... | 225 |
| 4.7.35 show event-monitor arp..... | 226 |
| 4.7.36 show event-monitor igmpsnooping..... | 228 |
| 4.7.37 show event-monitor mac..... | 230 |
| 4.7.38 show event-monitor mroute..... | 232 |
| 4.7.39 show event-monitor neighbor..... | 234 |
| 4.7.40 show event-monitor route6..... | 236 |
| 4.7.41 show event-monitor route..... | 237 |
| 4.7.42 show event-monitor sqlite..... | 238 |
| 4.7.43 show event-monitor stpunstable..... | 239 |
| 4.7.44 show hostname..... | 240 |
| 4.7.45 show hosts..... | 241 |
| 4.7.46 show ip domain-name..... | 242 |
| 4.7.47 show ip name-server..... | 243 |
| 4.7.48 show local-clock time-properties..... | 244 |
| 4.7.49 show ntp associations..... | 245 |
| 4.7.50 show ntp status..... | 246 |

Chapter 5: 7130 Platform Layer 1 Configuration..... 247

| | |
|---|-----|
| 5.1 Configuring Layer 1 on the 7130 Platform..... | 247 |
| 5.1.1 Addressing 7130 Platform Speed Mismatch..... | 249 |
| 5.1.2 Configuring the 7130 Platform and Multilane Sourcing..... | 250 |
| 5.1.3 Using Show Commands to Confirm Source Configurations..... | 251 |
| 5.2 7130 Layer 1 Commands..... | 252 |
| 5.2.1 I1 source..... | 253 |
| 5.2.2 show I1 destination..... | 255 |
| 5.2.3 show I1 matrix..... | 256 |
| 5.2.4 show I1 path..... | 259 |
| 5.2.5 show I1 source..... | 260 |
| 5.2.6 show I1 source capabilities..... | 262 |

Chapter 6: Timing Protocols..... 263

| | |
|--|-----|
| 6.1 Setting the PTP Mode..... | 263 |
| 6.2 Enabling PTP on an Interface..... | 264 |
| 6.3 Configuring the PTP Domain..... | 264 |
| 6.4 Configuring the Offset Hold Time..... | 265 |
| 6.5 Setting the PTP Priority..... | 265 |
| 6.6 Configuring the Source IP..... | 265 |
| 6.7 Configuring the TTL for PTP Packets..... | 265 |

| | |
|---|-----|
| 6.8 Configuring PTP Monitoring..... | 266 |
| 6.9 Setting the PTP Announce Interval..... | 267 |
| 6.10 Setting the PTP Timeout Interval..... | 267 |
| 6.11 Configuring the PTP Delay Mechanism..... | 267 |
| 6.12 Setting the Delay Request Interval..... | 268 |
| 6.13 Setting the Peer Delay Request Interval..... | 268 |
| 6.14 Setting the Peer Link Propagation Threshold..... | 268 |
| 6.15 Setting the Interval for Sending Synchronization Messages..... | 268 |
| 6.16 Setting the PTP Transport Type..... | 269 |
| 6.17 Viewing PTP Settings and Status..... | 272 |
| 6.17.1 Displaying General PTP Information..... | 272 |
| 6.17.2 Displaying PTP Clock Properties..... | 273 |
| 6.17.3 Displaying PTP Foreign Master..... | 273 |
| 6.17.4 Displaying PTP Information for all Interfaces..... | 273 |
| 6.17.5 Displaying PTP Interface Counters..... | 273 |
| 6.17.6 Displaying PTP Local Clock and Offset..... | 274 |
| 6.17.7 Displaying PTP Masters Information..... | 274 |
| 6.17.8 Displaying PTP Monitoring Information..... | 274 |
| 6.17.9 Displaying PTP Source IP..... | 275 |
| 6.18 Precision Time Protocol (PTP) Commands..... | 275 |
| 6.18.1 ptp announce interval..... | 277 |
| 6.18.2 ptp announce timeout..... | 278 |
| 6.18.3 ptp delay-mechanism..... | 279 |
| 6.18.4 ptp delay-req interval..... | 280 |
| 6.18.5 ptp domain..... | 281 |
| 6.18.6 ptp enable..... | 282 |
| 6.18.7 ptp forward-v1..... | 283 |
| 6.18.8 ptp hold-ptp-time..... | 284 |
| 6.18.9 ptp local-priority..... | 285 |
| 6.18.10 ptp mode..... | 286 |
| 6.18.11 ptp monitor threshold mean-path-delay..... | 287 |
| 6.18.12 ptp monitor threshold offset-from-master..... | 288 |
| 6.18.13 ptp monitor threshold skew..... | 289 |
| 6.18.14 ptp monitor..... | 290 |
| 6.18.15 ptp pdelay-neighbor-threshold..... | 291 |
| 6.18.16 ptp pdelay-req interval..... | 292 |
| 6.18.17 ptp priority1..... | 293 |
| 6.18.18 ptp priority2..... | 294 |
| 6.18.19 ptp role..... | 295 |
| 6.18.20 ptp source..... | 296 |
| 6.18.21 ptp sync timeout..... | 297 |
| 6.18.22 ptp sync-message interval..... | 298 |
| 6.18.23 ptp transport..... | 299 |
| 6.18.24 ptp ttl..... | 300 |
| 6.18.25 ptp unicast-negotiation..... | 301 |
| 6.18.26 show ptp..... | 302 |
| 6.18.27 show ptp foreign-master-record..... | 303 |
| 6.18.28 show ptp interface counters..... | 304 |
| 6.18.29 show ptp interface..... | 305 |
| 6.18.30 show ptp local-clock..... | 306 |
| 6.18.31 show ptp masters..... | 307 |
| 6.18.32 show ptp monitor..... | 308 |
| 6.18.33 show ptp source ip..... | 309 |
| 6.18.34 show ptp unicast-negotiation..... | 310 |
| 6.18.35 show ptp unicast-negotiation profile..... | 312 |

| | |
|---|------------|
| Chapter 7: Switch Environment Control..... | 313 |
| 7.1 Environment Control Introduction..... | 313 |
| 7.2 Environment Control Overview..... | 313 |
| 7.2.1 Temperature..... | 313 |
| 7.2.2 Fans..... | 313 |
| 7.2.3 Power..... | 314 |
| 7.3 Configuring and Viewing Environment Settings..... | 314 |
| 7.3.1 Overriding Automatic Shutdown..... | 314 |
| 7.3.2 Viewing Environment Status..... | 316 |
| 7.3.3 Locating Components on the Switch..... | 317 |
| 7.4 Environment Commands..... | 318 |
| 7.4.1 environment fan-speed..... | 319 |
| 7.4.2 environment insufficient-fans action..... | 320 |
| 7.4.3 environment overheat action..... | 322 |
| 7.4.4 locator-led..... | 324 |
| 7.4.5 show environment power..... | 325 |
| 7.4.6 show environment temperature..... | 326 |
| 7.4.7 show locator-led..... | 328 |
| 7.4.8 show system environment all..... | 329 |
| 7.4.9 show system environment cooling..... | 330 |
| 7.4.10 show system environment power budget..... | 331 |
| Chapter 8: Upgrades and Downgrades..... | 332 |
| 8.1 Upgrade/Downgrade Overview..... | 332 |
| 8.2 Smart System Upgrade..... | 332 |
| 8.2.1 Upgrading the EOS image with Smart System Upgrade..... | 333 |
| 8.2.2 Scheduling an SSU..... | 338 |
| 8.3 Standard Upgrades and Downgrades..... | 339 |
| 8.3.1 Upgrading or Downgrading the EOS on a Single-Supervisor Switch..... | 339 |
| 8.3.2 Upgrading or Downgrading the EOS on a Dual-Supervisor Switch..... | 344 |
| 8.4 Upgrade/Downgrade Commands..... | 347 |
| 8.4.1 install..... | 348 |
| 8.4.2 reload fast-boot..... | 349 |
| 8.4.3 reload hitless..... | 350 |
| Chapter 9: Security..... | 351 |
| 9.1 User Security..... | 351 |
| 9.1.1 AAA Configuration..... | 351 |
| 9.2 Control Plane Security..... | 474 |
| 9.2.1 Transport Layer Security..... | 474 |
| 9.2.2 802.1X Port Security..... | 507 |
| 9.3 Data Plane Security..... | 552 |
| 9.3.1 IP NAT..... | 552 |
| 9.3.2 Media Access Control Security..... | 584 |
| 9.3.3 Internet Protocol Security (IPsec)..... | 639 |
| 9.3.4 Macro-Segmentation Service (CVX)..... | 656 |
| Chapter 10: Quality of Service and Traffic Management..... | 689 |
| 10.1 Quality of Service..... | 689 |
| 10.1.1 Quality of Service Conceptual Overview..... | 689 |
| 10.1.2 QoS Configuration: Platform-Independent Features..... | 698 |

| | |
|---|-----|
| 10.1.3 QoS Configuration: Arad Platform Switches..... | 700 |
| 10.1.4 QoS Configuration: Jericho Platform Switches..... | 708 |
| 10.1.5 QoS Configuration: FM6000 Platform Switches..... | 717 |
| 10.1.6 QoS Configuration: Petra Platform Switches..... | 724 |
| 10.1.7 QoS Configuration: Trident and Tomahawk Platform Switches..... | 731 |
| 10.1.8 QoS Configuration: Trident II and Helix Platform Switches..... | 739 |
| 10.1.9 Support for Configuring Color Extended Communities..... | 748 |
| 10.1.10 ACL based QoS Configuration..... | 749 |
| 10.1.11 Configuring IPv6 Flow Label Matches for QoS..... | 752 |
| 10.1.12 Differentiated MMU Discard Counters..... | 754 |
| 10.1.13 txQueue Percentage-based Shaping..... | 755 |
| 10.1.14 Configuring Round Robin Scheduling on Shaped Subinterfaces..... | 756 |
| 10.1.15 Explicit Congestion Notification (ECN)..... | 756 |
| 10.1.16 Latency-based Explicit Congestion Notification..... | 757 |
| 10.1.17 Configuring a Low Latency Transmit Queue Scheduler Profile..... | 757 |
| 10.1.18 Quality of Service Commands..... | 758 |
| 10.1.19 Chipset Mapping for QoS..... | 860 |
| 10.2 Traffic Management..... | 865 |
| 10.2.1 Traffic Management Conceptual Overview..... | 865 |
| 10.2.2 Traffic Management Configuration Arad Platform Switches..... | 878 |
| 10.2.3 Traffic Management Configuration FM6000 Platform Switches..... | 885 |
| 10.2.4 Traffic Management Configuration Petra Platform Switches..... | 892 |
| 10.2.5 Traffic Management Configuration Trident Platform Switches..... | 895 |
| 10.2.6 Traffic Management Configuration Trident II Platform Switches..... | 903 |
| 10.2.7 Traffic Management Configuration Commands..... | 906 |

Chapter 11: Interface Configuration..... 994

| | |
|---|------|
| 11.1 Ethernet Ports..... | 994 |
| 11.1.1 Ethernet Ports Introduction..... | 994 |
| 11.1.2 Ethernet Standards..... | 994 |
| 11.1.3 Ethernet Physical Layer..... | 996 |
| 11.1.4 Interfaces..... | 1008 |
| 11.1.5 MRU Enforcement..... | 1013 |
| 11.1.6 Displaying Interface Interactions..... | 1014 |
| 11.1.7 Dynamic Link Flap Damping..... | 1018 |
| 11.1.8 Ethernet Configuration Procedures..... | 1018 |
| 11.1.9 Ethernet Configuration Commands..... | 1076 |
| 11.2 Port Channels and LACP..... | 1183 |
| 11.2.1 Port Channel Introduction..... | 1183 |
| 11.2.2 Port Channel Conceptual Overview..... | 1183 |
| 11.2.3 Port Channel Configuration Procedures..... | 1185 |
| 11.2.4 Load Balancing Hash Algorithms..... | 1194 |
| 11.2.5 Port Channel and LACP Configuration Commands..... | 1201 |
| 11.3 Multi-Chassis Link Aggregation..... | 1259 |
| 11.3.1 MLAG Introduction..... | 1259 |
| 11.3.2 MLAG Conceptual Overview..... | 1260 |
| 11.3.3 MLAG Maintenance..... | 1262 |
| 11.3.4 Configuring MLAG..... | 1266 |
| 11.3.5 EVPN - MLAG Single-homed Hosts..... | 1273 |
| 11.3.6 Configuring MLAG Layer 2 Subinterfaces..... | 1274 |
| 11.3.7 Configuring Forced Periodic ARP and NDP Refresh..... | 1276 |
| 11.3.8 MLAG Implementation Example..... | 1276 |
| 11.3.9 MLAG Commands..... | 1283 |
| 11.4 Data Transfer..... | 1306 |
| 11.4.1 Data Transfer Introduction..... | 1306 |

| | |
|---|------|
| 11.4.2 Data Transfer Methods..... | 1307 |
| 11.4.3 MAC Address Table..... | 1310 |
| 11.4.4 Configuring Ports..... | 1315 |
| 11.4.5 Monitoring Links..... | 1331 |
| 11.4.6 PHY test pattern CLI..... | 1343 |
| 11.4.7 Data Transfer Commands..... | 1347 |
| 11.5 Octal Port Renumber to Four Interfaces..... | 1441 |
| 11.5.1 Configuring Octal Port Renumber to 4 Interfaces..... | 1442 |
| 11.5.2 Show Commands..... | 1443 |
| 11.5.3 Limitations..... | 1443 |
| 11.5.4 Commands..... | 1443 |

Chapter 12: Layer 2 Configuration..... 1444

| | |
|---|------|
| 12.1 Spanning Tree Protocol..... | 1444 |
| 12.1.1 Introduction to Spanning Tree Protocols..... | 1444 |
| 12.1.2 Spanning Tree Overview..... | 1444 |
| 12.1.3 Configuring a Spanning Tree..... | 1452 |
| 12.1.4 STP Commands..... | 1466 |
| 12.2 Link Layer Discovery Protocol..... | 1535 |
| 12.2.1 LLDP Introduction..... | 1535 |
| 12.2.2 LLDP Overview..... | 1535 |
| 12.2.3 LLDP Configuration Procedures..... | 1536 |
| 12.2.4 LLDP Configuration Commands..... | 1541 |
| 12.3 Virtual LANs (VLANs)..... | 1562 |
| 12.3.1 VLAN Introduction..... | 1562 |
| 12.3.2 VLAN Conceptual Overview..... | 1562 |
| 12.3.3 VLAN Configuration Procedures..... | 1566 |
| 12.3.4 VLAN Configuration Commands..... | 1577 |
| 12.4 DCBX and Flow Control..... | 1616 |
| 12.4.1 Introduction..... | 1617 |
| 12.4.2 Overview..... | 1617 |
| 12.4.3 DCBX Configuration and Verification..... | 1618 |
| 12.4.4 Configuring Priority-Flow-Control (PFC)..... | 1619 |
| 12.4.5 Configuring PFC Watchdog..... | 1620 |
| 12.4.6 DCBX and Flow Control Commands..... | 1623 |
| 12.5 IP Address Locking..... | 1643 |
| 12.5.1 IP Address Locking Configuration..... | 1644 |
| 12.5.2 IP Address Locking Commands..... | 1652 |
| 12.6 Layer 2 Protocol Forwarding..... | 1666 |
| 12.6.1 Configuring L2 Protocol Forwarding..... | 1666 |
| 12.6.2 L2 Protocol Forwarding Limitations..... | 1671 |
| 12.6.3 L2 Protocol Forwarding Show commands..... | 1671 |
| 12.7 Layer 2 Subinterfaces..... | 1673 |
| 12.7.1 Configurations..... | 1673 |
| 12.7.2 QoS Show Commands..... | 1677 |

Chapter 13: Layer 3 Configuration..... 1679

| | |
|-------------------------------------|------|
| 13.1 IPv4..... | 1679 |
| 13.1.1 IPv4 Addressing..... | 1679 |
| 13.1.2 IPv4 Routing..... | 1688 |
| 13.1.3 IPv4 Multicast Counters..... | 1692 |
| 13.1.4 Route Management..... | 1695 |
| 13.1.5 IPv4 Route Scale..... | 1705 |
| 13.1.6 IP Source Guard..... | 1710 |

| | |
|---|------|
| 13.1.7 DHCP Server..... | 1715 |
| 13.1.8 DHCP Relay Global Configuration Mode..... | 1722 |
| 13.1.9 DHCP Snooping with Bridging..... | 1728 |
| 13.1.10 TCP MSS Clamping..... | 1730 |
| 13.1.11 IPv4 GRE Tunneling..... | 1735 |
| 13.1.12 GRE Tunneling Support..... | 1738 |
| 13.1.13 BfRuntime to Use Non-default VRFs..... | 1743 |
| 13.1.14 IPv4 Commands..... | 1744 |
| 13.2 IPv6..... | 1873 |
| 13.2.1 Introduction..... | 1873 |
| 13.2.2 IPv6 Description..... | 1874 |
| 13.2.3 Configuring IPv6..... | 1876 |
| 13.2.4 IPv6 Commands..... | 1889 |
| 13.3 Ingress and Egress Per-Port for IPv4 and IPv6 Counters..... | 1947 |
| 13.3.1 Configuration..... | 1947 |
| 13.3.2 Show Commands..... | 1948 |
| 13.3.3 Dedicated ARP Entry for TX IPv4 and IPv6 Counters..... | 1948 |
| 13.3.4 Considerations..... | 1949 |
| 13.4 ACLs and Route Maps..... | 1950 |
| 13.4.1 Introduction..... | 1950 |
| 13.4.2 Access Control Lists..... | 1950 |
| 13.4.3 Service ACLs..... | 1970 |
| 13.4.4 Sub-interface ACLs..... | 1974 |
| 13.4.5 RACL Sharing on SVIs..... | 1976 |
| 13.4.6 Route Maps..... | 1980 |
| 13.4.7 Prefix Lists..... | 1985 |
| 13.4.8 Port ACLs with User-Defined Fields..... | 1989 |
| 13.4.9 ACL, Route Map, and Prefix List Commands..... | 1991 |
| 13.5 VRRP and VARP..... | 2080 |
| 13.5.1 VRRP and VARP Conceptual Overview..... | 2080 |
| 13.5.2 VRRP and VARP Implementation Procedures..... | 2081 |
| 13.5.3 VRRP and VARP Implementation Examples..... | 2088 |
| 13.5.4 VRRP and VARP Configuration Commands..... | 2094 |
| 13.6 DirectFlow..... | 2121 |
| 13.6.1 Introduction..... | 2121 |
| 13.6.2 DirectFlow Configuration..... | 2122 |
| 13.6.3 DirectFlow Feature Interactions..... | 2125 |
| 13.6.4 DirectFlow Commands..... | 2127 |
| 13.7 Decap Groups..... | 2144 |
| 13.7.1 Decap Groups Overview..... | 2144 |
| 13.7.2 Configuring Decap Groups..... | 2145 |
| 13.7.3 Configuring Generic UDP Encapsulation (GUE) Decap Groups..... | 2145 |
| 13.7.4 Decap Groups Commands..... | 2147 |
| 13.8 Nexthop Groups..... | 2153 |
| 13.8.1 Nexthop Group Description..... | 2153 |
| 13.8.2 Nexthop Group Configuration..... | 2153 |
| 13.8.3 Support for IPv6 Link-Local Addresses in Nexthop Groups Entries..... | 2157 |
| 13.8.4 Nexthop Group Commands..... | 2158 |
| 13.9 Setting the MTU for all Layer 3 Interfaces..... | 2168 |
| 13.9.1 Configuring MTU for all Layer 3 Interfaces..... | 2168 |
| 13.9.2 Considerations..... | 2169 |
| 13.9.3 Show Commands..... | 2169 |
| 13.10 Support for Layer 3 MTU on 7280R3/7500R3/7800R3..... | 2170 |
| 13.10.1 Layer 3 MTU Configuration..... | 2170 |
| 13.10.2 Layer 3 MTU Show Commands..... | 2170 |
| 13.10.3 L3 MTU Considerations..... | 2170 |

| | |
|--|-------------|
| 13.11 Segment Security..... | 2171 |
| 13.11.1 Overview of MSS-Group..... | 2171 |
| 13.11.2 Configuring MSS-Group..... | 2171 |
| 13.11.3 Segment Security Considerations..... | 2173 |
| 13.11.4 Show Commands..... | 2174 |
| 13.11.5 Segment Security Commands..... | 2176 |
| Chapter 14: IP Services..... | 2198 |
| 14.1 CloudVision eXchange (CVX)..... | 2198 |
| 14.1.1 Upgrading CVX..... | 2198 |
| 14.1.2 CVX Overview..... | 2199 |
| 14.1.3 CVX Services..... | 2200 |
| 14.1.4 Deploying CVX..... | 2201 |
| 14.1.5 CVX Configuration..... | 2209 |
| 14.1.6 CVX Secure out-of-band Connection..... | 2216 |
| 14.1.7 CVX High Availability..... | 2219 |
| 14.1.8 CVX VIP..... | 2225 |
| 14.1.9 CVX Commands..... | 2226 |
| Chapter 15: Routing Protocols..... | 2247 |
| 15.1 Routing Information Protocol (RIP)..... | 2247 |
| 15.1.1 RIP Conceptual Overview..... | 2247 |
| 15.1.2 Running RIP on the Switch..... | 2247 |
| 15.1.3 Configuring RIP on Multiple VRFs..... | 2251 |
| 15.1.4 RIP Commands..... | 2252 |
| 15.2 Open Shortest Path First – Version 2..... | 2266 |
| 15.2.1 OSPFv2 Introduction..... | 2266 |
| 15.2.2 OSPFv2 Conceptual Overview..... | 2266 |
| 15.2.3 Configuring OSPFv2..... | 2269 |
| 15.2.4 OSPFv2 Configuration Examples..... | 2297 |
| 15.2.5 OSPFv2 Commands..... | 2306 |
| 15.3 Open Shortest Path First – Version 3..... | 2386 |
| 15.3.1 OSPFv3 Introduction..... | 2386 |
| 15.3.2 OSPFv3 Conceptual Overview..... | 2386 |
| 15.3.3 Configuring OSPFv3..... | 2390 |
| 15.3.4 OSPFv3 Configuration Examples..... | 2403 |
| 15.3.5 OSPFv3 Commands..... | 2412 |
| 15.4 IS-IS..... | 2480 |
| 15.4.1 IS-IS Introduction..... | 2480 |
| 15.4.2 IS-IS Segment Routing..... | 2480 |
| 15.4.3 IS-IS Graceful Restart..... | 2482 |
| 15.4.4 IS-IS Dynamic Flooding..... | 2482 |
| 15.4.5 Dynamic Link Delay using TWAMP Light..... | 2484 |
| 15.4.6 IS-IS Configuration..... | 2484 |
| 15.4.7 IS-IS Commands..... | 2524 |
| 15.5 Border Gateway Protocol (BGP)..... | 2612 |
| 15.5.1 BGP Conceptual Overview..... | 2612 |
| 15.5.2 Configuring BGP..... | 2629 |
| 15.5.3 BGP IPv6 Link Local Peers Discovery..... | 2691 |
| 15.5.4 BGP Examples..... | 2691 |
| 15.5.5 BGP Commands..... | 2695 |
| 15.6 Maintenance Mode..... | 2885 |
| 15.6.1 Overview..... | 2885 |
| 15.6.2 Maintenance Mode Elements..... | 2885 |

| | |
|--|------|
| 15.6.3 Maintenance Mode Features..... | 2889 |
| 15.6.4 Maintenance Mode Configuration..... | 2892 |
| 15.6.5 Maintenance Mode Commands..... | 2899 |
| 15.7 Bidirectional Forwarding Detection..... | 2950 |
| 15.7.1 Introduction..... | 2950 |
| 15.7.2 BFD Configuration..... | 2951 |
| 15.7.3 Hardware Accelerated BFD Transmit..... | 2958 |
| 15.7.4 BFD Commands..... | 2962 |
| 15.8 Routing Control Functions..... | 2987 |
| 15.8.1 Understanding RCF Language and Syntax..... | 2991 |
| 15.8.2 Configuring RCF Functions..... | 2999 |
| 15.8.3 Using RCF Code with Configuration Sessions..... | 3002 |
| 15.8.4 RCF Function Show Commands..... | 3003 |
| 15.8.5 Router Control Functions Commands..... | 3005 |
| 15.8.6 RCF - BGP Agent Support..... | 3021 |
| 15.8.7 RCF - IpRIB Agent Support..... | 3034 |
| 15.8.8 RCF - IS-IS Agent Support..... | 3035 |
| 15.8.9 RCF - KernelFib Agent Support..... | 3036 |
| 15.8.10 RCF - LDP Agent Support..... | 3038 |
| 15.8.11 RCF - VrfLeak Agent Support..... | 3039 |

Chapter 16: Multicast..... 3041

| | |
|--|------|
| 16.1 Multicast Architecture..... | 3041 |
| 16.1.1 Overview..... | 3041 |
| 16.1.2 Multicast Architecture Description..... | 3042 |
| 16.1.3 Multicast Listener Discovery (MLD)..... | 3043 |
| 16.1.4 Multicast Route Counters..... | 3049 |
| 16.1.5 Multicast (S,G) Counters..... | 3051 |
| 16.1.6 Static IP Mroute..... | 3053 |
| 16.1.7 Static Multicast..... | 3057 |
| 16.1.8 Configuring Multicast..... | 3058 |
| 16.1.9 Multicast Commands..... | 3068 |
| 16.2 IGMP and IGMP Snooping..... | 3117 |
| 16.2.1 IGMP Snooping..... | 3117 |
| 16.2.2 IGMP Host Proxy Description..... | 3118 |
| 16.2.3 Supported Features..... | 3118 |
| 16.2.4 IGMP Protocols..... | 3118 |
| 16.2.5 Configuring IGMP..... | 3119 |
| 16.2.6 Configuring IGMP Snooping..... | 3122 |
| 16.2.7 IGMP Host Proxy..... | 3131 |
| 16.2.8 IGMP and IGMP Snooping Commands..... | 3135 |
| 16.3 Protocol Independent Multicast..... | 3222 |
| 16.3.1 Introduction..... | 3222 |
| 16.3.2 Overview..... | 3222 |
| 16.3.3 Configuring PIM..... | 3225 |
| 16.3.4 Multicast Example..... | 3231 |
| 16.3.5 PIM Commands..... | 3236 |
| 16.4 Multicast Source Discovery Protocol (MSDP)..... | 3284 |
| 16.4.1 MSDP Introduction..... | 3284 |
| 16.4.2 MSDP Description..... | 3284 |
| 16.4.3 MSDP Configuration..... | 3286 |
| 16.4.4 MSDP Commands..... | 3295 |
| 16.5 Audio Video Bridging (AVB)..... | 3320 |
| 16.5.1 AVB Overview..... | 3320 |
| 16.5.2 AVB Protocols..... | 3320 |

| | |
|--|-------------|
| 16.5.3 AVB Configuration..... | 3322 |
| 16.5.4 AVB Commands..... | 3326 |
| Chapter 17: Virtual Extensible LANs (VXLANs)..... | 3337 |
| 17.1 VXLAN Introduction..... | 3337 |
| 17.2 VXLAN Description..... | 3337 |
| 17.2.1 VXLAN Architecture..... | 3337 |
| 17.2.2 VXLAN Gateway..... | 3338 |
| 17.2.3 VXLAN Processes..... | 3339 |
| 17.2.4 Multicast and Broadcast over VXLAN..... | 3340 |
| 17.2.5 VXLAN and MLAG..... | 3341 |
| 17.2.6 VXLAN Bridging and Routing Support..... | 3343 |
| 17.2.7 Data Structures..... | 3343 |
| 17.3 VXLAN Configuration..... | 3344 |
| 17.3.1 Configuring the VTI..... | 3344 |
| 17.3.2 Head End Replication Configuration..... | 3346 |
| 17.3.3 VXLAN Routing Configuration..... | 3347 |
| 17.3.4 Configuring VXLAN Routing with Overlay VRFs..... | 3352 |
| 17.3.5 Configuring VXLAN over MLAG..... | 3352 |
| 17.3.6 Configuring VXLAN Control Service..... | 3353 |
| 17.3.7 Configuring VXLAN Multicast Decapsulation..... | 3354 |
| 17.3.8 VXLAN Decapsulation for interface with multiple VRFs..... | 3354 |
| 17.3.9 VXLAN Rules Support for Mirror ACLs Configuration..... | 3354 |
| 17.3.10 Configuring EVPN VXLAN..... | 3355 |
| 17.3.11 Displaying VXLAN Configuration..... | 3360 |
| 17.3.12 Displaying VXLAN Bridging and Routing Support..... | 3362 |
| 17.4 VXLAN Commands..... | 3365 |
| 17.4.1 clear vxlan counters..... | 3366 |
| 17.4.2 designated-forwarder election hold-time..... | 3367 |
| 17.4.3 interface vxlan..... | 3368 |
| 17.4.4 ip address virtual..... | 3369 |
| 17.4.5 redistribute attached-host..... | 3371 |
| 17.4.6 show arp..... | 3372 |
| 17.4.7 show interfaces VXLAN..... | 3374 |
| 17.4.8 show service vxlan..... | 3375 |
| 17.4.9 show vxlan address-table..... | 3376 |
| 17.4.10 show vxlan counters..... | 3377 |
| 17.4.11 show vxlan flood vtep..... | 3379 |
| 17.4.12 show vxlan vtep..... | 3380 |
| 17.4.13 vxlan flood vtep..... | 3381 |
| 17.4.14 vxlan multicast-group decap..... | 3383 |
| 17.4.15 vxlan source-interface..... | 3384 |
| 17.4.16 vxlan udp-port..... | 3385 |
| 17.4.17 vxlan vlan vni..... | 3386 |
| 17.4.18 vxlan vni notation dotted..... | 3387 |
| Chapter 18: Ethernet VPN (EVPN)..... | 3388 |
| 18.1 EVPN Overview..... | 3388 |
| 18.1.1 EVPN Terminology..... | 3390 |
| 18.1.2 EVPN Service Models..... | 3392 |
| 18.1.3 VCS and EVPN in DCI..... | 3395 |
| 18.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)..... | 3395 |
| 18.1.5 EVPN VXLAN IPv6 Overlay..... | 3397 |
| 18.1.6 iBGP as PE-CE Protocol for BGP and EVPN L3 VPNs..... | 3397 |

| | |
|---|------|
| 18.2 EVPN Layer 3 Core Operations..... | 3397 |
| 18.2.1 MAC Address Learning..... | 3397 |
| 18.2.2 ARP Suppression..... | 3399 |
| 18.2.3 MAC Mobility..... | 3399 |
| 18.2.4 MAC Address Damping..... | 3400 |
| 18.2.5 Broadcast and Multicast Traffic..... | 3400 |
| 18.3 Integrated Routing and Bridging..... | 3402 |
| 18.3.1 IP VPN..... | 3407 |
| 18.4 VPN MPLS Transport Options..... | 3410 |
| 18.4.1 LDP..... | 3414 |
| 18.4.2 ISIS-SR..... | 3415 |
| 18.4.3 BGP-LU (BGP-SR)..... | 3417 |
| 18.5 EVPN Type-5 Routes: IP Prefix Advertisement..... | 3419 |
| 18.6 BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures..... | 3421 |
| 18.6.1 Configuring BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures..... | 3422 |
| 18.6.2 Show Commands..... | 3423 |
| 18.6.3 Troubleshooting..... | 3424 |
| 18.6.4 Limitations..... | 3425 |
| 18.7 VXLAN DSCP Mapping..... | 3425 |
| 18.8 EVPN E-Tree for MPLS and VXLAN..... | 3426 |
| 18.9 EVPN IGP Cost for VTEP Reachability..... | 3427 |
| 18.9.1 Configuration Example..... | 3427 |
| 18.9.2 Show Commands..... | 3429 |
| 18.10 EVPN VXLAN Single-Gateway Centralized Routing..... | 3430 |
| 18.10.1 Configuration..... | 3431 |
| 18.10.2 Show Commands..... | 3434 |
| 18.10.3 Limitations..... | 3437 |
| 18.10.4 Flood Traffic Filtering with EVPN..... | 3437 |
| 18.11 Inter-VRF Local Route Leaking..... | 3438 |
| 18.11.1 Inter-VRF Local Route Leaking using BGP VPN..... | 3438 |
| 18.11.2 Inter-VRF Local Route Leaking using VRF-leak Agent..... | 3442 |
| 18.12 EVPN Multicast VRF Leaking..... | 3442 |
| 18.13 Static Inter-VRF Route..... | 3445 |
| 18.13.1 Configuration..... | 3446 |
| 18.13.2 Show Commands..... | 3446 |
| 18.13.3 Limitations..... | 3446 |
| 18.14 VCS to EVPN Hitless Migration..... | 3446 |
| 18.14.1 Configuration..... | 3447 |
| 18.14.2 Show Commands..... | 3450 |
| 18.14.3 Limitations..... | 3452 |
| 18.15 Configuring EVPN..... | 3453 |
| 18.15.1 Configuring BGP-EVPN and VCS on CVX..... | 3453 |
| 18.15.2 EVPN MPLS Virtual Private Wire Service (VPWS)..... | 3454 |
| 18.15.3 Configuring Multi-Homing on a Multi-Domain EVPN VXLAN-MPLS Gateway..... | 3458 |
| 18.15.4 Configuring iBGP PE-CE Protocol for BGP/EVPN L3 VLANs..... | 3460 |
| 18.16 Sharing Equivalence Class entry across multiple VRF..... | 3461 |
| 18.17 Sample Configurations..... | 3462 |
| 18.17.1 EVPN VXLAN IRB Sample Configuration..... | 3462 |
| 18.17.2 Multi-Tenant EVPN VXLAN IRB Sample Configuration..... | 3466 |
| 18.17.3 EVPN MPLS Sample Configuration..... | 3486 |
| 18.17.4 EVPN VXLAN IPv6 Overlay..... | 3499 |
| 18.17.5 IP VPNs Sample Configuration..... | 3500 |
| 18.18 EVPN and VCS Commands..... | 3517 |
| 18.18.1 bfd vtep evpn..... | 3519 |
| 18.18.2 encapsulation VXLAN layer-3 set next-hop igp-cost..... | 3520 |
| 18.18.3 e-tree..... | 3521 |

| | |
|--|-------------|
| 18.18.4 leak routes..... | 3522 |
| 18.18.5 next-hop resolution disabled..... | 3523 |
| 18.18.6 redistribute bgp evpn VXLAN..... | 3524 |
| 18.18.7 redistribute router-mac next-hop vtep primary..... | 3525 |
| 18.18.8 redistribute service VXLAN..... | 3526 |
| 18.18.9 remote leaf host drop..... | 3527 |
| 18.18.10 route-target..... | 3528 |
| 18.18.11 route-target export..... | 3529 |
| 18.18.12 route-target import..... | 3530 |
| 18.18.13 route-target route-map..... | 3531 |
| 18.18.14 router general..... | 3533 |
| 18.18.15 router multicast vrf leak..... | 3534 |
| 18.18.16 show bgp evpn..... | 3535 |
| 18.18.17 show e-tree vlan..... | 3537 |
| 18.18.18 show ip bgp vrf..... | 3538 |
| 18.18.19 show ip route vrf..... | 3539 |
| 18.18.20 show ipv6 bgp vrf..... | 3540 |
| 18.18.21 show ipv6 route vrf..... | 3541 |
| 18.18.22 show l2rib input all..... | 3542 |
| 18.18.23 show l2Rib input VXLAN-control-service..... | 3543 |
| 18.18.24 show l2rib output..... | 3544 |
| 18.18.25 show service VXLAN address-table..... | 3545 |
| 18.18.26 show vrf leak flapping..... | 3547 |
| 18.18.27 show VXLAN control-plane..... | 3548 |
| 18.18.28 vlan (VLAN-AWARE-Bundle configuration mode)..... | 3549 |
| 18.18.29 vni-aware-bundle..... | 3550 |
| | |
| Chapter 19: Multiprotocol Label Switching (MPLS)..... | 3551 |
| 19.1 MPLS..... | 3551 |
| 19.1.1 MPLS Overview..... | 3551 |
| 19.1.2 MPLS Implementation..... | 3551 |
| 19.1.3 MPLSoGRE Filtered Mirroring..... | 3552 |
| 19.1.4 Mixed TTL/DSCP in MPLS Tunnel Termination..... | 3552 |
| 19.1.5 Support for MPLS Packets in IP ACLs..... | 3553 |

Overview

Arista Networks features switches with high-density, non-blocking Ethernet ports controlled through an extensible, Linux-based, modular network operating system. The intended audience for this manual is network administrators who configure Arista switches. A working knowledge of network administration is assumed.

New Features

This guide may not describe the features added in the most recent EOS version. For information on undocumented features, consult the TOI documents here: <https://www.arista.com/en/support/toi>.

Switch Platforms

A list of Arista switches and detailed information about each is available here: <https://www.arista.com/en/products>.

Recently released switches may not appear in the list but can be found in the most recent Release Notes (found under Active Releases here: <https://www.arista.com/en/support/software-download>).

Open-Source Licenses

Portions of Arista Networks software are covered by open-source licenses, including the [GNU General Public License \(GNU GPL\)](#).

See <https://www.arista.com/en/support/product-documentation/gpl>.

CloudVision

The configuration tasks required to deploy CloudVision, CVX, and CVP are in the CloudVision Configuration Guide. The latest version is available here: <https://www.arista.com/en/cg-cv/>.

Supported Features

For the complete supported features list in the latest EOS release, see <https://www.arista.com/en/support/product-documentation/supported-features>.

For details on a specific release, see the Release Notes (found under Active Releases here: <https://www.arista.com/en/support/software-download>).

This section contains the following topic:

[Command-Line Interface \(CLI\)](#)

1.1

Command-Line Interface (CLI)

The command-line interface (CLI) is one tool for controlling the switch and displaying information about its status and configuration. This chapter describes the use of the CLI.

This chapter includes these sections:

- [Accessing the EOS CLI](#)

-
- Processing Commands
 - Kernel-based Virtual Machine Commands and Configuration
 - Switch Platforms
 - Command Modes
 - Managing Switch Configuration Settings
 - Other Command-Line Interfaces
 - Directory Structure
 - Command-Line Interface Commands

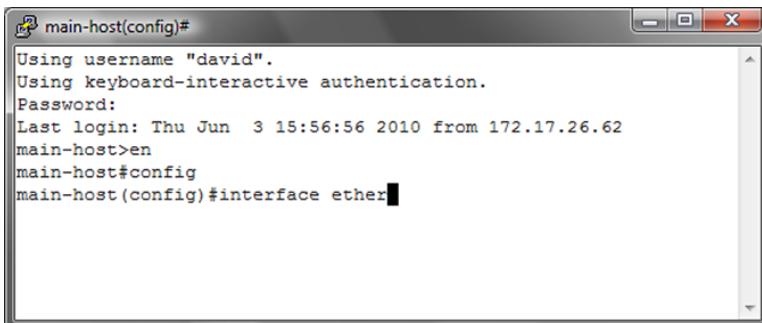

1.1.1 Accessing the EOS CLI

You can open an EOS CLI session through these connections:

- Ethernet management ports
- console port
- Telnet connections
- Secure Shell (SSH)

The following figure displays the EOS CLI in a Secure Shell connection.

Figure 1-1: EOS Command-Line Interface

```
main-host(config)#  
Using username "david".  
Using keyboard-interactive authentication.  
Password:  
Last login: Thu Jun 3 15:56:56 2010 from 172.17.26.62  
main-host>en  
main-host#config  
main-host(config)#interface ether
```

1.1.2 Processing Commands

1.1.2.1 Command Execution

Command keywords are not case-sensitive. The CLI also accepts truncated keywords that uniquely correspond to one command.

- The command abbreviation **con** does not execute a command in Privileged EXEC mode because the names of two commands begin with these letters: **configure** and **connect**.

```
switch# con  
% Ambiguous command
```

- The command abbreviation **conf** executes **configure** in Privileged EXEC mode because no other command name begins with **conf**.

```
switch# conf  
switch(config) #
```

1.1.2.2 Creating an Alias

The alias command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command.

Example

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-5**.

```
switch(config)# alias srie show running-config interface ethernet 1-5
switch(config)# srie
interface Ethernet1
    switchport access vlan 33
    storm-control broadcast level 1
    spanning-tree portfast
    spanning-tree bpduguard enable
interface Ethernet2
    switchport access vlan 33
    spanning-tree portfast
interface Ethernet3
    switchport access vlan 33
    spanning-tree portfast
    spanning-tree bpduguard enable
interface Ethernet4
interface Ethernet5
    shutdown
```

1.1.2.3 Cursor Movement Keystrokes

EOS supports these cursor movement keystrokes:

- Ctrl-B** or the **Left Arrow** key: moves cursor to the left.
- Ctrl-F** or the **Right Arrow** key: moves cursor to the right.
- Ctrl-A**: moves cursor to beginning of line.
- Ctrl-E**: moves cursor to end of line.
- Esc-B**: moves cursor left one word.
- Esc-F**: moves cursor right one word.

1.1.2.4 History Substitution Keystrokes

The history buffer retains the last 20 commands entered. History substitution keystrokes that access previously entered commands include:

- Ctrl-P** or the **Up Arrow** key: Recalls the most recent buffered commands. Repeat to recall older commands.
- Ctrl-N** or the **Down Arrow** key: Recalls more recent commands after using the **Ctrl-P** or the **Up Arrow**. Repeat to recall newer commands.

The **show history** command in Privileged EXEC mode displays the history buffer contents.

```
switch# show history
  en
  config
  exit
  show history
```

1.1.2.5 Command Lists and Syntax Assistance

EOS CLI uses widely followed conventions for providing command lists and syntax assistance. These conventions are available in all command modes.

- To display all commands available at this level, type a question mark (?):

```
switchName> ?
  clear      Reset functions
  connect    Open a terminal connection
  default   Set a command to its defaults
  disable    Turn off privileged commands
  enable     Turn on privileged commands
  exit       Exit from the EXEC
  logout    Exit from the EXEC
  no        Negate a command or set its defaults
  ping      Send echo messages
  show      Show running system information
  ssh       Open ssh connection
  tcpdump   Monitor packets with tcpdump
  telnet    Open a telnet connection
  terminal  Configure the terminal
  traceroute Trace route to destination
  watch     Execute a command repeatedly
  who       Display information about terminal lines
  zerotouch ZeroTouch configuration
```

- To display a list of commands beginning with a specific character sequence, type the sequence followed by a question mark.

```
switch# di?
  diff  dir  disable
```

- To display a command's keywords or arguments, type a question mark as an argument.

```
switch> ping ?
  WORD  Ping destination address or hostname
  ip    IPv4 echo
  ipv6  IPv6 echo
  mpls  Send echo messages for LSP
  vrf   Ping in a VRF
```

- The switch accepts an address-mask or CIDR notation (address-prefix) in commands that require an IP address and mask. For example, these commands are processed identically:

```
switch(config)# ip route 0.0.0.0 255.255.255.255 10.1.1.254
switch(config)# ip route 0.0.0.0/32 10.1.1.254
```

- The switch accepts an address-wildcard or CIDR notation in commands requiring an IP address and wildcard. Wildcards use zeros to mask portions of the IP address and are found in some protocol configuration statements, including OSPF. The switch processes these commands identically:

```
switch(config-router-ospf)# network 10.255.255.1 0.0.0.255 area 15
switch(config-router-ospf)# network 10.255.255.1/24 area 15
```

1.1.2.6 Regular Expressions

A regular expression is a search pattern composed of symbols, letters and numbers. Some CLI parameters are defined as regular expressions for specifying more expressive search criteria. The switch uses regular expression pattern matching in several BGP commands.

The functionality of a regular expression for an AS-Path varies based on BGP regex asn and string mode configurations in the `ip as-path regex-mode` command.

The following tables describe the behavior of special characters in asn and string modes respectively.

Table 1: Functionality of Special Characters in ASN Mode

| Special Characters | Characters Names | Description | Examples |
|--------------------|------------------|--|--|
| . | Period | Matches any AS number. | '.' matches '200'. '10.20' matches '10 30 20', but does not match '10 20'. |
| ^ | Caret | Matches the specified expression at the beginning of an input string. Also used to exclude expressions in brackets while matching. | '^123' matches '123', '123 456', '123 456 789', and so on; but does not match '1234'. '[^12]' matches '1', '2', '3', and so on; but does not match '12'. |
| * | Asterisk | Matches an entire AS number that appears either zero or more times. | '200_100*_300' matches '200 300', '200 100 300', '200 100 100 300', and so on. '^100*\$' matches empty AS path, '100', '100 100', '100 100 100', and so on. |
| + | Plus sign | Matches an entire AS number appearing either one or more times. | '10_20+_30' matches '10 20 30', '10 20 20 30' and so on; but does not match '10 200 30'. |
| \$ | Dollar sign | Matches the specified expression at the end of an input string. | '1_2_3\$' matches '1 2 3', but does not match '1 2 3 4'. |
| [] | Brackets | Matches either an AS number, or a range of AS numbers separated by a hyphen. | '[10_20_30-39]' matches '10', '20', '30', '31',...,'39'. |
| ? | Question mark | Matches either zero or one occurrence of the pattern but the previous operand or entire AS number may appear zero or one time. | '100_200?' matches '100' and '100 200'. '100_200?\$\$' does not match with '100 20'. |
| | Pipe | Matches the specified AS number on either side of the vertical bar. | '6400 6500' matches either '6400' or '6500'. |
| () | Parenthesis | Nests specified AS numbers for matching. | '^(100(200 300))\$' matches either '100 200' or '100 300'. '^100_200 300_400\$' matches AS path either "100 200" or "300 400". |
| _ | Underscore | Matches specified AS numbers that are converted into AS number delimiters. | '_123_456_' matches '123 456'. '_333_444_' matches '111 222 {333 444}'. |

Note: Precede the question mark (?) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

Table 2: Functionality of Special Characters in String Mode

| Special Characters | Characters Names | Description | Examples |
|--------------------|------------------|---|---|
| . | Period | Matches any single character. | '1.2' matches '102'. |
| ^ | Caret | Matches the specified expression at the beginning of an input string. | '^123' matches '123', '1234', '12345', and so on. It also matches '123 456', '123 456 789', and so on. |
| * | Asterisk | Matches either zero or more sequences of the expression preceding the asterisk. | '^5*\$' matches an empty AS path, '5', '55', '555', and so on. |
| + | Plus sign | Matches either one or more sequences of the expression preceding the plus sign. | '5+' matches to '5', '55', '555', and so on. |
| \$ | Dollar sign | Matches the expression at the end of an input string. | '123\$' matches '123', but does not match '1234'. |
| [] | Brackets | Matches either characters or a range of characters separated by a hyphen, within left and right brackets. | '[025-7]' matches '0', '2', and digits from '5' to '7'; but does not match digits from '1', '3', '4', '8', and '9'. |
| ? | Question mark | Matches either zero or one occurrence of the pattern. | '12?3' matches '13' and '123'. |
| | Pipe | Matches either one of the expressions or expression patterns on either side of the vertical bar. | '14(36 75)12' matches either '143612' or '147512'; but does not match '1412', '14367512', '14363612' or '14757512'. |
| () | Parenthesis | Nests specified expressions for matching. | '(17)*' matches any number of the two-character string '17'. |
| _ | Underscore | For AS-Path regex, '_' matches curly brackets '{}', the beginning of input string, the end of input string, or space. | '_1300_' matches '100 {1300 1400}', '100 1300 200', and so on. |
| {} | Braces | Matches repetitions of the previous expression with the number of repetitions provided in braces. | '10{2,3}' matches '100' and '1000'. |
| \ | Backslash | Matches the character following the backslash and special characters. | '\(42' matches '(42'. |

Precede the question mark (?) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

1.1.2.7 Scheduling CLI Commands

The **schedule** command facilitates the periodic execution of the specified CLI command. Command parameters configure the time to start script execution, the interval between consecutive execution instances, the maximum time to execute the script, and the maximum number of files log that needs to be created.

The **schedule config** command sets configuration parameters to the CLI scheduler.

The **show schedule** command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

Examples

- This command schedules the execution of a script once every **12** hours and the script execution is terminated if it exceeds **40** minutes. When max-log-files is set to zero, the script output is not logged.

```
switch# schedule ms_1 interval 720 timeout 40 max-log-files 0 command bash /mnt/flash/my
script.sh
```

- This command saves the running configuration contents to a log file every hour, terminates the script execution if it exceeds 30 minutes and creates up to **24** log files.

```
switch# schedule backup-test interval 60 max-log-files 24 command show running-config
```

- This command allows the switch to concurrently execute up to **2** scheduled commands.

```
switch(config)# schedule config max-concurrent-jobs 2
switch(config)#
```

- This command lists the commands that are scheduled for periodic execution.

```
switch(config)# schedule config max-concurrent-jobs 3
switch(config)# show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: No
Name          At time      Last      Interval    Timeout   Max       Logfile Location           Status
              time        time     (mins)      (mins)    log
files
-----
tech-support   now         00:29      60          30        100      flash:schedule/tech-support/
thehelp        12:02:00    00:02      60          40        100      flash:schedule/thehelp/   Success
                                         06/05/2018
switch(config) #
```

1.1.2.8 Running Bash Shell Commands Automatically with Event Handlers

Event handlers execute a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after **delay** seconds.

To create an event handler, use the [event-handler](#) command. This creates a new event handler and places the CLI in event handler configuration mode for that handler. Use the [action bash](#) command to configure a Bash command to run when the handler is triggered, and the [trigger](#) command to specify the trigger. Event handlers can be triggered by various events, including:

- system booting
- a change in a specified interface's operational status or IP address
- a change in the **startup-config** file
- a state change in a virtual machine monitored by VM Tracer

To change the delay period between the trigger and the action, use the [delay](#) command.

When an action is run, certain information is passed to it through environment variables. For the boot trigger, no variables are set. For the **interface** triggers, the following variables are set and passed to the action:

- \$INTF** interface name.
- \$OPERSTATE** current operational status of the specified interface.
- \$IP-PRIMARY** current primary IP address of the specified interface.

To execute more than one Bash command in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the [action bash](#) command.

To display information about all event handlers or about a specific event handler, use the [show event-handler](#) command.

The **no event-handler** command deletes an event handler.

Examples

- These commands create an event handler named **eth_4** which sends an email to a specified address when there is a change in the operational status of **Ethernet interface 4**:

```
switch(config)# event-handler eth_4
switch(config-event-eth_4)# action bash email x@yz.com -s "Et4 $OPERSTATE"
switch(config-event-eth_4)# trigger on-intf ethernet 4 operstatus
switch(config-event-eth_4)# delay 60
switch(config-event-eth_4)# exit
switch(config)#

```

The above handler uses the **\$OPERSTATE** variable to include the current operational state ("linkup" or "linkdown") in the subject of the email. Note that the action will only function if email has been configured on the switch.

- These commands create an event handler named **onStartup** which executes a user-defined script 60 seconds after the system boots.

```
switch(config)# event-handler onStartup
switch(config-event-onStartup)# action bash /mnt/flash/startupScript1
switch(config-event-onStartup)# trigger onboot
switch(config-event-onStartup)# delay 60
switch(config-event-onStartup)# exit
switch(config)#

```

The above handler will also be executed on exiting from event-handler configuration mode.

- This command displays information about all event handlers configured on the system.

```
switch# show event-handler
Event-handler onStartup
Trigger: onBoot delay 60 seconds
Action: /mnt/flash/startupScript1
Last Trigger Activation Time: 1 minutes 51 seconds ago
Total Trigger Activations: 1
Last Action Time: 51 seconds ago
Total Actions: 1
switch#

```

- This command deletes the event handler named **onStartup**.

```
switch(config)# no event-handler onStartup
switch(config)#

```

1.1.2.9

Running Adverse Drop Counters Monitor with Event Handlers

A monitoring capability for adverse drop counters can be used as a warning that the system is encountering an abnormal condition. The adverse drop counter monitor runs periodically (with a default of 60 seconds) and performs the following actions:

- Reads the values of adverse drop counters.
- Compares each value to the value read in the previous run.
- If counter values increase more than a certain threshold (with a default of 100), it is considered as a threshold violation.
- If any counter has more than a certain number of threshold violations within a specific time window (with a default of 3 violations within 15 minutes) a syslog message is logged.

No configuration is required to enable adverse drop counters monitor with event handlers. It is enabled by default and can be disabled, and can be customized for duration of time window and threshold levels. To customize the delay, polling interval, and condition for width, violation count, and threshold of this event

handler, use the `event-handler DropCountersHandler` command. To display details of this event handler, use the `show event-handler DropCountersHandler` command.

Examples

- These commands customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)# event-handler DropCountersHandler
switch(config-DropCountersHandler)# action bash DropCounterLog.py -l
switch(config-DropCountersHandler)# delay 0
switch(config-DropCountersHandler)# trigger on-counters
switch(config-DropCountersHandler-counters)# poll interval 60
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)# condition
bashCmd."DropCounterMonitor.py" -t 200" > 0
switch(config-DropCountersHandler-counters)#

```

- This command disables this event handler.

```
switch(config) # no event-handler DropCountersHandler  
switch(config) #
```

- This command displays details of this event-handler.

```
switch(config)# show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
    Polling Interval: 60 seconds
    Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config)#
```

1.1.3

Kernel-based Virtual Machine Commands and Configuration

Arista's EOS has leveraged its unmodified Linux kernel, and embraced open source standards-based technology that has brought operating system virtualization to Ethernet switching, utilizing the kernel-based virtual machine (KVM) as follows:

- The hypervisor is the Linux kernel.
 - The core virtualization infrastructure is provided by the kernel module.
 - The CPU-specific implementation is provided by the processor-specific module (Intel or AMD).
 - The generic machine emulator and virtualizer KVM is provided by a Modified Quick Emulator (QEMU), which transforms the Linux kernel into the hypervisor.

The standard Linux kernel is the hypervisor, resulting in changes to the standard kernel (such as memory support and scheduler). Optimizations to these Linux components (such as a new scheduler in the 2.6 kernel) benefit both the hypervisor (host operating system) and Linux guest operating systems. With the kernel acting as the hypervisor, the switch can run other operating systems, such as Windows or Linux.

All components required are pre-installed with the Arista EOS software image, requiring only the download of the image. A few additional configuration steps get the KVM fully operational.

This chapter contains the following sections:

- [KVM Commands](#)
- [KVM Configuration](#)

1.1.3.1 KVM Commands

The following table covers KVM commands used throughout the configuration.

Table 3: KVM Commands

| Command | Description |
|-------------|---|
| comment | Up to 240 character comment for this mode. |
| default | Set a command to its defaults. |
| disk-image | Add Virtual Machine disk image. |
| enable | Enable VM. |
| exit | Exit from Virtual Machine configuration mode. |
| memory-size | Set memory size. |
| no | Negate a command or set its defaults. |
| show | Show running system information. |
| virtual-nic | Add virtual NIC. |
| vnc-port | Set VNC server port. |
| !! | Append to comment. |

1.1.3.1.1 CLI Commands

The following KVN CLI commands are used throughout the configuration.

vm

In **config** mode, the **vm** CLI command creates or deletes a KVM configuration, or enters **config-vm** mode. A newly created KVM will have an empty config file path and is disabled.

The CLI command syntax is as follows:

[no] vm NAME

config-file

In **config-vm** mode, the **config-file** CLI command sets the path of the **libvirt** config file, using standard file syntax (e.g. **flash:vm/NetscalerVPX.xml** or **sata1:vm/NetscalerVPX.xml** or **/mnt/sata1/vm/NetscalerVPX.xml**). Changing this value does not affect the state of a currently enabled KVM. To use the new file, the user must disable and then re-enable the KVM.

The CLI command syntax is as follows:

```
config-file [PATH]
```

enabled

In **config-vm** mode, the **enabled** CLI command allows enabling a currently disabled VM, causing it to start up immediately. If a VM is enabled in the **startup-config**, it starts up automatically when EOS boots (or when **virtAgent** starts).

The CLI command syntax is as follows:

```
[no] enabled
```

Disabling a currently enabled VM initiates a shutdown process in the following sequence:

- Attempt to shut down the VM politely if the guest OS supports ACPI.
- If the VM is still running after 30 seconds, terminate it.

show vm

In **enable** mode, the **show vm** CLI command prints information about the configuration and status of a KVM, or of all KVMs if **NAME** is omitted, as follows:

- Configuration: Name, config file path, and enabled.
- Status: PID, log file path, and serial console pty path.
- Current resource usage: RES, CPU%.
- (Detailed only) contents of the log file.

(Detailed only) contents of the config file.

The CLI command syntax is as follows:

```
show vm [detailed] [NAME]
```

attach vm

In **enable** mode, the **attach vm** CLI command connects to a KVM's serial console pty (using virsh console).

Note: Press **Ctrl-[** to exit to the CLI.

The CLI command syntax is as follows:

```
attach vm [NAME]
```

show tech-support

The CLI command syntax is as follows:

```
show tech-support [detailed] [NAME]
```

reload

In **enable** mode, the **reload** CLI command is executed before restarting the system, and will shut down currently enabled KVMs using the same process as the **no enabled** command in **config-vm** mode.

The CLI command syntax is as follows:

```
reload
```

1.1.3.2 KVM Configuration

Arista EOS enables kernel-based virtual machine (KVM) instances by running KVM on the control-plane CPU of the switch. KVM instances can be defined from the CLI.

To configure a KVM, you must download the virtual machine image and configure the EOS.

This section contains the following topics:

- [Configuring a KVM](#)
- [Configuring a Guest KVM](#)

1.1.3.2.1 Configuring a KVM

To configure a KVM, perform the following steps:

1. Download the Virtual Machine Image to `/mnt/flash`
2. Name the virtual machine: `switch(config)# virtual-machine [kvm_name]`

Example:

```
switch(config)# virtual-machine foo
```

3. Provide a pointer to the image: `switch(config-vm-foo)# disk-image [file:[path] image-format [format]]`

Example:

```
switch(config-vm-foo)# disk-image file:/mnt/flash/fedora.img image-format qcow2
```

4. Define the amount of memory allocated: `switch(config-vm-foo)#memory-size [size in bytes]`
5. Bind the virtual NIC to an SVI (or management interface): `switch(config-vm-foo)#virtual-nic 1 vlan [1-4] switch(config-vm-foo)# virtual-nic 1 management [1-4]`
6. Create the VNC server's tcp port (display): `switch(config-vm-foo)# vnc-port [vnc-port number]`
7. Enable the virtual machine: `switch(config-vm-foo)# enable`

Optionally attach to the virtual machine via VNC client pointed to the switch's IP address. However, if Kernel **hair-pinning** is currently not enabled, preventing communication directly with the local switch, all traffic must have a destination on another networked device (such as a router, switch, or server).

For specifics about KVM visit <http://www.linux-kvm.org/>.

Note: In the Real VNC Viewer for **Options**, **Expert**, and **ColorLevel**, if the default value is **pa18**, establishing a session may fail. If this occurs, set this value to **full** and **reconnect**.

Example

```
switch# copy http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-openstack-sda.qcow2
```

```
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
openstack-sda.qcow2) flash:
...
switch(config)# virtual-machine foo
switch(config-vm-foo)# disk-image file:/mnt/flash/fedora.img image-format qcow2
switch(config-vm-foo)# memory-size 512
switch(config-vm-foo)# virtual-nic 1 vlan 1
switch(config-vm-foo)# virtual-nic 2 management 1
switch(config-vm-foo)# vnc-port 5900
switch(config-vm-foo)# enable
```

1.1.3.2.2 Configuring a Guest KVM

To configure a guest KVM, perform the following steps:

1. Download the Virtual Machine Image to **/mnt/flash**
2. Name the virtual machine: **switch(config)# virtual-machine [guest_name]**

Example

```
switch(config)# virtual-machine guest123
```

3. Provide a pointer to the image: **switch(config-vm-guest123)# disk-image [file:[path] image-format [format]]**

Example

```
switch(config-vm-guest123)# disk-image flash:f16-x86_64-openstack-sda.qcow2 image-format ?
iso iso image format qcow qcow image format qcows2 qcows2 image format raw raw image format
vmdk vmdk image format
switch(config-vm-guest123)# disk-image
flash:f16-x86_64-openstack-sda.qcow2 image-format qcows2
```

4. Define the amount of memory allocated: **switch(config-vm-guest123)#memory-size [size in bytes]**
5. Bind the virtual NIC to an SVI (or management interface): **switch(config-vm-guest123)# virtual-nic 1 vlan [1-4] switch(config-vm-guest123)# virtual-nic 2 management [1-4]**
6. Create the VNC server's tcp port (display): **switch(config-vm-guest123)# vnc-port [vnc-port number]**
7. Enable the virtual machine: **switch(config-vm-guest123)# enable**

Example

```
switch# copy http://berrange.fedorapeople.org/images/2012-02-
29/f16-x86_64-openstack-sda.qcow2
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
openstack-sda.qcow2) flash:
...
switch# config terminal
switch(config)# virtual-machine ?
WORD Virtual Machine name
switch(config)# virtual-machine foo
switch(config-vm-foo)# disk-image flash:f16-x86_64-openstack-sda.qcow2 image-format ?
iso iso image format
qcow qcow image format
qcows2 qcows2 image format
raw raw image format
vmdk vmdk image format
switch(config-vm-foo)# disk-image flash:f16-x86_64-openstack-sda.qcow2 image-format qcows2
switch(config-vm-foo)# memory-size 1024
switch(config-vm-foo)# virtual-nic ?
<1-4> Virtual NIC Id
```

```

switch(config-vm-foo)# virtual-nic 1 ?
    Management      Management interface
    Vlan           Vlan interface
switch(config-vm-foo)# virtual-nic 1 vlan 1
switch(config-vm-foo)# virtual-nic 2 management 1
switch(config-vm-foo)# enable
switch(config-vm-foo)#
switch(config-vm-foo)#
switch# ^Z
switch# write mem
switch#
switch# show virtual-machine detail
Virtual Machine: foo
    Enabled:          Yes
    State:            Running
    Disk Image:       /mnt/flash/f16-x86_64-openstack-sda.qcow2
    Disk Image Format: qcow2
    Memory Size:     1024MB
    VNC port:        5900
    Virtual Nic:     vnic1
        Mac Address:  52:54:00:ee:11:c9
        Device:        Vlan1
        Model Type:   e1000
    Virtual Nic:     vnic2
        Mac Address:  52:54:00:df:2a:e1
        Device:        Management1
        Model Type:   e1000
switch#

```

1.1.4 Switch Platforms

Features and CLI commands vary by switch platform. CLI options may also vary by switch platform for commands that are available on all platforms. Command descriptions in this manual describe feature availability and command parameters on the basis of switch platform, noting exceptions that exist among models that use a common platform.

- <https://www.arista.com/en/products-switches> lists the Arista switches and platforms upon which they operate.
- <https://www.arista.com/en/support/product-documentation-supported-features> lists Arista switch feature availability by switch platform. For the latest features, also consult the Release Notes, available at <https://www.arista.com/en/support/software-download>.

These sections describe the following topics:

- [Viewing the Model Number](#)
- [Modular System Platforms – 7500 and 7500E Series Switches](#)
- [Viewing Modules on 7300 Series Modular Switches](#)
- [Multi-Chip Devices](#)

1.1.4.1 Viewing the Model Number

To view the switch's model number through the CLI, enter the `show version` command.

Example

This command displays the model number, serial number, system MAC address, and manufacturing information of a DCS-7150S-64 switch.

```

switch> show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

```

```

Software image version: 4.13.2F
Architecture:          i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:      eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:                16 hours and 39 minutes
Total memory:          4017088 kB
Free memory:           1348228 kB switch>

```

1.1.4.2 Modular System Platforms – 7500 and 7500E Series Switches

Modular switch platforms depend on their installed modules along with the fabric and forwarding software modes. The `show module` command displays the fabric modules in the switch. System performance in switches containing both module types is based on first-generation fabric capabilities. Best practice is to avoid switch configurations with mixed fabric modules.

These sections describe modular switch components and software modes that program their capacities.

1.1.4.2.1 Fabric Modules and Fabric Mode – 7500 and 7500E Series Switches

Each modular switch fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

Fabric mode determines the switch's fabric performance capabilities. This mode must match the fabric modules in the switch. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe1600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compatibility mode ([Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series](#)) also reload in **fe600** fabric mode.
2. As specified by the [platform sand fabric mode \(7500 and 7500E Series\)](#) statement in **running-config**.
3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

Example

This command configures the switch to reload in **fe1600** fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```

switch(config)# platform sand fabric mode fe1600
switch(config)# exit
switch# show platform sand compatibility
               Configuration      Status
Forwarding mode    None            Arad
Fabric mode        Fe1600         Fe600  switch#

```

1.1.4.2.2 Determining a Switch's Operating Platform

FM6000 Platforms

To determine the operating platform on switch, display **platform** command options from Global Configuration command mode.

This command displays the operating platform of a switch operating on the FM6000 platform (7150 Series switches).

```
switch(config)# platform ?
      fm6000  FM6000 chip
switch(config)#platform
```

Arad and Petra Platforms

The **platform ?** command displays the same options on Arad and Petra platform switches. Refer to [Viewing the Model Number](#) to determine the switch's model number.

- Fixed system switches (DCS-7048 Series) operate on the Petra platform.
- Modular switches (DCS-7500 Series) operate on Arad and Petra platforms. [Modular System Platforms – 7500 and 7500E Series Switches](#) describe platform usage on these switches.

Arad and Petra platform switch typically utilize multiple chips. [Multi-Chip Devices](#) describe methods of determining the port distribution on multi-chip platforms.

Example

These commands display platform options of a switch operating on either Petra or Arad platforms.

```
switch(config)# platform ?
      arad    Arad switch chip
      fe1600 Fe1600 chip
      fe600  Fe600 fabric chip
      petraA PetraA switch chip
      ptp     Precision Time Protocol
      sand    Sand platform
switch(config)#platform
```

Trident and Trident II Platforms

The **platform ?** command returns **trident** on switches that operate on Trident or Trident II platforms. Trident II platform switches include options that configure the forwarding and routing tables. To determine the Trident platform that a switch uses, display **platform trident** options.

These commands indicate that the switch is operating on the Trident II platform:

```
switch(config)# platform ?
      ptp     Precision Time Protocol
      trident Trident chip
switch(config)# platform trident ?
      fabric          Fabric configuration
      forwarding-table Forwarding table configuration
      mmu            Trident MMU configuration
      routing-table   Routing table configuration
switch(config)#platform trident
```

Fixed and Modular switches are available that operate on the Trident II platform. Refer to [Viewing the Model Number](#) to determine the switch's model number. [Viewing Modules on 7300 Series Modular Switches](#) displays the modules on a Trident II platform modular switch.

Trident II platform switches typically utilize multiple chips. [Multi-Chip Devices](#) describes methods of determining port distribution on multi-chip platforms.

1.1.4.2.3 Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecard modules support all basic switch functions.
- E-Series linecard modules support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the switch's performance capabilities when forwarding data between linecard interfaces. Forwarding compatibility mode settings include:

- **PetraA:** Supports first-generation linecard modules.
- **Arad:** Supports E-Series linecard modules.

Forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on linecard module types.

Table 4: Linecard Module and Forwarding Mode Performance

| Linecard Module Type | Forwarding Compatibility Mode | Linecard Operating Capacity |
|----------------------|-------------------------------|--|
| First-generation | petraA | First-generation performance capacity. |
| First-generation | arad | Linecard is powered-down. |
| E-Series | petraA | First-generation performance capacity. |
| E-Series | arad | E-series performance capacity. |

Note: Switches must contain E-Series fabric modules to operate at E-Series performance capacities.

The forwarding compatibility mode is configured by the [platform sand forwarding mode \(7500 and 7500E Series\)](#) command. This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards.

Without a [platform sand forwarding mode \(7500 and 7500E Series\)](#) command, forwarding compatibility mode is determined by the first linecard that is operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards.

Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a [platform sand forwarding mode](#) command.

Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)# platform sand forwarding mode arad
```

```
switch(config) #
```

1.1.4.2.4 Viewing Modules – 7500 and 7500E Series

The `show module` command displays the model number of all installed modules.

- This command displays the modules of a 7504 switch that contains first-generation modules.

```
switch> show module
Module Ports Card Type Model Serial No.
-----
1 2 DCS-7500 Series Supervisor Module 7500-SUP JSH11440327

1.1.4.4 Multi-Chip Devices

Trident II, Petra, and Arad platform switches and linecards utilize multiple chips, with Ethernet ports evenly distributed among the chips. Creating multi-port data structures (including port channels) that include ports from multiple chips protects against the failure of an individual chip on a device.

The following sections describe methods of determining port distribution on various switch platforms

Petra Fixed Switches

7048-Series switches are Petra platform devices that distribute ports among two PetraA chips. The `show platform petraA port-info routing` command displays the ports that are controlled by each chip.

Example

This command displays the following Ethernet port distribution on a DCS-7048-T switch:

- **Petra0** chip controls **Ethernet 1** through **Ethernet 32**.
- **Petra1** chip controls **Ethernet 33** through **Ethernet 52**.

```
switch# show platform petraA port-info routing

switch#
```

Petra Modular Switches

Linecards on 7500-Series modular switches distribute Ethernet ports among multiple petraA chips. The **show platform petraA port-info routing** command displays the ports that are controlled by each chip on all PetraA linecards or on a single linecard.

Example

This command displays the following Ethernet port distribution on **linecard 4** of a DCS-7504 switch:

- **Petra4/0** chip controls **Ethernet 4/1** through **Ethernet 4/8**.
- **Petra4/1** chip controls **Ethernet 4/9** through **Ethernet 4/16**.
- **Petra4/2** chip controls **Ethernet 4/17** through **Ethernet 4/24**.
- **Petra4/3** chip controls **Ethernet 4/25** through **Ethernet 4/32**.
- **Petra4/4** chip controls **Ethernet 4/33** through **Ethernet 4/40**.
- **Petra4/5** chip controls **Ethernet 4/41** through **Ethernet 4/48**.

```

```

Arad Modular Switches

7500-E Series linecards distribute Ethernet ports among multiple Arad chips. The **show platform arad port-info routing** command displays the ports that are controlled by each chip on all Arad linecards.

Example

This command displays the following Ethernet port distribution on the 7500E-72S-LC linecard that is inserted as **module 3** in a DCS-7508E switch:

- **Arad3/0 chip: Ethernet 3/1– Ethernet 3/20.**
- **Arad3/1 chip: Ethernet 3/21 – Ethernet 3/34 and Ethernet 3/49/1 – Ethernet 3/49/12.**
- **Arad3/2 chip: Ethernet 3/35 – Ethernet 3/48 and Ethernet 3/50/1 – Ethernet 3/50/12.**

```
switch# show platform arad mapping
```

```

Trident II Fixed Switches

Trident II platform devices distribute their ports among multiple Trident II chips. The **show platform trident system port** command displays the ports that are controlled by each chip.

Example

This command displays the following Ethernet port distribution on a DCS-7250QX-64-F switch:

- **Trident 0 chip controls Ethernet 1/1 through Ethernet 16/4.**
- **Trident 1 chip controls Ethernet 17/1 through Ethernet 32/4.**
- **Trident 2 chip controls Ethernet 33/1 through Ethernet 48/4.**

- **Trident 3** chip controls **Ethernet 49/1** through **Ethernet 64/4**.

```
switch# show platform trident system port

      Intf     Chip    ModId   Logical   Port
                                         Physical   MMU
-----+-----+-----+-----+-----+
  Ethernet1/1  Linecard0/0  1        1        17       9

switch#

Trident II Modular Switches

Linecards on 7300-Series modular switches distribute Ethernet ports among multiple Trident II chips. The **show platform trident system port** command can display the ports that are controlled by each chip on all linecards or on a single chip.

This command displays the following Ethernet port distribution on DCS-7304-F switch that contains a 7300X-32Q-LC linecard as **module 3**:

- **Trident 0** chip controls **Ethernet 1/1** through **Ethernet 16/4** (on **module 3**).
- **Trident 1** chip controls **Ethernet 17/1** through **Ethernet 32/4** (on **module 3**).

```
switch# show platform trident system port

      Intf     Chip    ModId   Logical   Port
                                         Physical   MMU

1.1.5 Command Modes

Command modes define the user interface state. Each mode is associated with commands that perform a specific set of network configuration and monitoring tasks.

- [Mode Types](#) lists the available modes.
- [Navigating Through Command Modes](#) lists mode entry and exit commands.
- [Command Mode Hierarchy](#) describes the mode structure.
- [Group-Change Configuration Modes](#) describes editing aspects of these modes.

1.1.5.1 Mode Types

The switch includes these command modes:

- **EXEC:** EXEC mode commands display system information, perform basic tests, connect to remote devices, and change terminal settings. When logging into EOS, you enter EXEC mode.

EXEC mode prompt: `switch>`

- **Privileged EXEC:** Privileged EXEC mode commands configure operating and global parameters. The list of Privileged EXEC commands is a superset of the EXEC command set. You can configure EOS to require password access to enter Privileged EXEC from EXEC mode.

Privileged EXEC mode prompt: `switch#`

- **Global Configuration:** Global Configuration mode commands configure features that affect the entire system, such as system time or the switch name.

Global Configuration mode prompt: `switch (config) #`

- **Interface Configuration:** Interface configuration mode commands configure or enable Ethernet, VLAN, and Port-Channel interface features.

Interface Configuration mode prompt: `switch (config-if-Et24) #`

- **Protocol specific mode:** Protocol specific mode commands modify global protocol settings. Protocol specific mode examples include **ACL Configuration** and **Router BGP Configuration**.

The prompt indicates the active command mode. For example, the Router BGP command prompt is `switch (config-router-bgp) #`

1.1.5.2 Navigating Through Command Modes

To change the active command mode, perform one of these actions:

- To enter EXEC mode, log into the switch.
- To enter Privileged EXEC mode from EXEC, type `enable` (or `en`) followed, if prompted, by the `enable` password:

```
switch> en
Password:
switch#
```

- To enter Global Configuration mode from Privileged EXEC, type `configure` (or `config`):

```
switch# config
switch(config) #
```

- To enter Interface Configuration mode from Global Configuration, type `interface` and the name of the interface to be modified:

```
switch(config) # interface Et24
switch(config-if-Et24) #
```

- To enter a protocol specific configuration mode from Global Configuration, type the required command for the desired mode.

```
switch(config) # router bgp 100
switch(config-router-bgp) #
```

- To return one level from any configuration mode, type `exit`.

```
switch(config) # exit
switch#
```

-
- To return to Privileged EXEC mode from any configuration mode, type **end** or **Ctrl-Z**.

```
switch(config-if-Et24) # <Ctrl-z>
switch#
```

- To return to EXEC mode from Privileged EXEC mode, type **disable** (or **dis**).

```
switch# dis
switch>
```

- To exit EOS and log out of the CLI, type **exit** from EXEC mode or Privileged EXEC mode.

```
switch# exit
login:
```

1.1.5.3 Command Mode Hierarchy

Command modes are hierarchical. The parent mode of a specified command mode is the mode that contains the command that enters the specified mode.

Example

EXEC mode contains the **enable** command, which enters Privileged EXEC mode. Therefore, EXEC is the parent mode of Privileged EXEC.

Commands that are executable in a specified command mode include all commands available in the specified mode plus all commands executable from its parent mode.

Example

EXEC mode includes the **ping** command. EXEC mode is the parent mode of Privileged EXEC mode. Therefore, Privileged EXEC mode includes **ping**.

Additionally, Privileged EXEC is the parent mode of Global Configuration mode. Therefore, Global Configuration mode also includes **ping**.

Executing a configuration mode command from a child mode may change the active command mode.

Example

Global Configuration mode contains **interface ethernet** and **ip access-list** commands, which enter Interface Configuration and Access Control List (ACL) Configuration modes, respectively. When the switch is in Interface Configuration mode, the **ip access-list** command is available and changes the active mode to ACL Configuration.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip access-list master-list
switch(config-acl-master-list)#

```

The **exit** command changes the active command mode to its parent mode. When executed from Privileged EXEC or EXEC modes, the **exit** command terminates the session.

Example

- This command exits Global Configuration mode to Privileged EXEC mode.

```
switch(config)#exit
switch#
```

- This command terminates the user session.

```
switch# exit
```

1.1.5.4 Group-Change Configuration Modes

Group-change modes apply all changes made during an edit session only after exiting the mode. Changes are stored when the user exits the mode, either through an **exit** or **end** command or through a command that enters a different configuration mode.

The **abort** command discards all changes not previously applied.

Access Control List (ACL) and Multiple Spanning Tree (MST) configuration modes are examples of group-change modes.

1.1.6 Managing Switch Configuration Settings**1.1.6.1 Verifying Settings for the Current Mode**

To display only the lines of ***running-config*** that affect the current mode, use the **active** option of the [show \(various configuration modes\)](#) command. This command option is available in all configuration modes except global configuration.

Example

Type **show active** to display the content of ***running-config*** that affects the current mode. To include default settings in the display, type **show active all**.

```
switch(config-router-ospf3)# show active all
ipv6 router ospf 9
  router-id 0.0.0.0
  default-metric 10
  distance ospf intra-area 10
  area 0.0.0.200 default-cost 10
  area 0.0.0.200
  no log-adjacency-changes
  timers spf 5
switch(config-router-ospf3)#

```

To display any comments associated with the current mode, use the **comment** option of the [show \(various configuration modes\)](#) command.

Example

Type **show comment** to display any comments attached to the current mode.

```
switch(config-router-ospf3)# show comment
Comment for router-ospf3:
  Consult Thomas Morton before making changes to the OSPF configuration.
switch(config-router-ospf3)#

```

1.1.6.2 Verifying the Running Configuration Settings

The **running-config** command is the virtual file that stores the operating configuration. The **show running-config** command displays the **running-config**. The command is supported in Privileged EXEC mode.

Example

Type **show running-config** in Privileged EXEC mode. The response in the example is truncated to display only the ip route configured.

```
switch# show running-config
! Command: show running-config

!
ip route 0.0.0.0/0 192.0.2.1
!

end switch#
```

1.1.6.3 Adding a Comment to a Configuration Mode

To add a comment to most switch configuration modes, use the [comment \(various configuration modes\)](#) command. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. Comments cannot be added to global configuration mode

To append to an existing comment, enter !! followed by additional comment text. To display comments for the active mode, use the **show comment** command. The **no comment** and **default comment** commands remove the comment from **running-config**.

Examples

- These commands enter a comment in Router OSPF3 Mode.

```
switch(config-router-ospf3)# comment
Enter TEXT message. Type 'EOF' on its own line to end.
Consult Thomas Morton before making changes to the OSPF configuration.
EOF
switch(config-router-ospf3) #
```

- These commands append additional information to the comment entered above.

```
switch(config-router-ospf3)# !! x2735
switch(config-router-ospf3)# show comment
Comment for router-ospf3:
    Consult Thomas Morton before making changes to the OSPF configuration.
    x2735
switch(config-router-ospf3) #
```

1.1.6.4 Saving the Running Configuration Settings

startup-config is the file, stored in internal flash memory, that the switch loads when it boots. Configuration changes that are not saved to **startup-config** are lost the next time the switch is booted.

The **write** and **copy running-config startup-config** commands store the operating configuration to **startup-config**. Both commands are supported in Privileged EXEC mode.

Example

These equivalent commands save the current operating config to the startup-config file.

```
switch# write
switch# copy running-config startup-config
```

The **show startup-config** command displays the startup configuration file. The command is supported in Privileged EXEC mode.

Example

Type **show startup-config** to display the startup configuration file. The response in the example is truncated to display only the ip route configured in Admin Username.

```
switch# show startup-config
! Command: show startup-config
! Startup-config last modified at Wed Feb 19 08:34:31 2014 by admin
!
!
ip route 0.0.0.0/0 192.0.2.1
!
end switch#
```

1.1.7 Other Command-Line Interfaces

EOS can access other CLIs that provide switch commands, files, and services.

- [Aboot Command-Line Interface](#) describes the boot-loader CLI.
- [Bash Shell](#) describes the Bash shell CLI.

1.1.7.1 Aboot Command-Line Interface

Aboot is the switch boot loader. It reads a configuration file from the internal flash or a USB flash drive and attempts to boot a software image.

The switch opens an Aboot shell if the switch does not find a software image, the configuration is corrupted, or the user terminates the boot process. The Aboot shell provides a CLI for manually booting a software image, recovering the internal flash to its default factory state, running hardware diagnostics, and managing files.

1.1.7.2 Bash Shell

The switch provides a Linux Bash shell for accessing the underlying Linux operating system and extensions. The Bash shell is accessible in all command modes except EXEC. [Mode Types](#) describes EOC command modes.

- To enter the Bash, type **bash** at the prompt.

```
switch# bash
Arista Networks EOS shell
[admin@Switch ~]$
```

-
- To exit the Bash, type `logout`, `exit`, or `Ctrl-D` at the Bash prompt.

```
[admin@Switch ~]$ logout  
switch#
```

1.1.8 Directory Structure

EOS operates from a flash drive root mounted as the `/mnt/flash` directory on the switch. The EOS CLI supports these file and directory commands:

- `delete`: Delete a file or directory tree.
- `copy`: Copy a file.
- `more`: Display the file contents.
- `diff`: Compares the contents of files located at specified URLs.
- `rename`: Rename a file.
- `cd`: Change the current working directory.
- `dir`: Lists directory contents, including files and subdirectories.
- `mkdir`: Create a directory.
- `rmdir`: Remove a directory.
- `pwd`: Display the current working directory.

Verify flash memory space before copying a file. When a file is copied to flash, it is first written to a temporary file and then renamed to the destination rather than directly overwriting the destination file. This protects the integrity of the existing file if the `copy` command is interrupted, but requires more free space to complete the process.

Switch directory files are accessible through the Bash shell and Aboot. When entering the Bash shell from the switch, the working directory is located in `/home` and has the name of the user name from which Bash was entered.

Example

These commands were entered from the user name john:

```
switch# bash  
[john@switch ~]$ pwd  
/home/john  
[john@switch ~]$
```

In this instance, the working directory is `/home/john`.

When a flash drive is inserted in the USB flash port, flash drive contents are accessible through `/mnt/usb1`.

When entering Aboot, the working directory is the root directory of the boot.

1.1.9 Command-Line Interface Commands

Mode Navigation Commands

- `alias`
- `bash`
- `configure (configure terminal)`
- `copy running-config`
- `daemon`

- disable
- enable
- end
- exit

File Transfer Commands

- ip ftp client source-interface
- ip http client local-interface
- ip ssh client source-interface
- ip tftp client source-interface

File Management Commands

- configure checkpoint
- configure network
- copy running-config
- dir
- pwd

Modular Switch Platform Commands

- platform arad lag mode
- platform sand fabric mode (7500 and 7500E Series)
- platform sand forwarding mode (7500 and 7500E Series)
- platform sand lag hardware-only
- platform sand lag mode
- show platform sand compatibility
- show platform sand lag hardware-only

CLI Scheduling Commands

- schedule
- schedule config
- show schedule

Event Handler Commands

- action bash
- delay
- event-handler
- event-handler DropCountersHandler
- show event-handler
- show event-handler DropCountersHandler
- trigger

Terminal Parameter Commands

- terminal length
- terminal monitor

Display and Comment Commands

- `comment` (various configuration modes)
- `show` (various configuration modes)
- `show module`
- `show version`

1.1.9.1 action bash

The **action bash** command specifies a Bash shell command to be run when an event handler is triggered. When an event handler is triggered, execution of the associated shell command is delayed by a configurable period set by the **delay** command. Only a single Bash command may be configured for an event handler, but the command may have multiple arguments. If more than one Bash command must be executed in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the **action bash** command.

To specify the event that will trigger the action, use the **trigger** command.

If the event handler uses an **on-intf** trigger, the following environment variables are passed to the action and can be used as arguments to the Bash command:

- **\$INTF** interface name.
- **\$OPERSTATE** current operational status of the specified interface.
- **\$IP-PRIMARY** current primary IP address of the specified interface.

Command Mode

Event-Handler Configuration

Command Syntax

`action bash command`

Parameters

command Bash shell command to be executed when the event handler is triggered.

Examples

- This command configures the event handler “onStartup” to run a script on the flash drive.

```
switch(config-handler-onStartup) # action bash /mnt/flash/myScript1
switch(config-handler-onStartup) #
```

- This command configures the event handler “eth_4” to send email to the specified address when there is a change in the operational status of **Ethernet interface 4**.

```
switch(config-event-eth_4) # action bash email x@yz.com -s "Et4 $OPERSTATE"
switch(config-event-eth_4) #
```

The above action uses the **\$OPERSTATE** variable to include the current operational state (“linkup” or “linkdown”) in the subject of the email. Note that the action will only function if email has been configured on the switch.

1.1.9.2 alias

The **alias** command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command. Once created, an alias is accessible in all modes and all user sessions, but is subject to all the restrictions of the original command.

When using a command alias, no tokens may precede the alias except the no and default keywords. However, an alias can incorporate positional parameters.

In online help, aliases are preceded by an asterisk (*) in this format:

```
*alias_name=command_name
```

The **no alias** and **default alias** commands remove the specified alias.

Command Mode

Global Configuration

Command Syntax

```
alias alias_name command_name
```

```
no alias alias_name
```

```
default alias alias_name
```

Parameters

- **alias_name** the string which is to be substituted for the original command. The string can include letters, numbers, and punctuation, but no spaces. If the alias_name string is identical to an existing command, the alias will supercede the original command.
- **command_name** the command which is to be executed when the alias is entered in the CLI. If the original command requires additional parameters, they must be included in the *command_name* string in the following manner:

Positional parameters are of the form "%n" and must be whitespace-delimited. The first parameter is represented by "%1" and any additional parameters must be numbered sequentially. When executing the alias a value must be entered for each parameter or the CLI will display the error "% incomplete command".

Examples

- This command makes **e** an alias for the command **enable**.

```
switch(config)#alias e enable
```

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-6**.

```
switch(config)#alias srie show running-config interface ethernet 1-6
```

- These commands make **ss** an alias for the command **show interfaces ethernet <range> status** with a positional parameter for the port range, then use the alias to display the status of ports 4/1-4/5.

```
switch(config)#alias ss show interfaces ethernet %1 status
switch(config)#ss 4/1-4/5
Port      Name          Status       Vlan      Duplex   Speed Type
Et4/1     connected    in Po1     full     10000  10GBASE-SRL
Et4/2     notconnect   in Po1     full     10000  10GBASE-SRL
Et4/3     notconnect   1          full     10000  10GBASE-SRL
Et4/4     notconnect   1          full     10000  10GBASE-SRL
Et4/5     notconnect   1          full     10000  10GBASE-SRL
```

1.1.9.3 bash

The **bash** command starts the Linux Bash shell. The Bash shell gives you access to the underlying Linux operating system and system extensions.

To exit the Bash, type **logout**, **exit**, or **Ctrl-D** at the Bash prompt.

Command Mode

Privileged EXEC

Command Syntax

bash

Examples

- This command starts the Bash shell.

```
switch#bash
Arista Networks EOS shell
[admin@switch ~]$
```

- This command, executed within Bash, exits the Bash shell.

```
[admin@switch ~]$ logout
switch#
```

1.1.9.4 comment (various configuration modes)

The **comment** command adds a comment for the active configuration mode to **running-config**. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. To append to an existing comment, enter **!!** followed by additional comment text. To display comments, use the **comment** option of the [show \(various configuration modes\)](#) command.

The **no comment** and **default comment** commands remove the comment from **running-config**.

Comments cannot be added to the global configuration mode through the EOS.

Command Mode

All configuration modes except Global Configuration

Command Syntax

```
comment comment_text EOF
```

```
no comment
```

```
default comment !! comment_text
```

Parameters

- **comment_text** To create a comment, enter a message when prompted. The message may span multiple lines.
- **EOF** To end a comment, type EOF on its own line (case sensitive) and press **enter**.

Examples

- This command adds a comment to the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)# comment  
Enter TEXT message. Type 'EOF' on its own line to end.  
Consult Thomas Morton before making changes to the RADIUS configuration.  
EOF  
switch(config-sg-radius-RAD-SV1) #
```

- This command appends a line to the comment for the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)# !! x3452  
switch(config-sg-radius-RAD-SV1) #
```

1.1.9.5 **configure (configure terminal)**

The **configure** command places the switch in the Global Configuration mode to configure features at the system level. You can move to Interface Configuration mode and protocol-specific mode from the **Global Configuration** mode. The command may also be entered as **configure terminal**.

Command Mode

Privileged EXEC

Command Syntax

configure [terminal]

Example

This command places the switch in the Global Configuration mode.

```
switch> enable  
switch# configure  
switch(config)#
```

1.1.9.6 configure checkpoint

The **configure checkpoint** command saves the running configuration to a checkpoint file. This checkpoint file can be used for restoring the current running configuration in future, if required.

Command Mode

Privileged EXEC

Command Syntax

```
configure checkpoint {restore checkpoint_name | save [checkpoint_name]}
```

Parameters

- **restore *checkpoint_name*** restores the running configuration from the specified checkpoint file.
- **save *checkpoint_name*** saves running configuration to the specified checkpoint file.

Guidelines

If the filename already exists, EOS overwrites the filename. If the command is entered without a checkpoint name, the switch automatically saves the checkpoint under the name ckp-date-number where date is the date in YYYYMMDD format and number increments by one for each automatically named checkpoint file.

Examples

- This command saves ***running-config*** to the **ca_test** checkpoint file.

```
switch# configure checkpoint save ca_test
```

- This command restores the ***running-config*** from the **ca_test** checkpoint file.

```
switch# configure checkpoint restore ca_test
! Preserving static routes. Use 'no ip routing delete-static-routes' to clear them.
```

- This command saves ***running-config*** to the **13Aug2018** checkpoint file. The **dir** command shows the contents of the checkpoint directory.

```
switch# configure checkpoint save
switch# dir checkpoint:
Directory of checkpoint:/
-rw-          7426      Aug 13 12:00  ckp-20180813-17
-rw-          7588      Aug 13 12:10  ckp-20180813-18
-rw-          8499      Aug 13 12:13  ckp-20180813-19
-rw-          8499      Aug 13 12:13  ckp-20180813-20
```

1.1.9.7 **configure convert**

The **configure convert** command converts the current configuration syntax to the specified syntax.

Command Mode

Privileged EXEC

Command Syntax

```
configure convert new-syntax
```

Parameter

new-syntax converts ***running-config*** to the current version of EOS.

Example

This command converts running-config to the current version of EOS.

```
switch# configure convert new-syntax

WARNING!
Converting existing configuration to new syntax will lose backward compatibility.
Make sure you won't downgrade to releases that only support the old syntaxes.

Proceed [ y/n ]
```

1.1.9.8 **configure network**

The **configure network** command is deprecated. Use the **copy <url> running-config** command to configure the switch from a local file or network location.

1.1.9.9 copy running-config

The current operating configuration of the switch is stored in a virtual file called running-config. The copy running-config command saves the contents of the running-config virtual file to a new location.

Command Mode

Privileged EXEC

Command Syntax

```
copy running-config DESTINATION
```

Parameters

- **DESTINATION** destination for the contents of the running-config file. Values include:
 - **startup-config** the configuration file that the switch loads when it boots.
- The **copy running-config**, **startup-config**, and **write** commands are equivalent.
 - **file:** a file in the switch file directory.
 - **flash:** a file in flash memory.
 - **url** any valid URL.

The **copy running-config url** and **write network url** commands are equivalent.

Examples

- This command copies running-config to the startup-config file.

```
switch# copy running-config startup-config
switch#
```

- This command copies running-config to a file called **rc20110617** in the dev subdirectory of the switch directory.

```
switch# copy running-config file:dev/rc20110617
switch#
```

1.1.9.10 **daemon**

The **daemon** command accesses daemon configuration mode for adding or removing external daemons and scripts, which are then managed by ProcMgr.

The **no daemon** and **default daemon** commands delete the daemon by removing the corresponding **daemon** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
daemon daemon_name
no daemon daemon_name
default daemon daemon_name
```

Parameters

daemon_name label that references the daemon configuration mode.

Example

These commands enters daemon configuration mode and initiates the daemon script.

```
switch(config)# daemon process1
switch(config-daemon-process1)# command process-script -i -m
switch(config-daemon-process1) #
```

1.1.9.11 delay

The **delay** command specifies the time in seconds the system will delay between a triggering event and the execution of an event handler action. The default delay is **20** seconds.

Command Mode

Event-Handler Configuration

Command Syntax

`delay seconds`

Parameters

seconds number of seconds to delay before executing the action. The default is 20.

Example

This command configures the event handler Eth5 to delay 10 seconds before executing.

```
switch(config-handler-Eth5)# delay 10
switch(config-handler-Eth5) #
```

1.1.9.12 dir

The **dir** command displays a list of files on a file system.

Command Mode

Privileged EXEC

Command Syntax

dir [SCOPE][FILE TYPE]

Parameters

- **SCOPE** the files to display. Options include:
 - **no parameter** lists normal files in current directory.
 - **/all** list all files, including hidden files.
 - **/recursive** list files recursively.
- **FILE TYPE** The options include:
 - **no parameter** lists undeleted files.
 - **all_filesystems** list files on all filesystems including deleted files, undeleted files, and files with errors.
 - **extensions** directory or file name.
 - **file** directory or file name.
 - **flash** directory or file name.
 - **supervisor-peer** directory or file name.
 - **usb1** directory or file name.
 - **system** directory or file name.

Example

This command displays the flash directory.

```
switch# dir flash:  
Directory of flash:/  
  
-rwx 293409892          Oct 23 08:55 EOS-4.11.0.swi  
-rwx 221274543          Sep  6 13:37 EOS-4.7.5.swi  
-rwx 271453650          Sep  4 19:13 EOS_4.10.1-SSO.swi  
-rwx 135168              Dec 31 1979 FSCK0000.REC  
-rwx 26                  Oct 23 13:51 boot-config  
-rwx 8570                Sep 10 12:22 cfg_sso_mst  
-rwx 5642                Sep 20 10:35 config.reset  
drwx 4096                Oct 23 13:59 debug  
-rwx 12                  Oct 23 13:56 kernel-params  
drwx 4096                Oct 23 14:59 persist  
drwx 4096                Sep  6 14:50 schedule  
-rwx 5970                Oct 23 13:53 startup-config switch#
```

1.1.9.13 disable

The **disable** command exchanges the session's current command mode with the specified privilege level.

Command Mode

Privileged EXEC

Command Syntax

disable [PRIVILEGE_LEVEL]

Parameters

PRIVILEGE_LEVEL Session's new privilege level. Value ranges from **0** to **15**. Levels **2** through **15** place the switch in Privileged EXEC mode. Values of **0** or **1** leave the switch in EXEC mode.

- **no parameter** Session is assigned default level of **1**.
- **<0 to 15>** Specifies session level.

Restrictions

New privilege level must be less than the session's current level.

Example

This command exits Privileged EXEC mode level of 15 to enter EXEC mode level 1.

```
switch# disable  
switch>
```

1.1.9.14 enable

The **enable** command places the switch in Privileged EXEC mode. If an **enable** password is set, the CLI displays a password prompt when a user enters the **enable** command. If the user enters an incorrect password three times, the CLI displays the EXEC mode prompt.

To set a local **enable** password, use the **enable password** command.

Command Mode

EXEC

Command Syntax

enable [PRIVILEGE_LEVEL]

Parameters

- **PRIVILEGE_LEVEL** Session's privilege level. Values range from **0** to **15**. Values of **0** or **1** places the switch in EXEC mode. Any level above **1** leaves the switch in Privileged EXEC mode.
 - **no parameter** Session is assigned default level of **15**.
 - **<0 to 15>** Specifies session level.

Example

This command places the switch in Privileged EXEC mode with the default privilege level of **15**.

```
switch> enable  
switch#
```

1.1.9.15 end

The **end** command exits to Privileged Exec mode from any Configuration mode. If the switch is in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the **end** command also saves all pending changes made in that mode to ***running-config***.

Command Mode

All configuration modes

Command Syntax

```
end
```

Example

This command exits to Privileged Exec mode.

```
switch(config-if-Et25)# end  
switch#
```

1.1.9.16 event-handler DropCountersHandler

The **event-handler DropCountersHandler** command enables the adverse drop counters monitor with event handlers. The DropCountersHandler event handler is enabled by default, and can be customized for duration of time window and threshold levels.

The **no event-handler DropCountersHandler** command disables the adverse drop counters monitor with event handlers. The **default event-handler DropCountersHandler** command resets the DropCountersHandler event handler to the system default.

Command Mode

Global Configuration

Command Syntax

```
event-handler DropCountersHandler  
no event-handler DropCountersHandler  
default event-handler DropCountersHandler
```

Examples

- These commands customize the delay, polling interval, and condition for width (-w), violation count (-c), and threshold (-t) of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)# event-handler DropCountersHandler  
switch(config-DropCountersHandler)# action bash DropCounterLog.py -l  
switch(config-DropCountersHandler)# delay 0  
switch(config-DropCountersHandler)# trigger on-counters  
switch(config-DropCountersHandler-counters)# poll interval 60  
switch(config-DropCountersHandler-counters)# condition  
bashCmd."DropCounterMonitor.py" -w 800" > 0  
switch(config-DropCountersHandler-counters)# condition  
bashCmd."DropCounterMonitor.py" -c 5" > 0  
switch(config-DropCountersHandler-counters)# condition  
bashCmd."DropCounterMonitor.py" -t 200" > 0  
switch(config-DropCountersHandler-counters)#{
```

- This command disables this event handler.
- ```
switch(config)# no event-handler DropCountersHandler
switch(config)#{
```

### 1.1.9.17 event-handler

An event handler executes a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after **delay** seconds.

The **event-handler** command places the switch in event-handler configuration mode for the specified event handler. If the named event handler does not already exist, this command creates it. Event-handler configuration mode is a group change mode that configures event handlers.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode.

These commands are available in event-handler configuration mode:

- **action bash**
- **delay**
- **trigger**

The **no event-handler** and **default event-handler** commands delete the specified event handler by removing it from *running config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
event-handler name
no event-handler name
default event-handler name
```

#### Parameters

**name** name of the event handler to be configured. If the named event handler does not already exist, this command will create it.

#### Example

This command places the switch in event-handler configuration mode for an event handler called **Eth\_5**.

```
switch(config)# event-handler Eth_5
switch(config-handler-Eth_5) #
```

---

### 1.1.9.18 exit

The exit command places the switch in the parent of the command mode from which the exit command was entered.

- When used in Global configuration, the switch enters **Privileged EXEC mode**.
- When used in **EXEC** or **Privileged EXEC mode**, the **exit** command terminates the user session.
- When the command is used in a group-change mode (such as **ACL-Configuration mode** or **MST-Configuration mode**), the **exit** command also applies all pending changes made in that mode.

#### Command Mode

All modes

#### Command Syntax

`exit`

#### Examples

- This command exits Global Configuration mode to **Privileged EXEC mode**.

```
switch(config)# exit
switch#
```

- This command terminates the user session.

```
switch# exit
```

### 1.1.9.19 ip ftp client source-interface

By default, the FTP (File Transfer Protocol) source IP address is selected by the switch (the IP address of the source interface if one is assigned). The `ip ftp client source-interface` command allows the user to override the default FTP source address.

The `ip ftp client source-interface` and `ip ftp source-interface` commands are functionally equivalent. In each case, `ip ftp client source-interface` is stored in *running-config*.

The `no ip ftp client source-interface` and `default ip ftp client source-interface` commands restore default behavior by removing the `ip ftp client source-interface` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ftp [client] source-interface INTERFACE [vrf vrf_name]
```

```
no ip ftp [client] source-interface
```

```
default ip ftp [client] source-interface
```

#### Parameters

- ***client*** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet *e\_num*** Ethernet interface specified by *e\_num*.
  - **loopback *l\_num*** Loopback interface specified by *l\_num*.
  - **management *m\_num*** Management interface specified by *m\_num*.
  - **port-channel *p\_num*** Port-channel interface specified by *p\_num*.
  - **tunnel *t\_num*** Tunnel interface specified by *t\_num*.
  - **vlan *v\_num*** VLAN interface specified by *v\_num*.
  - **vrf *vrf\_name*** Uses the specified user-defined VRF.

#### Examples

- These commands configure the **10.10.121.15** as the source IP address the switch uses when communicating with FTP servers.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# ip address 10.10.121.15/24
switch(config-if-Et17)# ip ftp client source-interface ethernet 17
switch(config)#{
```

- This command configures the switch to use **interface tunnel 45** and **vrf vrf01** when communicating with FTP servers.

```
switch(config)#ip ftp client source-interface tunnel 45 vrf vrf01
switch(config)#{
```

---

### 1.1.9.20 ip http client local-interface

The **ip http client local-interface** command specifies the source IP address for hypertext transfer protocol (HTTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **no ip http client local-interface** and **default ip http client local-interface** commands restore default behavior by removing the **ip http client local-interface** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip http client local-interface INTERFACE [vrf vrf_name]
no ip http client local-interface
default ip http client local-interface
```

#### Parameters

- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
- **vrf vrf\_name** Uses the specified user-defined VRF.

#### Examples

- These commands configure the **10.15.17.9** as the source IP address the switch uses when communicating with HTTP servers.

```
switch(config)# interface vlan 10
switch(config-if-V110)# ip address 10.15.17.9/24
switch(config-if-V110)# ip http client local-interface vlan 10
switch(config)#
```

- This command configures the switch to use **interface tunnel 45** and **vrf vrf01** when communicating with HTTP servers.

```
switch(config)# ip http client local-interface tunnel 45 vrf vrf01
switch(config)#
```

### 1.1.9.21 ip ssh client source-interface

The **ip ssh client source-interface** command specifies the source IP address for secure shell (SSH) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **ip ssh client source-interface** and **ip ssh source-interface** commands are functionally equivalent. In each case, **ip ssh client source-interface** is stored in **running-config**.

The **no ip ssh client source-interface** and **default ip ssh client source-interface** commands restore default behavior by removing the **ip ssh client source-interface** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ssh [client] source-interface INTERFACE [vrf vrf_name]
```

```
no ip ssh [client] source-interface
```

```
default ip ssh [client] source-interface
```

#### Parameters

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
- **vrf vrf\_name** Uses the specified user-defined VRF.

#### Examples

- These commands configure the **10.17.17.9** as the source IP address the switch uses when communicating with SSH servers.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.17.17.9/24
switch(config-if-Vl10)# ip ssh client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use **interface tunnel 45** and **vrf vrf01** when communicating with SSH servers.

```
switch(config)# ip ssh client source-interface tunnel 45 vrf vrf01
switch(config)#
```

---

### 1.1.9.22 ip tftp client source-interface

The **ip tftp client source-interface** command specifies the source IP address for Trivial File Transfer Protocol (TFTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The **ip tftp client source-interface** and **ip tftp source-interface** commands are functionally equivalent. In each case, **ip tftp client source-interface** is stored in **running-config**.

The **no ip tftp client source-interface** and **default ip tftp client source-interface** commands restore default behavior by removing the **ip tftp client source-interface** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip tftp [client] source-interface INTERFACE [vrf vrf_name]
```

```
no ip tftp [client] source-interface
```

```
default ip tftp [client] source-interface
```

#### Parameters

- **client** Parameter has no functional effect.
- **INTERFACE** Interface providing the IP address. Options include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
- **vrf vrf\_name** Uses the specified user-defined VRF.

#### Examples

- These commands configure the **10.15.17.9** as the source IP address the switch uses when communicating with TFTP servers.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.15.17.9/24
switch(config-if-Vl10)# ip tftp client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use **interface tunnel 45** and **vrf vrf01** when communicating with TFTP servers.

```
switch(config)# ip tftp client source-interface tunnel 45 vrf vrf01
switch(config)#
```

---

### 1.1.9.23 platform arad lag mode

The **platform arad lag mode** command allows configuration of LAGs with more than 16 members.

#### Command Mode

## Global Configuration

### Command Syntax

```
platform arad lag mode [1024x16 | 256x64 | 512x32]
```

### Examples

- This command configures 1024 LAGs with 16 members each.

```
switch(config)# platform arad lag mode 1024x16
! Change will take effect only after switch reboot.
switch(config)#

```

- This command configures 256 LAGs with 64 members each.

```
switch(config)# platform arad lag mode 256x64
! Change will take effect only after switch reboot.
switch(config)#

```

- This command configures 512 LAGs with 32 members each.

```
switch(config)# platform arad lag mode 512x32
! Change will take effect only after switch reboot.
switch(config)#

```

### 1.1.9.24 platform sand fabric mode (7500 and 7500E Series)

The **platform sand fabric mode** command specifies the fabric mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

The fabric mode determines the modular switch's fabric performance capabilities and must be compatible with the installed fabric modules. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

**Note:** Switches that reload in **petraA** forwarding compatibility mode ([platform sand forwarding mode \(7500 and 7500E Series\)](#)) also reload in fe600 fabric mode regardless of the presence of a **platform sand fabric mode** statement in **running-config**.

The switch's fabric mode setting must match the capabilities of its installed fabric modules. Reloading the switch in a different mode may be required after exchanging fabric modules for a different module type. The [show module](#) command displays the fabric modules in the switch.

Each fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compatibility mode also reload in **fe600** fabric mode .
2. As specified by the **platform sand fabric mode** statement in **running-config**.
3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

The **no platform sand fabric mode** and **default platform sand fabric mode** commands remove the **platform sand fabric mode** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand fabric mode [MODE_SETTING]
no platform sand fabric mode
default platform sand fabric mode
```

#### Parameters

- **MODE\_SETTING** Specifies the switch's fabric mode. Options include:
  - **fe16000** E-Series fabric mode.

- **fe600** First-generation fabric mode.

### Example

This command configures the switch to reload in **fe1600** fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)# platform sand fabric mode fe1600
switch(config)# exit
switch# show platform sand compatibility
 Configuration Status
Forwarding mode None Arad
Fabric mode Fe1600 Fe600 switch#
```

### 1.1.9.25 platform sand forwarding mode (7500 and 7500E Series)

The **platform sand forwarding mode** command specifies the forwarding compatibility mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

Forwarding compatibility mode specifies switch forwarding capabilities and configures performance capacity of installed linecards. Forwarding compatibility modes settings include:

- **petraA**: Supports first-generation fabric modules.
- **arad**: Supports E-Series fabric modules.

**Note:** Switches that reload in **petraA** forwarding compatibility mode also reload in **fe600** fabric mode regardless of the presence of a [platform sand fabric mode \(7500 and 7500E Series\)](#) statement in **running-config**.

This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards. The [show module](#) command displays the linecard modules in the switch.

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecards support all basic switch functions.
- E-Series linecards support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on all linecard module types.

**Table 5: Linecard Module and Forwarding Mode Performance**

| Linecard Module Type | Forwarding Software Mode | Linecard Operating Capacity                                 |
|----------------------|--------------------------|-------------------------------------------------------------|
| First-generation     | petraA                   | Linecard performs at first-generation performance capacity. |
| First-generation     | arad                     | Linecard is powered-down.                                   |
| E-Series             | petraA                   | Linecard performs at first-generation performance capacity. |
| E-Series             | arad                     | Linecard performs at E-series performance capacity.         |

**Note:** Linecards operate at E-Series performance capacities only on switches that contain E-Series fabric modules and have a fabric mode setting of **fe1600** fabric mode ([platform sand fabric mode \(7500 and 7500E Series\)](#)).

Without a [platform sand fabric mode \(7500 and 7500E Series\)](#) command, forward compatibility mode is determined by the first linecard that becomes operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a **platform sand forwarding mode** command.

The **no platform sand forwarding mode** and **default platform sand forwarding mode** commands restore the **platform sand forwarding mode** command from **running-config**.

#### Command Mode

## Global Configuration

### Command Syntax

```
platform sand forwarding mode [MODE_SETTING]
no platform sand forwarding mode
default platform sand forwarding mode
```

### Parameters

- **MODE\_SETTING** Specifies the switch's software forwarding mode. Options include:
  - **arad** the switch supports E-Series linecard capabilities.
  - **petraA** the switch supports first-generation linecard capabilities.

### Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)# platform sand forwarding mode arad
switch(config)#[/pre]
```

### 1.1.9.26 platform sand lag hardware-only

The **platform sand lag hardware-only** command specifies that all LAGs will use hardware resources including single member LAGs. Hardware resource allocation and deallocation traffic disruption occurs on the first member addition or deletion, rather than the second member addition or deletion.

The **no platform sand lag hardware-only** and **default platform sand lag hardware-only** commands specify that LAGs are not required to be implemented in hardware, and therefore some LAGs may be implemented in software. Permitting both hardware and software LAGs may increase the total number of port-channels because we have no resource limit on the number of software LAGs.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand lag hardware-only
no platform sand lag hardware-only
default platform sand lag hardware-only
```

#### Examples

- This command configures all LAGs to use hardware resources. All existing one member LAGs will be allocated hardware resources, when available.

```
switch(config)# platform sand lag hardware-only
switch(config)#
```

- This command allows certain LAGs (single member LAGs) to not consume hardware resources. All existing one member LAGs will release their hardware resources.

```
switch(config)# no platform sand lag hardware-only
switch(config)#
```

### 1.1.9.27 platform sand lag mode

The **platform sand lag mode** configures two Link Aggregation Groups (LAG) partitions, Partition A and Partition B, to support twice as many available Port Channels. Use this command if the current LAG mode does not allow creating a large number of Port Channels on a single partition. Disable the usage of Partition B using the **platform sand lag mode 1024x16** command.

**Note:** Changing the configuration of the LAG mode requires the switch to restart and apply the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand lag mode [2048x8 | 1024x16 | 512x32 | 256x64 | 128x128 | 64x256]
```

#### Parameters

- 2048x8** - Specify 2048 LAGs with 8 members each.
- 1024x16** - Specify 1024 LAGs with 16 members each.

- **512x32** - Specify 512 LAGs with 32 members each.
- **256x64** - Specify 256 LAGs with 64 members each.
- **128x128** - Specify 128 LAGs with 128 members each.
- **64x256** - Specify 64 LAGs with 256 members each.

### Example

To configure a switch with 512 LAGS and 32 members each, use the following command:

```
switch(config) # platform sand lag mode 512x32
```

Use the **show platform sand lag mode** to display the LAG mode for Partition A and B:

```
switch(config) # show platform sand lag mode
Partition Configuration Status
A 1024x16 1024x16
B 1024x16 1024x16
```

---

### 1.1.9.28 pwd

The **pwd** command displays the working directory.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
pwd
```

#### Example

This command shows that the working is Flash.

```
switch# pwd
flash:/
switch#
```

### 1.1.9.29 schedule config

The **schedule config** command sets configuration parameters to the CLI scheduler.

The **no schedule config max-concurrent-jobs** and **default schedule config max-concurrent-jobs** commands reset the limit of maximum concurrent jobs to the default value of 1 by removing the corresponding schedule config max-concurrent-jobs statement from running-config.

The **no schedule config prepend-hostname-logfile** and **default schedule config prepend-hostname-logfile** commands reset the log filenames to the default state.

#### Command Mode

Global Configuration

#### Command Syntax

```
schedule config{max-concurrent-jobs limit | prepend-hostname-logfile}
no schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
default schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
```

#### Parameters

- max-concurrent-jobs *limit*** specifies the maximum number of concurrent commands that can run on the switch. The maximum concurrent jobs ranges from **1** to **4**. The default value is **1**.
- prepend-hostname-logfile** enables prepending hostnames to log filenames. By default, this option is enabled.

#### Examples

- This command configures to concurrently run a maximum of three commands on the switch.

```
switch(config)# schedule config max-concurrent-jobs 3
switch(config)# show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: No
Name At time Last Interval Timeout Max Logfile Location
Status
 time (mins) (mins) log
files

tech-support now 00:29 60 30 100 flash:schedule/tech-support/ Success
thelp 12:02:00 00:02 60 40 100 flash:schedule/thelp/
Fail
 06/05/2018
switch(config) #
```

- This command enables prepending the hostname to log filenames.

```
switch(config)# schedule config prepend-hostname-logfile
switch(config)# show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: Yes
Name At time Last Interval Timeout Max Logfile Location
Status
 time (mins) (mins) log
files

tech-support now 00:29 60 30 100 flash:schedule/tech-support/ Success
thelp 12:02:00 00:02 60 40 100 flash:schedule/thelp/
Fail
 06/05/2018
switch(config) #
```

### 1.1.9.30 schedule

The schedule command facilitates the periodic execution of a specified CLI command. Command parameters configure the start time of periodic execution, the interval between consecutive execution instances, the maximum time allotted for command execution, and the maximum number of log files that can be created.

The `no schedule` and `default schedule` commands disable execution of the specified command.

#### Command Mode

Global Configuration

#### Command Syntax

```
schedule schedule_name PERIOD {max-log-files count | timeout timeout_interval} {command cmd | logging verbose | loglocation flash:}
no schedule schedule_name
default schedule schedule_name
```

#### Parameters

- ***schedule\_name*** Label associated with the scheduled command.
- ***PERIOD*** Start time for execution and interval between consecutive execution instances. The interval ranges from **2** to **1440** minutes. The default interval while scheduling the `show tech-support` command is **60** minutes. Options include:
  - **at** Start time for execution. Options include:
    - ***hh:mm:ss interval interval*** The command execution starts at the specified time and repeats at the specified interval.
    - ***hh:mm:ss mm/dd/yyyy interval interval*** The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - ***hh:mm:ss once*** The command execution starts at the specified time and does not repeat.
    - ***hh:mm:ss mm/dd/yyyy once*** The command execution starts at the specified time on the specified day and does not repeat.
    - ***hh:mm:ss yyyy-mm-dd interval interval*** The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - ***hh:mm:ss yyyy-mm-dd once*** The command execution starts at the specified time on the specified day and does not repeat.
  - ***interval interval*** The command execution starts immediately and repeats at the specified interval.
  - ***now interval hh:mm:ss interval interval hh:mm:ss mm/dd/yyyy interval interval***  
***interval once hh:mm:ss hh:mm:ss mm/dd/yyyy once hh:mm:ss yyyy-mm-dd interval interval***  
***interval once hh:mm:ss yyyy-mm-dd interval interval now interval interval*** The command execution starts immediately and repeats at the specified interval.
  - ***max-log-files count*** Maximum number of log files command generates for command output. The count of maximum log files ranges from **1** to **10000**. The default count of maximum log files while scheduling the `show tech-support` command is **100**.
  - ***timeout timeout\_interval*** Maximum time allotted for the script execution. The timeout interval ranges from **1** to **480** minutes. The default timeout is **30** minutes.
- ***command cmd*** The command that needs to be executed.

**Note:** The command execution is terminated if it exceeds the specified timeout interval. The timeout allotted for the scheduled command must not be greater than the corresponding interval.

- **logging verbose** Sets the logging level to “verbose.” A syslog entry is added after the execution of the scheduled command, regardless of whether the scheduled command has succeeded or failed. In the absence of **logging verbose**, the syslog entry is added only if the execution of the scheduled command fails with an error.
- **loglocation destination** The flash destination for scheduled command output files.

## Guidelines

Log files created by the command are stored in the **flash:/schedule/ scheduled\_name /** directory. Empty log files are created for commands that do not generate any output.

## Examples

- This command saves the running configuration contents to the log file every hour with immediate effect and creates a maximum of 24 log files.

```
switch(config)# schedule backup-test interval 60 max-log-files 24 command show running-config
```

- This command starts the script execution at 12:00:00 and repeats every 720 minutes. The script execution is terminated if it exceeds 20 minutes. It generates a maximum of one log file because the specified bash command does not have an output.

```
switch(config)# schedule ms1 at 12:00:00 interval 720 timeout 20 max-log-files 1 command bash /mnt/flash/myscript.sh
```

- The **show schedule** command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

```
switch# show schedule summary
Maximum concurrent jobs 1
Prepend host name to logfile: Yes

Name At time Last Interval Timeout Max Logfile Location Status
 time (mins) (mins) log files
----- ----- ----- ----- -----
ms1 now 23:03 720 20 1 flash:/schedule/ms1 Success switch#
```

---

### 1.1.9.31 show (various configuration modes)

The **show** command, when executed within a configuration mode, can display data in ***running-config*** for the active configuration mode.

#### Command Mode

All configuration modes except Global Configuration

#### Command Syntax

**show [DATA\_TYPE]**

#### Parameters

- **DATA\_TYPE** Specifies display contents. Values include:
  - **active** Displays ***running-config*** settings for the configuration mode.
  - **active all** Displays ***running-config*** plus defaults for the configuration mode.
  - **active all detail** Displays ***running-config*** plus defaults for the configuration mode.
  - **comment** Displays comment entered for the configuration mode.

#### Related Commands

The **show** commands in ACL-configuration mode and MST-configuration mode include the **active** and **comment** options along with additional mode-specific options.

#### Example

This command shows the server-group-TACACS+ configuration commands in ***running-config***.

```
switch(config-sg-tacacs+-TAC-GR) # show active
 server TAC-1
 server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR) #
```

### 1.1.9.32 show event-handler DropCountersHandler

The show event-handler command displays details of the DropCountersHandler event handler.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-handler DropCountersHandler
```

#### Example

This command displays details of this event handler.

```
switch(config) # show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
 Polling Interval: 60 seconds
 Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config) #
```

---

### 1.1.9.33 show event-handler

The show event-handler command displays the contents and activation history of a specified event handler or all event handlers.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-handler [handler_name]
```

#### Parameters

*handler\_name* optional name of an event handler to display. If no parameter is entered, the command displays information for all event handlers configured on the system.

#### Example

This command displays information about an event handler called "eth\_5".

```
switch# show event-handler Eth_5
Event-handler Eth_5
Trigger: on-intf Ethernet5 on ip delay 20 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: :
Device-health Action: None
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: 15 days 2 hours 19 minutes ago
Total Trigger Detections: 1
Last Trigger Activation Time: 15 days 2 hours 19 minutes ago
Total Trigger Activations: 1
Last Action Time: 15 days 2 hours 19 minutes ago
Total Actions: 1 switch#
```

### 1.1.9.34 show module

The **show module** command displays information that identifies the supervisor, fabric, and linecard modules in a modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

#### Command Mode

EXEC

#### Command Syntax

```
show module [MODULE_NAME]
```

#### Parameters

- **MODULE\_NAME** Specifies modules for which data is displayed. Options include:
  - **no parameter** All modules (identical to **all** option).
  - **fabric fab\_num** Specified fabric module. Number range varies with switch model.
  - **linecard line\_num** Linecard module. Number range varies with switch model.
  - **supervisor super\_num** Supervisor module. Number range varies with switch model.
  - **mod\_num** Supervisor (1 to 2) or linecard (3 to 18) module.
  - **all** All modules.

#### Related Command

### 1.1.9.35 show platform sand compatibility

The **show sand platform compatibility** command displays the fabric and forwarding modes. These modes determine switch forwarding capabilities and programs performance capacity of installed linecards.

Information that identifies the supervisor, fabric, and linecard modules in the modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform sand compatibility
```

#### Related Commands

- [platform sand fabric mode \(7500 and 7500E Series\)](#) specifies the fabric software mode.
- [platform sand forwarding mode \(7500 and 7500E Series\)](#) specifies the forwarding software mode.

#### Example

This command indicates that the switch is in Fe600 fabric mode and PetraA forwarding mode.

```
switch# show platform sand compatibility
 Configuration Status
Forwarding mode None PetraA
Fabric mode None Fe600 switch#
```

---

### 1.1.9.36 show platform sand lag hardware-only

The **show platform sand lag hardware-only** command displays whether or not LAGs are hardware-only.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform sand lag hardware-only
```

#### Examples

- This command indicates that LAGs are hardware-only.

```
switch(config)# platform sand lag hardware-only
switch(config)# exit
switch# show platform sand lag hardware-only
Hardware resources are used for all LAGs: True switch#
```

- This command indicates that LAGs are not hardware-only.

```
switch(config)# no platform sand lag hardware-only
switch(config)# exit
switch# show platform sand lag hardware-only
Hardware resources are used for all LAGs: False switch#
```

### 1.1.9.37 show schedule

The **show schedule** command displays logging output on the terminal during the current terminal session. This command affects only the local monitor. The no terminal monitor command disables direct monitor display of logging output for the current terminal session.

The **show schedule** command displays the list of active scheduled commands and the summary of specified scheduled command.

#### Command Mode

Global Configuration

#### Command Syntax

```
show schedule {schedule_name | summary}
```

#### Parameters

- **schedule\_name** displays the summary of the specified scheduled command.
- **summary** displays the list of active scheduled commands.

#### Examples

- This command displays the summary of the **thelp** schedule.

```
switch(config)# show schedule thelp
The last CLI command failed with exit status 1
CLI command "show THelp" is scheduled next at "02:02:35 06/19/2018", interval is
60 minutes
Timeout is 40 minutes
Maximum of 100 log files will be stored
Verbose logging is off
100 log files currently stored in flash:/schedule/thelp

 Start time Size Filename

 06/05/2018
switch(config)#

```

---

### 1.1.9.38 show version

The **show version** command displays information that identifies the switch, including its model number, serial number, and system MAC address. The command also provides hardware and software manufacturing information, along with the available memory and elapsed time from the most recent reload procedure.

#### Command Mode

EXEC

#### Command Syntax

**show version [INFO\_LEVEL]**

#### Parameters

**INFO\_LEVEL** Specifies information the command displays. Options include:

- **no parameter** Model and serial numbers, manufacturing data, uptime, and memory.
- **detail** Data listed **no parameter** option plus version numbers of internal components.

#### Related Command

[show module](#) displays model and serial numbers of modular system components.

#### Example

This command displays the switch's model number, serial number, hardware and software manufacturing information, uptime, and memory capacity.

```
switch> show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture: i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 1 hour and 36 minutes
Total memory: 4017088 kB
Free memory: 1473280 kB
switch>
```

### 1.1.9.39 terminal length

The terminal length command overrides automatic pagination and sets pagination length for all show commands on a terminal. If the output of a show command is longer than the configured terminal length, the output will be paused after each screenful of output, prompting the user to continue.

To disable pagination for an SSH session, set terminal length to 0. By default, all console sessions have pagination disabled.

The no terminal length and **default terminal length** commands restore automatic pagination by removing the terminal length command from **running-config**.

The pagination setting is persistent if configured from Global Configuration mode. If configured from EXEC mode, the setting applies only to the current CLI session. Pagination settings may also be overridden when you adjust the size of the SSH terminal window, but can be reconfigured by running the terminal length command again.

#### Command Mode

EXEC

#### Command Syntax

```
terminal length lines
no terminal length
default terminal length
```

#### Parameters

*lines* number of lines to be displayed at a time. Values range from **0** through **32767**. A value of **0** disables pagination.

#### Examples

- This command sets the pagination length for the current terminal session to 10 lines.

```
switch# terminal length 10
Pagination set to 10 lines.
```

- This command configures the switch to paginate terminal output automatically based on screen size for the current terminal session.

```
switch# no terminal length
```

- These commands disable pagination globally.

```
switch# configure
switch(config)# terminal length 0
Pagination disabled.
```

---

#### 1.1.9.40 terminal monitor

The terminal monitor command enables the display of logging output on the terminal during the current terminal session. This command affects only the local monitor. The no terminal monitor command disables direct monitor display of logging output for the current terminal session.

##### **Command Mode**

Privileged EXEC

##### **Command Syntax**

```
terminal monitor
no terminal monitor
default terminal monitor
```

##### **Example**

This command enables the display of logging to the local monitor during the current terminal session.

```
switch# terminal monitor
switch#
```

### 1.1.9.41 trigger

The **trigger** command specifies what event will trigger the event handler. Handlers can be triggered either by the system booting or by a change in a specified interface's IP address or operational status.

To specify the action to be taken when the handler is triggered, use the [action bash](#) command.

#### Command Mode

Event-Handler Configuration

#### Command Syntax

```
trigger EVENT
```

#### Parameters

- **EVENT** event which will trigger the configuration mode event handler. Values include:
  - **onboot** triggers when the system reboots, or when you exit event-handler configuration mode. This option takes no further arguments, and passes no environment variables to the action triggered.
    - **on-intf INTERFACE CHANGE** triggers when a change is made to the specified interface.
    - **on-startup-config** triggers when a change is made to the **startup-config** file.
    - **vm-tracer vm** triggers when a virtual machine monitored by VM Tracer changes state.
  - **INTERFACE** the triggering interface. Values include:
    - **ethernet number** Ethernet interface specified by **number**.
    - **loopback number** loopback interface specified by **number**.
    - **management number** management interface specified by **number**.
    - **port-channel number** channel group interface specified by **number**.
    - **vlan number** VLAN interface specified by **number**.
  - **CHANGE** the change being watched for in the triggering interface. Values include:
    - **ip** triggers when the IPv4 address of the specified interface is changed.
    - **ip6** triggers when the IPv6 address of the specified interface is changed.
    - **operstatus** triggers when the operational status of the specified interface changes.

#### Examples

- This command configures the event handler **Eth5** to be triggered when there is a change in the operational status or IP address of **Ethernet interface 5**.

```
switch(config-handler-Eth5) # trigger on-intf Ethernet 5 operstatus ip
switch(config-handler-Eth5) #
```

- This command configures the event handler “onStartup” to be triggered when the system boots, or on exiting **event-handler configuration mode**.

```
switch(config-handler-onStartup) # trigger onboot
switch(config-handler-onStartup) #
```

## Booting the Switch

---

This chapter describes the switch boot process, describes configuration options, and lists the components it requires, including the boot loader, the boot loader shell, and other configuration files.

This chapter includes the following sections:

- [Boot Loader Aboot](#)
- [Configuration Files](#)
- [Supervisor Redundancy](#)
- [System Reset](#)
- [Aboot Shell](#)
- [Aboot Configuration Commands](#)
- [Switch Booting Commands](#)

### 2.1 Boot Loader Aboot

Aboot is the boot loader for Arista switches. In addition to booting the switch EOS, Aboot provides a shell for changing boot parameters, restoring default switch settings, diagnosing hardware problems, and managing switch files. [Aboot Shell](#) describes the Aboot shell.

The boot process loads an EOS image file, initiates switch processes, performs self-tests, restores interface settings, and configures other network parameters. The replacement image file can be in the switch's flash or on a device in the flash drive port. Configuration files stored in flash memory specify boot parameters.

Aboot supports most available USB flash drive models. The flash drive must be formatted using the FAT or VFAT file system. Windows NT File System (NTFS) is not supported.

Aboot initiates a system reboot upon a `reload` command or by restoring power to the switch. Before loading the EOS image file, Aboot provides an option to enter the Aboot shell. The user can either enter the shell to modify boot parameters or allow the switch to boot.

You can monitor the boot process through a terminal connected to the console port. Configuration file settings configure the console port to interact with the terminal.

### 2.2 Configuration Files

Three files define boot and running configuration parameters.

- ***boot-config***: contains the location and name of the image to be loaded.
- ***running-config***: contains the current switch configuration.
- ***startup-config***: contains the switch configuration that is loaded when the switch boots.

The ***running-config*** and ***startup-config*** are different since the configuration changes have not changed since the last boot.

## 2.2.1 boot-config

The **boot-config** file is an ASCII file that Aboot uses to configure console communication settings, locate the EOS flash image, and specify initial network configuration settings.

Aboot boots the EOS flash software image (extension .swi) referenced by **boot-config** if the user does not interrupt the boot process. See [Aboot Shell](#), which describes how Aboot uses **boot-config**.

You can view and edit the **boot-config** file contents. Viewing and editing options include:

- View **boot-config** file contents with the **more boot-config** command:

```
switch(config)# more boot-config
SWI=flash:/EOS.swi
CONSOLESPEED=2400
Aboot password (encrypted): 1A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
switch(config) #
```

- View **boot-config** settings with the **show boot-config** command:

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: 2400
Aboot password (encrypted): 1A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
Memory test iterations: (not set)
switch(config) #
```

- Modify file settings from the command line with EOS boot commands.

See Programming boot-config from the [Programming boot-config from the CLI](#) for a list of **boot** commands.

- Edit the file directly by using vi from the Bash shell.

See [boot-config Command Line Content](#) for a list of **boot-config** parameters.

### 2.2.1.1 boot-config File Structure

Each line in the **boot-config** file specifies a configuration setting and has this format:

NAME=VALUE

- NAME is the parameter label.
- VALUE indicates the parameter's bootup setting.

The NAME and VALUE fields cannot contain spaces.

Aboot ignores blank lines and lines that begin with a # character.

### 2.2.1.2 boot-config Command Line Content

Aboot configuration commands that **boot-config** files can contain include:

- **SWI** specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as the boot command to designate a local or network path.

#### Example

|                          |                               |
|--------------------------|-------------------------------|
| SWI=flash:EOS.swi        | <---flash drive location      |
| SWI=usb1:/EOS1.swi       | <---USB drive location        |
| SWI=file:/tmp/EOSExp.swi | <---switch directory location |
| SWI=/mnt/flash/EOS.swi   |                               |

```
SWI=http://foo.com/images/EOS.swi
SWI=ftp://foo.com/images/EOS.swi
SWI=tftp://foo.com/EOS.swi
SWI=nfs://foo.com/images/EOS.swi
```

- **CONSOLESPEED** specifies the console baud rate. The connected terminal must match the specified rate to communicate with the switch. Baud rates options include **1200, 2400, 4800, 9600, 19200, 38400, 57600**, and **115200**. The default baud rate is **9600**.

#### Example

```
CONSOLESPEED=19200
```

- **PASSWORD (ABOOT)** specifies the Aboot password, as described in [Accessing the Aboot Shell](#). The Aboot shell does not require a password when **boot-config** does not contain a **PASSWORD** command.

#### Example

```
PASSWORD=1CdWp5wfe$pzNtE3ujBoFEL8vjcd7jo/
```

- Aboot uses **NET commands** during switch booting to configure the network interface for the switch. You can enter this manually in Aboot.

**NETDEV** indicates the configured network interface. If **boot-config** does not contain a **NETDEV** command, the booting process does not attempt to configure a network interface. Other **NET** commands specify settings that Aboot uses to configure the interface.

#### Examples

- This **NETDEV** command specifies **management port 1** as the network interface to be configured by **boot-config**:

```
NETDEV=ma1
```

- This **NETAUTO** command instructs the switch to configure the network interface through a DHCP server, ignoring other NET settings:

```
NETAUTO=dhcp
```

- These **NET** commands configure the network interface:

```
NETIP=10.12.15.10
NETMASK=255.255.255.0
NETGWS=10.12.15.24
NETDOMAIN=mycompany.com
NETDNS=10.12.15.13
```

### 2.2.1.3 Programming boot-config from the CLI

The switch CLI provides **boot** commands for editing **boot-config** content. The **boot** commands are not accessible from a console port CLI. You can modify parameters by directly editing the **boot-config** file, which is not configurable from a **boot** command.

Commands that configure boot parameters include **boot system**, **boot secret**, and **boot console**.

#### boot system

The **boot system** command provides the EOS image file location to Aboot.

#### Examples

- This command specifies EOS1.swi as the software image load file on USB flash memory.

```
switch(config)# boot system usb1:EOS1.swi
switch(config)#

```

- The **boot system** command adds this line to **boot-config**.

```
SWI=usb1:/EOS1.swi

```

- This command designates EOS.swi as the EOS software image load file on the switch flash.

```
switch(config)# boot system flash:EOS.swi
switch(config)#

```

- The **boot system** command adds this line to **boot-config** respectively:

```
SWI=flash:/EOS.swi

```

## **boot secret**

The **boot secret** command sets the Aboot password.

### Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)# boot secret xr19v
switch(config)#

```

```
switch(config)# boot secret 0 xr19v
switch(config)#

```

- This command shows the set password.

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): 1k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
switch(config)#

```

The **boot secret** commands earlier add this line to **boot-config**:

```
PASSWORD=1k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.

```

The user must enter xr19v at the login prompt to access the Aboot shell.

- This command sets the Aboot password to xr123. The encrypted string generated previously is xr123 as the clear-text seed.

```
switch(config)# boot secret 5 1QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#

```

- This command shows the set password.

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): 1QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#

```

- The **boot secret** command earlier adds this line to **boot-config**:

```
PASSWORD=1QfbYkVWb$PIXG0udEguW0wOSiZBN3D/
```

The user must enter xr123 at the login prompt to access the Aboot shell.

- This command removes the Aboot password; it does not authenticate subsequent Aboot access.

```
switch(config)# no boot secret
switch(config)#{
```

- This command shows that there is now no Aboot password.

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): (not set)
switch(config)#{
```

## boot console

The **boot console** command sets console settings for attaching devices.

### Examples

- This command sets the console speed to **4800** baud:

```
switch(config)# boot console speed 4800
switch(config)#{
```

- This command shows the console speed.

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: 4800
Aboot password (encrypted): (not set)
switch(config)#{
```

- The **boot console** command earlier adds this line to **boot-config**:

```
CONSOLESPEED=4800
```

## install bios source

The **install bios source** command loads an Aboot Update File (AUF) to provide a signed method of upgrading Aboot.

### Examples

- This command installs the file *update.auf* stored in **/mnt/flash**:

```
switch# install bios source flash:/update.auf
switch(config)#{
```

- This command performs a reboot directly after the installation:

```
switch# install bios source flash:/update.auf reload
switch(config)#{
```

- This command skips the prompts and performs the installation automatically:

```
switch# install bios source flash:/update.auf now
switch(config)#
```

- This command performs the installation only on the standby supervisor:

```
switch# install bios source flash:/update.auf standby
switch(config)#
```

**Note:** On a modular system with two supervisors, Aboot gets upgraded on both by default.

## 2.2.2 running-config

The ***running-config*** is a virtual file that contains the system's operating configuration, formatted as a command sequence. Commands entered from the CLI modify the ***running-config***, and copying a file to ***running-config*** updates the operating configuration by executing the commands in the copied file.

Commands for viewing and copying ***running-config*** include:

- **show running-config** displays the contents of ***running-config***.
- **copy running-config startup-config** copies ***running-config*** contents to ***startup-config***.
- **write** copies ***running-config*** contents to ***startup-config***.

## 2.2.3 startup-config

The ***startup-config*** file is stored in flash memory and contains the configuration the switch loads when booting. During a switch boot, ***startup-config*** replaces the ***running-config***. When the system reboots, changes to ***running-config*** that are not in ***startup-config*** are lost.

Commands affecting ***startup-config*** include:

- **show startup-config** displays the contents of ***startup-config***.
- **copy file\_name startup-config** copies contents of the specified file to ***startup-config***.
- **delete startup-config** deletes the ***startup-config*** file.

## 2.3 Supervisor Redundancy

On modular switches with redundant supervisor modules, the standby supervisor switch can take control to minimize downtime and data loss in the case of an active supervisor's reset, reload, or failure. The redundancy protocol configured on the active supervisor determines the switchover.

Use the **show redundancy status** command to display both the supervisors' state and the current redundancy protocol. Use the **show redundancy file-replication** command to display the state of configuration file synchronization between the supervisors,

### 2.3.1 Redundancy Supervisor Protocols

There are three available supervisor redundancy protocols.

## Route Processor Redundancy (RPR)

The default redundancy protocol is Route Processor Redundancy (RPR), which synchronizes ***startup-config*** files between the supervisor modules and partially boots the standby supervisor to a standby warm state but does not synchronize ***running-config***. If the active supervisor fails or a manual switchover initiates with the **redundancy manual switchover** command, the standby supervisor will become active. The running state, including the spanning tree, is lost, bringing down all links temporarily.

Under RPR, you can access the CLI of the standby supervisor by SSH or through the console port, but the available command set is limited. Any configuration changes made to the standby supervisor will be lost when the supervisor reboots.

## Stateful Switchover (SSO)

In the Stateful Switchover (SSO) protocol, the switch synchronizes ***startup-config*** and ***running-config*** files between the supervisor modules. It fully boots the standby module to a standby hot state to speed up the switchover process and minimize packet loss. If the active supervisor fails or a manual switchover initiates, the standby supervisor immediately becomes active, and the L2 running state is maintained. An SSO switchover is largely transparent from the outside. Still, because the L3 state is not synchronized, the switchover can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

Under SSO, the console port can access the CLI of the standby supervisor, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

**Note:** When upgrading the EOS on a dual-supervisor switch to an SSO-capable version (4.11.0 or higher) from a version that does not support SSO, both supervisors will reset simultaneously, causing several seconds of system downtime.

## Simplex

When a simplex protocol is on the switch, the standby supervisor is disabled, and switchover will not occur even if the active supervisor fails. To reload the active supervisor results in system downtime while the supervisor reboots and the standby supervisor remains disabled. The redundancy protocol must change to RPR or SSO to transfer control of the switch to the standby supervisor.

Under the simplex protocol, the console port can access the CLI of the disabled supervisor, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

### 2.3.2 Configuring Supervisor Redundancy

To configure the supervisor redundancy protocol, use the **protocol** command in redundancy configuration mode (accessed with the **redundancy** command).

Changing the redundancy protocol on the active supervisor resets the standby supervisor regardless of redundancy protocol, and executing the **write** command on the active supervisor synchronizes the ***startup-config*** files between supervisors in RPR and SSO modes.

## Examples

- These commands display the current redundancy state of the switch and the most recent file synchronization information.

```
switch# show redundancy state
my state = ACTIVE
peer state = STANDBY WARM
Unit = Primary
```

```

Unit ID = 1

Redundancy Protocol (Operational) = Route Processor Redundancy
Redundancy Protocol (Configured) = Route Processor Redundancy
Communications = Up
Ready for switchover

Last switchover time = 7:23:56 ago
Last switchover reason = Supervisor has control of the active supervisor lock
switch# show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files total.

File Status Last Synchronized

file:persist/sys Synchronized 0:10:04 ago
flash:startup-config Synchronized 0:10:04 ago switch#

```

- These commands set the redundancy protocol for the active supervisor to stateful switchover (SSO).

```

switch# config
switch(config)# redundancy
switch(config-redundancy)# protocol sso
Peer supervisor will be restarted.
switch(config-redundancy)#

```

## 2.4 System Reset

When a reset condition exists, Aboot can either reset the switch without user intervention or facilitate a manual reset through the Aboot shell. A reset operation clears the switch, including memory states and other hardware logic.

- Fixed systems:** The power supply remains powered up during the reset. All other switch components lose power for two to five seconds.
- Modular systems:** The power supply on the active supervisor remains powered up during the reset. All other supervisor components lose power for at least one second. In Stateful Switchover (SSO) and Route Processor Redundancy (RPR) modes, resetting the standby supervisor does not affect the active supervisor. However, resetting the active supervisor causes the standby supervisor to become active immediately. After the supervisor becomes functional, it manages the power cycling of all line cards.

The `reload` command initiates an immediate reset, terminating all CLI instances not running through the console port. The console port CLI displays messages that the switch generates during a reset. The standby supervisor does not terminate CLI sessions on modular switches with redundant supervisors.

The `reload (scheduled)` command schedules a reset operation to initiate at a specific time or after a specified period.

### 2.4.1 Typical Reset Sequence

The `reload` command power cycles the switch and resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

By default, the `reload` command triggers a request to store unsaved `running-config` commands and an option to open the Aboot shell before starting the reboot when accessing the CLI through the console port. The switch then begins the reboot process, which Aboot controls.

The following procedure is an example of a typical restart.

- Begin the reboot process by typing the `reload` command:

```

switch# reload

```

---

The switch sends a message to confirm the reload request:

```
Proceed with reload? [confirm]
```

2. Select **enter** or type **y** to confirm the requested reload. Pressing any other key terminates the reload operation.

The switch sends a series of messages, including a notification that a message was broadcast to all open CLI instances, informing them that the system rebooted. The reload pauses when the CLI displays the Aboot shell notification line.

```
Broadcast message from root@mainStopping sshd: [OK]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

3. To continue the reload process, do nothing. Typing **Ctrl-C** opens the Aboot shell; see [Aboot Commands](#) for Aboot editing instructions.
4. The switch continues the reset process, displaying messages indicating the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rooWelcome to Arista Networks EOS 4.4.0
Mounting filesystems: [OK]
Entering non-interactive startup
Starting EOS initialization stage 1: [OK]
ip6tables: Applying firewall rules: [OK]
iptables: Applying firewall rules: [OK]
iptables: Loading additional modules: nf_conntrack_tftp [OK]
Starting system logger: [OK]
Starting system message bus: [OK]
Starting NorCal initialization: [OK]
Starting EOS initialization stage 2: [OK]
Starting ProcMgr: [OK]
Completing EOS initialization: [OK]

Generating SSH2 RSA host key: [OK]
Starting isshd: [OK]
Starting sshd: [OK]
Starting xinetd: [OK]
[OK] crond: [OK]

switch login:
```

5. Log in to the switch to resume configuration tasks.

## 2.4.2 Switch Recovery

Aboot can automatically erase the internal flash and copy the contents of a USB drive inserted before powering up or rebooting the switch. This recovery method does not require access to the switch console or Aboot password entry, even if the **boot-config** file lists one.

Aboot invokes the recovery mechanism only in each of these two conditions:

- It ignores the file contents. Providing an empty text file is sufficient.
- If the USB drive contains a **boot-config** file, the timestamp must differ from the timestamp of the **boot-config** file on the internal flash.

This prevents Aboot from invoking the recovery mechanism again on every boot if you leave the flash key inserted.

To use this recovery mechanism, set up and install the USB drive with the current EOS software image, a customized or empty **boot-config**, and an empty file named “fullrecover.”

Check that the **boot-config** has a current timestamp to meet the earlier conditions.

### 2.4.3 Display Reload Cause

The `show reload cause` command displays the cause of the most recent system reset and lists recommended actions, if any exist, to avoid future spontaneous resets or resolve other issues that may have caused the reset.

#### Example

To display the 'reset cause', type `show reload cause` at the prompt.

```
switch# show reload cause
Reload Cause 1:

Reload requested by the user.

Recommended Action:

No action necessary.

Debugging Information:

None available.
switch#
```

### 2.4.4 Configuring Zero Touch Provisioning

Zero Touch Provisioning (ZTP) is a switch configuration method that uses files referenced by a DHCP server to initially provision the switch without user intervention. A switch enters ZTP mode if flash memory does not reload a **startup-config** or **zerotouch-config** file.

ZTP cancellation boots the switch without using a **startup-config** file. Flash memory does not store a **startup-config** file for a canceled ZTP mode. The switch returns to ZTP mode on subsequent reboots until the **startup-config** file stores to flash. This section describes the steps to implement, monitor, and cancel ZTP.

#### 2.4.4.1 Configuring the Network for ZTP

A switch performs the following after booting in ZTP mode:

- It configures each physical interface to **no switchport** mode.
- It sends a DHCP query packet on all Ethernet and management interfaces.

After the switch receives a DHCP offer, it responds with a DHCP request for **Option 66** (TFTP server name), **Option 67** (bootfile name), and dynamic network configuration settings. When the switch receives a valid DHCP response, it configures the network settings and fetches the file from the location listed in **Option 67**. If **Option 67** returns a network URL (`http://` or `ftp://`), the switch obtains the file from the network. If **Option 67** returns a file name, the switch retrieves the file from the TFTP server listed in **Option 66**.

The **Option 67** file can be a **startup-config** file or a boot script. The switch distinguishes between a **startup-config** file and a boot script by examining the first line in the file:

- The first line of a boot file must consist of the `#!` characters followed by the interpreter path. The switch executes the code in the script and then reboots. The boot script may fetch an EOS software image or perform customization tasks.

---

The following boot file fetches an EOS software image and stores a startup configuration file to flash.

```
#!/usr/bin/Cli -p2
copy http://company.com/startup-config flash:startup-config
copy http://company.com/EOS-2.swi flash:EOS-2.swi
config
boot system flash:EOS-2.swi
```

- The switch identifies any other file as a **startup-config** file. The switch copies the **startup-config** file into flash as **mnt/flash/startup-config**, then reboots.

The switch uses its system MAC address as the DHCP client identifier and **Arista** as the Vendor Class Identifier (**Option 60**). When the switch receives an HTTP URL through **Option 67**, it sends the following HTTP headers in the GET request:

```
X-Arista-SystemMAC:
X-Arista-HardwareVersion:
X-Arista-SKU:
X-Arista-Serial:
X-Arista-Architecture:
```

#### 2.4.4.2 Monitoring ZTP Progress

A switch displays the following message after rebooting when it does not contain a **startup-config** file:

```
No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to
download the startup-config from a remote system. The device will not
be fully functional until a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is canceled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.

switch login:
```

After successfully downloading a **startup-config** file, the switch displays a **CONFIG\_DOWNLOAD\_SUCCESS** message and continues the reload process described in the [Typical Reset Sequence](#).

```
=====
Successful download
=====

Apr 15 21:36:46 switch ZeroTouch: %ZTP-5-DHCP QUERY: Sending DHCP request on [Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18, Ethernet21, Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9, Management1, Management2]
Apr 15 21:36:56 switch ZeroTouch: %ZTP-5-DHCP_SUCCESS: DHCP response received on Ethernet24 [Mtu: 1500; Ip Address: 10.10.0.4/16; Nameserver: 10.10.0.1; Domain: aristanetworks.com; Gateway: 10.10.0.1; Boot File: http://10.10.0.2:8080/tmp/172.17.11.196-startup-config.1]

Broadcast messagStopping sshd: [OK]
watchdog is not running
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0
```

Press Control-C now to enter Aboot shell

#### 2.4.4.3 ZTP Failure Notification

The switch displays a **DHCP\_QUERY\_FAIL** message when it does not receive a valid DHCP response within 30 seconds of sending the query. The switch then sends a new DHCP query and waits for a response. The switch sends queries until it receives a valid response or cancels ZTP mode.

```
switch login: admin
admin
switch>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP
request on [Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18,

Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-DHCP_QUERY_FAIL: Failed to get a
valid DHCP response
Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-RETRY: Retrying Zero Touch
Provisioning from the beginning (attempt 1)
Apr 15 21:29:22 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request on
[Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18, Ethernet21,
Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9,
Management1, Management2]
```

#### 2.4.4.4 Canceling ZTP Mode

Log into the console to boot the switch without a **startup-config** file, then cancel ZTP mode. After the switch boots, it uses all factory default settings. Flash memory prevents the switch from entering ZTP mode on subsequent boots when a **startup-config** file exists.

### 2.4.5 Configuring the Networks

If the **boot-config** file contains a NETDEV statement, Aboot attempts to configure the network interface as specified by Network configuration commands. See [boot-config Command Line Content](#) for a list of commands that define the network configuration.

## 2.5 Aboot Shell

The Aboot shell is an interactive command-line interface used to manually boot a switch, restore the internal flash to its factory-default state, run hardware diagnostics, and manage files. The Aboot shell resembles the Linux Bourne Again Shell (Bash).

The Aboot shell provides commands for restoring the state of the internal flash to factory defaults or a customized default state. You can select these recovery methods to:

- Restore the factory-default flash contents before transferring the switch to another owner.
- Restore Aboot shell access if the Aboot password is lost or forgotten.
- Restore console access if the baud rate or other settings are incompatible with the terminal.
- Replace the internal flash contents with configuration or image files stored on a USB flash drive.

## 2.5.1 Aboot Shell Operation

When the switch is powered on or rebooted, Aboot reads its configuration from **boot-config** on the internal flash and attempts to boot a configured EOS software image (with the extension **.swi**).

You can monitor the automatic boot process or enter the Aboot shell only from the console port. You can connect a PC or terminal directly to the port and run a terminal emulator to interact with the serial port or access it through a serial concentrator device.

The **boot-config** stores the console settings; the factory-default settings for Arista switches are **9600** baud, no parity, **8** character bits, and **1** stop bit. If you do not know the current settings, perform a full flash recovery to restore the factory default settings. When the console port is connected and the configured terminal settings are proper, the terminal displays a message similar to the following a few seconds after powering up the switch:

```
Aboot 1.0.0
Press Control-C now to enter the Aboot shell
```

To abort the automatic boot process and enter the Aboot shell, select **Ctrl-C** (ASCII 3 in the terminal emulator) after the *Press Control-C now to enter Aboot shell* message appears. Pressing **Ctrl-C** can interrupt the boot process up through the starting of the new kernel.

If the **boot-config** file does not contain a password command, the Aboot shell starts immediately. Otherwise, you must enter the password using the password prompt to start the shell. If you enter the wrong password three times, Aboot displays this message:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory default
state, or just press Enter to reboot:
```

- Selecting **Enter** continues a normal soft reset without entering the Aboot shell.
- Typing **fullrecover** and pressing **Enter** performs a full flash recovery to restore the factory-default settings, removing all previous flash drive contents.

The Aboot shell starts by printing:

```
Welcome to Aboot.
```

Aboot then displays the **Aboot#** prompt.

Aboot reads its configuration from **boot-config** on the internal flash.

## 2.5.2 Accessing the Aboot Shell

This procedure accesses the Aboot Shell.

1. Reload the switch and select **enter** or type **y** when prompted, as described in the [Typical Reset Sequence](#).  
The command line displays this Aboot entry prompt.

```
Press Control-C now to enter Aboot shell
```

2. Type **Ctrl-C**.

If the **boot-config** file does not contain a **PASSWORD** command, the CLI displays an Aboot welcome banner and prompt.

```
^C Welcome to Aboot.
Aboot#
```

The CLI displays a password prompt if the **boot-config** file contains a PASSWORD command. In this case, proceed to **Step 3**. Otherwise, the CLI displays the Aboot prompt.

3. If prompted, enter the Aboot password.

```
Press Control-C now to enter Aboot shell
^CAboot password:
Welcome to Aboot.
Aboot#
```

Aboot allows three attempts to enter the correct password. After the third attempt, the CLI prompts the user to continue the reboot process without entering the Aboot shell or restoring the flash drive to the factory default state.

```
Press Control-C now to enter Aboot shell
^CAboot password:
incorrect password
Aboot password:
incorrect password
Aboot password:
incorrect password
incorrect password
Type "fullrecover" and press Enter to revert /mnt/flash to factory default
state, or just press Enter to reboot: fullrecover
All data on /mnt/flash will be erased; type "yes" and press Enter to proceed,
or just press Enter to cancel:
```

The **fullrecover** operation replaces the flash contents with a factory default configuration. The CLI displays text similar to the following when performing a **fullrecover**, finishing with another entry option in the Aboot shell.

**Note:** For hardware purchased after June 2017, the factory default partition will not have the backup EOS software image. It increases the flash size on smaller flash size disks, and other options are available in the **fullrecover** command functionality to restore the factory default EOS image applicable to both fixed system and modular system hardware.

```
Erasing /mnt/flash

startup-config
EOS.swi
210770 blocks
Restarting system.

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

### 2.5.3 Aboot File Structure

When you enter the Aboot CLI, the current working directory is the root directory on the switch. Switch image and configuration files are at **/mnt/flash**. When exiting the Aboot shell, only **/mnt/flash** preserves the contents. The **/mnt** directory contains the file systems of storage devices. Aboot mounts the internal flash device at **/mnt/flash**.

When you insert a USB flash drive in one of the flash ports, Aboot mounts its file system on **/mnt/usb1**. The file system is unmounted when you remove the USB flash drive from the port. Most USB drives contain an LED that flashes when the system is accessing it; wait to remove the drive from the flash port until the LED stops flashing.

## 2.5.4 Booting From the Aboot Shell

Aboot boots the EOS software image (with the extension .swi), which is available in **boot-config** automatically if you take no action during the boot process. Suppose the boot process fails for any reason, such as an incorrectly configured software image. In that case, Aboot enters the shell, allowing you to manually correct the configuration or boot a software image. The **boot** command loads and boots an EOS software image file.

The **boot** command syntax is

**boot SWI**

where **SWI** lists the location of the EOS image that the command loads. **SWI** options include:

- **device:path** loads the image file from the specified storage device. The default **device** value is **flash**; other values include **file** and **usb1**.
- **/PATH** loads the image file from the specified path in the switch directory.
- **http://server/path** loads the image file from the HTTP server on the host server.
- **ftp://server/path** loads the image file from the FTP server on the host server.
- **tftp://server/path** loads the image file from the TFTP server on the host server.
- **nfs://server/path** mounts the path's parent directory from the host server and loads the image file from the loaded directory.

It accepts the same commands as the **SWI** variable in the **boot-config** file. See [boot-config Command Line Content](#) for a list of boot command formats.

Suppose the **boot-config** does not have a specified image or booting the image results in an error condition (for example, an incorrect path or unavailable HTTP server). In that case, Aboot halts the boot process and drops into the shell.

### Example

To boot EOS.swi from internal flash, enter one of these commands on the Aboot command line:

```
boot flash:EOS.swi
```

```
boot /mnt/flash/EOS.swi
```

## 2.5.5 Aboot Commands

To list the contents of the internal flash, enter **ls /mnt/flash** at the Aboot# prompt.

### Example

```
Aboot# ls /mnt/flash
EOS.swi boot-config startup-config
```

Commonly used commands include:

- **ls** prints a list of the files in the current working directory.
- **cd** changes the current working directory.
- **cp** copies a file.
- **more** prints the contents of a file one page at a time.
- **vi** edits a text file.

- `boot` boots a software image file.
- `swiinfo` prints information about a software image.
- `recover` recovers the factory-default configuration.
- `reboot` reboots the switch.
- `udhcpc` configures a network interface automatically via DHCP.
- `ifconfig` prints or alters network interface settings.
- `wget` downloads a file from an HTTP or FTP server.
- `showtech` prints device hardware information.

Busybox, an open-source implementation of UNIX utilities, provides many Aboot shell commands. Busybox command help is available at <http://www.busybox.net/downloads/BusyBox.html>. Aboot provides access to only a subset of the documented commands.

Aboot can access networks through the Ethernet management ports. Aboot provides network interfaces mgmt1 and mgmt2 unconfigured by default; you can configure management port settings using Aboot shell commands like `ifconfig` and `udhcpc`. After configuring a management interface, use `wget` to transfer files from an HTTP or FTP server, `tftp` to transfer files from a TFTP server, or `mount` to mount an NFS filesystem.

## 2.6 Aboot Configuration Commands

This section describes the Aboot configuration commands that a *boot-config* file can contain.

- CONSOLESPEED
- NET commands

### Installation Commands (Aboot)

- install bios source
- PASSWORD (ABOOT)
- SWI

---

## 2.6.1 CONSOLESPEED

The **CONSOLESPEED** command in the **boot-config** file specifies the console baud rate when the switch is booted. The connected terminal must match the specified rate to communicate with the switch. Baud rate options include **1200**, **2400**, **4800**, **9600**, **19200**, **38400**, **57600**, and **115200**.

The default baud rate is **9600**.

### Command Syntax

`CONSOLESPEED=baud_rate`

### Parameters

*baud\_rate* specifies the console speed. Values include **1200**, **2400**, **4800**, **9600**, **19200**, **38400**, **57600**, and **115200**.

### Example

This command in a **boot-config** file sets the baud rate to 2400 when the switch boots.

```
CONSOLESPEED=2400
```

## 2.6.2 NET Commands

Aboot uses **NET** commands in the **boot-config** file during switch booting to configure the network interface used for switch configuration. You can enter these commands manually in Aboot.

**NETDEV** indicates the configured network interface. If **boot-config** does not contain a **NETDEV** command, the booting process does not attempt to configure a network interface. Other **NET** commands specify settings that Aboot uses to configure the interface.

### Command Syntax

```
NETDEV=device_interface
NETAUTO=auto_setting
NETIP=interface_address
NETMASK=interface_mask
NETGW=gateway_address
NETDOMAIN=domain_name
NETDNS=dns_address
```

### Parameters

- **device\_interface** the network interface. Options include:
  - **ma1** management **port 1**.
  - **ma2** management **port 2**.
- **auto\_setting** the configuration method. Options include:
  - **dhcp** interface is configured through a DHCP server; other NET commands are not.
  - If the **NETAUTO** command is omitted, the interface configures with other NET commands.
- **interface\_address** interface IP address, in dotted-decimal notation.
- **interface\_mask** interface subnet mask, in dotted-decimal notation.
- **gateway\_address** default gateway IP address, in dotted decimal notation.
- **domain\_name** interface domain name.
- **dns\_address** IP address of the Domain Name Server, in dotted decimal notation.

### Examples

- This command specifies management **port 1** as the network interface configured for management traffic.

```
NETDEV=ma1
```

- This command instructs the switch to configure the network interface through a DHCP server, ignoring other **NET** commands.

```
NETAUTO=dhcp
```

- These **NET** commands configure the network interface.

```
NETIP=10.12.15.10
NETMASK=255.255.255.0
NETGW=10.12.15.24
NETDOMAIN=mycompany.com
NETDNS=10.12.15.13
```

### 2.6.3 install bios source

`install bios source` command is used to install an Aboot Update File (AUF) to upgrade Aboot firmware. `install bios source` indicates the location of the source file and the actions taken.

#### Command Syntax

```
install bios source SOURCE [active | standby] [reload | now]
```

#### Parameters

**SOURCE** the file location.

#### Examples

- This command installs an AUF file `update.auf` stored in `/mnt/flash`.

```
switch# install bios source flash:/update.auf
```

**Note:** Follow the prompts after executing the command during the installation process.

- This command performs a reboot directly after installation.

```
switch# install bios source flash:/update.auf reload
```

- This command skips the prompts and performs the reboot automatically after installation.

```
switch# install bios source flash:/update.auf now
```

- This command performs the installation only on the standby supervisor.

```
switch# install bios source flash:/update.auf standby
```

**Note:** By default, the active supervisor gets upgraded, followed by the standby where applicable.

## 2.6.4 PASSWORD (ABOOT)

PASSWORD specifies the Aboot password, as described in [Accessing the Aboot Shell](#). The Aboot shell does not require a password when **boot-config** does not contain a **PASSWORD** command.

The **boot-config** file stores the password as an MD5-encrypted string generated from a clear-text seed by the UNIX password program or the crypt library function. When entering the Aboot password, the user types the clear-text seed.

There is no method of recovering the password from the encrypted string. If the clear-text password is lost, delete the corresponding **PASSWORD** command line from the **boot-config** file.

**Note:**  
 The EOS **boot secret** command adds or modifies the **PASSWORD** configuration line.

### Command Syntax

**PASSWORD = *encrypted\_string***

### Parameters

***encrypted\_string***, the encrypted string that corresponds to the clear-text Aboot password.

### Example

This line is a **PASSWORD** command example in which the encrypted string corresponds to the clear-text password **abcde**.

```
PASSWORD=1CdWp5wfe$pzNtE3ujBoFEL8vjcq7jo/
```

---

## 2.6.5 SWI

SWI specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as **boot-config** to designate a local or network path.

### Command Syntax

**SWI = SWI\_PATH**

### Parameters

**SWI\_PATH** specifies the location of the EOS image file. Options include:

- **file\_path** specifies a file location on the internal flash drive.
- **file:file\_path** specifies a file location in the switch directory.
- **usb1:file\_path** specifies a file location on the USB drive.
- **http:file\_path** specifies an HTTP path to the image file.
- **ftp:file\_path** specifies an FTP path to the image file.
- **tftp:file\_path** specifies a TFTP path to the image file.
- **nfs:file\_path** specifies an NFS path to the image file.

### Examples

- This SWI command in **boot-config** causes Aboot to boot the switch from the file **EOS.swi** on the switch's internal flash drive.

```
SWI=flash:EOS.swi
```

- This SWI command in **boot-config** causes Aboot to boot the switch from the file **EOS.swi** at the specified location on foo.com.

```
SWI=http://foo.com/images/EOS.swi
```

---

## 2.7 Switch Booting Commands

- [boot console](#)
- [boot secret](#)
- [boot system](#)
- [delete startup-config](#)
- [protocol](#)
- [redundancy](#)
- [redundancy manual switchover](#)
- [reload](#)
- [reload \(scheduled\)](#)
- [show platform bios](#)
- [show redundancy file-replication](#)
- [show redundancy status](#)
- [show redundancy switchover sso](#)
- [show reload](#)
- [show reload cause](#)
- [show reload fast-boot](#)

## 2.7.1 boot console

The **boot console** command configures terminal settings for serial devices connecting to the console port. The only console setting specified from **boot-config** is **speed**.

The factory-default console settings are **9600** baud, no parity, **8** character bits, and **1** stop bit. If you do not know the current settings, restore the factory default settings described in [Restoring the Factory Default EOS Image and Startup Configuration](#).

The **no boot console** and **default boot console** commands restore the factory default settings on the switch and remove the corresponding **CONSOLESPEED** command from the **boot-config** file.

### Command Mode

Global Configuration

### Command Syntax

```
boot console speed baud_rate
```

### Parameters

**baud\_rate** console baud rate. Options include **1200**, **2400**, **4800**, **9600**, **19200**, **38400**, **57600**, and **115200**.

### Examples

- This command sets the console speed to **57600** baud.

```
switch(config)# boot console speed 57600
switch(config)#{
```

- This command displays the result of the console speed change.

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: 57600
Aboot password (encrypted): (not set)
switch(config)#{
```

- The above **boot console** command adds the following line to **boot-config**.

```
CONSOLESPEED=57600
```

## 2.7.2 boot secret

The **boot secret** command creates or edits the Aboot shell password and stores the encrypted string in the **PASSWORD** command line of the **boot-config** file.

The **no boot secret** and **default boot secret** commands remove the Aboot password from the **boot-config** file. When the Aboot password does not exist, no password is required to enter the Aboot shell.

### Command Mode

Global Configuration

### Command Syntax

```
boot secret [ENCRYPT_TYPE] password
```

```
no boot secret
```

```
default boot secret
```

### Parameters

- **ENCRYPT\_TYPE** indicates the encryption level of the password parameter. Settings include:
  - **no parameter** and the password is clear text.
  - **0** the password is clear text. Equivalent to the **no parameter** case.
  - **5** the password is an MD5-encrypted string.
  - **sha512**, the password is entered as a **sha512** encrypted string.
- **password** specifies the boot password.
  - **password** must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - **password** must be an appropriately encrypted string if **ENCRYPT\_TYPE** specifies encryption.

### Restrictions

The **sha512** encryption option is not available on Trident platform switches.

### Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)# boot secret xr19v
switch(config)#

```

```
switch(config)# boot secret 0 xr19v
switch(config)#

```

This command displays the result:

```
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): 1k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
switch(config)#

```

The **boot secret** commands earlier add this line to **boot-config**:

```
PASSWORD=1k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
```

The user must enter **xr19v** at the login prompt to access the Aboot shell.

- These commands set the Aboot password to **xr123** and display the resulting **boot-config** code. In the past, the encrypted string uses **xr123** as the clear-text seed.

```
switch(config)# boot secret 5 1QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)# show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): 1QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#

```

The **boot secret** command above adds this line to **boot-config**:

```
PASSWORD=1QfbYkVWb$PIXG0udEquW0wOSiZBN3D/

```

The user must enter **xr123** at the login prompt to access the Aboot shell.

- This command removes the Aboot password, allowing access to the Aboot shell without a password.

```
switch(config)# no boot secret
switch(config)#

```

## 2.7.3 boot system

The **boot system** command specifies the location of the EOS software image that Aboot loads when the switch boots. The command can refer to files on Flash or a module in the USB flash port.

### Command Mode

Global Configuration

### Command Syntax

```
boot system DEVICE file_path
```

### Parameters

- **DEVICE** location of the image file. Options include:
  - **file**: file is located in the switch file directory.
  - **flash**: file is located in flash memory.
  - **usb1**: file is located on a drive inserted in the USB flash port. Available if a drive is in the port.
  - **file\_path** path and name of the file.

### Examples

- This command designates **EOS1.swi**, on USB flash memory, as the EOS software image load file.

```
switch(config)# boot system usb1:EOS1.swi
switch(config)#
```

The **boot system** command earlier adds this line to **boot-config**.

```
SWI=usb1:/EOS1.swi
```

- This command designates **EOS1.swi**, on the switch flash, as the EOS software image load file.

```
switch(config)# boot system flash:EOS.swi
switch(config)#
```

The **boot system** command earlier adds this line to **boot-config**:

```
s
```

## 2.7.4 delete startup-config

The `delete startup-config` command erases or deletes the ***startup-config*** file.

### Command Mode

Privileged EXEC

### Command Syntax

```
delete startup-config [CONFIRMATION]
```

### Parameters

**CONFIRMATION** confirmation for immediate erasure. Options include:

- **no parameter** the switch requires a confirmation before starting the erasure.
- **now** the erasure begins immediately without prompting the user to confirm the request.

### Examples

- This command deletes the startup configuration from the switch. When the `delete startup-config` command is entered, the switch sends a message prompting the user to confirm the request.

```
switch# delete startup-config
Proceed with erasing startup configuration? [confirm] y
switch#
```

- This command deletes the startup configuration from the switch immediately without prompting.

```
switch# delete startup-config now
switch#
```

## 2.7.5 protocol

The **protocol** command configures how the supervisors on a modular switch will handle switchover events. By default, the switch is set to **route processor redundancy (RPR)**, which synchronizes **startup-config** files between the supervisor modules and partially boots the standby supervisor. You can set the mode to **simplex** (manual switchover only) or to **stateful switchover (SSO)**, which synchronizes both **startup-config** and **running-config** files between the supervisor modules, fully boots the standby module to speed the switchover process, and minimizes packet loss. SSO synchronizes the L2 state between the supervisors, but the L3 state is not synchronized. This can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

The **no protocol** and **default protocol** commands set the redundancy protocol to the default value (**rpr**) by removing the **protocol** command from **running-config**.

### Command Mode

Redundancy Configuration

### Command Syntax

```
protocol {rpr | simplex | sso}
no protocol
default protocol
```

### Parameters

- **rpr** route processor redundancy protocol (RPR, the default).
- **simplex** no redundancy. Switchover must be initiated manually.
- **sso** stateful switchover (SSO).

### Related Commands

[redundancy](#) places switch in redundancy configuration mode.

### Example

These commands enter redundancy configuration mode and set the redundancy protocol to SSO.

```
switch(config)# redundancy
switch(config-redundancy)# protocol sso
switch(config-redundancy) #
```

## 2.7.6 redundancy

The **redundancy** command places the switch in redundancy configuration mode.

### Command Mode

Global Configuration

### Command Syntax

```
redundancy
```

### Commands Available in Redundancy Configuration Mode

[protocol](#)

### Related Commands

[redundancy manual switchover](#) manually initiates a switchover.

### Example

These commands enter redundancy configuration mode and set the redundancy protocol to stateful switchover.

```
switch(config)# redundancy
switch(config-redundancy)# protocol sso
switch(config-redundancy) #
```

---

## 2.7.7 redundancy manual switchover

The **redundancy manual switchover** command immediately switches control of the switch to the standby supervisor. If the redundancy mode is set to simplex or the standby supervisor is unavailable for any other reason, this command will not function.

### Command Mode

Privileged EXEC

### Command Syntax

```
redundancy manual switchover
```

### Related Command

[redundancy](#) places the switch in redundancy configuration mode.

### Example

This command forces a switchover to the standby supervisor. The switchover is executed immediately without further confirmation from the user.

```
switch# redundancy manual switchover
This supervisor will be restarted.
switch#
```

## 2.7.8 reload

The **reload** command power cycles the switch and resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

**Note:** The **reload fast-boot** and **reload hitless** commands initiate Smart System Upgrade (SSU); for a description of this feature and the appropriate command syntax, refer to the [Smart System Upgrade \(Leaf SSU\)](#) section.

The command behaves differently in fixed and modular systems.

- **Fixed 1-RU systems:** the power supply remains powered up through the reset. All other switch components lose power for two to five seconds.
- **Modular systems:** the power supply on the active supervisor remains powered up through the reset. All other supervisor components lose power for at least one second. After the supervisor becomes functional, it manages the power-cycling of all line cards.

### Command Mode

Privileged EXEC

### Command Syntax

**reload [TARGET] [CONFIRMATION]**

### Parameters

- **TARGET** specifies which supervisor(s) to reset. Some options are available only on dual-supervisor switches. Options include:
  - **no parameter** the active supervisor is reset.
  - **all** supervisors are reset.
  - **peer** the peer supervisor is reset.
  - **power** the active supervisor is reset.
- **CONFIRMATION** confirmation for immediate reset. Options include:
  - **no parameter** the switch requires a confirmation before starting the reset.
  - **now** the reset begins immediately without prompting the user to confirm the request.

### Related Commands

- [reload \(scheduled\)](#) schedules a pending reload operation.
- [show reload cause](#) displays cause of most recent reload.

### Examples

- Begin the reboot process by typing the **reload** command:

```
switch# reload
switch#
```

- When the **reload** command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request. In this example, the user does not save modifications to the system before reloading.

```
System configuration has been modified. Save? [yes/no/cancel/diff]:n
Proceed with reload? [confirm]y
```

- 
- The switch responds by broadcasting messages, including a notification about the system rebooted to all open CLI instances. The reload pauses to provide an option for the user to enter Aboot shell; the Aboot shell supports commands that restore the state of the internal flash to factory defaults or create a customized default state.

```
Broadcast message from root@mainStopping sshd: [OK]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

- No action is required to continue the reset process. The switch displays messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rootWelcome to Arista Networks EOS 4.4.0
Mounting filesystems: [OK]
Entering non-interactive startup
Starting EOS initialization stage 1: [OK]
ip6tables: Applying firewall rules: [OK]
iptables: Applying firewall rules: [OK]
iptables: Loading additional modules: nf_conntrack_tftp [OK]
Starting system logger: [OK]
Starting system message bus: [OK]
Starting NorCal initialization: [OK]
Starting EOS initialization stage 2: [OK]
Starting ProcMgr: [OK]
Completing EOS initialization: [OK]
Starting Power On Self Test (POST): [OK]
Generating SSH2 RSA host key: [OK]
Starting isshd: [OK]
Starting sshd: [OK]
Starting xinetd: [OK]
[OK] crond: [OK]

switch login:
```

## 2.7.9 reload (scheduled)

The **reload (scheduled)** command configures the switch to reset at a specified time or after a specified interval. Refer to [reload](#) for the functional details of the reset operation.

The switch prompts to save the configuration and confirm the reload request. Once the request is confirmed, the switch resumes normal operation until the reload initiates.

The **reload cancel**, **no reload**, and **default reload** commands cancel the pending reload operation.

### Command Mode

Privileged EXEC

### Command Syntax

```
reload [all | power | peer] {at hh:mm [month | day] | in hh:mm} [force | reason]
reload cancel
no reload
default reload
```

### Parameters

- **All** reloads all supervisors.
- **Power** resets the active supervisor.
- **Peer** resets the peer supervisor.
- **At** performs reload at specified times.
  - **hh:mm** specifies reload time in hours (0 to 23) and minutes (0 to 59). If no month and day are specified, reload occurs at the specified time on the day the command is issued.
    - **Month** optionally specifies the month of the year (Jan, Feb, etc.)
    - **Day** day of the month. Values range from **1** to **31**.
- **In** performs the reload after a specified delay.
  - **hh:mm** specifies delay before reload in hours (**0** to **23**) and minutes (**0** to **59**).
- **Force** performs action immediately without prompting.
- **Reason** enter text to display explaining the purpose of the reload.
- **Cancel** cancels any existing reload request.

### Related Commands

- [reload](#) initiates an immediate reload operation.
- [show reload](#) displays time and reason of any pending reload operation.

### Examples

- This command schedules a switch reset to begin in 12 hours.

```
switch# reload in 12:00
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 05:57:25 2012 (in 11 hours 59 minutes)
switch#
```

- This command cancels a scheduled reset.

```
switch# no reload
```

---

```
Scheduled reload has been cancelled switch#
```

- This command schedules a reload of the active supervisor to begin in 12 hours.

```
switch# reload power in 12:00
Reload scheduled for Thu Feb 13 18:56:01 2020 (in 11 hours 59 minutes)
switch#
```

## 2.7.10 show platform bios

The **show platform bios [history | detail]** command displays the BIOS versions on the switch.

### Command Mode

EXEC

### Command Syntax

```
show platform bios
```

### Examples

- This command displays the Running, Programmed, and Fallback versions of Aboot.

```
switch# show platform bios
FixedSystem BIOS versions
 Location Version

 Running Aboot-norcal9-9.0.5-13882759
 Programmed Aboot-norcal9-9.0.3-4core-13882759
 Fallback Aboot-norcal9-9.0.3-4core-13882759
switch#
```

- This command displays the BIOS installation history.

```
switch# show platform bios history
Supervisor-1 BIOS version history

 Timestamp Version

 2020-04-07 04:20:22 Aboot-norcal9-9.0.5-13882759
 2020-04-05 08:32:03 Aboot-norcal9-9.0.3-4core-13882759

Supervisor-2 BIOS version history

Last update failed on 2020-04-15: Compatibility check failed.

 Timestamp Version

 2020-04-05 08:32:09 Aboot-norcal9-9.0.5-13882759
switch#
```

- This command displays the BIOS installation history details.

```
switch# show platform bios history detail
Supervisor-1 BIOS version history

switch#
```

---

## 2.7.11 show redundancy file-replication

The **show redundancy file-replication** command displays the status and last synchronization date of file replication between the supervisors on the switch.

### Command Mode

EXEC

### Command Syntax

```
show redundancy file-replication
```

### Related Commands

- [show redundancy status](#) status and redundancy protocol of supervisors.
- [show redundancy switchover sso](#) displays stateful switchover information since last reload.

### Example

This command displays the supervisors' current file replication status.

```
switch# show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files total.

File Status Last Synchronized

file:persist/sys Synchronized 25 days, 19:48:26 ago
flash:startup-config Synchronized 25 days, 19:48:26 ago
switch#
```

## 2.7.12 show redundancy status

The **show redundancy status** command displays the current status (active or standby) and the configured redundancy protocol of both supervisors, and summary information about the latest switchover event.

### Command Mode

EXEC

### Command Syntax

```
show redundancy status
```

### Related Commands

- [show redundancy file-replication](#) displays status of file replication between supervisors.
- [show redundancy switchover sso](#) displays stateful switchover information since last reload.

### Example

This command displays redundancy information for both supervisors and a summary of the latest switchover.

```
switch# show redundancy status
 my state = ACTIVE
 peer state = STANDBY HOT
 Unit = Primary
 Unit ID = 1

Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
switchover completion timeout = 720.0 seconds (default)
Ready for switchover

 Last switchover time = 0:32:15 ago
Last switchover reason = Supervisor has control of the active supervisor lock switch#
```

---

## 2.7.13 show redundancy switchover sso

The **show redundancy switchover sso** command displays the number of stateful switchovers since the last reload and a log of the events in the latest stateful switchover.

### Command Mode

EXEC

### Command Syntax

```
show redundancy switchover sso
```

### Related Commands

- [show redundancy file-replication](#) displays status of file replication between supervisors.
- [show redundancy status](#) displays status and redundancy protocol of supervisors.

### Example

This command displays stateful switchover information.

```
switch# show redundancy switchover sso
Total number of Stateful Switchover completed since reload: 4

Latest Stateful Switchover occurred 29 days, 12:48:22 ago @ 2012-06-09 19:47:50
(completed)
 0.000000: switchover started
 0.000235: stage PCIEAcquired started
 0.000349: event PCIEAcquired:_dummyInternal1_ completed
 0.000394: event PCIEAcquired:PlxPcie-system started
 0.027738: event PCIEAcquired:PlxPcie-system completed

 0.079620: event DmaReady:ForwardingAgent completed
 0.079699: stage DmaReady is complete
 0.079781: stage TimeCriticalServices started
 0.079887: event TimeCriticalServices:_dummyInternal1_ completed
 0.079928: event TimeCriticalServices:Stp started
 0.208035: event TimeCriticalServices:Stp completed
 0.208120: stage TimeCriticalServices is complete
 <-----OUTPUT OMITTED FROM EXAMPLE----->
 39.675076: stage NonCriticalServices started
 39.675145: event NonCriticalServices:_dummyInternal1_ completed
 39.675183: stage NonCriticalServices is complete
 39.675399: switchover is complete switch#
```

## 2.7.14 show reload

The **show reload** command displays the time and reason for any pending reload operation. The **reload (scheduled)** command schedules a reload operation and can be used to cancel a pending reload.

### Command Mode

EXEC

### Command Syntax

```
show reload
```

### Related Commands

- **reload (scheduled)** schedules a pending reload operation.
- **show reload cause** displays cause of most recent reload.

### Example

These commands schedule a reload for 2:45 pm, display the time of the pending reload, and then cancel the scheduled reload.

```
switch# reload at 14:45
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 14:45:00 2012 (in 4 hours 11 minutes)
switch# show reload
Reload scheduled for Tue Mar 27 14:45:00 2012 (in 4 hours 11 minutes)
switch# reload cancel
Scheduled reload has been cancelled switch#
```

---

## 2.7.15 show reload cause

The `show reload cause` command displays the reason for the most recent reload operation. The command displays recommended actions and debug information related to the executed reload.

### Command Mode

EXEC

### Command Syntax

```
show reload cause
```

### Related Commands

- `reload` initiates an immediate reload operation.
- `show reload` displays time and reason of all pending reload operations.

### Example

This command displays the cause of the most recent reload operation.

```
switch# show reload cause
Reload Cause 1:

Reload requested by the user.

Recommended Action:

No action necessary.

Debugging Information:

None available.
switch#
```

## 2.7.16 show reload fast-boot

The `show reload fast-boot` command verifies that the switch configuration is valid for Smart System Upgrade (SSU).

### Command Mode

EXEC

### Command Syntax

```
show reload fast-boot
```

### Related Commands

- `reload` initiates an immediate reload operation.
- `show reload` displays time and reason of all pending reload operations.

### Example

This command displays why SSU cannot be initiated and which features must be reconfigured to allow SSU to proceed.

```
switch# show reload fast-boot
'reload fast-boot' cannot proceed due to the following:
 Spanning-tree portfast is not enabled for one or more ports
 Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

## Initial Configuration and Recovery

---

This chapter describes initial configuration and recovery tasks. Subsequent chapters provide details about features introduced in this chapter.

This chapter contains these sections:

- [Initial Switch Access](#)
- [Connection Management](#)
- [Securely Erasing a Switch Storage Device](#)
- [Configure Session](#)
- [Recovery Procedures](#)
- [Session Management Commands](#)

### 3.1 Initial Switch Access

Arista network switches provide two initial configuration methods:

- [Zero Touch Provisioning \(ZTP\)](#) configures the switch without user interaction.
- [Manual provisioning](#) configures the switch with commands entered by a user through the CLI.

#### 3.1.1 Zero Touch Provisioning

Zero Touch Provisioning (ZTP) configures a switch without user intervention by downloading a startup configuration file, **startup-config**, or a boot script from a location specified by a DHCP server. [Configuring the Network for ZTP](#) describes network tasks required to set up ZTP.

If the flash memory does not contain a **startup-config** or **zerotouch-config** file, the switch enters ZTP mode when it boots . It remains in ZTP mode until you cancel ZTP mode or until the switch retrieves a **startup-config** or a boot script. After downloading a file through ZTP, the switch reboots again, using the retrieved file.

#### Security Considerations

The ZTP process cannot distinguish an approved DHCP server from a rogue DHCP server. For secure provisioning, you must ensure that only approved DHCP servers can communicate with the switch until after completing the ZTP process. Arista also recommends validating the EOS image on your ZTP server by confirming that the MD5 checksum matches the MD5 checksum found on the [EOS download page](#) of the Arista website.

On a UNIX server, the **md5sum** command calculates this checksum:

```
% md5sum EOS.swi
3bac45b96bc820eb1d10c9ee33108a25 EOS.swi
```

Use this command from the CLI or within the Bash shell of a switch.

```
switch# bash md5sum /mnt/flash/EOS-4.18.0F.swi
```

```
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
switch#[admin@switch ~]$ md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
[admin@switch ~]$
```

To provision the switch through ZTP, use the following steps:

1. Mount the switch in a permanent location.
2. Connect at least one management or Ethernet port to a network that can access the DHCP server and the configuration file.
3. Provide power to the switch.

**Note:** ZTP does not initiate if flash memory contains either a **startup-config** or **zerotouch-config** file.

You can monitor the ZTP progress on the console port. The [Console Port](#) section provides information for setting up the console port. [Canceling Zero Touch Provisioning](#) provides information for monitoring ZTP progress and canceling ZTP mode.

### 3.1.2 Manual Provisioning

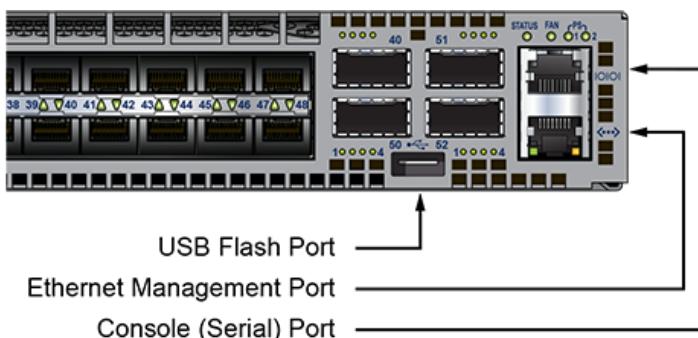

Initial manual switch provisioning requires the cancellation of ZTP mode, the assignment of an IP address to a network port, and the establishment of an IP route to a gateway. The serial console and Ethernet management ports perform the initial provisioning.

- Use the console port for serial access to the switch. These conditions may require serial access:
  - Management ports do not have assigned IP addresses.
  - The network is inoperable.
  - Unavailable password for the user's login.
  - The password to access the *enable* mode is not available.
- It uses the Ethernet management ports for out-of-band network management tasks. That port must have IP address before using a management port for the first time.

#### 3.1.2.1 Console Port

The console port is a serial port located on the front of the switch. The [Figure 3-1: Switch Ports](#) section displays the console port on the DCS-7050T-64 switch. Use a serial or RS-232 cable to connect to the console port. The accessory kit also includes an RJ-45 to DB-9 adapter cable connecting to the switch.

**Figure 3-1: Switch Ports**

## Port Settings

Use these settings when connecting the console port:

- 9600 baud
- no flow control
- 1 stop bit
- no parity bits
- 8 data bits

## Admin Username

The initial configuration provides one username, **admin**, without an assigned password. You can only log into the switch through the console port using the admin username without a password. After assigning a password to the **admin** username, log into the switch through any port.

The **username** command modifies a specified username and can be used to create or delete usernames, including **admin**.

## Example

This command assigns the password **pxq123** to the **admin** username:

```
switch(config) # username admin secret pxq123
switch(config) #
```

When the switch reboots, EOS loses the passwords unless the startup configuration saves the new or altered passwords.

**Note:** Access the Aboot shell through the console port to log into the switch after deleting usernames from the configuration.

### 3.1.2.2 Canceling Zero Touch Provisioning

Zero Touch Provisioning (ZTP) installs a **startup-config** file from a network location if flash memory does not contain a **startup-config** or **zerotouch-config** file when the switch reboots. Canceling ZTP is required if the switch cannot download a **startup-config** or boot script file.

When the switch boots without a **startup-config** or **zerotouch-config** file, EOS displays the following message through the console port:

```
No startup-config was found.

The device is in Zero Touch Provisioning mode and is attempting to
download the startup-config from a remote system. The device will not
be fully functional until a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is cancelled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.

localhost login:
```

To cancel ZTP mode, log into the switch with the **admin** password, then enter the **zerotouch cancel** command. The switch immediately boots without installing a **startup-config** file.

```
localhost login: admin
admin
localhost>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP
request on [Ethernet10, Ethernet13, Ethernet14, Ethernet17, Ethernet18,
```

```

Ethernet21, Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8,
Ethernet9, Management1, Management2]
Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-DHCP_QUERY_FAIL: Failed to get a
valid DHCP response
Apr 15 21:28:51 localhost ZeroTouch: %ZTP-5-RETRY: Retrying Zero Touch
Provisioning from the beginning (attempt 1)
Apr 15 21:29:22 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request on

Ethernet22, Ethernet23, Ethernet24, Ethernet7, Ethernet8, Ethernet9,
Management1, Management2]

localhost>zerotouch cancel
zerotouch cancel
localhost>Apr 15 21:29:39 localhost ZeroTouch: %ZTP-5-CANCEL: Canceling Zero
Touch Provisioning
Apr 15 21:29:39 localhost ZeroTouch: %ZTP-5-RELOAD: Rebooting the system
Broadcast messagStopping sshd: [OK]
watchdog is not running
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0
Press Control-C now to enter the Aboot shell

```

To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file described in [Step 8](#) of the [Ethernet Management Port](#).

### 3.1.2.3 Ethernet Management Port

Arista switches provide one or more Ethernet management ports for configuring the switch and managing the network out of the band. The [Figure 3-1: Switch Ports](#) section displays the location of the Ethernet management ports on a DCS-7050T-64 switch. Managing the switch requires only one port.

Access the Ethernet management port(s) remotely over a common network or locally through a connected PC. Before you can access the switch through a remote connection, the switch must have an IP address and a static route to the default gateway. Configure a virtual IP address on a modular switch with dual supervisors to access the management port on an active supervisor.

#### Assigning a Virtual IP Address to Access the Active Ethernet Management Port

This procedure assigns a virtual IP address on modular switches with dual supervisors, which connects to the Ethernet management port of the active supervisor. See the following section to assign a physical IP address to an Ethernet management port.

1. Connect a PC or terminal server to the console port. Use the settings listed in [Console Port](#) under [Port Settings](#).
2. Use the command **admin** at the login prompt to log into the switch. Initial login through the console port does not require a password.

```

Arista EOS
switch login: admin
Last login: Fri Apr 9 14:22:18 on Console switch>

```

3. Use the command **enable** at the command prompt to enter Privileged EXEC mode.

```

switch> enable
switch#

```

4. Use the command **configure terminal** or **config** to enter global configuration mode.

```

switch# configure terminal
switch(config)#

```

- 
5. Use the command **interface management 0** to enter interface configuration mode for the virtual interface that accesses management port 1 on the currently active supervisor.

```
switch(config)# interface management 0
switch(config-if-Ma0)#[/pre>
```

6. Use the command **ip address**, followed by the desired address, to assign a virtual IP address to access to the active management port. This command assigns IP address 10.0.2.5 to management port 0.

```
switch(config-if-Ma0)# ip address 10.0.2.5/24
```

7. Use the command **exit** at both the interface and global configuration prompts to return to **Privileged EXEC** mode.

```
switch(config-if-Ma0)# exit
switch(config)# exit
switch#
```

8. Use the command **write** (or **copy running-config startup-config**) to save the new configuration to the **startup-config** file.

```
switch# write
switch#
```

### Assigning an IP Address to a Specific Ethernet Management Port

Use the following steps to assign an IP address to a specific Ethernet management port:

1. Connect a PC or terminal server to the console port. Use the settings listed in [Console Port](#) under [Port Settings](#).
2. Use the command **admin** at the login prompt to log into the switch. The initial login does not require a password.

```
Arista EOS
switch login: admin
Last login: Fri Apr 9 14:22:18 on Console switch>
```

3. Use the command **enable** at the command prompt to enter Privileged EXEC mode.

```
switch> enable
switch#
```

4. Use the command **configure terminal** (or **config**) to enter Global Configuration Mode.

```
switch# configure terminal
```

5. Use the command **interface management 1** to enter Interface Configuration Mode. Use the available management port for management port 1.

```
switch(config)# interface management 1
switch(config-if-Ma1)#[/pre>
```

6. Use the command **ip address**, followed by the desired address, to assign an IP address to the port. This command assigns the IP address 10.0.2.8 to management port 1.

```
switch(config-if-Ma1)# ip address 10.0.2.8/24
```

7. Use the command **exit** at the Interface and Global Configuration Mode prompts to return to Privileged EXEC mode.

```
switch(config-if-Ma1)# exit
```

```
switch(config)# exit
switch#
```

8. Use the command **write** (or **copy running-config startup-config**) to save the new configuration to the **startup-config** file.

```
switch# write
switch#
```

### Configuring a Default Route to the Gateway

Use the following steps to configure a default route to a gateway located at 10.0.2.1.

1. Enter global configuration mode.

```
switch> enable
switch# configure terminal
```

2. Create a static route to the gateway with the IP route command.

```
switch(config)# ip route 0.0.0.0/0 10.0.2.1
```

3. Save the new configuration.

```
switch# write
switch#
```

## 3.2 Connection Management

The switch supports three connection methods:

- Console
- SSH
- Telnet

The switch always enables the console and SSH. By default, EOS disables Telnet.

**Management** commands place the switch in a configuration mode to change session connection parameters.

### Examples

- The **management console** command places the switch in Console Management Mode:

```
switch(config)#management console
switch(config-mgmt-console) #
```

- The **management ssh** command places the switch in SSH Management Mode:

```
switch(config)#management ssh
switch(config-mgmt-ssh) #
```

- The **management telnet** command places the switch in Telnet Management Mode:

```
switch(config)#management telnet
switch(config-mgmt-telnet) #
```

- The **exit** command returns the switch to global configuration mode:

```
switch(config-mgmt-ssh) #exit
```

```
switch(config) #
```

The `idle-timeout` commands shown in the following examples configure the idle timeout period for the configured connection type. The idle timeout defines the wait for a connection after a recent command before shutting down the connection. Setting the idle timeout to zero automatically disables the connection timeout, the default setting.

### Examples

- The [idle-timeout \(SSH Management\)](#) command configures an SSH idle-timeout period of three hours.

```
switch(config) # management ssh
switch(config-mgmt-ssh) # idle-timeout 180
```

- The [idle-timeout \(Telnet Management\)](#) command automatically disable the connection timeout for Telnet connections.

```
switch(config) # management telnet
switch(config-mgmt-telnet) # idle-timeout 0
```

The [shutdown \(Telnet Management\)](#) command turns the Telnet on and off on the switch.

- These commands enable Telnet.

```
switch(config) # management telnet
switch(config-mgmt-telnet) # no shutdown
```

- These commands disable Telnet.

```
switch(config) # management telnet
switch(config-mgmt-telnet) # shutdown
```

## 3.3

### Securely Erasing a Switch Storage Device

The Secure erase feature removes all data from the flash and optional SSD storage device(s) on an Arista switch. It securely erases the storage devices whose partitions mount to `/mnt/crash`, `/mnt/drive`, and `/mnt/flash` (as applicable), then repartitions these storage devices and re-creates the file systems for each of the partitions. In other words, the partition table of each storage device returns to the same partition table before the secure erase procedure and destroys the MBR. Each partition has the same file system type and partition label and mount to the same mount point with the same options. Boot the EOS again by installing a new boot-config file and and EOS SWI, then rebooting using Aboot or fullrecover.

All secure erasing is best effort. Use firmware-based secure erase when available and a software-based mechanism when the firmware mechanism might fail or be insufficient such as writing random data after sending an ATA Secure Erase command or does not exist. Unfortunately, no non-physically destructive mechanism can guarantee the destruction of all data on a storage device.

**Note:** Certain Arista switches have a dedicated storage device for serial console logging. The console output contains sensitive data, and the switch does not secure erasing this storage device. Locate platform support and usage information regarding serial console [here](#).

#### Preparing for Secure Erase

Always connect to the switch or supervisor through the serial console before executing the `reset system storage secure` command. Executing the command leaves the switch in Aboot since the Aboot shell is only available from the serial console. Access a switch through the serial port after executing this command. If a system has two supervisors, `standby` has the redundancy state of the erased supervisor.

## Performing Secure Erase

To securely erase the flash and optional SSD storage device(s) on supported platforms, use the `reset system storage secure` command.

### Examples

- The following commands check the redundancy status of the supervisor to be erased, then perform a switchover to change its status to `standby` preparatory to initiating the secure erase:

```
switch#show redundancy status
my state = active
peer state = standby switch#config
switch(config)#redundancy manual switchover
This supervisor is restarted.
```

- The following command securely erases data stored on the switch, excluding dedicated console logging storage:

```
switch#reset system storage secure
WARNING! This will destroy all
data and will NOT be recoverable.
Device will reboot into Aboot, and
execution may take up to one hour.
Would you like to proceed? [y/N] y
```

## 3.4 Configuration Sessions Overview

The `configure session` command creates a configuration session for CLI commands and ends it after issuing the `commit` command. Each `configure session` has a unique name. You can enter, modify, and exit the session anytime without impacting the currently running system configuration.

While in the commit stage of a session, the `running-config` command creates copies of the modified configuration of the session, overwriting any other configuration changes made since creating the session. A session can be aborted or removed, which removes the session completely and frees up memory used by the session. You must explicitly request the changes in a deferred session to the switch configuration by entering a `commit` command and exiting the mode. Alternatively, abandon the changes by entering an `abort` command. The switch discards an uncommitted configuration session if the switch reboots and the session times out after 24 hours.

Configuration sessions implement the changes after verifying that no configuration errors occur. Configuration sessions allow the administrator to pre-provision a group of CLI commands in a named session and execute each configuration session at specified times.

**Note:** Committing a configuration session replaces the `running-config` with the session configuration which includes the running configuration at the initial session and the commands entered as part of the session. Any changes made to `running-config` since the initiation of the session overwrite the session during the commit stage.

### 3.4.1 Configuration Session

The `configure session` command allows you to execute a series of configuration changes in a temporary location and commit them to `running-config` by issuing the `commit` command.

- **configure session <name of session>** and **running-config**: The user enters a session (versus **configure terminal** where configuration sessions are not used). It creates a system-named session if a session name is not specified, and it copies a snapshot of the current **running-config** into the session's data structure as the basis of further configuration changes.
- CLI configuration commands - The user can run any commands inside the session.
- **rollback clean-config** - The user can run the **rollback** command to revert the session configuration to the factory-default configuration (or clean configuration).
- **show session-config** - The user can run **show session-config** to show the session configuration, which will be the future **running-config** after committing.
- **commit** - Issues the **commit** command to commit the changes and replace the current **running-config**.
- **abort** - Abort the session and discard all changes.
- **exit** - **exit** from the session and return to the same session by running the **configure session** again.
- For a named session, more than one CLI instance can enter the same session and change the session configuration. After the session commits in any of the CLIs, no other CLI can commit or make any other changes in that session.

 **Note:** Committing a configuration session replaces **running-config** with the session configuration, which consists of the running configuration at the initial session and the commands entered as part of the session. Any changes made to **running-config** since the initiation of the session overwrite when the session is in the commit stage.

### 3.4.2 Replacing the Configuration

The command **configure replace URL** replaces the current **running-config** with the configuration saved in a **URL**. By default, the configuration in the **configure replace URL** replaces **running-config** only if the configuration in the URL loads without errors. The command **configure replace URL ignore-errors** force the operation even if there are errors.

 **Note:** The command **copy URL running-config** applies a saved configuration file to the system and appends that configuration to the current **running-config** instead of replacing it. However, Arista recommends using the command **configure replace URL** to streamline the process of restoring the system to a known good configuration.

The normal workflow uses a configuration session to perform the **configure replace**.

### 3.4.3 Configuration CLI

In the CLI, execute the following configuration steps to create a configuration session.

1. **configure session [name of session]**

Create or enter a session. If a name is not specified, it automatically generates. The user is in the session configuration mode, and the prompt will change to show the first six characters of the session name. Designating the name of a session is optional. When the *name of session* is not specified, a unique name is assigned.

```
no configure session name of session
```

Delete the specified configuration session. Designating the name of a session is required.

2. **commit**

Commit the changes made in the session. Configuration mode issues this command within the session.

```
abort
```

Abort the session, which is the same as deleting it. Configuration mode issues this command within the session.

**3. `rollback clean-config`**

Revert the configuration in the session to the clean, factory-default configuration. Configuration mode issues this command within the session.

**4. `service configuration session max completed number`**

Sets a limit on the maximum number of saved committed sessions.

**5. `service configuration session max pending number`**

Sets a limit on the maximum number of uncommitted sessions that can be outstanding.

## 3.5 Recovery Procedures

These sections describe the following switch recovery procedures:

- [Removing the Enable Password from the Startup Configuration](#)
- [Reverting the Switch to the Factory Default Startup Configuration](#)
- [Restoring the Factory Default EOS Image and Startup Configuration](#)
- [USB Support for ZeroTouch Provisioning](#)
- [Restoring the Configuration and Image from a USB Flash Drive](#)

The first three procedures require Aboot Shell access through the console port. If the console port becomes inaccessible, use the last procedure in the list to replace the configuration file through the USB Flash Drive.

The [Removing the Enable Password from the Startup Configuration](#) section describes the switch booting process and includes descriptions of the Aboot shell, Aboot boot loader, and required configuration files.

### 3.5.1

## Removing the Enable Password from the Startup Configuration

The `enable password` controls access to Privileged EXEC mode. The switch stores the `enable password` as an encrypted string generated from the clear-text password to prevent unauthorized disclosure. When using local switch authentication mode and a configured `enable password`, the CLI prompts to enter the clear-text password after entering the `enable` command at the EXEC prompt.

The `startup-config` file stores the encrypted `enable password` to ensure the switch loads it when rebooting. If the text version of the `enable password` is lost or forgotten, restore access to enable mode by removing the encrypted `enable password` from the startup configuration file.

**Note:** During the recovery process, the secondary supervisor must be physically removed from the system containing more than one supervisor. It ensures that the switch does not recover the previous configuration from the secondary supervisor upon reboot during the recovery process.

This procedure restores access to enable mode without changing any other configuration settings.

**1. Access the Aboot shell:**

- a. Power cycle the switch by successively removing and restoring access to its power source.
- b. Enter **Ctrl-C** when prompted early in the boot process.
- c. Enter the Aboot password if prompted. If you do not know the Aboot password, refer to [Restoring the Factory Default EOS Image and Startup Configuration](#) for instructions on reverting all flash directory contents to the factory default, including the startup configuration and EOS image.

**2. Change the active directory to the `/mnt/flash` directory.**

```
Aboot# cd /mnt/flash
```

- 
3. Open the startup-config file using VI or emacs.

```
Aboot# vi startup-config
```

4. Remove the enable password line.

```
enable password 5 1dBXo2KpF$Pd4XYLpI0ap1zaU7g1G1w/
```

5. Save the changes and exit vi.

6. Exit Aboot. The switch reboots.

```
Aboot# exit
```

### 3.5.2

## Reverting the Switch to the Factory Default Startup Configuration

The **startup-config** file contains configuration parameters that the switch uses during a boot. Parameters that do not appear in the **startup-config** set to factory defaults when the switch reloads. The process requires the Aboot password if Aboot is password protected.

This procedure reverts EOS configuration settings to default by bypassing the **startup-config** file during a switch boot.

1. Access the Aboot shell through the console port:

- a. Enter **reload** at the Privileged EXEC prompt.
- b. Enter **Ctrl-C** when prompted early in the boot process.
- c. Enter the Aboot password if prompted. If you do not know the Aboot password, refer to [Restoring the Factory Default EOS Image and Startup Configuration](#) for instructions on reverting all flash directory contents to the factory default, including **startup-config** and EOS image.

2. Change the active directory to the **/mnt/flash** directory.

```
Aboot# cd /mnt/flash
```

3. Rename the startup configuration file.

```
Aboot# mv startup-config startup-config.old
```

4. Exit Aboot. This boots the switch.

```
Aboot# exit
```

5. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions.

For non-canceled ZTP, the switch performs one of the following actions:

- Boots using the **startup-config** file or boot script that it obtains from the network, or
- Remains in ZTP mode if the switch cannot download a **startup-config** file or boot script.

6. Configure the **admin** and **enable** passwords.

```
switch> enable
switch# configure terminal
switch(config)# enable password xyz1
switch(config)# username admin secret abc41
```

7. Save the new **running-config** to the startup configuration file.

```
switch# write
```

8. (Optional) Delete the old startup configuration file.

```
switch# delete startup-config.old
```

After canceling ZTP, the switch reboots using the factory default settings and to avoid entering ZTP mode on subsequent reboots, create a **startup-config** file before the next switch reboot.

### 3.5.3 Restoring the Factory Default EOS Image and Startup Configuration

A **fullrecover** command removes all internal flash contents including configuration files, EOS image files, and user files, and then restores the factory default EOS image and **startup-config**. When the default image becomes outdated, the switch requires a subsequent installation of the current EOS image. This process requires Aboot shell access through the console port.

**Note:** For hardware available after June 2017, the factory default partition does not contain the backup EOS software image. It increases the flash size on smaller flash disks. Other options are available in the **fullrecover** command functionality to restore the factory default EOS image. It applies to both fixed system and modular system hardware.

This procedure restores the factory default EOS image and startup configuration.

1. Access the Aboot shell through the console port:
    - a. Enter **reload** at the Privileged EXEC prompt.
    - b. Enter **Ctrl-C** when prompted early in the boot process.
    - c. Enter the Aboot password if prompted. If you do not know the Aboot password, enter an empty password three times, after which the CLI displays:
- ```
Type "fullrecover" and press Enter to revert /mnt/flash to factory default state, or just
press Enter to reboot:
```
- d. Type **fullrecover** and go to 4.
2. Enter **fullrecover** at the Aboot prompt.

```
Aboot#fullrecover
```

Aboot displays this warning:

```
All data on /mnt/flash will be erased; type "yes" and press Enter to proceed, or just press
Enter to cancel:
```

3. Enter **yes** and press the **Enter** key.

The switch performs one of the following actions:

- Erases the contents of **/mnt/flash**.
- Writes new boot-config, startup-config, and EOS.swi files to **/mnt/flash**.
- Returns to the Aboot prompt.

4. Exit Aboot. The switch reboots.

```
Aboot#exit
```

The serial console settings restore to their default values (9600/N/8/1/N).

5. Reconfigure the console port if you require non-default settings.
6. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions.

If you do not cancel ZTP, the switch does one of the following:

- Boots, using the **startup-config** file or boot script that it obtains from the network or
- Remains in ZTP mode if the switch cannot download a **startup-config** file or boot script.

When you cancel ZTP, the switch reboots using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file before the next switch reboot.

3.5.4 USB Support for ZeroTouch Provisioning

Use [Arista's Zero Touch Provisioning](#) to configure a switch without user intervention. The USB adds another way to provide the bootstrap name and verify the authenticity of the file server.

3.5.4.1 USB Deployment

When using a USB drive during ZTP, configure the following features:

1. Specify the location of the bootstrap file instead of using DHCP Option 67.
2. Provide the **x509** root of trust for verifying the bootstrap download location.
3. Provide the enrollment token for CloudVision Service customers.

3.5.4.2 Configuration

Plug in a USB flash drive containing a *yaml configuration* file into the Arista EOS switch before powering it on.

The configuration (`<USB-ROOT>/ztp/ztpConfig.yaml`) should look like this:

```
"bootstrapUrl"  
"serverCaCertificate"  
"enrollmentToken"  
"version": "1.0"
```

bootstrapUrl - The URL for bootstrap file, such as `https://cvp/config.py`.

```
"bootstrapUrl"
```

serverCaCertificate - The path for the **x509** root of trust on the remote file server on the USB, such as `"ca.crt"`.

```
"serverCaCertificate"
```

enrollmentToken - The path for the enrollment token on the USB, such as `"token.tok"`

```
"enrollmentToken"
```

All ZTP related files, **serverCaCertificate** and **enrollmentToken**, should be present in (`<USB-ROOT>/ztp/*`), and the location specified in the ztpConfiguration **yaml** **w.r.t** to this folder.

```
"version": "1.0"
```

All the fields are optional. The following example displays a valid configuration. It performs as if no USB in place.

```
"bootstrapUrl"  
"serverCaCertificate"  
"enrollmentToken"  
"version": "1.0"
```

- The following is a sample of the configuration. Use the following structure for the USB drive:
- USB Drive Root
 - `ca.crt`
 - `token.tok`

```
"bootstrapUrl"  
"serverCaCertificate"  
"enrollmentToken"
```

```
"version": "1.0"
```

3.5.4.3 Advantages of USB ZTP

- DHCP Server no longer need to configure Option 67.
- The boot script location can now undergo additional checks, such as validating the endpoint before downloading and running the boot script.
- If you want to enroll your devices with the CloudVision Service can do so easily.

3.5.5 Restoring the Configuration and Image from a USB Flash Drive

The USB flash drive port restores an original configuration when you cannot establish a connection to the console port. This process removes the contents of the internal flash drive, restores the factory default configuration, and installs a new EOS image from the USB flash drive.

This procedure restores the factory default configuration and installs an EOS image stored on a USB flash drive.

1. Prepare the USB flash drive:

- a. Verify the drive has a MS-DOS or FAT file system format. Most USB drives ship with a pre-formatted with a compatible file system.
- b. Create a text file named **fullrecover** on the USB flash drive. The filename does not have an extension. The file may be empty.
- c. Create a text file named **boot-config**. The last modified timestamp of the **boot-config** file on the USB flash must differ from the timestamp of the **boot-config** file on the switch.
- d. Enter this line in the new **boot-config** file on the USB flash:

```
SWI=flash:EOS.swi
```

- e. Copy an EOS image file to the flash drive. Rename it **EOS.swi** if it has a different file name. For best results, the flash drive should contain only these three files because the procedure copies all files and directories on the USB flash drive to the switch.
 - fullrecover
 - boot-config
 - EOS.swi

2. Insert the USB flash drive into the USB flash port on the switch, as shown in [Figure 3-1: Switch Ports](#).
3. Connect a terminal to the console port and configure it with the default terminal settings (9600/N/8/1) to monitor progress messages on the console.
4. Power up or [reload](#) the switch.

The switch erases internal flash contents and copies the files from the USB flash drive to internal flash. The switch then boots automatically.

5. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions.

If ZTP is not canceled, the switch either:

- Boots, using the startup-config file or boot script that it obtains from the network or
- Remains in ZTP mode if the switch cannot download a **startup-config** file or boot script.

After canceling ZTP, the switch reboots using the factory default settings to avoid entering ZTP mode on subsequent reboots and creates a **startup-config** file before the next switch reboot.

3.6 Session Management Commands

Global Configuration Commands

- commit timer
- configure replace
- configure session
- management api eos-sdk-rpc
- management api external-services
- management api gnmi
- management api gnsi
- management api gribi
- management api http-commands
- management api models
- management api netconf
- management api restconf
- management console
- management ssh
- management telnet
- management xmpp
- reset system storage secure

Management Configuration Commands

- domain (XMPP Management)
- idle-timeout (Console Management)
- idle-timeout (SSH Management)
- idle-timeout (Telnet Management)
- protocol http (API Management)
- protocol https (API Management)
- protocol https certificate (API Management)
- server (XMPP Management)
- session privilege (XMPP Management)
- shutdown (API Management)
- shutdown (Telnet Management)
- shutdown (XMPP Management)
- switch-group (XMPP Management)
- username (XMPP Management)
- vrf (API Management)
- vrf (XMPP Management)
- xmpp send
- xmpp session

Display Commands

- show inventory
- show xmpp neighbors
- show xmpp status
- show xmpp switch-group

3.6.1 commit timer

The **commit timer** command can automatically roll back changes performed during a configuration session if you haven't confirmed them within a preset time interval. This feature can prevent a user from committing configuration changes that could cause a network disruption. The **no commit timer** command deletes the session.

Command Mode

Configure Session Configuration Mode

Command Syntax

commit timer *hh:mm:ss*

Parameters

hh:mm:ss - Specify the time interval for the commit session.

Example

Use the following command to create a commit timer for *01:00:00* hour:

```
switch(config-s-MySession)# commit timer 01:00:00  
switch#
```

3.6.2 configure replace

The **configure replace** command replaces the current configuration with a new configuration from the specified source.

Command Mode

Privileged EXEC

Command Syntax

```
configure replace source_file_path:source_file_name [ignore-errors] [md5 md5sum] [skip-checkpoint] [vrf instance_name]
```

Parameters

- **source_file_path:source_file_name** replaces the current configuration with the configuration from the specified source file.
- **boot-extensions**: - Replace the current configuration with the boot extensions configuration.
- **certificate**: - Replace the current configuration with the certificate configuration.
- **checkpoint**: - Replace the current configuration with the checkpoint configuration.
- **clean-config**: - Replace the current configuration with a clean, default configuration.
- **extension**: - Replace the current extensions configuration with an extensions configuration.
- **file**: - Replace the current configuration with a configuration from a file location.
- **flash**: - Replace the current configuration with a configuration from a flash location.
- **ftp**: - Replace the current configuration with a configuration from a FTP location.
- **http**: - Replace the current configuration with a configuration from an HTTP location.
- **https**: - Replace the current configuration with a configuration from an HTTPS location.
- **installed-extensions**: - Replace the current configuration with the installed extensions status.
- **running-config**: - Replaces the current configuration with the running configuration.
- **scp**: - Replace the current configuration with a configuration from an SCP location.
- **sftp**: - Replace the current configuration with a configuration from an SFTP location.
- **snapshot**: - Replace the current configuration with a configuration from a snapshot.
- **ssh-auth-principals-cmd**: - Retrieve a configuration from an SSH location and replace the current configuration.
- **ssh-ca-key**: - Retrieve a configuration from an SSH location and replace the current configuration.
- **ssh-key**: - Retrieve a configuration from an SSH location and replace the current configuration.
- **ssh-revoke-list**: - Retrieve a configuration from an SSH location and replace the current configuration.
- **startup-config**: - Replace the current configuration with the startup configuration.
- **system**: - Retrieve a configuration from a system location and replace the current configuration.
- **terminal**: - Retrieve a configuration from a terminal location and replace the current configuration.
- **tftpt**: - Retrieve a configuration from a TFTP location and replace the current configuration.
- **ignore-errors** - Replace the configuration and ignore errors while loading the new configuration.
- **md5 md5sum** - Performs a checksum to validate data integrity with the specified MD5 hashing algorithm.
- **skip-checkpoint** - Skips creating the checkpoint file of **running-config**.

Example

This command replaces the current configuration state with the startup configuration.

```
switch(config)# configure replace start-config
! Preserving static routes. Use 'no ip routing delete-static-routes' to clear them.
switch#
```

3.6.3 configure session

The `configure session` command allows a series of temporary configuration changes and commits to ***running-config*** later by issuing the `commit` command. EOS discards an uncommitted configuration session if the switch reboots and times out after 24 hours.

Note: Committing a configuration session replaces ***running-config*** with the session configuration, which consists of the running configuration at the initial session and the commands entered as part of the session. When the session commits, it overwrites any changes to ***running-config*** since the initiation.

The `no configure session session_name` and `default configure session session_name` commands delete the specified configuration session.

Command Mode

Privileged EXEC

Command Syntax

```
configure session [session_name] [abort | commit | [description description]]  
no configure session session_name  
default configure session
```

Parameter

- **session_name** - Create a name for the configuration session.
- **abort** - Ends the configuration sessions and deletes it.
- **commit** - Commits the changes executed during the session.
- **description description** - Create a description for the configuration session.

Guidelines

- Creates a session with a name generated by the switch if you do not specify a session name.
- The switch permits up to five uncommitted sessions.
- When the switch reboots, it discards the uncommitted sessions.
- Uncommitted sessions time out after 24 hours.

Example

This command creates a session named ***MySession*** and adds commands. Issuing the `commit` command executes all commands and overwrites any configuration performed since the creation of the session.

```
switch(config)#configure session  
switch(config-s-sess-1)#aaa authentication dot1x default group radius  
switch(config-s-sess-1)#dot1x system-auth-control  
switch(config-s-sess-1)#commit  
switch(config-s-sess-1)#{
```

3.6.4 domain (XMPP Management)

The **domain** command configures the switch's XMPP domain name. The XMPP client accepts messages only when using a locally configured domain. It uses the switch's domain name if none is specified.

Management over XMPP is disabled by default. To enable it, you must provide the server's location, domain, username, and password for the switch.

Arista recommends configuring the XMPP domain before the username, because it provides shortcuts for the **switch-group** and **username** so you can configure it without the domain attached to it, for example, USERNAME, instead of USERNAME@DOMAIN.

The **no domain** and **default domain** commands delete the domain name by removing the **domain** command from *running-config*.

Command Mode

Management XMPP Configuration

Command Syntax

`domain string`

`no domain`

`default domain`

Parameter

string - Configures the domain name as a text string.

Examples

- This command configures *test.aristanetworks.com* as the switch's domain name.

```
switch(config)# management xmpp
test1(config-mgmt-xmpp)# server arista-xmpp
test1(config-mgmt-xmpp)# domain test.aristanetworks.com
test1(config-mgmt-xmpp)# username test1@test.aristanetworks.com password 0 arista
test1(config-mgmt-xmpp)# no shutdown
```

- This command removes the domain name from the XMPP configuration.

```
switch(config-mgmt-xmpp)# no domain
switch(config-mgmt-xmpp) #
```

3.6.5 idle-timeout (Console Management)

The **idle-timeout (Console Management)** command configures the idle-timeout period for console connection sessions. The idle timeout refers to the length of time that a connection waits after a user's most recent command before shutting down the connection. By default, setting the idle timeout to zero disables the connection timeout automatically.

The **no idle-timeout** and **default idle-timeout** commands disable the automatic connection timeout by removing the **idle-timeout** statement from **running-config**.

Command Mode

Management Console Configuration

Command Syntax

```
idle-timeout idle_period
no idle-timeout
default idle-timeout
```

Parameters

idle_period session idle-timeout length. Options include:

- **0** - Disables the automatic connection timeout.
- **1 to 86400** - Configures the automatic timeout period in minutes.

Examples

- These commands configure a console idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)# management console
switch(config-mgmt-console)# idle-timeout 180
switch(config-mgmt-console)# exit
switch(config)#

```

- These commands disable automatic connection timeout.

```
switch(config)# management console
switch(config-mgmt-console)# idle-timeout 0
switch(config-mgmt-console)#

```

3.6.6 idle-timeout (SSH Management)

The **idle-timeout (SSH Management)** command configures the idle-timeout period for SSH connection sessions. The idle timeout refers to the length of time that a connection waits after a user's most recent command before shutting down the connection. Setting the idle timeout to zero disables the connection timeout automatically.

The **no idle-timeout** and **default idle-timeout** commands disable the automatic connection timeout by removing the **idle-timeout** statement from **running-config**.

Command Mode

Management SSH Configuration

Command Syntax

```
idle-timeout idle_period  
no idle-timeout  
default idle-timeout
```

Parameters

idle_period session idle-timeout length. Options include the following:

- **0** - Disables the automatic connection timeout.
- **1 to 86400** - Configures the automatic timeout period in minutes.

Examples

- These commands configure an SSH idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)# management ssh  
switch(config-mgmt-ssh)# idle-timeout 180  
switch(config-mgmt-ssh)# exit  
switch(config)#{
```

- These commands disable automatic connection timeout.

```
switch(config)# management ssh  
switch(config-mgmt-ssh)# idle-timeout 0  
switch(config-mgmt-ssh)#{
```

3.6.7 idle-timeout (Telnet Management)

The **idle-timeout (Telnet Management)** command configures the idle-timeout period for Telnet connection sessions. The idle timeout refers to the length of time that a connection waits after a user's most recent command before shutting down the connection. Setting the idle timeout to zero disables the connection timeout automatically.

The **no idle-timeout** and **default idle-timeout** commands disable the automatic connection timeout by removing the **idle-timeout** statement from **running-config**.

Command Mode

Management Telnet

Command Syntax

```
idle-timeout idle_period
no idle-timeout
default idle-timeout
```

Parameters

idle_period session idle-timeout length. Options include:

- **0** - Disables the automatic connection timeout.
- **1 to 86400** - Configures the automatic timeout period in minutes.

Examples

- These commands configure a Telnet idle-timeout period of three hours, then return the switch to **global configuration mode**.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# idle-timeout 180
switch(config-mgmt-telnet)# exit
switch(config)#

```

- These commands disable automatic connection timeout.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# idle-timeout 0
switch(config-mgmt-telnet)#

```

3.6.8 management api eos-sdk-rpc

The **management api eos-sdk-rpc** command places the switch in EOS SDK RPC API management configuration mode.

The **no management api eos-sdk-rpc** and **default management api eos-sdk-rpc** commands delete the mgmt-api-eos-sdk-rpc configuration mode statements from ***running-config***.

EOS SDK RPC API management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the EOS SDK RPC API management configuration mode does not affect the ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api eos-sdk-rpc  
no management api eos-sdk-rpc  
default management api eos-sdk-rpc
```

Commands Available in EOS SDK RPC API Configuration Mode

- **transport (EOS SDK RPC API Management)**

Examples

- This command places the switch in EOS SDK RPC API management configuration mode.

```
switch(config)# management api eos-sdk-rpc  
switch(config-mgmt-api-eos-sdk-rpc) #
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-eos-sdk-rpc) # exit  
switch(config) #
```

3.6.9 management api external-services

The **management api external-services** command places the switch in External Services API configuration mode.

The **no management api external-services** and **default management api external-services** commands delete the mgmt-api-external-services configuration mode statements from ***running-config***.

External Services API configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the External Services API configuration mode does not affect the ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api external-services  
no management api external-services  
default management api external-services
```

Commands Available in Mgmt-API Configuration Mode

- **shutdown (External Services API Management)**
- **vrf (External Services API Management)**

Examples

- This command places the switch in External Services API Management configuration mode.

```
switch(config)# management api external-services  
switch(config-mgmt-api-external-services)#[/pre]
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-external-services)# exit  
switch(config)#[/pre]
```

3.6.10 management api gnmi

The `management api gnmi` command places the switch in GNMI API Management configuration mode.

The `no management api gnmi` and `default management api gnmi` commands delete the mgmt-api-gnmi configuration mode statements from *running-config*.

GNMI API Management configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting the GNMI API Management configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api gnmi  
no management api gnmi  
default management api gnmi
```

Commands Available in Mgmt-API Configuration Mode

- `operation (GNMI API Management)`
- `provider (GNMI API Management)`
- `transport (GNMI API Management)`

Examples

- This command places the switch in GNMI API Management configuration mode.

```
switch(config)# management api gnmi  
switch(config-mgmt-api-gnmi)#[/pre]
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gnmi)# exit  
switch(config)#[/pre]
```

3.6.11 management api gnsi

The **management api gnsi** command places the switch in GNSI API management configuration mode.

The **no management api gnsi** and **default management api gnsi** commands delete the mgmt-api-gnsi configuration mode statements from ***running-config***.

GNSI API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the GNSI API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api gnsi  
no management api gnsi  
default management api gnsi
```

Commands Available in GNSI API Management Configuration Mode

- **service** (GNSI API Management)
- **transport** (GNSI API Management)

Examples

- This command places the switch in GNSI API Management configuration mode.

```
switch(config)# management api gnsi  
switch(config-mgmt-api-gnsi)#[/pre]
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gnsi)# exit  
switch(config)#[/pre]
```

3.6.12 management api gribi

The `management api gribi` command places the switch in gRIBI API Management configuration mode.

The `no management api gribi` and `default management api gribi` commands delete the mgmt-api-gribi configuration mode statements from *running-config*.

gRIBI API Management configuration mode is not a group change mode; *running-config* changes immediately upon entering commands. Exiting the gRIBI API Management configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api gribi  
no management api gribi  
default management api gribi
```

Commands Available in gRIBI API Management Configuration Mode

- `transport` (gRIBI API Management)

Examples

- This command places the switch in gRIBI API Management configuration mode.

```
switch(config)# management api gribi  
switch(config-mgmt-api-gribi) #
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-gribi) # exit  
switch(config) #
```

3.6.13 management api http-commands

The `management api http-commands` command places the switch in HTTP Commands API Management Configuration Mode.

The `no management api http-commands` and `default management api http-commands` commands delete the HTTP Commands API Management Configuration Mode statements from *running-config*.

HTTP Commands API Management Configuration Mode is not a group change mode. The *running-config* changes immediately upon entering commands. Exiting HTTP Commands API Management configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api http-commands  
no management api http-commands  
default management api http-commands
```

Commands Available in HTTP Commands API Management Configuration Mode

- `protocol http`
- `protocol https`
- `protocol https certificate`
- `protocol shutdown`
- `protocol vrf`

Examples

- This command places the switch in HTTP Commands API Management Configuration Mode.

```
switch(config)# management api http-commands  
switch(config-mgmt-api-http-cmds) #
```

- This command returns the switch to Global Configuration Mode.

```
switch(config-mgmt-api-http-cmds) # exit  
switch(config) #
```

3.6.14 management api models

The **management api models** command places the switch in Models API Management configuration mode.

The **no management api models** and **default management api models** commands delete the mgmt-api-models configuration mode statements from *running-config*.

Models API Management configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting Models API Management configuration mode does not affect *running-config*. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api models  
no management api models  
default management api models
```

Commands Available in Models API Management Configuration Mode

- **models** (Models API Management)
- **modules** (Models API Management)
- **provider** (Models API Management)

Examples

- This command places the switch in Models API Management configuration mode.

```
switch(config)# management api models  
switch(config-mgmt-api-models)#[/pre]
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-models)# exit  
switch(config)#[/pre]
```

3.6.15 management api netconf

The **management api netconf** command places the switch in Netconf API Management configuration mode.

The **no management api netconf** and **default management api netconf** commands delete the mgmt-api-netconf configuration mode statements from ***running-config***.

Netconf API Management configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting Netconf API Management configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api netconf  
no management api netconf  
default management api netconf
```

Commands Available in Netconf API Management Configuration Mode

- **transport** (Netconf API Management)

Examples

- This command places the switch in Netconf API Management configuration mode.

```
switch(config)# management api netconf  
switch(config-mgmt-api-netconf) #
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-netconf) # exit  
switch(config) #
```

3.6.16 management api restconf

The `management api restconf` command places the switch in Restconf API Management configuration mode.

The `no management api restconf` and `default management api restconf` commands delete the mgmt-api-restconf configuration mode statements from *running-config*.

Restconf API Management configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting Restconf API Management configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
management api restconf  
no management api restconf  
default management api restconf
```

Commands Available in Restconf API Management Configuration Mode

- `transport` (Restconf API Management)

Examples

- This command places the switch in Restconf API Management configuration mode.

```
switch(config)# management api restconf  
switch(config-mgmt-api-restconf) #
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-restconf) # exit  
switch(config) #
```

3.6.17 management console

The **management console** command places the switch in Console Management Configuration Mode to adjust the idle-timeout period for console connection sessions. The idle-timeout period determines the inactivity interval that terminates a connection session.

The **no management console** and **default management console** commands delete the Console Management Configuration Mode statements from **running-config**.

The **mgmt-console** configuration mode is not a group change mode. The **running-config** changes immediately upon entering commands. Exiting the **mgmt-console** configuration mode does not affect **running-config**. The **exit** command returns the switch to Global Configuration Mode.

Command Mode

Global Configuration

Command Syntax

```
management console  
no management console  
default management console
```

Commands Available in Console Management Configuration Mode

[idle-timeout \(Console Management\)](#)

Examples

- This command places the switch into Console Management Configuration Mode:

```
switch(config)# management console  
switch(config-mgmt-console) #
```

- This command returns the switch to Global Management Mode:

```
switch(config-mgmt-console) # exit  
switch(config) #
```

3.6.18 management ssh

The **management ssh** command places the switch in SSH Management Configuration Mode to adjust SSH session connection parameters.

The **no management ssh** and **default management ssh** commands delete the SSH Management Configuration Mode statements from ***running-config***.

The **mgmt-ssh** configuration mode is not a group change mode. The ***running-config*** changes immediately upon entering commands. Exiting the SSH Management Configuration Mode does not affect ***running-config***. The **exit** command returns the switch to Global Configuration Mode.

Command Mode

Global Configuration

Command Syntax

```
management ssh
no management ssh
default management ssh
```

Commands Available in Mgmt-ssh Configuration Mode

- authentication mode
- cipher
- fips restrictions
- hostkey
- idle-timeout
- ip access group
- ipv6 access group
- login timeout
- key-exchange
- mac hmac
- server-port
- shutdown
- vrf

Examples

- This command places the switch in SSH Management Configuration Mode:

```
switch(config)# management ssh
switch(config-mgmt-ssh) #
```

- This command returns the switch to Global Configuration Mode:

```
switch(config-mgmt-ssh) # exit
switch(config) #
```

3.6.19 management telnet

The **management telnet** command places the switch in Telnet Management Configuration Mode to adjust Telnet session connection parameters.

The **no management telnet** and **default management telnet** commands delete the Telnet Management Configuration Mode statements from **running-config**.

The Telnet Management Configuration Mode is not a group change mode. The **running-config** changes immediately upon entering commands. Exiting the **Telnet Management Configuration Mode** does not affect the **running-config**. The **exit** command returns the switch to **Global Configuration Mode**.

Command Mode

Global Configuration

Command Syntax

```
management telnet  
no management telnet  
default management telnet
```

Commands Available in Telnet Management Configuration Mode

- **idle-timeout**
- **ip access group**
- **ipv6 access group**
- **shutdown**
- **vrf)**

Examples

- This command places the switch in Telnet Management Configuration Mode:

```
switch(config)# management telnet  
switch(config-mgmt-telnet)#[/pre]
```

- This command returns the switch to Global Configuration Mode:

```
switch(config-mgmt-telnet)#! exit  
switch(config)#[/pre]
```

3.6.20 management xmpp

The **management xmpp** command places the switch in Management XMPP Configuration Mode. EOS disables Management over XMPP by default. To enable XMPP, you must provide the location of the XMPP server along with the username and password for the switch.

The **no management xmpp** and **default management xmpp** commands delete the Management XMPP Configuration Mode statements from ***running-config***.

The **mgmt-xmpp** configuration mode does not provide a group change mode. The ***running-config*** changes immediately upon entering commands. Exiting the **mgmt-xmpp** configuration mode does not affect ***running-config***. The **exit** command returns the switch to **Global Configuration Mode**.

Command Mode

Global Configuration

Command Syntax

```
management xmpp
no management xmpp
default management xmpp
```

Commands Available in Management XMPP Configuration Mode

- domain
- server
- session
- shutdown
- switch-group
- username
- vrf

Examples

- This command places the switch in ***mgmt-xmpp configuration mode***:

```
switch(config)# management xmpp
switch(config-mgmt-xmpp) #
```

- This command returns the switch to ***global*** management mode:

```
switch(config-mgmt-xmpp) # exit
switch(config-mgmt-xmpp) #
```

3.6.21 protocol http (API Management)

The **protocol http** command enables the hypertext transfer protocol (HTTP) server.

The **no protocol http** and **default protocol http** commands disable the HTTP server by removing the **protocol http** statement from ***running-config***.

Command Mode

Mgmt-API Configuration

Command Syntax

```
protocol http [TCP_PORT]
```

```
no protocol http
```

```
default protocol http
```

Parameters

- **TCP_PORT** Port number used for the HTTP server. Options include:
 - **no parameter** Specifies default **port number 80**.
 - **port 1 to 65535** Specifies HTTP server port number. The value ranges from **1** to **65535**.
- **localhost** The name of the server bound on the localhost.
- **port** The number of the TCP port to serve on.

Related Commands

[management api http-commands](#) places the switch in ***mgmt-api configuration mode***.

Example

These commands enables the management API for the HTTP server.

```
switch(config) # management api http-commands  
switch(config-mgmt-api-http-cmds) #
```

3.6.22 protocol https (API Management)

The **protocol https** command enables the HTTP secure server. The HTTP secure server is active by default.

The **default protocol https** command restores the default setting by removing the **no protocol https** statement from *running-config*. The **no protocol https** command disables the HTTP secure server.

Command Mode

API Management Configuration

Command Syntax

```
protocol https [TCP_PORT]
no protocol https
default protocol https
```

Parameters

- **TCP_PORT** - Port number used for the HTTPS server. Options include:
 - **no parameter** - Specifies default **port number 443**.
 - **port 1 to 65535** - Specifies HTTP server port number. The value ranges from **1** to **65535**.
- **certificate** - The HTTPS key and certificate to use for the switch.
- **cipher** - Exclusive list of cryptographic ciphers.
- **key-exchange** - Exclusive list of key-exchange algorithms.
- **mac** - Exclusive list of MAC algorithms.
- **port** - The TCP port number to serve on.
- **ssl** - Configure SSL options.

Related Commands

[management api http-commands](#) places the switch in **API Management Configuration Mode**.

Examples

- These commands enables service to the HTTP server. The **no shutdown** command allows access to the service.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# protocol https
switch(config-mgmt-api-http-cmds)# no shutdown
```

- These commands specify the port number used for the HTTPS server. The **no shutdown** command allows access to the service.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# protocol https port 52
switch(config-mgmt-api-http-cmds)# no shutdown
```

3.6.23 protocol https certificate (API Management)

The `protocol https certificate` command configures the HTTP secure server to request an X.509 certificate from the client. The client then authenticates the certificate with a public key.

The `no protocol https certificate` and `default protocol https certificate` commands restore default behavior by removing the `protocol https certificate` statement from *running-config*.

Command Mode

API Management Configuration

Command Syntax

```
protocol https certificate  
no protocol https certificate  
default protocol https certificate
```

Related Command

[management api http-commands](#) places the switch in ***API Management Configuration Mode***.

Example

These commands configure the HTTP secure server to request an X.509 certificate from the client for authentication.

```
switch(config)# management api http-commands  
switch(config-mgmt-api-http-cmds)# protocol https certificate  
switch(config-mgmt-api-http-cmds)#[/pre]
```

3.6.24 reset system storage secure

Use the **reset system storage secure** command to trigger the secure erase mechanism. Secure erase is a command that deliberately, permanently, and irreversibly removes and destroys the data stored on a storage device, rendering that data unrecoverable.

Command Mode

EXEC

Command Syntax

```
reset system storage secure
```

Examples

- To trigger the secure erase mechanism, use the **reset system storage secure** command.

```
switch# reset system storage secure
WARNING! This will destroy all
data and will NOT be recoverable.
Device will reboot into Aboot, and
execution may take up to one hour.
Would you like to proceed? [y/N]
```

- If a particular platform does not support the **reset system storage secure** command , the following message appear:

```
switch#reset system storage secure
% Unavailable command (not supported on this hardware platform)
```

3.6.25 server (XMPP Management)

The **server** command adds an XMPP server to ***running-config***. You can set up multiple XMPP servers for redundancy. The XMPP server location should be a DNS name and not a raw IP address for redundant configurations. The DNS server returns the list of available XMPP servers, which the client can use to find an accessible server.

The XMPP server provides the user authentication. The EOS local configuration or TACACS+ provides the command authentication. The XMPP server should use the same authentication source as the switches. RADIUS is not supported as an XMPP authorization mechanism.

The **no server** and **default server** commands remove the specified XMPP server from ***running-config***.

Command Mode

XMPP Management Configuration Mode

Command Syntax

```
server SERVER_NAME [SERVER_PORT]
```

```
no server
```

```
default server
```

Parameters

- **SERVER_NAME** XMPP server location. Options include the following:
 - **IP address** - Specify an IP address in dotted decimal notation.
 - Specify a host name for the XMPP server.
- **SERVER_PORT** - Specify the server port. Options include:
 - **port 1 to 65535** - Specify a port *number* ranges from **1** to **65535**. If no port is specified, the default **port 5222** is used.

Examples

- This command configures the server hostname **arista-xmpp** to **server port 1**.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# server arista-xmpp port 1
```

- This command removes the XMPP server.

```
switch(config-mgmt-xmpp)# no server
```

3.6.26 session privilege (XMPP Management)

The **session privilege** command places the user in EXEC mode. By default, the initial privilege level has no configured privileges. However, with the configuration of roles, users can add meaning to the different privilege levels. By default, XMPP does not limit access to any command.

Level 1-15: Commands accessible from EXEC Mode.

If no AAA configuration exists and the switch is configured to connect to the XMPP client, any message received is executed with privilege level 1 by default.

The **no session privilege** and **default session privilege** commands revert the list contents to **none** for the specified privilege levels.

Command Mode

XMPP Management Configuration Mode

Command Syntax

```
session privilege priv_level  
no session privilege  
default session privilege
```

Parameter

priv_level - Privilege levels of the commands. The value ranges from **0** and **15**.

Examples

- These commands authorize configuration commands (privilege level config 5) for XMPP.

```
switch(config)# (config)# management xmpp  
switch(config-mgmt-xmpp)# session privilege 5  
switch(config-mgmt-xmpp) #
```

- This command removes the privilege levels set for the XMPP session.

```
switch(config)# management xmpp  
switch(config-mgmt-xmpp)# no session privilege
```

3.6.27 show inventory

The **show inventory** command displays the hardware components installed in the switch. Each component has a serial number and a description.

Command Mode

EXEC

Command Syntax

```
show inventory
```

Example

This command displays the hardware installed in a DCS-7150S-52 switch.

```
switch> show inventory
System information
  Model           Description
  -----
  DCS-7150S-52-CL      52-port SFP+ 10GigE 1RU + Clock

  51   Arista Networks SFP-10G-SR    XCW1225FD753  0002
  52   Arista Networks SFP-10G-SR    XCW1225FD753  0002
switch>
```

3.6.28 show xmpp neighbors

The **show xmpp neighbors** command displays all neighbors and connection status. The XMPP server keeps track of all relationships between users.

Command Mode

EXEC

Command Syntax

```
show xmpp neighbors
```

Example

This command displays all the XMPP neighbors and connection status.

```
switch# show xmpp neighbors
Neighbor                               State      Last Seen Login Time
-----                                -----
admin@test.aristanetworks.com          present    0:01:40 ago
test1@test.aristanetworks.com          present    20:29:39 ago

Neighbor                               Status Message
-----                                -----
admin@test.aristanetworks.com
test1@test.aristanetworks.com
Arista Networks DCS-7048T-4S
```

3.6.29 show xmpp status

The **show xmpp status** command displays the current XMPP connection status to the server.

The XMPP server keeps track of all relationships between users. For two users to communicate directly, the other party must establish and confirm this relationship.

Switches automatically confirm requests from outside parties as long as they are users from the same domain name, for example, when you chat with your switch from your XMPP chat client.

Command Mode

EXEC

Command Syntax

```
show xmpp status
```

Example

This command displays the server's current XMPP connection status.

```
switch# show xmpp status
XMPP Server: port 5222
Client username: test@test.aristanetworks.com
Default domain: test.aristanetworks.com
Connection status: connected switch#
```

3.6.30 show xmpp switch-group

The **show xmpp switch-group** command displays the configured and active switch groups for the switch.

Command Mode

EXEC

Command Syntax

```
show xmpp switch-group
```

Example

This command displays the configured and active switch groups.

```
switch# show xmpp switch-group
testroom@conference.test.aristanetworks.com switch#
```

3.6.31 shutdown (API Management)

The **shutdown** command disables management over API on the switch in API Management Configuration Mode. EOS disables API Management by default.

The **no shutdown** command enables the API management access in mgmt-api configuration mode.

The **default shutdown** command disables the management API access in mgmt-api configuration mode.

Command Mode

Mgmt-API Configuration

Command Syntax

```
shutdown  
no shutdown  
default shutdown
```

Related Command

[management api http-commands](#) places the switch in ***mgmt-api*** configuration mode.

Examples

- These commands disable API access to the HTTP server.

```
switch(config)# management api http-commands  
switch(config-mgmt-api-http-cmds)# shutdown  
switch(config-mgmt-api-http-cmds) #
```

- These commands enable API access to the HTTP server.

```
switch(config)# management api http-commands  
switch(config-mgmt-api-http-cmds)# no shutdown  
switch(config-mgmt-api-http-cmds) #
```

3.6.32 shutdown (Telnet Management)

The **shutdown** command disables or enables Telnet on the switch. EOS disables by default. The **management telnet** command places the switch in the Telnet Management Configuration Mode.

- To enable Telnet, enter **no shutdown** at the Telnet Management prompt.
- To disable Telnet, enter **shutdown** at the Telnet Management prompt.

Command Mode

Telnet Management Configuration

Command Syntax

```
shutdown  
no shutdown
```

Examples

- These commands enable Telnet and return the switch to the Global Configuration Mode.

```
switch(config)# management telnet  
switch(config-mgmt-telnet)# no shutdown  
switch(config-mgmt-telnet)# exit  
switch(config)#[/pre]
```

- This command disables Telnet.

```
switch(config-mgmt-telnet)# shutdown
```

3.6.33 shutdown (XMPP Management)

The **shutdown** command disables or enables management over XMPP on the switch in management-telnet mode. EOS disables XMPP by default.

The **no shutdown** and **default shutdown** commands re-enable XMPP by removing the **shutdown** command from *running-config*.

Command Mode

XMPP Management Configuration

Command Syntax

```
shutdown  
no shutdown  
default shutdown
```

Examples

- These commands enable management over XMPP and return the switch to the Global Configuration Mode.

```
switch(config-mgmt-xmpp) # no shutdown  
switch(config-mgmt-xmpp) # exit  
switch(config) #
```

- This command disables management over XMPP.

```
switch(config-mgmt-xmpp) # shutdown  
switch(config-mgmt-xmpp) #
```

3.6.34 switch-group (XMPP Management)

The **switch-group** command allows you to configure each switch to join specified chat rooms on startup. Configure the switch to belong to the specified chat room to participate in a chat group.

The **no switch-group** and **default switch-group** commands delete the specified switch-group configuration (or all switch-group configurations if no name is specified) by removing the corresponding **switch-group** statement from **running-config**.

Command Mode

XMPP Management Configuration Mode

Command Syntax

```
switch-group name SECURITY  
no switch-group  
default switch-group
```

Parameters

- **name** Group name text that the user enters at the login prompt to access the CLI. To enter multiple names in a single command, separate them with spaces.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

@ # \$ % ^ & * - _ = + ; < > , . ~ |

- **SECURITY** password assignment.
 - **password** *pwd_txt* *name* is protected by a specified password. *pwd_txt* is a clear-text string.
 - **password 0** *pwd_txt* *name* is protected by a specified password. *pwd_txt* is a clear-text string.
 - **password 7** *pwd_txt* *name* is protected by a specified password. *pwd_txt* is encrypted string.

Guidelines

- A switch group is an arbitrary grouping of switches within the network belonging to one chat group.
- In order to belong to one or more switch groups, the switch has to be manually assigned to it.
- Switch groups are defined dynamically based on the configuration of all of the switches in the network.
- To comply with the multi-user chat XMPP standard (XEP-0045), switch groups contain the full name of GROUPNAME@conference.DOMAIN.
- All CLI commands allow either the full group name or the short name appended to the @conference.DOMAIN.
- You must configure each group with a separate command if the switch belongs to multiple chat rooms.

Examples

- These commands configure the switch-group to be part of the chat room.

```
switch(config)# management xmpp  
switch(config-mgmt-xmpp)# switch-group  
testroom@conference.test.aristanetworks.com password 0 arista
```

- Use the **show xmpp switch-group** to verify the active switch-group for the switch.

```
switch# show xmpp switch-group  
testroom@conference.test.aristanetworks.com
```

3.6.35 username (XMPP Management)

The **username** command configures the username and password for the switch on the XMPP server.

The **no username** and **default username** commands delete the specified username by removing the corresponding **username** statement from *running-config*.

Command Mode

XMPP Management Configuration

Command Syntax

```
username name security
```

```
no username
```

```
default username
```

Parameters

- **name** - Specify a username for the XMPP server.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

```
@ # $ % ^ & * ( ) - _ = + { } [ ] ; < > , . ~ |
```

- **security** password assignment.

- **password *pwd_txt* *name*** specifies and unencrypted shared key. *pwd_txt* is a clear-text string.
- **password 0 *pwd_txt* *name*** specifies an unencrypted key. *pwd_txt* is a clear-text string.
- **password 7 *pwd_txt* *name*** specifies a hidden key. *pwd_txt* is an encrypted string.

Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The **password 7** option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

Examples

- These commands create the username and assign it a password. Because password parameter set to zero, the password appears in clear text.

```
switch(config)# management xmpp
switch(config-mgmt-xmpp)# server arista-xmpp
switch(config-mgmt-xmpp)# domain test.aristanetworks.com
switch(config-mgmt-xmpp)# username test1@test.aristanetworks.com password 0 arista
switch(config-mgmt-xmpp)# no shutdown
```

- This command removes all usernames from the XMPP server.

```
switch(config-mgmt-xmpp)# no username
switch(config-mgmt-xmpp) #
```

3.6.36 vrf (API Management)

The **vrf** command places the switch in the server's VRF configuration mode. If the named VRF does not already exist, this command creates it.

Command Mode

API Management Configuration

Command Syntax

vrf VRF_INSTANCE

Parameters

VRF_INSTANCE - Specifies the VRF instance.

- **default** - Instance created in the default VRF.
- **vrf_name** - Instance created in the specified user-defined VRF.

Related Command

[management api http-commands](#) places the switch in API Management Configuration.

Example

This command creates a VRF named management-vrf and places the switch in **VRF** configuration mode for the new VRF.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# vrf management-vrf
switch(config-mgmt-api-http-cmds-vrf-management-vrf) #
```

3.6.37 vrf (XMPP Management)

The **vrf** command places the switch in VRF Configuration mode for the XMPP server. If the named VRF does not already exist, this command creates it.

The VRF configuration for the client is for the entire XMPP service rather than per server. All servers resolving on a particular hostname must be reachable in the same VRF.

Command Mode

XMPP Management Configuration

Command Syntax

vrf [VRF_INSTANCE]

Parameters

VRF_INSTANCE - Specifies the VRF instance.

- **default** - Instance created in the default VRF.
- **vrf_name** - Instance created in the specified user-defined VRF.

Example

This command creates a VRF named *management-vrf* and places the switch in **VRF Configuration Mode** for the server.

```
switch(config) # management xmpp
switch(config-mgmt-xmpp) # vrf management-vrf
switch(config-mgmt-xmpp)
```

3.6.38 xmpp send

The **xmpp send** command can connect to the XMPP server and send messages to switches or switch groups within the network.

Before switches can send messages, they must be connected with each other. The **show xmpp neighbor** command verifies the friendship between switches.

Command Mode

Privileged EXEC

Command Syntax

```
xmpp send neighbor XMIT_TYPE content
```

Parameters

- **neighbor** - Options include switches or switch groups within the network that are connected as friends in a chat room.
- **XMIT_TYPE** - Specifies the transmission type. Valid options include:
 - **command** - Sends an XMPP command.
 - **message** - Sends an XMPP message.
- **content** The command you want the friends within the chat room to display or execute.

Configuration Restrictions

- Allows only enable-mode commands within the multi-switch CLI.
- Does not support changing into a different CLI mode and running several commands.
- An external XMPP client can send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After processing the message, the switch automatically returns to the enable mode.
- Does not support commands that prompt for a response, such as reload.
- Long commands, such as image file copies, may cause the switch XMPP client to stop responding and disconnect momentarily. The switch should reconnect, and the long command should be complete.
- Displays many command outputs in a specific table format. Select a mono-spaced font, such as Courier, for the incoming messages to achieve the same visual feel as through a terminal.

Example

This command sends a request to the switch in the chat room for executing the **show version** command.

```
switch# xmpp send test2 command show version
message from user: test2@test.aristanetworks.com
-----
Hardware version: 04.40
Serial number: JFL08432083
System MAC address: 001c.7301.7d69
Software image version: 4.12.3
Architecture: i386
Internal build version: 4.12.3
Internal build ID: f5ab5f57-9c26-4fe4-acaa-fb60fa55d01d
Uptime: 2 hours and 38 minutes
Total memory: 1197548 kB
Free memory: 182452 kB
```

3.6.39 xmpp session

The **xmpp session** command is similar to running SSH from the switch. The user must input their username and password in order to connect to the XMPP server. EOS uses the format **USER@DEFAULTDOMAIN** by default. This command allows you to interact in the enable mode with a switch or switch group over XMPP using the standard CLI, with access to help and tab completion. All commands are then executed remotely and only the non-empty results are displayed on the screen.

Command Mode

Privileged EXEC

Command Syntax

```
xmpp session switchgroup
```

Parameters

switchgroup The option includes the switch group within the network connected as friends in a chat room.

Configuration Restrictions

- Allows only enable-mode commands within the multi-switch CLI.
- Does not support changing into a different CLI mode and running several commands.
- An external XMPP client can send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After processing the message, the switch automatically returns to the enable mode.
- Does not support commands that prompt for a response, such as reload.
- Long commands, such as image file copies, may cause the switch XMPP client to stop responding and disconnect momentarily. The switch should reconnect, and the long command should be complete.
- Displays many command outputs in a specific table format. Select a mono-spaced font, such as Courier, for the incoming messages to achieve the same visual feel as through a terminal.

Example

This command displays the status of **Ethernet 3** from **test1**, a member of the switch group chat room.

```
switch# xmpp session all@test.aristanetworks.com
xmpp-all# show int Eth3 status
response from: test1@test.aristanetworks.com
-----
Port  Name  Status      Vlan   Duplex  Speed   Type
Et3   bs3   connected  in Po3   a-full  a-1000  10GBASE-SR switch#
```

Administering the Switch

This chapter describes administrative tasks that are typically performed only after initially configuring the switch or after recovery procedures.

This chapter includes these sections:

- [Managing the Switch Name](#)
- [System Clock and Time Protocols](#)
- [Managing Display Attributes](#)
- [Logging of Event Notifications](#)
- [Event Monitor](#)
- [Managing EOS Extensions](#)
- [Switch Administration Commands](#)

4.1 Managing the Switch Name

These sections describe how to configure the switch's domain and host name.

- [Assigning a Name to the Switch](#) describes assigning an FQDN to the switch.
- [Specifying DNS Addresses](#) describes adding name servers to the configuration.

4.1.1 Assigning a Name to the Switch

A Fully Qualified Domain Name (FQDN) labels the switch and defines its organization ID in the Domain Name System hierarchy. The switch's FQDN consists of a host name and domain name.

The host name is uniquely associated with one device within an IP-domain. The default host name is **localhost**. You can configure the prompt to display the host name as described in [prompt](#).

- To assign a host name to the switch, use the [hostname](#) command. To return the switch's host name to the default value of **localhost**, use the [no hostname](#) command.
- To specify the domain location of the switch, use the [dns domain](#) command.

Examples

- This command assigns the string *main-host* as the switch's host name.

```
switch(config)# hostname main-host  
main-host(config)#
```

- This command configures *aristanetworks.com* as the switch's domain name.

```
switch(config)# dns domain aristannetworks.com  
switch(config)#
```

- This procedure configures ***sales1.samplecorp.org*** as the switch's FQDN.

```
switch(config)# dns domain samplecorp.org
switch(config)#

```

- This ***running-config*** extract contains the switch's host name and IP-domain name.

```
switch# show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)
!
vlan 3-4
!
username john secret 5 $1$a7Hjept9$TIKRX6ytkg8o.ENja.na50
!
hostname sales1
ip name-server vrf default 172.17.0.22
dns domain samplecorp.org
!
end switch#

```

4.1.2 Specifying DNS Addresses

The Domain Name Server (DNS) maps FQDN labels to IP addresses and provides addresses for network devices. Each network requires at least one server to resolve addresses. The configuration file can list a maximum of three server addresses.

To add name servers to the configuration, use the [ip name-server](#) command. Each command can add multiple servers. All server addresses support multiple VRFs, and a priority may be specified for each server named. If all name servers have the default priority (**0**), the default DNSmasq behavior is followed for the configuration. It queries all name servers simultaneously and forwards the requests to the first name server for 50 queries or 20 seconds, whichever expires sooner for answering. If any priorities are non-zero, queries are issued in order with a five second timeout between unresponsive name servers.

Note: DNSmasq does not fulfill in-flight requests to unresponsive name servers.

Example

This code displays the configuration file.

```
switch(config)# show ip name-server
IP Address VRF      Priority
-----
10.0.0.1   default    0
10.0.0.2   default    1
10.0.0.1   vrf1       2
10.0.0.2   vrf1       3
fc00::1    default    4

```

The switch assigns source IP addresses to outgoing DNS requests. To force the switch to use a single, user-defined source interface for all requests, use the [ip domain lookup](#) command.

Examples

- This command forces the switch to use **VLAN 5** as the source interface for DNS requests originating from the default VRF.

```
switch(config)# ip domain lookup source-interface Vlan5
```

```
switch(config) #
```

- This command forces the switch to use **VLAN 10** as the source interface for DNS requests originating from VRF purple.

```
switch(config) # ip domain lookup vrf purple source-interface Vlan10
switch(config) #
```

- This command configures up to four name servers on VRF purple.

```
switch(config) # ip name-server vrf purple 10.1.1.24 priority 4
switch(config) #
```

- This command removes the name servers.

```
switch(config) # no ip name-server vrf purple 10.1.1.24
switch(config) #
```

- This command removes all configured name in all VRFs.

```
switch(config) # no ip name-server
switch(config) #
```

Note:

NXDOMAIN is considered a valid reply for the query.

4.2 System Clock and Time Protocols

The switch uses the system clock to display the time and time-stamping messages. Set the system clock to Coordinated Universal Time (UTC); the switch calculates local time based on the time zone setting. Time-stamps and time displays are in local time. The system clock can be set manually or via Network Time Protocol (NTP); any NTP servers properly configured on the switch override time manually entered.

The following sections deal with the configuration of the system clock and the use of NTP and PTP.

- [Configuring the Time Zone](#)
- [Setting the System Clock Manually](#)
- [Displaying the Time](#)
- [Network Time Protocol \(NTP\)](#)

4.2.1 Configuring the Time Zone

Select the switch's time zone to convert the system time (UTC) to local time. To specify the time zone, use the [clock timezone](#) command.

Examples

- These commands configure the switch for the United States Central Time Zone.

```
switch(config) # clock timezone US/Central
switch(config)#show clock
Mon Jan 14 18:42:49 2013
timezone is US/Central
```

```
switch(config) #
```

- To view the predefined time zone labels, enter **clock timezone** with a question mark.

```
switch(config)# clock timezone ?  
Africa/Abidjan           Africa/Accra  
    WET                   WET timezone  
    Zulu                  Zulu timezone  
  
switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)# clock timezone AMERICA?  
America/Adak             America/Anchorage  
  
America/Yellowknife  
switch(config)#clock timezone AMERICA
```

4.2.2 Setting the System Clock Manually

The [clock set](#) command manually configures the system clock time and date in local time. Manually enter any NTP servers properly configured on the switch override time.

Example

This command manually sets the switch time.

```
switch# clock set 08:15:24 14 Jan 2013  
Mon Jan 14 08:15:25 2013  
timezone is US/Central
```

4.2.3 Displaying the Time

Enter the show clock command to display the local time and configured time zone.

Example

This command displays the switch time.

```
switch(config)# show clock  
Mon Jan 14 16:32:46 2013  
timezone is America/Los_Angeles
```

4.2.4 Network Time Protocol (NTP)

EOS enables Network Time Protocol (NTP) on the switch by default, and time settings from any properly configured NTP server override manual setting of the system clock.

NTP servers synchronize time settings of systems running an NTP client. The switch supports NTP versions 1 through 4, and uses version 4 by default. After configuring the switch to synchronize with an NTP server, it may take up to ten minutes for the switch to set the clock. Select the configured **running-config** lists of the NTP servers that the switch uses.

The following sections describe NTP configuration on the switch:

- Configuring the NTP Server
- Configuring the NTP Source
- Configuring the Switch as an NTP Server
- Configuring NTP Authentication
- Viewing NTP Settings and Status

4.2.4.1 Configuring the NTP Server

The [ntp server](#) command adds a server to the list or modifies the parameters of a previously listed address. When the system contains multiple NTP servers, the prefer keyword can be used to specify a preferred NTP server and uses it as the NTP server.

Note that all NTP servers must be in the same VRF and added in the default VRF if you do not specify a VRF.

NTP sets the system clock if enabled, and if the switch has one properly configured NTP server. NTP overrides the manual setting of the system clock. EOS enables NTP by default. To disable NTP, select the **no ntp** command.

Example

Use the following commands to add three NTP servers and designate the second server as the preferred NTP server.

```
switch(config) # ntp server local-NTP
switch(config)#ntp server 172.16.0.23 Prefer
switch(config)#ntp server 172.16.0.25
```

4.2.4.2 Configuring the NTP Source

A local interface can be specified as the source in outgoing NTP packets using the [ntp local-interface](#) command to control the address to send NTP responses to the switch. The IP address of that interface uses the source address in all outgoing NTP packets unless the switch acts as an NTP server and a server-specific source configured using the **source** option of the **ntp server** command.

Example

This command configures the IP address of **VLAN interface 25** as the source specified in all outgoing NTP packets.

```
switch(config) # ntp local-interface vlan 25
switch(config) #
```

4.2.4.3 Configuring the Switch as an NTP Server

To configure the switch to accept NTP requests on all interfaces, use the [ntp serve all](#) command to enable NTP server mode globally on the switch. To configure an individual interface to accept or deny NTP requests, use the [ntp serve](#) command. Interface level settings override the global settings, and changing the settings at either the global or interface level also causes the switch to re-synchronize with its upstream NTP server. Disable the NTP server mode by default.

Examples

- This command configures the switch to act as an NTP server, accepting NTP requests.

```
switch(config)# ntp serve all  
switch(config)#{/pre>
```

- These commands configure **interface ethernet 5** to accept NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5  
switch(config-if-Et5)#ntp serve  
switch(config-if-Et5)#{/pre>
```

4.2.4.4 Configuring NTP Authentication

The switch can be configured to accept NTP packets only from an authenticated server or client. Disable the NTP authentication by default.

To configure the switch to authenticate NTP packets, create one or more authentication keys using the [ntp authentication-key](#) command, specify which keys are trusted by using the [ntp trusted-key](#) command, use the [ntp authenticate](#) command to enable NTP authentication, and specify to use the trusted-key for a specific server. The NTP server must be configured to select the same authentication key and key ID number.

Note: Enable when NTP authentication on a switch; all NTP servers upstream of the switch and all NTP clients of the switch should have matching keys configured, and clients must have NTP authentication enabled.

Example

These commands configure the switch to authenticate NTP packets using key 328 with the plaintext password timeSync.

```
switch(config)# ntp authentication-key 328 md5 timeSync  
switch(config)#ntp trusted key 328  
switch(config)#ntp authenticate  
switch(config)#{/pre>
```

4.2.4.5 Viewing NTP Settings and Status

To display the status of Network Time Protocol (NTP) on the switch, use the [show ntp status](#) command. To display the status of connections to NTP servers, use the [show ntp associations](#) command.

Note: In the output for **show ntp associations**, the reference ID (which identifies the time source of the NTP server) is either the IPv4 address of the time source or, if that source has an IPv6 address, the first four octets of the MD5 hash of that IPv6 address. In EOS releases prior to 4.23.2, the **show ntp status** command identified the system peer by its reference ID as described above. Still, in later releases, it shows the IP address (whether IPv4 or IPv6).

Examples

- This command displays the status of the switch's NTP connection.

```
switch# show ntp status  
synchronised to NTP server (192.168.78.62) at stratum 3  
    time correct to within 66 ms  
    polling server every 1024 s  
switch #{/pre>
```

- This command displays data about the NTP servers in the configuration.

```
switch# show ntp associations
remote          refid      st t when   poll  reach    delay    offset   jitter
=====
+1.ntp.arista.co 125.157.10.11  2 u  539   1024   377  121.748  -0.345  0.893
-3.ntp.arista.co 127.31.152.34  2 u  868   1024   377  101.671  2.434  1.529
+2.ntp.arista.co 176.131.12.185 2 u  676   1024   377  116.505  0.03   0.768
*4.ntp.arista.co 120.181.192.192 2 u  696   1024   377  48.431  -0.416  0.15 switch#
```

4.3 Managing Display Attributes

Display commands control the content of the banner and the command line prompt.

4.3.1 Banners

The switch can display two banners:

- Login banner:** The login banner precedes the login prompt. Use a login banner to warn against unauthorized network access attempts or other messages to users.
- motd banner:** After the user logs into the switch, the Message of the Day (motd) banner displays.

This output displays both banners in bold:

```
This is a login banner
switch login: john
Password:
Last login: Mon Jan 14 09:24:36 2013 from aristanetworks.com
This is an motd banner
switch>
```

Use the following commands to create a login and motd banner:

```
switch(config)# banner login
Enter TEXT message. Type 'EOF' on its line to end.
This is a login banner
EOF
switch(config)# banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner
EOF
switch(config) #
```

Use the following steps to create a banner:

- Enter global configuration mode.

```
switch# config
switch(config) #
```

- Enter Banner Configuration Mode by typing the desired command:

- To create a login banner, type `banner login`.
- To create a motd banner, type `banner motd`

The switch responds with instructions about entering the banner text.

```
switch(config)# banner login
Enter TEXT message. Type 'EOF' on its own line to end.
```

-
3. Enter the banner text.

```
This is the first line of banner text.
```

```
This is the second line of banner text.
```

4. Press **Enter** to place the cursor on a blank line after completing the banner text.
5. Exit banner edit mode by typing EOF.

```
EOF  
switch(config) #
```

4.3.2 Configuring the CLI Prompt

The prompt provides an entry point for EOS commands. The [prompt](#) command configures the contents of the prompt. The [no prompt](#) command returns the prompt to the default of %H%P.

Characters allowed in the prompt include A-Z, a-z, 0-9, and the following additional characters:

```
! @ # $ % ^ & * ( ) - = + f g [ ] ; : < > , . ? / ~ n
```

The prompt supports these control sequences:

- %s “ - Space character
- %t “ - Tab character
- %% “ - Percent character
- %H “ - Host Name
- %D “ - Time and Date
- %D{*f_char*} “ - time and date, format specified by the BSD **strftime** (*f_char*) time conversion function.
- %h “ - Host name up to the first.
- %P “ - Extended command mode
- %p “ - Command mode
- %r “ - Redundancy status on modular systems (has no effect on a fixed system)
- %R “ - Extended redundancy status on modular systems – includes status and slot number (has no effect on a fixed system)

Examples

- This command creates a prompt that displays **system 1** and the Command Mode.

```
switch(config)# prompt system%$1%P  
system 1(config) #
```

- This command creates a prompt that displays the Command Mode.

```
switch(config)# prompt %p  
(config) #
```

- These equivalent commands create the Default prompt.

```
% prompt %H%P  
host-name.dut103(config) #  
  
%no prompt  
host-name.dut103(config) #
```

4.4 Logging of Event Notifications

Arista switches log Event Notifications using the Syslog protocol. By default, EOS logs the event notifications internally to the folder, `/var/log/messages` but can also be displayed on the console or logged to an external server. Configure severity levels and log message destinations using the CLI, and configure individual processes and protocols to adjust or limit the messages from them. Use the `show logging` command to view details of the current logging configuration.

For a full list of Syslog messages, visit the [Arista website](#).

4.4.1 Managing TCAM Capacity Warnings

Strata chipsets, present in the 7010, 7050X, 7060X, 7250X, 7260X, and 7300X series switches, provide event logging for the hardware capacity of TCAM tables on a per-slice basis, and trigger a capacity warning by default whenever any TCAM slice exceeds 90% capacity. As a result, default TCAM logging can generate high levels of syslog messages on these platforms. The `hardware capacity alert table` command can adjust the capacity levels for the warnings above the 90% default. In that case, this adjustment can be made per TCAM resource and per slice. The command can also disable TCAM hardware capacity messages at the level **Warning** and below for a given slice. To disable messages, set the threshold to 0 or use the `no` version of the command.

Examples

- This command reduces hardware capacity Syslog warnings by increasing the capacity threshold to 99% for EFP table monitoring in slice 2.

```
switch(config)# hardware capacity alert table EFP feature Slice-2 threshold 99
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the IFP table in slice 5.

```
switch(config)# hardware capacity alert table IFP feature Slice-5 threshold 0
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the VFP table in all slices.

```
switch(config)# no hardware capacity alert table VFP
```

Note:

Hardware capacity messages are user-configurable only at or below the “Warning” level. When depleting TCAM management software, it always sends “Error” messages to Syslog and affected features when all TCAM resources are used.

4.4.2 Layer 2 MAC Learn Failure Detection

A hash collision occurs when two or more distinct pieces of data map to the same entry or slot in the hardware table. It can happen when the hash function used to calculate the index for a MAC address results in the already occupied index and causes a failure of inserting the later MAC address to the hardware table.

Configuring Layer 2 MAC Learn Failure Detection

Use the following commands to enable system logging of MAC Learn Failures on the switch:

```
switch(config) # platform trident hardware mac-address-table collision-tracking
```

Use the **no** version of the command to disable the feature:

```
switch(config) # no platform trident hardware mac-address-table collision-tracking
```

Displaying Layer MAC Learn Failure Information

Use the following command to display missing MAC addresses in the hardware table:

```
switch# show platform trident 12 hardware mac-address-table missing
  Vlan |   Mac Address      | Present in SW? | Present in HW |
  Missing in HW |
-----|-----|-----|-----|-
-----|
  2141 | 00:00:04:00:00:09 | Y           |           |
  Switchcard1/0 |
-----|
  2141 | 00:00:03:00:19:0c | Y           |           |
  Switchcard1/0 |
-----|
-----|
Total entries missing in software: 0

Total entries missing in hardware: 2
Switchcard1/0: 2
```

Sample Syslog Message for L2 MAC Learn Failure

%ETH---MACADDRBANKFULL: Unable to program learned dynamic host table entry for MAC address *MAC address* in VLAN *VLAN Id* due to hardware resource exhaustion.

4.5 Event Monitor

The Event Monitor writes system event records to local files for access by SQLite database commands.

Note: The switch does not enable **event-monitor** by default. Use the **event-monitor** command to explicitly enable event-monitor.

4.5.1 Description

The event monitor receives notifications for important events or changes to the enabled event monitor tables. These changes are logged to a fixed-size circular buffer. The size of this buffer is configurable, but it does not grow dynamically. Buffer contents can be stored to permanent files to increase the event monitor effective

capacity. The permanent file size and the number of permanent files is configurable. The buffer is stored at a fixed location on the switch.

Specific event monitor queries are available through CLI commands. For queries not available through specific commands, manual queries are supported through other CLI commands. When the user issues a query command, the relevant events from the circular buffer and permanent files are written to and accessed from a temporary SQLite database file. The database keeps a separate table for each logging type (such as MAC, ARP, route, and others). When the monitor receives notification of a new event, the database file is deleted, then recreated.

4.5.2 Configuring the Event Monitor

Enabling the Event Monitor

The `event-monitor` command enables the Event Monitor and specifies the types of events to log by the switch. The Event Monitor provides an event logging service that records system events to a local database. The Event Monitor records these events:

- All changes to all events.
- ARP changes to the ARP table (IPv4 address to MAC address mappings).
- Neighbor changes to the neighbor table (IPv6 address to MAC address mappings).
- Backed up log files.
- Buffer changes to the local buffer settings.
- IGMP snooping changes to the IGMP snooping table.
- LACP changes to the LACP table events.
- MAC changes to the MAC address table (MAC address to port mappings).
- mRoute changes to the IP multicast routing table.
- Neighbor changes to the neighbor routing table.
- Route changes to the IPv4 routing table.
- Route changes to the IPv6 routing table.
- STP unstable events that cause STP instability.

The switch does not enable `event-monitor` by default. Use the `event-monitor` command to explicitly enable the Event Monitor. The `no event-monitor all` disables the Event Monitor. The `no event-monitor` command, followed by a log type parameter, disables event recording for the specified type.

Example

- This command disables the Event Monitor for all types of events.

```
switch(config)# no event-monitor all
```

- This command enables the Event Monitor for routing table changes.

```
switch(config)# event-monitor route
```

The `event-monitor clear` command removes the contents of the Event Monitor buffer. If enabled, this command removes the contents from all Event Monitor backup files.

Example

This command clears the contents of the Event Monitor buffer.

```
switch# event-monitor clear
```

```
switch(config) #
```

Configuring the Buffer

The `event-monitor buffer max-size` command specifies the size of the Event Monitor buffer. The Event Monitor buffer has a fixed-size circular data structure that receives event records from the Event Monitor. When enabling Event Monitor backup, the buffer copies the events to a backup file before each rollover. Buffer size ranges from 6 Kb to 50 Kb with a default size of 32 Kb.

Example

This command configures a buffer size of **48 Kb**.

```
switch(config) # event-monitor buffer max-size 48
switch(config) #
```

Configuring Permanent Files

The `event-monitor backup path` command enables storage of the Event Monitor buffer to permanent switch files and specifies the path and name of these files. The command references file location either from the flash drive root directory where the CLI operates (`/mnt/flash`) or from the switch root directory (`/`).

The Event Monitor buffer becomes circular after the buffer fills, new data replaces older data at the beginning of the buffer. The switch copies the buffer into a new backup file after each buffer writing cycle before the switch starts re-writing the buffer.

Example

These commands configure the switch to store the Event Monitor buffer in `sw-event.log`, then display the new file in the flash directory.

```
switch(config) # event-monitor backup path eventmon_backup_dir/event.log
switch(config) #
bash-4.3# ls /mnt/flash/eventmon_backup_dir/
arpevent.log.1 lacpevent.log.1 neighborevent.log.1 routeevent.log.1
igmpsnoopingevent.log.1 macevent.log.1 route6event.log.1
stpunstableevent.log.1
```

The `event-monitor backup max-size` command specifies the quantity of Event Monitor backup files the switch maintains. The switch appends an extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file after exceeding the file limit.

Example

These commands configure the switch to back up the event buffer to a series of files named `sw-event.log`. The switch can store a maximum of four files.

```
switch(config) # event-monitor backup path sw-event.log
switch(config) # event-monitor backup max-size 4
switch(config) #
```

The switch creates these first five files to store Event Monitor buffer contents:

```
sw-event.log.0
sw-event.log.1
sw-event.log.2
```

```
sw-event.log.3
sw-event.log.4
```

The switch deletes **sw-event.log.0** the first time it verifies the number of existing backup files after the creation of **sw-event.log.4**.

4.5.3 Querying the Event Monitor

These CLI commands perform SQL-style queries on the Event Monitor database:

- The `show event-monitor arp` command displays ARP table events.
- The `show event-monitor mac` command displays MAC address table events.
- The `show event-monitor route` command displays routing table events.

Example

This command displays all events triggered by MAC address table events.

```
switch# show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
```

For other database queries, the `show event-monitor sqlite` command performs an SQL-style query on the database, using the statement specified in the command.

Example

This command displays all entries from the route table.

```
switch# show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|updated|20
2019-09-30 14:01:21.659464|192.168.201.12/30|default|connected|1|0|updated|21
2019-09-30 14:01:21.659497|192.168.1.255/32|default|receiveBcast|0|0|updated|22
2019-09-30 14:01:21.659503|192.168.201.8/32|default|receiveBcast|0|0|updated|23
2019-09-30 14:01:21.659512|16.16.16.0/32|default|receiveBcast|0|0|updated|24
2019-09-30
14:01:21.659517|192.168.201.12/32|default|receiveBcast|0|0|updated|25
2019-09-30
14:01:21.659524|192.168.201.15/32|default|receiveBcast|0|0|updated|26
2019-09-30 14:01:21.659541|192.168.201.8/30|default|connected|1|0|updated|27
2019-09-30 14:01:21.659564|16.16.16.0/24|default|connected|1|0|updated|28
2019-09-30 14:01:21.659578|192.168.201.9/32|default|receive|0|0|updated|29
```

4.5.4 Accessing Event Monitor Database Records

The `event-monitor sync` command combines the event monitor buffer with all backup logs and synchronizes them into a single SQLite file. The data can be accessed through SQLite or by using the `show event-monitor` commands.

Example

- This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)# event-monitor sync
switch(config)#
```

4.6 Managing EOS Extensions

The most simple and efficient way to make the most of the extensibility in EOS through the use of extensions. An extension provides a pre-packaged optional feature or a set of scripts in an RPM Package Manager (RPM) or Software image extension (SWIX) format. Arista provides a variety of extensions on the [EOS Software Downloads](#) page.

These sections describe basic EOS extension tasks:

- [Installing EOS Extensions](#)
- [Installing EOS Extensions on a Dual-Supervisor Switch](#)
- [Verifying EOS Extensions Installation](#)
- [Uninstalling an EOS Extension](#)

4.6.1 Installing EOS Extensions

Complete the following steps to install an EOS extension.

1. Download the desired extension and copy it onto the devices flash storage.

```
switch# dir
Directory of flash:/
-rwx 479183792 Jun 23 09:46 EOS-4.13.3F.swi
-rwx 21280296 Feb 6 16:48 arista-splunk-extension.swix
-rwx 27 Jun 23 10:08 boot-config drwx 4096 Sep 26 2012 schedule
-rwx 1481 Jun 27 05:54 startup-config
```

2. Copy the file from the flash storage to the extensions partition.

```
switch# copy flash:arista-splunk-extension.swix extension:
Copy completed successfully.
```

3. Install the EOS extension.

```
switch# extension arista-splunk-extension.swix
If this extension modifies the behavior of the Cli, any running Cli sessions will
need to be reset in order for the Cli modifications to take effect.
```

4. If you require extension persistence across rebooting the switch, the extension should also be copied into the boot-extensions partition.

```
switch# copy installed-extensions boot-extensions
```

5. Run the extension. As the CloudVision extension adds additional CLI commands to EOS, the CLI session must be restarted so that the additional commands become available. To achieve this, close the SSH or the Telnet session and open a new session.

4.6.2 Installing EOS Extensions on a Dual-Supervisor Switch

Complete the following steps to install an EOS extension on a dual-supervisor switch.

1. Copy the extension from the primary supervisor to the standby supervisors flash directory.

```
switch(s1) # copy flash:<filename>.swix supervisor-peer://mnt/flash/
```

- Establish a session to the standby supervisor from the primary.

```
switch(s1) # session peer-supervisor
Warning: Permanently added '[127.1.0.2]:3601' (RSA) to the list of known hosts.
Last login: Mon Aug 27 17:32:00 2018 from supervisor1
```

```
WARNING - you are currently logged in to the standby supervisor.
Not all cli commands are available or supported. Any configuration
done from this cli will not be reflected in the active supervisor's
running config and will be lost when the active supervisor writes
its startup config.
switch(s2) #
```

- Repeat the steps listed in the [Installing EOS Extensions](#) to install the EOS extension.
- Repeat the steps listed in the [Verifying EOS Extensions Installation](#) to verify the extension installation.
- Exit standby supervisor.

```
switch(s2) # exit
Connection to 127.1.0.1 closed.
switch(s1) #
```

4.6.3 Verifying EOS Extensions Installation

Complete the steps to verify that the EOS extensions installed correctly.

- Run the **show extensions** command to verify that the EOS extensions are available and installed correctly.

```
switch# show extensions
Name Version/Release Status Extension
-----
EosSdk-1.2.1-f1.boca-1943435.i686.rpm 1.2.1/1943435.flbocaeosssd A, NI 1
arista-splunk-extension.swix 0.95/1498976.2013ltdsplun A, I 2
fping-2.4b2-10.fc12.i686.rpm 2.4b2/10.fc12 A, I 16
gnuplot.swix 1.10.0/1.fc14 A, I 16
splunkforwarder-5.0.9-213964.i386.rpm 5.0.9/213964 A, NI 1
```

A: available | NA: not available | I: installed | NI: not installed | F: forced

- Run the **show boot-extensions** command to verify that the EOS extensions are enabled for boot persistence.

```
switch# show boot-extensions
arista-splunk-extension.swix
fping-2.4b2-10.fc12.i686.rpm
gnuplot.swix
```

4.6.4 Uninstalling an EOS Extension

Complete the following steps to uninstall an EOS extension.

- Uninstall the existing EOS extension using the **no extension** command.

```
switch# no extension fping-2.4b2-10.fc12.i686.rpm
switch#show extensions
Name Version/Release Status Extension
-----
EosSdk-1.2.1-f1.boca-1943435.i686.rpm 1.2.1/1943435.flbocaeosssd A, NI 1
arista-splunk-extension.swix 0.95/1498976.2013ltdsplun A, I 2
```

| | | |
|---------------------------------------|------------------|------|
| fping-2.4b2-10.fc12.i686.rpm | 2.4b2/10.fc12 A, | NI 1 |
| gnuplot.swix | 1.10.0/1.fc14 A, | I 16 |
| splunkforwarder-5.0.9-213964.i386.rpm | 5.0.9/213964 A, | NI 1 |

A: available | NA: not available | I: installed | NI: not installed | F: forced

2. Remove the extension from the boot-extension using the **copy installed-extensions boot-extensions** command.

```
switch# copy installed-extensions boot-extensions
```

 **Note:** If you have a Dual-Supervisor Switch, connect to the secondary supervisor using the session peer-supervisor command, repeat steps 1 and 2, and finally exit from the secondary supervisor.

4.7 Switch Administration Commands

Switch Name Configuration Commands

- [clear ptp interface counters](#)
- [dns domain](#)
- [hostname](#)
- [ip domain-list](#)
- [ip domain lookup](#)
- [ip host](#)
- [ip name-server](#)
- [ipv6 host](#)
- [show hostname](#)
- [show hosts](#)
- [show ip domain-name](#)
- [show ip name-server](#)
- [show local-clock time-properties](#)

Banner Configuration Commands

- [banner login](#)
- [banner motd](#)
- [show banner](#)

Prompt Configuration Command

- [prompt](#)

Event Manager Commands

- [event-monitor](#)
- [event-monitor backup max-size](#)
- [event-monitor backup path](#)
- [event-monitor buffer max-size](#)

- [event-monitor clear](#)
- [event-monitor sync](#)
- [no event-monitor](#)
- [show event-monitor arp](#)
- [show event-monitor igmpsnooping](#)
- [show event-monitor mac](#)
- [show event-monitor mroute](#)
- [show event-monitor neighbor](#)
- [show event-monitor route6](#)
- [show event-monitor route](#)
- [show event-monitor sqlite](#)
- [show event-monitor stpunstable](#)

Email Configuration Command

- [email](#)

System Clock Commands

- [clock set](#)
- [clock timezone](#)
- [show clock](#)

NTP Commands

- [ntp authenticate](#)
- [ntp authentication-key](#)
- [ntp local-interface](#)
- [ntp serve](#)
- [ntp serve all](#)
- [ntp server](#)
- [ntp trusted-key](#)
- [show ntp associations](#)
- [show ntp status](#)

Syslog Configuration Commands

- [logging format](#)
- [logging persistent](#)
- [logging repeat-messages](#)

Power Configuration Commands

- [power enable module](#)

4.7.1 banner login

The **banner login** command configures a message that the switch displays before login and password prompts. The login banner is available on console, telnet, and ssh connections.

The **no banner login** and **default banner login** commands delete the login banner.

Command Mode

Global Configuration

Command Syntax

```
banner login  
no banner login  
default banner login
```

Parameters

- ***banner_text*** To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports the following keywords:
 - **\$hostname**) displays the switch's host name.
 - **EOF** To end the banner editing session, type EOF on its own line and press **enter**.

Examples

- These commands create a two-line login banner.

```
switch(config)# banner login  
Enter TEXT message. Type 'EOF' on its own line to end.  
This is a login banner for $(hostname).  
Enter your login name at the prompt.  
EOF  
switch(config) #
```

- This output displays the login banner.

```
This is a login banner for switch.  
Enter your login name at the prompt.  
switch login:john  
Password:  
Last login: Mon Jan 14 09:05:23 2013 from adobe-wrks.aristanetworks.com switch>
```

4.7.2 banner motd

The **banner motd** command configures a message of the day (motd) that the switch displays after a user logs in. The motd banner is available on console, telnet, and ssh connections.

The **no banner motd** and **default banner motd** commands delete the motd banner.

Command Mode

Global Configuration

Command Syntax

```
banner motd  
no banner motd  
default banner motd
```

Parameters

- **banner_text** To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports this keyword:
 - **\$(hostname)** displays the switch's host name.
- **EOF** To end the banner editing session, type EOF on its own line and press **enter**.

Examples

- These commands create an motd banner.

```
switch(config)# banner motd  
Enter TEXT message. Type 'EOF' on its own line to end.  
This is an motd banner for $(hostname)  
EOF  
switch(config) #
```

- This output displays the motd banner.

```
switch login: john  
Password:  
Last login: Mon Jan 14 09:17:09 2013 from adobe-wrks.aristanetworks.com  
This is an motd banner for Switch switch>
```

4.7.3 clear ptp interface counters

The **clear ptp interface counters** command resets the Precision Time Protocol (PTP) packet counters.

Command Mode

Privileged EXEC

Command Syntax

```
clear ptp interface [INTERFACE_NAME] counters
```

Parameters

INTERFACE_NAME Interface type and numbers. Options include:

- **no parameter** Displays information for all interfaces.
 - **ethernet e_range** Ethernet interface range specified by **e_range**.
 - **loopback l_range** Loopback interface specified by **l_range**.
 - **management m_range** Management interface range specified by **m_range**.
 - **port-channel p_range** Port-Channel Interface range specified by **p_range**.
 - **vlan v_range** VLAN interface range specified by **v_range**.
 - **VXLAN vx_range** VXLAN interface range specified by **vx_range**.

Valid parameter formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command clears all PTP counters.

```
switch# clear ptp counters  
switch#
```

4.7.4 clock set

The **clock set** command sets the system clock time and date. If the switch is configured with an NTP server, NTP time synchronizations override manually entered time settings.

Time entered by this command is local, as configured by the **clock timezone** command.

Command Mode

Privileged EXEC

Command Syntax

`clock set hh:mm:ss date`

Parameters

- ***hh:mm:ss*** is the current time (24-hour notation).
- ***date*** is the current date. Date formats include:
 - **mm/dd/yy** example: 05/15/2012
 - example: May 15 2012
 - example: 15 May 2012

Example

This command manually sets the switch time.

```
switch# clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

4.7.5 clock timezone

The **clock timezone** command specifies the UTC offset that converts system time to local time. The switch uses local time for time displays and to time-stamp system logs and messages.

The **no clock timezone** and **default clock timezone** commands delete the **timezone** statement from **running-config**, setting local time to UTC.

Command Mode

Global Configuration

Command Syntax

```
clock timezone zone_name  
no clock timezone  
default clock timezone
```

Parameters

zone_name the time zone. Settings include a list of predefined time zone labels.

Examples

- This command configures the switch for the United States Central Time Zone.

```
switch(config)# clock timezone US/Central  
switch(config)# show clock  
Fri Jan 11 18:42:49 2013  
timezone is US/Central  
switch(config)#{
```

- To view the predefined time zone labels, enter **clock timezone** with a question mark.

```
switch(config)# clock timezone ?  
Africa/Abidjan Africa/Accra  
Africa/Addis_Ababa Africa/Algiers  
Africa/Asmara Africa/Asmera  
Africa/Bamako Africa/Bangui  
  
W-SU W-SU timezone  
WET WET timezone  
Zulu Zulu timezone  
  
switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)# clock timezone AMERICA?  
America/Adak America/Anchorage  
America/Anguilla America/Antigua  
America/Araguaina America/Argentina/Buenos_Aires  
  
America/Virgin America/Whitehorse  
America/Winnipeg America/Yakutat  
America/Yellowknife  
  
switch(config)#clock timezone AMERICA
```

4.7.6 dns domain

The **dns domain** command configures the switch's domain name. The switch uses this name to complete unqualified host names.

The **no dns domain** and **default dns domain** commands delete the domain name by removing the **dns domain** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

dns domain *string*

no dns domain

default dns domain

Parameter

string domain name (text string).

Example

This command configures ***aristanetworks.com*** as the switch's domain name.

```
switch(config) # dns domain aristianetworks.com  
switch(config) #
```

4.7.7 email

The **email** command places the switch in email client configuration mode. If you configure a from-user and an outgoing SMTP server on the switch, you can then use an email address as an output modifier to a **show** command and receive the output as email.

Command Mode

Global Configuration

Command Syntax

email

Example

This command places the switch in email client configuration mode.

```
switch(config) # email  
switch(config) #
```

4.7.8 event-monitor backup max-size

The **event-monitor backup max-size** command specifies the quantity of event monitor backup files the switch maintains. Values range from 1 to 200 files with a default of ten files.

The **event-monitor backup path** command specifies the path/name of these files. The switch appends an extension to the file name that tracks the creation order of backup files. When the quantity of files exceeds the configured limit, the switch deletes the oldest file.

The **no event-monitor backup max-size** and **default event-monitor backup max-size** command restores the default maximum number of backup files the switch can store to ten by removing the corresponding **event-monitor backup max-size** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
event-monitor backup max-size file_quantity
no event-monitor backup max-size
default event-monitor backup max-size
```

Parameter

file_quantity maximum number of backup files. Value ranges from **1** to **200**. Default is **10**.

Example

These commands configure the switch to back up the event buffer to a series of files named sw-event.log. The switch can store a maximum of four files.

```
switch(config) # event-monitor backup path sw-event.log
switch(config) # event-monitor backup max-size 4
switch(config) #
```

The first five files that the switch creates to store event monitor buffer contents are:

```
sw-event.log.0
sw-event.log.1
sw-event.log.2
sw-event.log.3
sw-event.log.4
```

The switch deletes **sw-event.log.0** the first time it verifies the number of existing backup files after the creation of **sw-event.log.4**.

4.7.9 event-monitor backup path

The **event-monitor backup path** command enables the storage of the event monitor buffer to switch files and specifies the path/name of these files. The command references the file location either from the flash drive root directory (/mnt/flash) where the CLI operates or from the switch root directory (/).

The event monitor buffer is circular after the buffer is filled, new data is written to the beginning of the buffer, replacing old data. At the conclusion of each buffer writing cycle, it is copied into a new backup file before the switch starts re-writing the buffer. The switch appends a extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit specified by the [event-monitor backup max-size](#) command is exceeded.

running-config can contain a maximum of one **event-monitor backup path** statement. Subsequent **event-monitor backup path** commands replace the existing statement in **running-config**, changing the name of the file where event monitor backup files are stored.

The **no event-monitor backup path** and **default event-monitor backup path** commands disable the storage of the event monitor buffer to switch files by deleting the **event-monitor backup path** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

event-monitor backup path URL_FILE

no event-monitor backup path

default event-monitor backup path

Parameters

URL_FILE path and file name of the backup file:

- **path_string** specified path is appended to /mnt/flash/.
- **file: path_string** specified path is appended to /.
- **flash: path_string** specified path is appended to /mnt/flash/.

Example

These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.

```
switch(config)# event-monitor backup path eventmon_backup_dir/event.log
switch(config)#
bash-4.3# ls /mnt/flash/eventmon_backup_dir/
arpevent.log.1 lacpevent.log.1 neigborevent.log.1 routeevent.log.1
igmpsnopingevent.log.1 macevent.log.1 route6event.log.1
stpunstableevent.log.1
```

4.7.10 event-monitor buffer max-size

The `event-monitor buffer max-size` command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled (`event-monitor backup path`), the buffer is copied to a backup file before each rollover.

Buffer size ranges from **6 Kb** to **50 Kb**. The default size is **32 Kb**.

The `no event-monitor buffer max-size` and `default event-monitor buffer max-size` commands restore the default buffer size of 32 Kb by removing the `event-monitor buffer max-size` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
event-monitor buffer max-size buffer_size
no event-monitor buffer max-size
default event-monitor buffer max-size
```

Parameters

buffer_size buffer capacity (Kb). Values range from **6** to **50**. Default value is **32**.

Example

This command configures a buffer size of **48 Kb**.

```
switch(config) # event-monitor buffer max-size 48
switch(config) #
```

4.7.11 event-monitor clear

The **event-monitor clear** command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

Command Mode

Privileged EXEC

Command Syntax

```
event-monitor clear
```

Example

This command clears the contents of the event monitor buffer.

```
switch# event-monitor clear  
switch#
```

4.7.12 event-monitor sync

The **event-monitor buffer sync** command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file, which is stored at **/var/log/eventMon.db**.

Command Mode

Privileged EXEC

Command Syntax

```
event-monitor sync
```

Example

This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config) # event-monitor sync  
switch(config) #
```

4.7.13 event-monitor

The **event-monitor** command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database.

The database maintains a separate table for each event type.

The event monitor is disabled by default.

- The **no event-monitor all** command disables the event monitor.
- The **no event-monitor** command, followed by a log type parameter, disables event recording for the specified type.
- The **event-monitor** command enables the specified event logging type by removing the corresponding **no event-monitor** command from *running-config*.

The **no event-monitor** and **default event-monitor** commands, without a **LOG_TYPE** parameter, restore the default event monitor settings by deleting all event monitor related commands from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
event-monitor LOG_TYPE
no event-monitor LOG_TYPE
default event-monitor LOG_TYPE
```

Parameters

LOG_TYPE specifies the event logging type. Options include:

- **all** all event logging types.
- **arp** changes to ARP table.
- **backup** backed up log files.
- **buffer** changes to the local buffer settings.
- **igmpsnooping** changes to IGMP snooping table.
- **lacp** changes to the LACP table events.
- **mac** changes to MAC address table.
- **mroute** changes to multicast routing table.
- **neighbor** changes to the neighbor routing table.
- **route** changes to IP routing table.
- **route6** changes to IP route6 table.
- **stpunstable** events that cause STP instability.

Related Command

no event-monitor

Examples

- This command disables the event monitor for all types of events.

```
switch(config)# no event-monitor all
switch(config) #
```

- This command enables the event monitor for routing table changes.

```
switch(config)# event-monitor route
switch(config)#{
```

4.7.14 hostname

The **hostname** command assigns a text string as the switch's host name. The default host name is **localhost**.

The prompt displays the host name when appropriately configured through the **prompt** command.

The **no hostname** and **default hostname** commands return the switch's host name to the default value of **localhost**.

Command Mode

Global Configuration

Command Syntax

hostname *string*

no hostname

default hostname

Parameter

string host name assigned to the switch.

Example

This command assigns the string **main-host** as the switch's host name.

```
switch(config) # hostname main-host  
main-host(config) #
```

The prompt was previously configured to display the host name.

4.7.15 ip domain lookup

The **ip domain lookup** command specifies the source interface for all DNS requests sent from the specified VRF.

The **no ip domain lookup** and **default ip domain lookup** commands return the switch to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

Command Mode

Global Configuration

Command Syntax

```
ip domain lookup [VRF_INSTANCE] source-interface INTF_NAME
no ip domain lookup [VRF_INSTANCE] source-interface
default ip domain lookup [VRF_INSTANCE] source-interface
```

Parameters

- **VRF_INSTANCE** specifies the VRF instance being modified.
 - **no parameter** changes are made to the default VRF.
 - **vrf vrf_name** changes are made to the specified VRF.
- **INTF_NAME** name of source interface to be used for DNS requests. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.

Examples

- This command specifies **VLAN 5** as the source interface for DNS requests originating from the default VRF.

```
switch(config)# ip domain lookup source-interface Vlan5
switch(config)#

```

- This command specifies **VLAN 10** as the source interface for DNS requests originating from VRF purple.

```
switch(config)# ip domain lookup vrf purple source-interface Vlan10
switch(config)#

```

4.7.16 ip domain-list

The **ip domain-list** command specifies a domain name to add to the IP domain list.

The **no ip domain-list** and **default ip domain-list** commands return the IP domain list to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

Command Mode

Global Configuration

Command Syntax

```
ip domain-list [IP_DOMAIN_NAME]  
no ip domain-list [IP_DOMAIN_NAME]  
default ip domain-list [IP_DOMAIN_NAME]
```

Parameter

IP_DOMAIN_NAME specifies the IP domain name.

Examples

- This command specifies foo.com as the IP domain name to add to the IP domain list.

```
switch(config)# ip domain-list foo.com  
switch(config)#
```

- This command removes foo.com and returns the IP domain list to its default state.

```
switch(config)# no ip domain-list foo.com  
switch(config)#
```

4.7.17 ip host

The `ip host` command associates a hostname to an IPv4 address. This command supports local hostname resolution based on local hostname IP address maps. Multiple hostnames can be mapped to an IP address. IPv4 and IPv6 addresses can be mapped to the same hostname. To map an IPv6 address to a hostname, use the `ipv6 host` command. The `show hosts` command displays the local hostname IP address mappings.

The `no ip host` and `default ip host` commands remove hostname IP address maps by deleting the corresponding `ip host` command from *running-config*, as specified by the following command parameters:

- ***no parameters*** - Removes all hostname IP address maps.
- ***hostname*** - Removes all IP address maps for the specified hostname.
- ***hostname* and *IP address*** - Removes specified hostname IP address maps.

Command Mode

Global Configuration

Command Syntax

```
ip host hostname hostadd_1 [hostadd_2] ...[hostadd_X]
no ip host [hostname] [hostadd_1 [hostadd_2] [hostadd_X]]
default ip host [hostname] [hostadd_1 [hostadd_2] [hostadd_X]]
```

Parameters

- ***hostname*** - hostname (text).
- ***hostadd_N*** - IPv4 address associated with hostname in dotted decimal notation.

Related Commands

- `ipv6 host`
- `show hosts`

Examples

- This command associates the hostname **MyTestLab** with the IP addresses **10.24.18.5** and **10.24.16.3**.

```
switch(config)#ip host MyTestLab 10.24.18.5 10.24.16.3
```

- This command removes all IP address maps for the hostname **production_lab**.

```
switch(config)#no ip host production_lab
switch(config) #
```

4.7.18 ip name-server

The **ip name-server** command adds name server addresses to ***running_config***. The switch uses name servers for name and address resolution. The switch can be configured with up to three name servers. Although a command can specify multiple name server addresses, ***running_config*** stores each address in a separate statement. Name server addresses can be IPv4 and IPv6; each command can specify both address types.

Attempts to add a fourth server generate an error message. All name server addresses must be configured in the same VRF. When name servers were previously configured in a VRF, they must all be removed before adding new name server entries.

The **no ip name-server** and **default ip name-server** commands remove specified name servers from ***running_config***. Commands that do not list an address remove all name servers.

Command Mode

Global Configuration

Command Syntax

```
ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
no ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
default ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
```

Parameters

- **VRF_INSTANCE** specifies the VRF instance containing the addresses.
 - **no parameter** default VRF.
 - **vrf vrf_name** a user-defined VRF.
- **SERVER_X** IP address of the name server (dotted decimal notation). Options include:
 - **ipv4_addr** (A.B.C.D)
 - **ipv6_addr** (A:B:C:D:E:F:G:H)

A command can contain both (IPv4 and IPv6) address types.

Guidelines

All configured name server addresses must come from the same VRF. To use a user defined VRF for connection to a name server, first remove any name servers configured in the default VRF.

Examples

- This command adds two name servers to the configuration.

```
switch(config)# ip name-server 172.0.14.21 3:4F21:1902::
```

- This command attempts to add a name server when the configuration already lists three servers.

```
switch(config)# ip name-server 172.1.10.22
% Maximum number of nameservers reached. '172.1.10.22' not added
switch(config)#
```

4.7.19 ipv6 host

The **ipv6 host** command associates a hostname to an IPv6 address. This command supports local hostname resolution based on local hostname IP address maps. Multiple hostnames can be mapped to an IPv6 address. IPv4 and IPv6 addresses can be mapped to the same hostname. To map IPv4 addresses to a hostname, use the **ip host** command. The **show hosts** command displays the local hostname IP address mappings.

The **no ipv6 host** and **default ipv6 host** commands remove hostname IP address maps by deleting the corresponding **ipv6 host** command from **running-config**, as specified by command parameters:

- **no parameters** - Removes all hostname IPv6 address maps.
- **hostname** - Removes all IPv6 address maps for the specified hostname.
- **hostname** and **IP address** - Removes specified hostname IP address maps.

Command Mode

Global Configuration

Command Syntax

```
ipv6 host hostname hostadd1 [hostadd2] ...[hostaddX]
no ipv6 host [hostname] [hostadd1 [hostadd2] [hostaddX]]
default ipv6 host [hostname] [hostadd1 [hostadd2] [hostaddX]]
```

Parameters

- **hostname** - hostname in a text format.
- **hostaddN** IPv6 addresses associated with the hostname in dotted decimal notation.

Related Commands

- [ip host](#)
- [show hosts](#)

Example

This command associates the hostname **MySupportLab** with the IPv6 address **2001:0DB8:73:ff:ff:26:fd:90**.

```
switch(config) #ipv6 host MySupportLab 2001:0DB8:73:ff:ff:26:fd:90
switch(config) #
```

4.7.20 logging format

The **logging format** command configures formatting options for syslog messages.

The **no logging format** and **default logging format** commands remove the corresponding **logging format** command from **running-config** and restore the specified formatting to its default setting.

Command Mode

Global Configuration

Command Syntax

```
logging format {hostname{fqdn|ipv4}|rfc5424|sequence-numbers|timestamp{high-resolution|traditional[timezone][year]}}  
no logging format {hostname|rfc5424|sequence-numbers|timestamp}  
default logging format {hostname|rfc5424|sequence-numbers|timestamp}
```

Parameters

hostname {fqdn|ipv4} specifies the formatting for the hostname in syslog messages as either **fqdn** (fully qualified domain name) or **ipvr** (IPv4 address).

rfc5424 causes syslogs generated locally to include high-resolution timestamps, and syslogs forwarded to remote servers to be sent in RFC5424 format.

sequence-numbers causes the sequence numbers of syslog messages to be visible when the messages are displayed.

timestamp {high-resolution|traditional[timezone][year]} specifies the formatting for syslog timestamps as either **high-resolution** (high-resolution RFC3339 timestamps) or **traditional** (traditional syslog timestamps as specified in RFC3164). When using the traditional timestamp format, **timezone** and **year** can also be included.

Examples

- This command enables sequence numbering that can be seen when Syslog messages are displayed.

```
switch(config)# logging format sequence-numbers  
switch(config)#
```

- To display the sequence numbers, issue the **show logging** command.

```
switch# show logging  
    Syslog logging: enabled  
    Buffer logging: level debugging  
    Console logging: level informational  
    Synchronous logging: disabled  
    Trap logging: level informational  
    Sequence numbers: enabled  
    Syslog facility: local4  
    Hostname format: Hostname only  
    Repeat logging interval: disabled  
  
Log Buffer:

4.7.21 logging persistent

The **logging persistent** command logs the files stored on the flash disk. It can store upto 30MB logs.

The **no logging persistent** command disables the logging from the *running-config*.

Command Mode

Global Configuration Mode

Command Syntax

```
logging persistent logging file size
no logging persistent logging file size
```

Parameter

- ***logging file size*** The maximum size (in bytes) of logging file stored on flash disk. The value ranges from 1024 to 2147483647.

Example

- This command configures logging persistent on the switch.

```
switch# config
switch(config)# logging persistent 1024
! Note: writing system log message on non-volatile flash will affect the life
expectancy of the flash drive due to heavy writing. Please disable persistent logging unless
needed.
```

4.7.22 logging repeat-messages

The **logging repeat-messages** command configures repetition of syslog messages instead of summarizing the count of repeats.

The **no logging repeat-messages** and **default logging repeat-messages** commands disable the functionality to repeat logging messages in ***running-config***.

Command Mode

Global Configuration

Command Syntax

```
logging repeat-messages
no logging repeat-messages
default logging repeat-messages
```

Examples

- This command repeats syslog messages instead of summarizing the count of repeats.

```
switch(config)# logging repeat-messages
switch(config)#{
```

- This command displays the status of logging repeat messages command.

```
switch(config)# show logging
Syslog logging: enabled
  Buffer logging: level debugging
  Console logging: level debugging
  Monitor logging: level debugging
  Synchronous logging: disabled
  Trap logging: level informational
  Sequence numbers: disabled
  Syslog facility: local4
  Hostname format: Hostname only
  Repeat logging interval: disabled
  Repeat messages: enabled

  Facility           Severity           Effective Severity
  -----             -----             -----
  aaa                debugging          debugging
  accounting         debugging          debugging

switch(config)#{
```

4.7.23 no event-monitor

The **no event-monitor** and **default event-monitor** commands remove the specified **event-monitor** configuration statements from **running-config**, returning the switch to the specified default state.

- **no event-monitor** with **no parameters**, restores all default setting states:
 - event monitor is enabled.
 - buffer backup is disabled.
- The **no event-monitor backup** disables the backup.

To disable the event monitor, enter the **no event-monitor all** command ([event-monitor](#)).

Command Mode

Global Configuration

Command Syntax

```
no event-monitor [PARAMETER]  
default event-monitor [PARAMETER]
```

Parameters

PARAMETER the event monitor property that is returned to the default state.

- **no parameter** all event monitor properties.
- **backup** event monitor buffer backup is disabled.

Example

This command removes all event monitor configuration statements from **running-config**.

```
switch(config) # no event-monitor  
switch(config) #
```

4.7.24 ntp authenticate

The **ntp authenticate** command enables the authentication of incoming NTP packets. When authentication is enabled, NTP packets will be used to synchronize time on the switch only if they include a trusted authentication key. Authentication keys are created on the switch using the **ntp authentication-key command**, and the **ntp trusted-key** command is used to specify which keys are trusted. NTP authentication is disabled by default.

The **no ntp authenticate** and **default ntp authenticate** commands disable NTP authentication on the switch by removing the corresponding **ntp authenticate** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ntp authenticate  
no ntp authenticate  
default ntp authenticate
```

Examples

- This command enables NTP authentication on the switch.

```
switch(config)# ntp authenticate  
switch(config)#
```

- This command disables NTP authentication on the switch.

```
switch(config)# no ntp authenticate  
switch(config)#
```

4.7.25 ntp authentication-key

The `ntp authentication-key` command creates an authentication key for use in authenticating incoming NTP packets. For the key to be used in authentication:

- It must be configured as a trusted key using the `ntp trusted-key` command.
- NTP authentication must be enabled on the switch using the `ntp authenticate` command.
- The same key must be configured on the NTP server.

The `no ntp authentication-key` and `default ntp authentication-key` commands remove the specified authentication key by removing the corresponding `ntp authentication-key` command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ntp authentication-key key_id ENCRYPT_TYPE password_text
no ntp authentication-key key_id
default ntp authentication-key key_id
```

Parameters

- *key_id* key ID number. Value ranges from **1** to **65534**.
- **ENCRYPT_TYPE** encryption method. Values include:
 - **md5** *key_text* is MD5 encrypted.
 - **sha1** *key_text* is SHA-1 encrypted.
- *password_text* the authentication-key password.

Examples

- This command creates an NTP authentication key with **ID 234** and password **timeSync** using MD5 encryption.

```
switch(config)# ntp authentication-key 234 md5 timeSync
```

Running-config stores the password as plain text.

- This command removes **NTP authentication key 234**.

```
switch(config)# no ntp authentication-key 234
```

4.7.26 ntp local-interface

The **ntp local-interface** command configures an interface as the local NTP source. The IP address of that interface will then be used as the source address in NTP packets sent by the switch. If the switch is acting as an NTP server and a server-specific source interface has been configured using the **source** option of the **ntp server** command, the server-specific source address will take precedence.

The **no ntp local-interface** and **default ntp local-interface** commands remove the **ntp local-interface** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ntp local-interface [VRF_INSTANCE] INT_PORT
```

```
no ntp local-interface
```

```
default ntp local-interface
```

Parameters

- **VRF_INSTANCE** the VRF instance to be used for connection to the specified server. Options include:
 - **no parameter** connects using the default VRF.
 - **vrf vrf_name** connects using the specified user-defined VRF.
- **INT_PORT** the interface port that specifies the NTP local interface. Settings include:
 - **ethernet e_range** Ethernet interface list.
 - **loopback l_range** loopback interface list.
 - **management m_range** management interface list.
 - **port-channel c_range** port channel interface list.
 - **vlan v_range** VLAN interface list.

Examples

- This command configures **ntp local-interface vlan 25** as the local NTP source. NTP packets exiting the switch use the IP address of **VLAN interface 25** as their source address.

```
switch(config)# ntp local-interface vlan 25
switch(config)#

```

- This command removes the **ntp local-interface** command from the configuration.

```
switch(config)# no ntp local-interface
switch(config)#

```

4.7.27 **ntp serve all**

The **ntp serve all** command configures the switch to act as an NTP server by accepting incoming NTP requests.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Individual interfaces can be configured separately to accept or deny NTP requests by using the [ntp serve](#) command, and these settings override the global setting.

Command Mode

Global Configuration

Command Syntax

```
ntp serve all  
no ntp serve all  
default ntp serve all
```

Example

- This command configures the switch to accept incoming NTP requests.

```
switch(config)# ntp serve all  
switch(config)#
```

- This command configures the switch to deny incoming NTP requests.

```
switch(config)# no ntp serve all  
switch(config)#
```

4.7.28 ntp serve

The **ntp serve** command configures the command mode interface to accept incoming NTP requests regardless of the global setting.

The **no ntp serve** command configures the command mode interface to refuse incoming NTP requests regardless of the global setting. The **default ntp serve** command configures the command mode interface to follow the global setting.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Command Modes

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

```
ntp serve
```

```
no ntp serve
```

```
default ntp serve
```

Examples

- These commands configure **interface ethernet 5** to accept incoming NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ntp serve
switch(config-if-Et5)#End
```

- These commands configure **interface ethernet 5** to deny incoming NTP requests regardless of global settings.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ntp serve
switch(config-if-Et5)#End
```

- These commands configure **interface ethernet 5** to use global settings in responding to incoming NTP requests.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# default ntp serve
switch(config-if-Et5)#End
```

4.7.29 ntp server

The **ntp server** command adds a Network Time Protocol (NTP) server to the **running-config**. If the command specifies an existing server in the **running-config**, it modifies the server settings. The switch synchronizes the system clock with an NTP server when **running-config** contains at least one valid NTP server.

The switch supports NTP versions 1 through 4. The default is version 4.

The **prefer** option specifies a preferred NTP server to use as the NTP server if not discarded by NTP.

The **no ntp server** and **default ntp server** commands remove the specified NTP server from **running-config**. To remove an NTP server configured in a user-defined VRF, include the VRF name in the **no ntp server** command.

Command Mode

Global Configuration

Command Syntax

```
ntp server [ vrf vrf_instance | host_name] refresh [version ntp_version] [source-address [ ipv4_address | ipv6_address] burst [iburst [ key auth_key ] [ maxpoll max_poll_interval ][ minpoll min_poll_interval ] prefer source interface_name  
no ntp server [vrf_instance] host_name  
default ntp server [vrf_instance] host_name
```

All parameters except **vrf** and **hostname** can be placed in any order.

Parameters

- **vrf vrf_instance** - Specify the VRF instance to use for the connection to the specified server.
- **host_name** Specify the name or IP address of the NTP server. Options include:
 - **ip_address** - Specify an IPv4 or IPv6 address in dotted decimal notation.
 - **host_name** - Specify the hostname of the NTP server.
- **prefer** - Indicates the priority of this server when the switch selects a synchronizing server.
 - **no parameter** - The server has no special priority.
 - **prefer** - This server has priority when the switch selects a synchronizing server.
- **refresh** - Specifies sending periodic DNS queries for the NTP server. If the DNS response doesn't include the resolved IP address of the NTP server, then a request selects the next available IP address and restarts the service with an updated configuration.
- **version ntp_version** - Specifies the NTP version. Settings include:
 - **no parameter** - Sets NTP version to 4 (default).
 - **version number** - Specify a version **number** from **1** to **4**.
- **source-address ip_source** - Specifies the source IPv4 address or IPv6 address for NTP updates for the specified NTP server. This option overrides global settings created by the [ntp local-interface](#) command.
- **burst** - Indicates that when the switch reaches the NTP server, the switch sends packets to the server in bursts of eight instead of the usual one. Recommended only for local servers. Disabled by default.
- **iburst** - Indicates that the switch sends packets to the server in bursts until reaching the server. Recommended for general use to speed synchronization. Disabled by default.

- **key auth_key** - Specify the authentication key to use when authenticating NTP packets from the server.
 - **no parameter** - Specify no authentication key.
 - **key 1 to 65534** - The switch uses the specified key to authenticate NTP packets from the server.
- **max_poll_interval** - Specifies the maximum polling interval for the server as the base-2 logarithm of the interval in seconds. Settings include the following:
 - **no parameter** - Sets the maximum polling interval to **10**. (**1,024** seconds, the default).
 - **maxpoll number** - Specifies to use the **number** as the base-2 logarithm of the interval in seconds. Values range from **3** (**8** seconds) to **17** (**131,072** seconds, approximately **36** hours).
- **minpoll min_poll_interval** - Specifies the minimum polling interval for the server as the base-2 logarithm of the interval in seconds. Settings include the following:
 - **no parameter** - Sets the minimum polling interval to **6** (**64** seconds, the default).
 - **number**, where **number** is the base-2 logarithm of the interval in seconds. Values range from **3** (**8** seconds) to **17** (**131,072** seconds, approximately **36** hours).

Guidelines

To configure multiple parameters for a single server, include them all in a single **ntp server** command. Using the command again for the same server overwrites parameters previously configured in **running-config**.

All NTP servers must use the same VRF. If you do not specify a VRF, the server uses the default VRF. To use a user-defined VRF for connection to an NTP server, first use the **no ntp server** command to remove any NTP servers configured in the default VRF.

When specifying a source interface, choose an interface in the same VRF as the server. If the source interface does not exist on the same VRF, the **running-config** includes the source data but does not add it to the NTP packets.

An NTP server may be configured using an invalid or inactive VRF, but the status of the NTP server remains inactive until the VRF becomes active.

Examples

- This command configures the switch to update the time with the NTP server at address **172.16.0.23** and designates it as a preferred NTP server.

```
switch(config)# ntp server 172.16.0.23 prefer
```

- This command configures the switch to update the time through an NTP server named **local-nettime**.

```
switch(config)# ntp server local-nettime
```

- This command configures the switch to update the time through a **version 3** NTP server.

```
switch(config)# ntp server 171.18.1.22 version 3
```

- These commands reconfigure the switch to access the above NTP servers through VRF magenta.

```
switch(config)# no ntp server 172.16.0.23
switch(config)# no ntp server local-nettime
switch(config)# no ntp server 171.18.1.22
switch(config)# ntp server vrf magenta 172.16.0.23 prefer
switch(config)# ntp server vrf magenta local-nettime
switch(config)# ntp server vrf magenta 171.18.1.22 version 3
switch(config)#
```

4.7.30 ntp trusted-key

The **ntp trusted-key** command specifies which authentication keys will be trusted for authentication of NTP packets. A packet with a trusted key will be used to update the local time if authenticated.

The **no ntp trusted-key** and **default ntp trusted-key** commands remove the specified authentication keys from the trusted key list by removing the corresponding **ntp trusted-key** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ntp trusted-key key_list
no ntp trusted-key
default ntp trusted-key
```

Parameter

key_list specified one or more keys. Formats include a number (**1** to **65534**), number range, or comma-delimited list of numbers and ranges.

Example

This command configures the switch to trust authentication keys **234** and **237** for authentication of NTP packets.

```
switch(config) # ntp trusted-key 234,237
switch(config) #
```

4.7.31 power enable module

The **power enable module** command powers up the specified module. The **no power enable module** command powers down the specified module.

Command Mode

Global Configuration

Command Syntax

```
power enable module {fabric|linecard|supervisor|switchcard} module_number  
no power enable module {fabric|linecard|supervisor|switchcard} module_number  
default power enable module {fabric|linecard|supervisor|switchcard} module_number
```

Parameters

fabric specifies a fabric card

linecard specifies a linecard

supervisor specifies a supervisor

switchcard specifies a switch card

module_number specifies the number of the module

Examples

- This command powers down linecard 3.

```
switch(config)# no power enable module linecard 3  
switch(config)#{}
```

- These commands reload fabric module 2.

```
switch(config)# no power enable module fabric 2  
switch(config)# power enable module fabric 2  
switch(config)#{}
```

4.7.32 prompt

The **prompt** command specifies the contents of the CLI prompt. Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

```
! @ # $ % # & * ( ) - = + f g [ ] ; : < > , . ? / # n
```

The prompt supports these control sequences:

- %s – space character
- %t – tab character
- %% – percent character
- %D – time and date
- %D{*f_char*} – time and date, format specified by the BSD **strftime** (*f_char*) time conversion function.
- %H – host name
- %h – host name up to the first ‘.’
- %P – extended command mode
- %p – command mode
- %r¹ – redundancy status on modular systems.
- %R² – extended redundancy status on modular systems – includes status and slot number.

Table 6: Command Mode Prompt Examples

| Command Mode | Command Mode Prompt | Extended Command Mode Prompt |
|--------------------------------------|---------------------|------------------------------|
| Exec | > | > |
| Privileged Exec | # | # |
| Global Configuration | (config)# | (config)# |
| Ethernet Interface Configuration | (config-if)# | (config-if-ET15)# |
| VLAN Interface Configuration | (config-if)# | (config-if-VI24)# |
| Port Channel Interface Configuration | (config-if)# | (config-if-Po4)# |
| Management Interface Configuration | (config-if)# | (config-if-Ma1) |
| Access List Configuration | (config-acl)# | (config-acl-listname)# |
| OSPF Configuration | (config-router)# | (config-router-ospf)# |
| BGP Configuration | (config-router)# | (config-router-bgp)# |

The **no prompt** and **default prompt** commands return the prompt to the default of **%H%R%P**.

Command Mode

Global Configuration

Command Syntax

```
prompt p_string
```

¹ When logged into a fixed system or a supervisor on a modular system, this option has no effect.

² When logged into a fixed system, this option has no effect.

```
no prompt  
default prompt
```

Parameters

p_string prompt text (character string). Elements include letters, numbers, and control sequences.

Examples

- This command creates a prompt that displays **system 1** and the command mode.

```
host-name.dut103(config)# prompt system%s1%P  
system 1(config)#
```

- This command creates a prompt that displays the command mode.

```
host-name.dut103(config)# prompt %p  
(config)#
```

- These equivalent commands create the default prompt.

```
% prompt %H%P  
host-name.dut103(config)#
```

```
% no prompt  
host-name.dut103(config)#
```

4.7.33 show banner

The **show banner** command displays the specified banner.

Command Mode

Privileged EXEC

Command Syntax

```
show banner BANNER_TYPE [login | motd]
```

Parameters

BANNER_TYPE banner that the command displays. Options include:

- **login** command displays login banner.
- **motd** command displays message of the day banner.

Example

These commands configure and display the message of the day banner.

```
switch(config)# banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner for $(hostname)
EOF

switch(config)# show banner motd
This is an motd banner for $(hostname)
switch(config)#

```

4.7.34 show clock

The **show clock** command displays the current system clock time and configured time zone. The switch uses the system clock for system log messages and debugging traces.

Command Mode

EXEC

Command Syntax

```
show clock
```

Example

This command displays the current system clock time and configured time zone.

```
switch> show clock
Wed Nov  2 10:29:32 2011
timezone is America/Los_Angeles switch>
```

4.7.35 show event-monitor arp

The `show event-monitor arp` command performs an SQL-style query on the event monitor database and displays ARP table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor arp [GROUP] [MESSAGES] [INTERFACE] [IP] [MAC] [TIME] [VRF]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
 - **no parameter** results are not grouped.
 - **group by interface** results are grouped by interface.
 - **group by ip** results are grouped by IP address.
 - **group by mac** results are grouped by MAC address.
 - **group by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
 - **no parameter** result-set not restricted by interface.
 - **match-interface ethernet e_range** Ethernet interface list.
 - **match-interface loopback l_range** loopback interface list.
 - **match-interface management m_range** management interface list.
 - **match-interface port-channel c_range** port channel interface list.
 - **match-interface tunnel t_range** tunnel interface list.
 - **match-interface VXLAN vx_range** VXLAN interface list.
 - **match-interface port-channel c_range** port channel interface list.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ip ip_address_rex** IP address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
 - **no parameter** result-set not restricted to specific MAC addresses.
 - **match-mac mac_address_rex** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events generated during specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

- **VRF** restricts result-set to events that include a specific VRF.
 - **no parameter** result-set not restricted by time of event.
 - **match-vrf vrf_name** the VRF name.

Example

This command displays ARP table events listed in the event monitor database.

```
switch# show event-monitor arp
% Writing 220017 Arp, 234204 Route, 1732559 Mac events to the database
2012-11-06 12:36:10|10.33.6.159|Vlan1417|0000.00dc.cc0d|0|added|2186271
2012-11-06 12:38:20|10.33.7.150|Vlan1417|0000.00f7.e25f|0|added|2186292
2012-11-06 12:38:34|10.33.6.62|Vlan1417|0000:00:01:c2:ac|0|added|2186295

4.7.36 show event-monitor igmpsnooping

The **show event-monitor igmpsnooping** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor igmpsnooping [GROUP] [MESSAGES] [MAC] [INTERFACE] [VLAN] [TIME]
```

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
 - **no parameter** results are not grouped.
 - **group-by interface** results are grouped by interface.
 - **group-by mac** results are grouped by MAC address.
 - **group-by vlan** results are grouped by VLAN.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
 - **no parameter** result-set not restricted to specific MAC addresses.
 - **match-mac mac_address_rex** MAC address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
 - **no parameter** result-set not restricted by interface.
 - **match-interface ethernet e_range** Ethernet interface list.
 - **match-interface loopback l_range** loopback interface list.
 - **match-interface management m_range** management interface list.
 - **match-interface port-channel c_range** port channel interface list.
 - **match-interface vlan v_range** VLAN interface list.
 - **match-interface tunnel t_range** tunnel interface list.
 - **match-interface VXLAN vx_range** VXLAN interface list.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.
- **VLAN** restricts result-set to events that include a specific VLAN (SQL Like command).
 - **no parameter** result-set not restricted by time of event.
 - **match-vlan vlan** VLAN interface number.

Example

```
switch# show event-monitor igmpsnooping
```

```
switch#
```

4.7.37 show event-monitor mac

The `show event-monitor mac` command performs an SQL-style query on the event monitor database and displays MAC address table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor mac [GROUP] [MESSAGES] [INTERFACE] [MAC] [TIME]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL `group by` command.
 - **no parameter** results are not grouped.
 - **group-by interface** results are grouped by interface.
 - **group-by mac** results are grouped by MAC address.
- **MESSAGES** number of messages returned from query. Analogous to SQL `limit` command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
 - **no parameter** result-set not restricted by interface.
 - **match-interface ethernet e_range** Ethernet interface list.
 - **match-interface loopback l_range** loopback interface list.
 - **match-interface management m_range** management interface list.
 - **match-interface port-channel c_range** port channel interface list.
 - **match-interface vlan v_range** VLAN interface list.
 - **match-interface tunnel t_range** tunnel interface list.
 - **match-interface VXLAN vx_range** VXLAN interface list.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
 - **no parameter** result-set not restricted to specific MAC addresses.
 - **match-mac mac_address_rex** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

Examples

- This command displays all events triggered by MAC address table events.

```
switch# show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
```

- This command displays events triggered by MAC address table changes.

```
switch# show event-monitor mac match-mac 08:08:08:%
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|added|0
```

4.7.38 show event-monitor mroute

The **show event-monitor mroute** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor mroute [GROUP] [MESSAGES] [IP] [INTERFACE] [SRC_IP] [TIME]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
 - **no parameter** results are not grouped.
 - **group-by interface** results are grouped by interface.
 - **group-by ipv6** results are grouped by IPv6 address.
 - **group-by mac** results are grouped by MAC address.
 - **group-by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ipv6 ip_address_rex** IP address, as represented by regular expression.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
 - **no parameter** result-set not restricted by interface.
 - **match-interface ethernet e_range** Ethernet interface list.
 - **match-interface loopback l_range** loopback interface list.
 - **match-interface management m_range** management interface list.
 - **match-interface port-channel c_range** port channel interface list.
 - **match-interface vlan v_range** VLAN interface list.
 - **match-interface tunnel t_range** tunnel interface list.
 - **match-interface VXLAN vx_range** VXLAN interface list.
- **SRC_IP** restricts result-set to events that include specified Source IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ip ip_address_rex** IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor mroute
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|||added|30
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan2|iif|join|31

```

4.7.39 show event-monitor neighbor

The **show event-monitor neighbor** command performs an SQL-style query on the event monitor database and displays neighbor table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor neighbor [GROUP][MESSAGES][INTERFACE][IP6][MAC][TIME][VRF]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
 - **no parameter** results are not grouped.
 - **group-by interface** results are grouped by interface.
 - **group-by ip6** results are grouped by IPv6 address.
 - **group-by mac** results are grouped by MAC address.
 - **group-by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **INTERFACE** restricts result-set to events that include specified interface (SQL Like command).
 - **no parameter** result-set not restricted by interface.
 - **match-interface ethernet e_range** Ethernet interface list.
 - **match-interface loopback l_range** loopback interface list.
 - **match-interface management m_range** management interface list.
 - **match-interface port-channel c_range** port channel interface list.
 - **match-interface vlan v_range** VLAN interface list.
 - **match-interface tunnel t_range** tunnel interface list.
 - **match-interface VXLAN vx_range** VXLAN interface list.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ipv6 ip6_address_rex** IPv6 address, as represented by regular expression.
- **MAC** restricts result-set to events that include specified MAC address (SQL Like command).
 - **no parameter** result-set not restricted to specific MAC addresses.
 - **match-mac mac_address_rex** MAC address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

- VRF restricts result-set to events that include a specific VRF (SQL Like command).
 - ***no parameter*** result-set not restricted by time of event.
 - **match-vrf vrf_name** VRF name, as represented by a regular expression.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor neighbor
2019-09-30 14:37:32.894147|def0::1|Vlan1|default|0005.0005.0005|1|added|1

```

4.7.40 show event-monitor route6

The **show event-monitor route6** command performs an SQL-style query on the event monitor database and displays routing6 table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor route6 [GROUP][MESSAGES][IP6][TIME]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
 - **no parameter** results are not grouped.
 - **group by interface** results are grouped by interface.
 - **group by ip6** results are grouped by IPv6 address.
 - **group by mac** results are grouped by MAC address.
 - **group by vrf** results are grouped by VRF.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **IP6** restricts result-set to events that include specified IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ipv6 ip6_address_rex** IPv6 address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

Example

This command displays neighbor table events listed in the event monitor database.

```
switch# show event-monitor route6

```

4.7.41 show event-monitor route

The **show event-monitor route** command performs an SQL-style query on the event monitor database and displays routing table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor route [GROUP][MESSAGES][IP][TIME]
```

Optional parameters can be placed in any order.

Parameters

- **GROUP** used with aggregate functions to group results. Analogous to SQL **group by** command.
 - **no parameter** results are not grouped.
 - **group-by ip** results are grouped by IPv4 address.
- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **IP** restricts result-set to events that include specified IP address (SQL Like command).
 - **no parameter** result-set not restricted to specific IP addresses.
 - **match-ip ip_address_rex** IP address, as represented by regular expression.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

Example

This command displays 10 routing table events listed in the event monitor database.

```
switch# show event-monitor route limit 10
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|updated|20

```

4.7.42 show event-monitor sqlite

The **show event-monitor sqlite** command performs an SQL-style query on the event monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor sqlite statement
```

Parameter

statement SQLite statement.

Example

This command displays all entries from the route table.

```
switch# show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|updated|20
2019-09-30 14:01:21.659464|192.168.201.12/30|default|connected|1|0|updated|21
2019-09-30 14:01:21.659497|192.168.1.255/32|default|receiveBcast|0|0|updated|22
2019-09-30 14:01:21.659503|192.168.201.8/32|default|receiveBcast|0|0|updated|23
2019-09-30 14:01:21.659512|16.16.16.0/32|default|receiveBcast|0|0|updated|24
2019-09-30
14:01:21.659517|192.168.201.12/32|default|receiveBcast|0|0|updated|25
2019-09-30
14:01:21.659524|192.168.201.15/32|default|receiveBcast|0|0|updated|26
2019-09-30 14:01:21.659541|192.168.201.8/30|default|connected|1|0|updated|27
2019-09-30 14:01:21.659564|16.16.16.0/24|default|connected|1|0|updated|28
2019-09-30 14:01:21.659578|192.168.201.9/32|default|receive|0|0|updated|29 switch#
```

4.7.43 show event-monitor stpunstable

The **show event-monitor stpunstable** command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

Command Mode

Privileged EXEC

Command Syntax

```
show event-monitor stpunstable [MESSAGES][TIME]
```

Optional parameters can be placed in any order.

Parameters

- **MESSAGES** number of messages returned from query. Analogous to SQL **limit** command.
 - **no parameter** result-set size is not limited.
 - **limit msg_quantity** number of results that are displayed. Values range from **1** to **15,000**.
- **TIME** restricts result-set to events with specified period.
 - **no parameter** result-set not restricted by time of event.
 - **match-time last-minute** includes events generated during last minute.
 - **match-time last-day** includes events generated during last day.
 - **match-time last-hour** includes events generated during last hour.
 - **match-time last-week** includes events generated during last week.

Example

```
switch# show event-monitor stpunstable limit 5
2019-02-07 07:22:10.286164|Cist|Ethernet5|forward-delay-while|1
2019-02-07 07:22:10.286651|Cist|Ethernet6|forward-delay-while|2
2019-02-07 07:22:10.286844|Cist|Ethernet8|forward-delay-while|3
2019-02-07 07:22:10.287030|Cist|Ethernet14|forward-delay-while|4
2019-02-07 07:22:10.287215|Cist|Ethernet21|forward-delay-while|5 switch#
```

4.7.44 show hostname

The **show hostname** command displays the hostname and the Fully Qualified Domain Name (FQDN) of the switch.

Command Mode

EXEC

Command Syntax

show hostname

Example

This command displays the hostname and FQDN of the switch.

```
switch> show hostname
Hostname: switch_1
FQDN:      switch_1.aristanetworks.com switch>
```

4.7.45 show hosts

The **show hosts** command displays the default domain name, name lookup service style, a list of name server hosts, and the static hostname-IP address maps.

Command Mode

EXEC

Command Syntax

show hosts

Example

This command displays the switch's IP domain name:

```
switch> show hosts
Default domain is: aristananetworks.com
Name/address lookup uses domain service
Name servers are: 172.22.22.40, 172.22.22.10
Static Mappings:
      Hostname          IP      Addresses
TEST_LAB           IPV4    10.24.18.6
PRODUCTION_LAB    IPV4    10.24.18.7
SUPPORT_LAB       IPV6  2001:0DB8:73:ff:ff:26:fd:90
switch>
```

4.7.46 show ip domain-name

The **show ip domain-name** command displays the switch's IP domain name that is configured with the **ip domain name** command.

Command Mode

EXEC

Command Syntax

```
show ip domain-name
```

Example

This command displays the switch's IP domain name:

```
switch> show ip domain-name  
aristanetworks.com switch>
```

4.7.47 show ip name-server

The **show ip name-server** command displays the ip addresses of name-servers in *running-config*. The name servers are configured by the **ip name-server** command.

Command Mode

EXEC

Command Syntax

```
show ip name-server
```

Example

This command displays the IP address of name servers that the switch is configured to access.

```
switch> show ip name-server
172.22.22.10
172.22.22.40 switch>
```

4.7.48 show local-clock time-properties

The `show local-clock time-properties` command displays the Precision Time Protocol (PTP) clock properties.

Command Mode

Privileged EXEC

Command Syntax

```
show local-clock time-properties
```

Example

This command shows the PTP clock properties.

```
switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0 switch#
```

4.7.49 show ntp associations

The `show ntp associations` command displays the status of connections to NTP servers.

Command Mode

EXEC

Command Syntax

```
show ntp associations
```

Display Values

- **refid (reference ID)**: the reference ID of the configured NTP server's time source. The reference ID is either the IPv4 address of the source or (if the source has an IPv6 address) the first four octets of the MD5 hash of the IPv6 address.
- **st (stratum)**: number of steps between the switch and the reference clock.
- **t (transmission type)**: u unicast; b broadcast; l local.
- **when**: interval since reception of last packet (seconds unless unit is provided).
- **poll**: interval between NTP poll packets. Maximum (1024) reached as server and client syncs.
- **reach**: octal number that displays status of last eight NTP messages (377 - all messages received).
- **delay**: round-trip delay of packets to the NTP server.
- **offset**: difference between local clock and the server's clock.
- **jitter**: nominal offset estimation error.

Example

This command displays the status of the switch's NTP associations.

```
switch> show ntp associations
      remote      refid      st t when    poll   reach     delay    offset   jitter
=====
+1.ntp.arista.co 125.157.10.11  2 u  539  1024  377  121.748  -0.345  0.893
-3.ntp.arista.co 127.31.152.34  2 u  868  1024  377  101.671   2.434  1.529
+2.ntp.arista.co 176.131.12.185 2 u  676  1024  377  116.505   0.03   0.768
*4.ntp.arista.co 120.181.192.192 2 u  696  1024  377  48.431  -0.416  0.15 switch#
```

4.7.50 show ntp status

The **show ntp status** command displays the status of NTP on the switch. If the switch clock is not synchronized to an NTP server, the status reads “unsynchronised” and shows the server polling interval. If the clock is synchronized to an NTP server, the status shows the IP address and stratum of the server, the precision of the synchronization, and the polling interval.

Note: In EOS releases prior to 4.23.2, this command identified system peers with IPv6 addresses by their reference IDs (the first four octets of the MD5 hash of the IPv6 address). In later releases, this command always shows the IP address of the system peer (whether IPv4 or IPv6).

Command Mode

EXEC

Command Syntax

```
show ntp status
```

Example

This command displays the switch's NTP status.

```
switch> show ntp status
synchronised to NTP server (192.168.78.62) at stratum 3
    time correct to within 66 ms
    polling server every 1024 s
switch>
```

7130 Platform Layer 1 Configuration

This section describes the purpose, behavior, and configuration of the 7130 platform and includes the following topics:

- [Configuring Layer 1 on 7130 Platform Interface](#)
 - [Addressing 7130 Platform Speed Mismatch](#)
 - [Configuring the 7130 Platform and Multilane Sourcing](#)
 - [Using Show Commands to Confirm Source Configurations](#)
- [7130 Platform Layer 1 Commands](#)

7130 Platform Overview

The Arista 7130 Series provides a comprehensive set of platforms to service ultra-low latency networking, in-network applications, and composable custom packet processing. The product family contains a broad selection of powerful hardware, FPGA-based network applications and developer toolkits.

The series contains the following features:

- The 7130 Connect Layer 1+ network devices with port-to-port ultra low latencies.
- The FPGA-enabled devices of the 7130E and L Series, programmable switches hosting up to 3 FPGAs, and running Arista and third party network applications.
- The 7130 network applications which feature capabilities for low latency multiplexing using a MetaMux interface, tapping, tap aggregation, and sub-nanosecond precision timestamping on a MetaWatch interface. Capabilities also include Layer 2 switching on a SwitchApp, filtering on a MetaProtect interface, inline timestamping on an ExchangeApp interface, and segmented multiplexing for multi-tenant environments on a MultiAccess interface. Arista also provides development toolkits and IP Cores for users to develop applications.

This chapter provides information about [configuring a 7130 Layer 1 interface](#) to connect on your network.

5.1 Configuring Layer 1 on the 7130 Platform

Switch interfaces can be used instead of the application interfaces for creating connections between app interfaces and front panel ports. Configure Layer 1 traffic between front panel ports, application FPGA ports, and switch interfaces using the [l1 source](#) command.

Adding this connection does not affect previously configured destinations.

This section contains the following topics:

- [Addressing 7130 Platform Speed Mismatch](#)
- [Configuring the 7130 Platform and Multilane Sourcing](#)
- [Using Show Commands to Confirm Source Configurations](#)

On DCS-7130 series switches, change the default connections dynamically by using the [l1 source](#) and using the switch interfaces as a source or destination. Connect bidirectional network traffic on a Switch1/26 and an Ethernet 36 interface when using a Layer 2 full profile.

Example

```
switch(config)# 11 connect Switch1/26 Ethernet36
```

Configuring Layer 1 on an Interface

Use the following command to connect Layer 1 traffic from the Ethernet interface **et2**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# 11 source interface et2
```

Configuring Layer 1 for a MetaMux Interface

MetaMux is an FPGA-based feature available on Arista 7130 platforms. It performs ultra-low latency Ethernet packet multiplexing with or without packet contention queuing. The port to port latency functions as the selected MetaMux profile, using the front panel ingress port, the front panel egress port, the FPGA connector ingress port, and the platform.

Use the **11 source** and **11 connect** commands to connect the **MuxIn** and **MuxOut** ports to Ethernet ports. In this example, the commands connect the first two Mux1 inputs, **MuxIn2/1/1** and **MuxIn2/1/2** of the MetaMux instance 2 to the ingress ports of Ethernet 17 and 20 and the Mux1 output, **MuxOut2/1** of the same instance to the egress port of Ethernet 22.

Example

Use the following commands to configure a Layer 1 topology for a MetaMux interface:

```
switch(config)# interface MuxIn 2/1/1
switch(config-if-MuI2/1/1)# 11 source interface Eth5
switch(config-if-MuI2/1/1)# interface MuxIn 2/1/2
switch(config-if-MuI2/1/2)# 11 source interface Eth6
switch(config-if-MuI2/1/2)# interface eth11
switch(config-if-Et22)# 11 source interface muxout 2/1
```

To verify the configuration, use the [show 11 path](#) or [show 11 matrix](#) commands:

```
switch# show 11 path int et17,20,22
Source          Destination      Type
-----
Ethernet17      MuxIn2/1/1 (Ap2/1) dynamic
Ethernet20      MuxIn2/1/2 (Ap2/2) dynamic
MuxOut2/1 (Ap2/4)   Ethernet22    dynamic

switch# show 11 matrix int et5,6,11
      Ethernet   MuxIn
      5 6 11     2/1/1* 2/1/2*
Et5 -> -|-|-----+   |
Et6 -> -|-|-----+
MuO2/1* -> -|-|+
MAC -> +-+
* indicates interface is a function interface
```

For more information about MetaMux interfaces, see [Software Downloads](#) for the 7130 platform.

Configuring Layer 1 for MultiAccess

7130 platforms provide support for MultiAccess, an FPGA-based feature. It performs low-latency Ethernet multiplexing with optional packet contention queuing, storm control, VLAN tunneling, and packet access control. The interface to interface latency provides functionality for the selected MultiAccess profile, front panel interfaces, MultiAccess interfaces, configuration settings, and platform used. The MultiAccess feature uses the Downstream and Upstream interfaces to connect to Ethernet interfaces.

Example

To configure Multiaccess Layer 1 topology, use the following commands. In this case, you have an active Multiaccess instance with an ID of 2 to bidirectionally connect the two Downstream interfaces from Group 2 to Ethernet interfaces, 17 and 20.

```
switch(config)# interface Ethernet17
switch(config-if-Et17)# 11 source interface Downstream2/1/1
switch(config-if-Et17)# interface Downstream2/1/1
switch1(config-if-Dn2/1/1)# 11 source interface Ethernet17
switch(config-if-Dn2/1/1)#

switch(config)# interface Ethernet20
switch(config-if-Et20)# 11 source interface Downstream2/1/2
switch(config-if-Et20)# interface Downstream2/1/2
switch(config-if-Dn2/1/2)# 11 source interface Ethernet20
switch(config-if-Dn2/1/2)#

```

Next, add the Upstream interface, **Upstream2/1**, to the configuration:

```
oml201(config)# interface Ethernet25
switch(config-if-Et25)# 11 source interface Upstream2/1
switch(config-if-Et25)# interface Upstream2/1
switch(config-if-Up2/1)# 11 source interface Ethernet25
switch(config-if-Up2/1)#

```

To display the configuration, use the **show 11 path** and the **show 11 matrix** command:

```
switch# show 11 path interface Ethernet17,20,25
Source          Destination          Type
-----
Ethernet17      Downstream2/1/1 (Ap1/5)    dynamic
Ethernet20      Downstream2/1/2 (Ap1/6)    dynamic
Ethernet25      Upstream2/1 (Ap1/12)     dynamic
Downstream2/1/1 (Ap1/5)   Ethernet17    dynamic
Downstream2/1/2 (Ap1/6)   Ethernet20    dynamic
Upstream2/1 (Ap1/12)    Ethernet25    dynamic

switch# show 11 matrix interface Ethernet17,20,25
      Ethernet  Downstream  Upstream
      17 20 25  2/1/1* 2/1/2* 2/1*
Et17 -> -|---|---+ | |
Et20 -> -|---|---+ | |
Et25 -> -|---|---+ |
Dn2/1/1* -> --+ | |
Dn2/1/2* -> ----+ |
Up2/1* -> -----+
* indicates interface is a function interface

```

For more information about MultiAccess interfaces, see [Software Downloads](#) for the 7130 platform.

5.1.1 Addressing 7130 Platform Speed Mismatch

When configuring the L1 source of an interface, the following speed restrictions should be considered:

- The configuration for an L1 source only applies if the source and destination interfaces have the same speed configuration.
- If you configure an interface and a single lane with a multilane speed, such as 40Gbps, all other lanes must also be sourced individually. In the config mode, display the additional lanes with the [service interface inactive expose](#) command.

If you configure the two interfaces with mismatched speeds, the mapping does not apply to the configuration. When running the **11 source** command, the console does not display any warnings that a speed

mismatch exists. When you execute the `11 source` command, you can see if the configuration accepts the parameters.

```
(config) #int sw1/1/1
    (config-if-sw1/1/1) #speed 10g
    (config-if-sw1/1/1) #int et1/1
    (config-if-et1/1) #speed 1g
    (config-if-et1/1) #11 source int sw1/1/1

Interface      Source Interface      Type
-----          -----
Ethernet1/1                dynamic
```

Check the `show logging` output for warnings about speed mismatch. In this example, you see the following syslog text:

```
L1SOURCE-6-SPEED_MISMATCH: Speed mismatch found between Layer1 source Switch1/1/1 and destination Ethernet1/1, configuration has not been applied.
```

If you attempt to configure an unsupported interface, such as a static interface, as a source, the `show logging` output displays the following log message:

```
L1SOURCE-6-UNSUPPORTED: The configured Layer1 source for interface name is unsupported.
```

When you resolve the misconfiguration, the `show logging` output displays the following log message:

```
L1SOURCE-6-OK: Layer1 sourcing has been successfully applied between source source interface and destination destination interface.
```

5.1.2 Configuring the 7130 Platform and Multilane Sourcing

Source the lanes individually if an interface configuration has a multi-lane speed, such as 40Gbps. Display the individual lanes using the `service interface inactive expose` command while in the configure mode. Configure the individual lanes with a corresponding interface name. To learn more about configuring port speeds, see [speed](#).

See the example for an Ethernet interface connecting to a switch interface at 40Gbps.

Example

The following commands expose the individual lanes on interface `sw1` and set the sources and speed.

```
(config) # service interface inactive expose
(config) # int sw1/1/1
(config-if-sw1/1/1) # speed 40g
(config-if-sw1/1/1) # int et1/1
(config-if-et1/1) # speed 40g
(config-if-et1/1) # 11 source int sw1/1/1
(config-if-et1/1) # int et1/2
(config-if-et1/2) # 11 source int sw1/1/2
(config-if-et1/2) # int et1/3
(config-if-et1/3) # 11 source int sw1/1/3
(config-if-et1/3) # int et1/4
(config-if-et1/4) # 11 source int sw1/1/4
(config-if-et1/4) # show 11 source int et1/1-4

Interface      Source Interface      Type
-----          -----
Ethernet1/1      Switch1/1/1      dynamic
Ethernet1/2      Switch1/1/2      dynamic
Ethernet1/3      Switch1/1/3      dynamic
Ethernet1/4      Switch1/1/4      dynamic
```

5.1.3 Using Show Commands to Confirm Source Configurations

If the interfaces have matching speeds and the configuration applies to the interface, confirm the configuration by running the `show ll source` command on the destination interface.

```
(config-if-et1/1) # ll source int sw1/1/1
(config-if-et1/1) # show ll source int et1/1
Interface      Source Interface      Type
-----          -----
Ethernet1/1    Switch1/1/1         dynamic
```

If a speed mismatch occurs, the `show ll source` output does not display mapping for the mismatched interface. To display the speed of the source before the mismatch occurs, use the `show active` command and check the output. View the mismatched speeds by running the `show interface status` command for each interface.

```
(config-if-et1/1) # ll source int sw1/1/1
(config-if-et1/1) # show ll source int et1/1
Interface      Source Interface      Type
-----          -----
Ethernet1/1    dynamic

(config-if-et1/1) # show active
interface Ethernet1
11 source interface Switch1/1/1
```

```
(config-if-et1/1) # show interface et1/1 status
Port   Name   Status   Vlan   Duplex   Speed   Type   Flags Encapsulation
-----  -----  -----
Et1     signal  Not Bridged  full    10G    10GBASE-CR

(config-if-et1/1) # show interface sw1/1/1 status
Port   Name   Status   Vlan   Duplex   Speed   Type   Flags Encapsulation
-----  -----  -----
Sw1/1/1  notconnect  1       full    1G     N/A
```

Static Mappings and Speed Mismatches

Some configurations may appear even if a speed mismatch occurs on the interfaces. You may see the configurations when reviewing the static interface mappings. You cannot change the static mappings using the CLI and the `ll source` command or change the speed. Compare this to dynamic mappings, which can be configured and updated based on speed changes.

The example output displays the static mappings between the switch and application interfaces on a DCS-7130LBR series device:

```
#show ll source interface sw1/25/1-8
Interface      Source Interface      Type
-----          -----
Switch1/25/1   Application1/25    static
Switch1/25/2   Application1/26    static
Switch1/25/3   Application1/27    static
Switch1/25/4   Application1/28    static
Switch1/25/5   Application1/57    static
Switch1/25/6   Application1/58    static
Switch1/25/7   Application1/59    static
Switch1/25/8   Application1/60    static
```

L1 Configuration Considerations

The following information should be considered when using the L1 source suite of commands:

- EOS only enforces speed mismatch on Ethernet to Ethernet, switch to switch, and Ethernet to switch connections. Be sure both sides of a connection have matching speeds to avoid linking between 10G and 40G interfaces. Currently, EOS does not enforce speed checks on the following interface:
 - **Cpu**
- The **show l1 source** command does not display a mapping for a mismatched interface. Run the **show active** command to display the source before speeds mismatched. The default source is configured if the output does not display a mapping.

For more information, refer to <https://www.arista.com/en/support/toi/eos-4-27-1f/14877-switchapp-ultra-low-latency-packet-switch>.

5.2 7130 Layer 1 Commands

Layer 1 Configuration Commands

- [l1 source](#)

Layer 1 Show Commands

- [show l1 destination](#)
- [show l1 matrix](#)
- [show l1 path](#)
- [show l1 source](#)
- [show l1 source capabilities](#)

5.2.1 l1 source

The **l1 source** command configures the source for patching Layer 1 traffic between various front panel interfaces and Switch Application (SwitchApp) ports in the Ethernet Interface configuration mode.

The **no l1 source** and **default l1 source** commands remove the source configurations and return to the default platform configurations.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
l1 source [interface | mac | none]
```

Parameters

- **interface** patches the Layer 1 traffic from the specified interface.
 - **Application 1-1** - Application FPGA connector interface
 - **CPU 1-4** - CPU interface
 - **Downstream 1-255** - Downstream interface
 - **Ethernet 1-96** - Ethernet interface
 - **MuxIn 1-24** - Metamux input interface
 - **MuxOut 1-24** - Metamux output interface
 - **Ptp 1-2** - MetaWatch PIP interface
 - **Switch 1-7** Switch interface
 - **TrafficGen 1-256** - Traffic Generation interface
 - **Upstream 1-255** - Upstream interface
 - **WatchIn 1-255** - WatchIn interface
 - **WatchOut 1-255** - WatchOut interface
 - **WatchPassthrough 1-255** - Watch passthrough interface
 - **WhiteRabbit 1-255** - White Rabbit interface
- **mac** patches the Layer 1 traffic from the specified MAC address.
- **none** unpatches the Layer 1 traffic source.

Examples

- This command patches the Layer 1 traffic from the Ethernet interface **et2**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# l1 source interface et2
switch(config-if-Et1) #
```

- This command unpatches the Layer 1 traffic source.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# l1 source none
```

```
(config)# int sw1/1/1
(config-if-sw1/1/1)# speed 10g
(config-if-sw1/1/1)# int et1/1
(config-if-et1/1)# speed 1g
(config-if-et1/1)# l1 source int sw1/1/1
(config-if-et1/1)# show l1 source int et1/1
```

| Interface | Source Interface | Type |
|-----------|------------------|------|
|-----------|------------------|------|

Ethernet1/1

dynamic

5.2.2 show ll destination

The `show ll destination` command displays the list of all destinations for all interfaces.

Command Mode

Privileged EXEC

Command Syntax

```
show ll destination [interface]
```

Parameters

interface lists the destination interfaces to connect for the specified interface.

- **application** - Application FPGA connector interface.
- **cpu** - CPU interface.
- **ethernet** - Ethernet interface.
- **switch** - Switch interface.

Examples

- This command displays the list of all interfaces to connect in the crosspoint and the specific destination ports.

```
switch> show ll destination

Interface          Destination Interface(s)  Type
-----            -----
Ethernet1          App1/1, Sw1           dynamic
Ethernet2          Ethernet3, Ethernet4   dynamic
Ethernet3
Ethernet4
Ethernet5
App1/1             Ethernet1           dynamic
App1/2             Sw17                static
Sw1
Sw2
Sw3
Sw4
Sw5
Sw17               App1/2              static
Cpu1
Cpu2
```

Note: Interfaces without a destination port are listed, but the Destination Interface and Type columns appear as blanks.

- This command displays the list of destination interfaces to connect for the Ethernet interface **et1**.

```
switch# show ll destination interface et1

Interface          Destination Interfaces   Type
-----            -----
Ethernet1          App1/1, Sw1           dynamic
```

5.2.3 show l1 matrix

The **show l1 matrix** command displays the matrix representation of Layer 1 paths for available interfaces in the privileged EXEC mode.

Command Mode

Privileged EXEC

Command Syntax

```
show l1 matrix [all | interface | detail | physical]
```

Parameters

- **all** displays the matrix of Layer 1 paths for possible interface types even if they do not have a connection.
- **interface** displays the matrix of Layer 1 paths for the specified interface.
 - **Application** 1-1 - Application FPGA connector interface
 - **CPU** 1-4 - CPU interface
 - **Downstream** 1-255 - Downstream interface
 - **Ethernet** 1-96 - Ethernet interface
 - **MuxIn** 1-24 - Metamux input interface
 - **MuxOut** 1-24 - Metamux output interface
 - **Ptp** 1-2 - MetaWatch PIP interface
 - **Switch** 1-7 Switch interface
 - **TrafficGen** 1-256 - Traffic Generation interface
 - **Upstream** 1-255 - Upstream interface
 - **WatchIn** 1-255 - WatchIn interface
 - **WatchOut** 1-255 - WatchOut interface
 - **WatchPassthrough** 1-255 - Watch passthrough interface
 - **WhiteRabbit** 1-255 - White Rabbit interface
- **detail** displays the detailed matrix of Layer 1 paths.
- **physical** displays the Layer 1 matrix for physical interfaces only.

Examples

- This command displays the matrix of Layer 1 paths for all available interface types.

```
switch> show l1 matrix
Ethernet      Switch      App
1 3 4        1 17        1/1 1/2
| | |        | |         | |
Et1 -> -|-|-|-----+-----+
Et2 -> -|---+-----+
Sw17 -> -|-----+-----+
App1/1 -> --+-----+
App1/2 -> -----+
```

- This command displays the matrix of Layer 1 paths for all available interface types even if the interfaces do not have a connection.

```
switch> show l1 matrix all
Ethernet                               Switch
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16   1 2 3 4 5 6 7 8 9 10

5.2.4 show l1 path

The **show l1 path** command displays the source and destination paths for all interfaces in the system.

Command Mode

Privileged EXEC

Command Syntax

show l1 path [interface]

Parameters

- **interface** lists the connections available for the specified interface.
 - **Application 1-1** - Application FPGA connector interface
 - **CPU 1-4** - CPU interface
 - **Downstream 1-255** - Downstream interface
 - **Ethernet 1-96** - Ethernet interface
 - **MuxIn 1-24** - Metamux input interface
 - **MuxOut 1-24** - Metamux output interface
 - **Ptp 1-2** - MetaWatch PIP interface
 - **Switch 1-7** Switch interface
 - **TrafficGen 1-256** - Traffic Generation interface
 - **Upstream 1-255** - Upstream interface
 - **WatchIn 1-255** - WatchIn interface
 - **WatchOut 1-255** - WatchOut interface
 - **WatchPassthrough 1-255** - Watch passthrough interface
 - **WhiteRabbit 1-255** - White Rabbit interface

Examples

- This command displays the source and destination paths for all interfaces in the system.

```
switch# show l1 path
Source          Destination        Type
-----
Ethernet1       App1/1            dynamic
Ethernet1       Sw1               dynamic
Ethernet2       Ethernet3         dynamic
Ethernet2       Ethernet4         dynamic
App1/1          Ethernet1         dynamic
App1/2          Sw17              static
Sw17            App1/2            static
```

- This command displays the list of all connections that include the Ethernet interfaces **et1** and **et4**.

```
switch# show l1 path interface et1, et4
Source          Destination        Type
-----
Ethernet1       App1/1            dynamic
Ethernet1       Sw1               dynamic
Ethernet2       Ethernet4         dynamic
App1/1          Ethernet1         dynamic
```

5.2.5 show l1 source

The **show l1 source** command displays the list of all source interfaces to connect for specific interfaces such as Ethernet ports, switch, FPGA ports, or CPU ports.

Command Mode

Privileged EXEC

Command Syntax

```
show l1 source [interface | capabilities]
```

Parameters

- **interface** lists the source interfaces available to connect for the specified interface.
 - **Application 1-1** - Application FPGA connector interface
 - **CPU 1-4** - CPU interface
 - **Downstream 1-255** - Downstream interface
 - **Ethernet 1-96** - Ethernet interface
 - **MuxIn 1-24** - Metamux input interface
 - **MuxOut 1-24** - Metamux output interface
 - **Ptp 1-2** - MetaWatch PIP interface
 - **Switch 1-7** Switch interface
 - **TrafficGen 1-256** - Traffic Generation interface
 - **Upstream 1-255** - Upstream interface
 - **WatchIn 1-255** - WatchIn interface
 - **WatchOut 1-255** - WatchOut interface
 - **WatchPassthrough 1-255** - Watch passthrough interface
 - **WhiteRabbit 1-255** - White Rabbit interface
- **capabilities** lists the Layer 1 source capabilities for the specified switch.

Examples

- This command displays the list of all source interfaces to connect in the crosspoint and the specific interfaces.

```
switch# show l1 source
Interface      Source Interface     Type
-----
Ethernet1      App1/1             dynamic
Ethernet2
Ethernet3      Ethernet2          dynamic
Ethernet4      Ethernet2          dynamic
Ethernet5      MAC                dynamic
App1/1         Ethernet1          dynamic
App1/2         Sw17               static
Sw1            Ethernet1          dynamic
Sw2
Sw3
Sw4
Sw5
Sw17           App1/2             static
Cpu1
Cpu2
```

Note: Interfaces without a source port are listed as well, but the Source Interface and Type columns appear as blanks.

- This command displays the list of source interfaces to connect for the Ethernet interface **et1**.

```
switch# show l1 source interface et1
Interface          Source Interface      Type
-----              -----
Ethernet1           App1/1                  dynamic
```

5.2.6 show l1 source capabilities

The **show l1 source capabilities** command displays the list of all interfaces available to connect in the crosspoint and the possible source ports.

Command Mode

Privileged EXEC

Command Syntax

```
show l1 source capabilities
```

Examples

- This command displays the list of all possible source interfaces available to connect in the crosspoint and the specific interfaces.

```
switch# show l1 source capabilities
Interface          Possible Source Interface(s)
-----
Ethernet1          Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet2          Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet3          Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet4          Ap1/1,Cpu1-2,Et1-16,Sw1-16
Ethernet5          Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/1     Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/2     Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch1            Sw17
Switch2            Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch3            Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch4            Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch5            Ap1/1,Cpu1-2,Et1-16,Sw1-16
Switch17           Ap1/2
Cpu1              Ap1/1,Cpu1-2,Et1-16,Sw1-16
Cpu2              Ap1/1,Cpu1-2,Et1-16,Sw1-16
```

- This command displays the list of possible source interfaces available to connect for the Ethernet interface **et1**.

```
switch# show l1 source interface et1 capabilities
Interface          Possible Source Interface(s)
-----
Ethernet1          Ap1/1,Cpu1-2,Et1-16,Sw1-16
```

- This command displays the list of possible source interfaces available to connect for the FPGA port **fpga**.

```
switch# show l1 source fpga capabilities
Interface          Possible Source Interface(s)
-----
Application1/1    Ap1/1,Cpu1-2,Et1-16,Sw1-16
Application1/2    Sw17
```

Timing Protocols

The Precision Time Protocol (PTP) provides clock accuracy for networked devices, allowing clocks to be synchronized locally in increments of less than a microsecond. PTP uses a master-slave hierarchy similar to that used by NTP. The master clock provides the most precise time, and slave devices use its signal to synchronize their clocks.

The master clock sends a **sync** request, called an **announce** message by the IEEE 1588-2008 standard, at a regular interval. The slave clock responds with a time-stamped delay request message in order to measure and compensate for packet delays between the devices. The slave then receives a message from the master specifying the time of the delay message and allows the slave to calculate final values for clock synchronization. The time maintains synchronization by regularly exchanging PTP packets between master and slave.

Note: Arista switches do not support setting the system clock using PTP. Use the NTP service on the PTP grandmaster for system clock synchronization.

EOS disables PTP globally by default. Enabling PTP on an interface requires the following steps:

- [Setting the PTP Mode](#)
- [Enabling PTP on an Interface](#)

Optional PTP global configurations include the following:

- [Configuring the PTP Domain](#)
- [Configuring the Offset Hold Time](#)
- [Setting the PTP Priority](#)
- [Configuring the Source IP](#)
- [Configuring the TTL for PTP Packets](#)
- [Configuring PTP Monitoring](#)

Optional PTP interface-level configurations include the following:

- [Setting the PTP Announce Interval](#)
- [Setting the PTP Timeout Interval](#)
- [Configuring the PTP Delay Mechanism](#)
- [Setting the Delay Request Interval](#)
- [Setting the Peer Delay Request Interval](#)
- [Setting the Peer Link Propagation Threshold](#)
- [Setting the Interval for Sending Synchronization Messages](#)
- [Setting the PTP Transport Type](#)
- [Viewing PTP Settings and Status](#)
- [Precision Time Protocol \(PTP\) Commands](#)

6.1 Setting the PTP Mode

To enable PTP on switch interfaces, set the PTP mode using the `ptp mode` command. PTP mode options include the following:

- **boundary** - The device acts as a boundary clock and runs and participates in the best master clock algorithm.
- **disabled** - Disables PTP, and the device forwards all PTP packets as normal traffic.
- **end-to-end transparent** - The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
- **peer-to-peer transparent** - The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
- **generalized Precision Time Protocol (gPTP)** - The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

To disable PTP globally on the switch, use the `no` or `default` forms of the `ptp mode` command.

Example

This command configures the device as a PTP boundary clock.

```
switch(config)# ptp mode boundary  
switch(config) #
```

6.2 Enabling PTP on an Interface

To enable PTP on a specific interface on the device, use the `ptp enable` command.

Example

This command enables PTP on **interface ethernet 5**.

```
switch(config)# interface ethernet 5  
switch(config-if-Et5)#ptp enable
```

6.3 Configuring the PTP Domain

To set the domain number to use for the clock, use the `ptp domain` command.

Example

This command configures the **domain 1** to use with a clock.

```
switch(config)# ptp domain 1  
switch(config) #
```

6.4 Configuring the Offset Hold Time

To set the PTP offset hold time, use the `ptp hold-ptp-time` command.

Example

This command configures the PTP offset hold time to **600** seconds.

```
switch(config)# ptp hold-ptp-time 600
switch(config)#{
```

6.5 Setting the PTP Priority

To set the priority 1 value, use the `ptp priority1` command. Lower values take precedence.

This command configures the priority 1 value of **120** to use when advertising the clock.

```
switch(config)# ptp priority1 120
switch(config)#{
```

To set the priority 2 value for the clock, use the `ptp priority2` command.

This command configures the priority 2 value of **128**.

```
switch(config)# ptp priority2 128
switch(config)#{
```

6.6 Configuring the Source IP

To set the source IP address for all PTP packets, use the `ptp source` command.

Example

This command configures the source IP address of **10.0.2.1** for all PTP packets.

```
switch(config)# ptp source ip 10.0.2.1
switch(config)#{
```

This command configures the source IP address of **2001:db8:ac10:fe01::** for all PTP packets.

```
switch(config)# ptp source ip 2001:db8:ac10:fe01::
switch(config)#{
```

6.7 Configuring the TTL for PTP Packets

To set the Time To Live (TTL) of PTP packets, use the `ptp ttl` command. TTL is the maximum number of hops that a PTP packet may make.

Example

This command configures a TTL of **64** hops for PTP packets.

```
switch(config)# ptp ttl 64  
switch(config)#{
```

6.8 Configuring PTP Monitoring

PTP Monitoring records PTP information, including the offset from the master, mean path delay, and skew values, which you view using a **show** command. PTP Syslog messages generate the metrics with threshold values configured on the switch when enabled. EOS enables PTP Monitoring by default.

Enabling and Disabling PTP Monitoring

Use the **ptp monitor** command to enable PTP monitoring on the device. The **no** form of the command disables PTP monitoring and clears all of the recorded PTP data.

Example

This command disables PTP monitoring and clears all recorded PTP data from the switch.

```
switch(config)# no ptp monitor
```

Configuring the Offset-from-master Threshold

The offset is the difference in nanoseconds between master and slave time. Use the **ptp monitor threshold offset-from-master** command to specify the offset-from-master threshold in nanoseconds. EOS generates a Syslog message if the most recently calculated time offset from the PTP master occurs outside the configured range. The maximum offset threshold is one second. The **no** form of the command clears the threshold value and prevents further Syslog messages from generating for this parameter.

Example

This command sets an offset-from-master threshold value of **500** nanoseconds.

```
switch(config)# ptp monitor threshold offset-from-master 500
```

Configuring the Mean-path-delay Threshold

Mean path delay is the mean time in nanoseconds PTP packets take to travel between master and slave. Use the **ptp monitor threshold mean-path-delay** command to specify the mean-path-delay threshold in nanoseconds. EOS generates a Syslog message if the value of the most recently calculated mean path delay becomes greater than or equal to this threshold. The maximum mean-path-delay threshold is one second. The **no** form of the command clears the threshold value and prevents further Syslog messages from generating for this parameter.

Note: Mean path delay is always non-negative.

Example

This command sets a mean-path-delay threshold value of **2000** nanoseconds.

```
switch(config)# ptp monitor threshold mean-path-delay 2000
```

Configuring the Skew Threshold

PTP skew is the clock frequency difference between master and slave. Use the `ptp monitor threshold skew` command to configure the value of the skew-threshold percentage. A Syslog message generates if the value of the most recently calculated skew does not fall within the range $(1/(1+<\text{threshold}>), 1*(1+<\text{threshold}>))$. Skew threshold percentage represents a double precision (16 digit) real number ranging from **0** (0%) to **10** (1000%). The `no` form of the command clears the threshold value and prevents further Syslog messages from generating for this parameter.

Example

This command sets a skew threshold value of **5** (500%).

```
switch(config)# ptp monitor threshold skew 5
```

6.9 Setting the PTP Announce Interval

To set the interval at which an interface sends PTP **announce** messages, use the `ptp announce interval` command. The interval is measured in log seconds. This value also affects the timeout interval.

This command configures the interval between PTP announcement messages on **interface ethernet 5** to **4** seconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce interval 2
switch(config-if-Et5) #
```

6.10 Setting the PTP Timeout Interval

To set the timeout multiplier for an interface, use the `ptp announce timeout` command. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP announcement before a timeout occurs; values range from **2** to **255**. The default multiplier is **3**, which results in a **6**-second timeout interval when the announcement interval is set to the default of **2** seconds.

This command sets timeout multiplier for the interface to **5**; since the announcement interval has just been set to **2** (**4** seconds), this means the interface will time out if it doesn't receive a PTP announcement for **20** seconds.

```
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5) #
```

6.11 Configuring the PTP Delay Mechanism

To set the delay mechanism used in boundary-mode, use the `ptp delay-mechanism` command.

Example

This command sets the delay mechanism in boundary clock mode for the interface to peer-to-peer.

```
switch(config-if-Et5) # ptp delay-mechanism p2p  
switch(config-if-Et5) #
```

6.12 Setting the Delay Request Interval

To set the time for the slave devices to send delay request messages, use the **ptp delay-req interval** command.

Example

This command sets the time the slave devices to send delay request messages to the master state to **3** for the interface.

```
switch(config-if-Et5) # ptp delay-request interval 3  
switch(config-if-Et5) #
```

6.13 Setting the Peer Delay Request Interval

To set the minimum interval between the PTP peer delay-request messages, use the **ptp pdelay-req interval** command.

Example

This command sets the interval between PTP peer delay-request messages on the interface to **3**.

```
switch(config-if-Et5) # ptp pdelay-request interval 3  
switch(config-if-Et5) #
```

6.14 Setting the Peer Link Propagation Threshold

To set the delay threshold for which the peer will be considered unable to run generalized Precision Time Protocol (gPTP), use the **ptp pdelay-neighbor-threshold** command.

Example

This command sets the link propagation delay threshold on the interface to **200000** nanoseconds..

```
switch(config-if-Et5) # ptp pdelay-neighbor-threshold 200000  
switch(config-if-Et5) #
```

6.15 Setting the Interval for Sending Synchronization Messages

To set the interval (in log seconds) for sending synchronization messages, use the **ptp sync-message interval** command. Value ranges and defaults vary based on the PTP mode of the switch.

Example

This command configures the interval for sending synchronization messages on the interface to **3 (8** seconds).

```
switch(config-if-Et5)# ptp sync-message interval 3
switch(config-if-Et5)#{/pre}

```

6.16 Setting the PTP Transport Type

To set the PTP transport type, use the **ptp transport** command.

- This command configures the PTP transport type for the interface to IPv4.

```
switch(config-if-Et5)# ptp transport ipv4
switch(config-if-Et5)#{/pre}

```

- This command configures the PTP transport type for the interface to IPv6.

```
switch(config-if)# ptp transport ipv6
switch(config-if)#{/pre}

```

Setting the Local Priority of the Clock and Interfaces

To set the local priority of the clock and interfaces to control the topology, use the **ptp local-priority** command.

```
switch(config)# ptp local-priority 1
switch(config-if)# ptp local-priority 255
switch(config-if)#{/pre}

```

Setting up as a Slave to another PTP Device

Each interface may be configured with a candidate grantor IP address to send requests and potentially become the slave device to another PTP device. After configuration, the switch starts negotiating with the candidate grantor, and depending on the Announce messages received, it may start requesting Sync and Delay Response to sync the clock. Each grantor may be associated with a unicast negotiation profile. If the configuration omits the profile, the device uses the default interval of one second and a duration of 60 seconds for all message types. If the profile does not exist, the switch uses the default values until the profile gets added.

Use the **ptp unicast-negotiation candidate-grantor** command to set up the profile. The following commands set up the candidate grantor profile.

```
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1 profile fastProfile
switch(config-if)#{/pre}

```

Setting up as a Master to another PTP Device

Each interface may be configured with a range of IP addresses of remote grantees to grant incoming requests and potentially become a master to another PTP device. By default, the interface denies incoming requests

outside the configured range of IP addresses. Each grantee may be associated with a unicast negotiation profile. If the configuration omits the profile, the interface grants incoming requests with an interval of **0** or longer for all message types. If you specify a profile, it compares it to the configured interval. If the profile does not exist, the switch uses the default values until you add the profile.

Use the **ptp unicast-negotiation remote-grantee** command to set up the profile. The following commands set up the remote grantee profile.

```
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24 profile fastProfile
```

Setting the masterOnly Flag

For ports that should not be a slave regardless of other attributes, use the **ptp role master** command.

```
switch(config-if)# ptp role master
```

Configuring the Unicast Profile

A Unicast negotiation profile may be configured to change message rates and durations. The following tables displays the default value and the configurable range of each value.

| Field | Range | Default |
|-------------------------|------------|---------|
| Announce interval | [-3, 0] | 0 |
| Announce duration | [60, 1000] | 60 |
| Sync interval | [-7, 0] | 0 |
| Sync duration | [60, 1000] | 60 |
| Delay Response interval | [-7, 0] | 0 |
| Delay Response duration | [60, 1000] | 60 |

When you apply a profile to a remote grantee on a Grant port, it uses the profile values to determine if the given request should be granted or denied. If the requested interval is shorter than the profile, the port denies the request. When a profile applies to a candidate grantor on a Request port, it will be requested to the candidate grantor using the values in the profile.

The following configures a typical Unicast negotiation profile.

```
switch(config)# ptp unicast-negotiation profile fastProfile
switch(config-unicast-negotiation-profile-fastProfile)# announce interval -2
switch(config-unicast-negotiation-profile-fastProfile)# announce duration 500
switch(config-unicast-negotiation-profile-fastProfile)# sync interval -3
switch(config-unicast-negotiation-profile-fastProfile)# sync duration 300
switch(config-unicast-negotiation-profile-fastProfile)# delay-resp interval -3
switch(config-unicast-negotiation-profile-fastProfile)# delay-resp duration 300
```

Displaying Unicast Negotiation Configurations

The **show ptp unicast-negotiation profile** command displays all user configured profiles and their values.

```
(switch) # show ptp unicast-negotiation profile
Unicast Negotiation Profile fastProfile
Announce interval: 0.25 seconds
Announce duration: 500 seconds
Sync interval: 0.125 seconds
Sync duration: 300 seconds
```

```
Delay Response interval: 0.125 seconds
Delay Response duration: 300 seconds
```

The **show ptp unicast-negotiation candidate-grantor** command displays all configured candidate grantors, associated profile name and latest update.

```
(switch) # show ptp unicast-negotiation candidate-grantor
Interface      Address      Profile      Grantor Status
-----
Ethernet1      4:::1        fastProfile   Master
Ethernet1      4:::2        fastProfile   Candidate Master
Ethernet2      4:::2        fastProfile   Blacklisted
```

The **show ptp unicast-negotiation remote-grantee** command displays all configured remote grantees, associated profile name and latest update.

```
(switch) # show ptp unicast-negotiation remote-grantee
Interface      Address      Profile
-----
Ethernet1      4:::1/96    fastProfile
Ethernet1      4:::2/96    fastProfile
Ethernet2      4:::2/96    fastProfile
```

The **show ptp unicast-negotiation granted** command displays to which remote grantees each port has granted and some detail.

```
(switch) # show ptp unicast-negotiation granted
Interface      Address      Message      Interval      Duration      Expires In
-----
Ethernet2      4:::1        Announce     0.25 seconds  300 seconds  30 seconds
Ethernet2      4:::1        Sync         2.0 seconds   300 seconds  30 seconds
```

The **show ptp unicast-negotiation requested** command displays to which candidate grantors each port has requested and some detail.

```
(switch) # show ptp unicast-negotiation requested
Interface      Address      Message      Interval      Duration      Expires In
-----
Ethernet2      4:::2        Announce     0.25 seconds  600 seconds  250 seconds
Ethernet2      4:::2        Sync         2.0 seconds   300 seconds  denied
```

The **show ptp local-clock** command displays the clock local priority in G8275.2 mode.

```
(switch) # show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Clock Domain: 44
Number of PTP ports: 64
Priority1: 128
Priority2: 128
Local Priority: 128
Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
Offset From Master: -5
Mean Path Delay: 416 nanoseconds
Steps Removed: 1
Skew: 1.00000006399
Last Sync Time: 23:42:33 UTC Nov 01 2018
Current PTP System Time: 23:42:33 UTC Nov 01 2018
```

The **show ptp interface** command displays the interface local priority in G8275.2 mode.

Note: The Announce, Sync and Delay request message intervals are for multicast mode. Since G8275.2 operates in unicast mode, those values should be ignored.

```
(switch) # show ptp interface Ethernet 42 | nz  Interface Ethernet42
PTP: Enabled
Port state: Slave
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 0.25 seconds
Local Priority: 128
Transport mode: ipv4
Announce messages received: 2964
Sync messages received: 2558
Follow up messages received: 2558
Delay request messages sent: 2540
Delay response messages received: 2540
Signaling messages sent: 98
Signaling messages received: 101
```

6.17 Viewing PTP Settings and Status

The following commands display the status of the switch PTP server connections:

- [Displaying General PTP Information](#)
- [Displaying PTP Local Clock and Offset](#)
- [Displaying PTP Masters Information](#)
- [Displaying PTP Clock Properties](#)
- [Displaying PTP Information for all Interfaces](#)
- [Displaying PTP Interface Counters](#)
- [Displaying PTP Foreign Master](#)
- [Displaying PTP Monitoring Information](#)
- [Displaying PTP Source IP](#)

6.17.1 Displaying General PTP Information

To display general Precision Time Protocol (PTP) information, use the [show ptp](#) command.

```
switch# show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface State ASTime Since LastNeighbor Mean Path Residence
Capable Changed Rate Ratio Delay (ns) Time (ms)
----- -----
Et1 Disabled No Never 1.0 00
Et2 Disabled No Never 1.0 00
Et3 Disabled No Never 1.0 00
Et4 Disabled No Never 1.0 00
Et5 Disabled No Never 1.0 00
Et6 Disabled No Never 1.0 00
```

| | | | | |
|-----|--------|-----|---------|----------------|
| Et7 | Master | Yes | 0:21:08 | 1.000000094200 |
|-----|--------|-----|---------|----------------|

6.17.2 Displaying PTP Clock Properties

To display PTP clock properties, use the [Displaying PTP Clock Properties](#) command.

```
switch# show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0 switch#
```

6.17.3 Displaying PTP Foreign Master

To display information about foreign masters (PTP sources not designated as the switch's master from which the switch has received sync packets), use the [show ptp foreign-master-record](#) command.

```
switch# show ptp foreign-master-record
No Foreign Master Records switch#
```

6.17.4 Displaying PTP Information for all Interfaces

To display PTP information for specified interfaces, use the [show ptp interface](#) command.

```
switch# show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv4
```

6.17.5 Displaying PTP Interface Counters

To display PTP interface counters for specified interfaces, use the [show ptp interface counters](#) command.

```
switch# show ptp interface ethernet 5 counters
```

```
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
Peer delay response follow up messages received: 0
```

6.17.6 Displaying PTP Local Clock and Offset

To display the local PTP clock and offset, use the **show ptp local-clock** command.

```
switch# show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
    Class: 248
    Accuracy: 0x30
    OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
```

6.17.7 Displaying PTP Masters Information

To display the PTP clocks master and grandmaster identity and configuration, use the **show ptp masters** command.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
    Class: 248
    Accuracy: 0x30
    OffsetScaledLogVariance: 0xffff
    Priority1: 128
    Priority2: 128
```

6.17.8 Displaying PTP Monitoring Information

To display the list of up to 100 recorded entries of offset from master, mean path delay and skew values, the current PTP mode, whether or not the feature is enabled, the number of entries displayed, and the configured thresholds for each metric, use the **show ptp monitor** command. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

```
switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5
Interface      Time                      Offset from    Mean Path     Skew
                  Master (ns)      Delay (ns)
-----
```

| Interface | Time | Offset from Master (ns) | Mean Path Delay (ns) | Skew |
|-----------|------------------------------|-------------------------|----------------------|-------------|
| Et8 | 21:23:12.901 UTC Feb 22 2018 | 71 | 5849 | 1.003159918 |
| Et1 | 21:23:12.901 UTC Feb 22 2018 | 113 | 3672 | 1.004990621 |
| Et2 | 21:23:12.901 UTC Feb 22 2018 | 706 | 7799 | 1.002744199 |
| Et1 | 21:23:12.901 UTC Feb 22 2018 | 803 | 5861 | 1.003432049 |
| Et1 | 21:23:12.901 UTC Feb 22 2018 | 610 | 3415 | 0.998974658 |

6.17.9 Displaying PTP Source IP

To display PTP IP source information, use the **show ptp source ip** command.

```
switch# show ptp source ip
PTP source IP: 10.0.2.1
```

6.18 Precision Time Protocol (PTP) Commands

PTP Commands

- [ptp announce interval](#)
- [ptp announce timeout](#)
- [ptp delay-mechanism](#)
- [ptp delay-req interval](#)
- [ptp domain](#)
- [ptp enable](#)
- [ptp forward-v1](#)

- [ptp monitor threshold skew](#)
- [ptp pdelay-neighbor-threshold](#)
- [ptp pdelay-req interval](#)
- [ptp priority1](#)
- [ptp priority2](#)

-
- `ptp role`
 - `ptp source`
 - `ptp sync timeout`
 - `ptp sync-message interval`
 - `ptp transport`
 - `ptp ttl`
 - `ptp unicast-negotiation`

PTP Show Commands

- `show ptp foreign-master-record`
- `show ptp interface`
- `show ptp interface counters`
- `show ptp local-clock`
- `show ptp masters`
- `show ptp monitor`
- `show ptp source ip`
- `show ptp unicast-negotiation`
- `show ptp unicast-negotiation profile`
- `show ptp`

6.18.1 ptp announce interval

The **ptp announce interval** command configures the interval at which the configuration mode interface sends PTP **announce** messages. The **no ptp announce interval** command resets the announce interval to its default of 1 (2 seconds).

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp announce interval log_interval
no ptp announce interval
default ptp announce interval
```

Parameters

log_interval The number of log seconds between PTP announce messages (base 2 log (seconds)). Value ranges from -3 (1/8 second) to 4 (16 seconds); default value is 1 (2 seconds).

Examples

- These commands set the interval between PTP **announce** messages sent by **interface ethernet 5** to **4** seconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce interval 2
switch(config-if-Et5) #
```

- These commands reset the PTP **announce** interval on **interface ethernet 5** to the default value of **1** (**2** seconds).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp announce interval
switch(config-if-Et5) #
```

6.18.2 ptp announce timeout

The **ptp announce timeout** sets the timeout multiplier for the configuration-mode interface. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP **announce** message before a timeout occurs; the range is from **2** to **255**. The default multiplier is 3, which results in a 6-second timeout interval when the announce interval is set to the default of 2 seconds. To configure the announce interval, use the [ptp announce interval](#) command.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp announce timeout multiplier
no ptp announce timeout
default ptp announce timeout
```

Parameter

multiplier Number of announce intervals after which the interface will time out if it does not receive a PTP **announce** message. The range is from **2** to **255**; default value is **3**.

Examples

- This command sets the timeout multiplier for **interface ethernet 5** to **5**. This means that the interface will time out if it doesn't receive a PTP **announce** message within five announce intervals.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp announce timeout 5
switch(config-if-Et5)#{
```

- These commands reset the PTP timeout interval on **interface ethernet 5** to the default value of **3**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp announce timeout
switch(config-if-Et5)#{
```

6.18.3 ptp delay-mechanism

The **ptp delay-mechanism** command configures the delay mechanism in boundary clock mode. The **no ptp delay-mechanism** command disables the feature.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp delay-mechanism mech_type
no ptp delay-mechanism
default ptp delay-mechanism
```

Parameters

mech_type The delay mechanism. Options include the following:

- **e2e** end-to-end delay mechanism.
- **p2p** peer-to-peer mechanism.

Examples

- This command sets the delay mechanism to peer-to-peer in the boundary clock mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-mechanism p2p
switch(config-if-Et5) #
```

- This command sets the delay mechanism to end-to-end in the boundary clock mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-mechanism e2e
switch(config-if-Et5) #
```

- This command removes the delay mechanism configuration from **Ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp delay-mechanism e2e
switch(config-if-Et5) #
```

6.18.4 ptp delay-req interval

The **ptp delay-req interval** command specifies the time in log seconds recommended to the slave devices to send delay request messages. You must enable PTP on the switch first and configure the source IP address for PTP communication. The **no ptp delay-req interval** command resets the interval to its default of **5 (32 seconds)**.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp delay-req interval log_interval
no ptp delay-req interval
default ptp delay-req interval
```

Parameter

log_interval The range is **-1** to **8** log seconds (base **2** log (seconds)). The default is **5 (32 seconds)**.

Examples

- These commands set the minimum interval allowed between PTP delay request messages on **interface ethernet 5 to 3 (8 seconds)**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp delay-request interval 3
switch(config-if-Et5)#

```

- These commands reset the minimum interval allowed between PTP delay-request messages to the default of **5 (32 seconds)**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp delay-request interval
switch(config-if-Et5)#

```

6.18.5 ptp domain

The **ptp domain** command sets the domain number to use for the clock. The **no ptp domain** command resets or restores the domain to the default number 0.

Command Mode

Global Configuration

Command Syntax

```
ptp domain domain_number
```

```
no ptp domain
```

```
default ptp domain
```

Parameter

domain_number Value ranges from **0** to **255**. Default number is 0.

Examples

- This command shows how to configure **domain 1** for use with a clock.

```
switch(config)# ptp domain 1  
switch(config)#{
```

- This command removes the configured **domain 1** for use with a clock.

```
switch(config)# no ptp domain 1  
switch(config)#{
```

6.18.6 ptp enable

The **ptp enable** command enables PTP on the interface. The **no ptp enable** command disables PTP on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp enable  
no ptp enable  
default ptp enable
```

Examples

- This command enables PTP on *interface ethernet 5*.

```
switch(config)# interface ethernet 5  
switch(config-if-Et5)# ptp enable
```

- This command disables PTP on *Ethernet interface 5*.

```
switch(config)# interface ethernet 5  
switch(config-if-Et5)# no ptp enable
```

6.18.7 ptp forward-v1

The **ptp forward-v1** command configures the switch to forward Precision Time Protocol version 1 packets as regular multicast traffic. By default, PTP v1 packets are trapped by the CPU, logged and discarded.

The **no ptp forward-v1** and **default ptp forward-v1** commands restore the default forwarding behavior by removing the corresponding **ptp forward-v1** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

```
ptp forward-v1  
no ptp forward-v1  
default ptp forward-v1
```

Examples

- This command configures the switch to forward PTP v1 packets as regular multicast traffic.

```
switch(config)# ptp forward-v1  
switch(config)#{
```

- This command configures the switch to log and discard PTP v1 packets.

```
switch(config)# no ptp forward-v1  
switch(config)#{
```

6.18.8 ptp hold-ptp-time

The **ptp hold-ptp-time** command configures the PTP offset hold time in seconds. The **no ptp hold-ptp-time** command resets or restores the PTP hold time to the default value.

Command Mode

Global Configuration

Command Syntax

```
ptp hold-ptp-time offset
no ptp hold-ptp-time
default ptp hold-ptp-time
```

Parameter

offset Value ranges from **0** to **86400**.

Examples

- This command shows how to configure the PTP offset hold time.

```
switch(config)# ptp hold-ptp-time 600
switch(config)#{
```

- This command resets or restores the PTP offset hold time to the default value.

```
switch(config)# no ptp hold-ptp-time
switch(config)#{
```

6.18.9 ptp local-priority

The **ptp local-priority** command configures the local priority of the clock and interfaces to control the topology.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ptp local-priority PRIORITY_NUM

Parameter

PRIORITY_NUM The priority number from **1** to **255**.

Example

This command sets the priority for the subinterface.

```
switch(config)# ptp local-priority 1  
switch(config-if)# ptp local-priority 255
```

6.18.10 ptp mode

The **ptp mode** command configures the Precision Time Protocol (PTP) packet forwarding mode for the switch. By default, PTP is disabled globally; the mode must be changed to use PTP on switch interfaces.

The **no ptp mode** and **default ptp mode** commands return the forwarding mode to **disabled** by removing the **ptp mode** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ptp mode mode_name
```

```
no ptp mode
```

```
default ptp mode
```

Parameters

mode_name Default mode is **disabled**. Options include:

- **boundary** The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
 - **disabled** The default mode. PTP is disabled, and the device forwards all PTP packets as normal traffic.
 - **e2etransparent** The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
 - **p2ptransparent** The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
 - **gptp** The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

Examples

- This command configures the switch to act as a PTP boundary clock.

```
switch(config)# ptp mode boundary
switch(config)#
```

- This command restores PTP to disabled mode.

```
switch(config)# no ptp mode
switch(config)#
```

6.18.11 ptp monitor threshold mean-path-delay

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between PTP master and slave. The `ptp monitor threshold mean-path-delay` command configures the mean-path-delay threshold in nanoseconds. When this threshold is configured, a Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this value.

The `no ptp monitor threshold mean-path-delay` and `default ptp monitor threshold mean-path-delay` commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

```
ptp monitor threshold mean-path-delay threshold
no ptp monitor threshold mean-path-delay
default ptp monitor threshold mean-path-delay
```

Parameter

threshold threshold in nanoseconds. Values range from **0** to **1000000000** (**1** second).

Example

This command sets a mean-path-delay threshold value of **2000** nanoseconds.

```
switch(config)# ptp monitor threshold mean-path-delay 2000
```

6.18.12 ptp monitor threshold offset-from-master

PTP offset is the difference in nanoseconds between master and slave time. The **ptp monitor threshold offset-from-master** command configures the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range (-<threshold>, <threshold>). The maximum offset threshold is one second.

The **no ptp monitor threshold offset-from-master** and **no ptp monitor threshold offset-from-master** commands clear the threshold value and prevents further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

```
ptp monitor threshold offset-from-master threshold
no ptp monitor threshold offset-from-master
default ptp monitor threshold offset-from-master
```

Parameter

threshold Offset threshold value in nanoseconds. Values range from **0** to **1000000000**.

Example

This command sets an offset-from-master threshold value of **500** nanoseconds.

```
switch(config)# ptp monitor threshold offset-from-master 500
switch(config)#{
```

6.18.13 ptp monitor threshold skew

PTP skew is the clock frequency difference between master and slave. The **ptp monitor threshold skew** command configures the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range $(1/(1+threshold), 1*(1+threshold))$.

The **no ptp monitor threshold skew** and **default ptp monitor threshold skew** commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

Command Mode

Global Configuration

Command Syntax

```
ptp monitor threshold skew threshold
no ptp monitor threshold skew
default ptp monitor threshold skew
```

Parameter

threshold skew percentage threshold represented as a double precision (16 digit) real number ranging from **0 (0%)** to **10 (1000%)**.

Example

This command sets a skew threshold value of **5 (500%)**.

```
switch(config)# ptp monitor threshold skew 5
switch(config)#
```

6.18.14 ptp monitor

The **ptp monitor** command enables and disables PTP monitoring on the switch. When PTP monitoring is enabled, the switch records PTP status and configuration information (which can be viewed using the [show ptp monitor](#) command) and generates Syslog messages for metrics whose threshold values have been configured. PTP monitoring is enabled by default.

The **no ptp monitor** command disables the PTP monitoring and clears all the recorded data from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ptp monitor  
no ptp monitor
```

Related Commands

- [ptp monitor threshold mean-path-delay](#)
- [ptp monitor threshold offset-from-master](#)
- [ptp monitor threshold skew](#)
- [show ptp monitor](#)

Example

This command disables ptp monitor PTP monitoring on the switch and clears all the recorded data.

```
switch(config)# ptp monitor  
switch(config)#End
```

6.18.15 ptp pdelay-neighbor-threshold

The **ptp pdelay-neighbor-threshold** command configures the propagation delay threshold above which the switch will consider the neighbor connected to this port to be incapable of participating in generalized Precision Time Protocol (gPTP).

The **no ptp pdelay-neighbor-threshold** and **default ptp pdelay-neighbor-threshold** commands restore the threshold to 100000 nanoseconds by removing the corresponding **ptp pdelay-neighbor-threshold** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp pdelay-neighbor-threshold link_prop
no ptp pdelay-neighbor-threshold
default ptp pdelay-neighbor-threshold
```

Parameter

link_prop Threshold in nanoseconds. Value ranges from **0** to **10000000000** (ten billion). Default is **100000**.

Examples

- These commands set the link propagation delay threshold on **interface ethernet 5** to **200000** nanoseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5) #
```

- These commands restore the link propagation delay threshold on **interface ethernet 5** to its default value of **100000** nanoseconds.

```
switch(config)# interface ethernet 5s
witch(config-if-Et5)# no ptp pdelay-neighbor-threshold
switch(config-if-Et5) #
```

6.18.16 ptp pdelay-req interval

The **ptp pdelay-req interval** command configures the interval between Precision Time Protocol peer delay-request messages. The **no ptp pdelay-req interval** command removes the configuration.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp pdelay-req interval log_interval
```

```
no ptp pdelay-req interval
```

```
default ptp pdelay-req interval
```

Parameter

log_interval The log interval in seconds (base 2 log (seconds)). Value ranges from **0** to **5**.

Examples

- This command shows how to configure the interval allowed between PTP peer delay request messages on **interface Ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp pdelay-request interval 3
switch(config-if-Et5)#

```

- This command removes the configure the interval allowed between PTP peer delay request messages on **interface Ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp pdelay-request interval
switch(config-if-Et5)#

```

6.18.17 ptp priority1

The **ptp priority1** command configures the priority 1 value for advertising the switch's PTP clock. Priority 1 is the most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The **no ptp priority1** and **default ptp priority1** commands restore the priority 1 default setting of 128.

Command Mode

Global Configuration

Command Syntax

```
ptp priority1 priority_rate
no ptp priority1
default ptp priority1
```

Parameter

priority_rate Value ranges from **0** to **255**. Default is **128**.

Examples

- This command sets the **priority 1** level for the switch's PTP clock to **120**.

```
switch(config)# ptp priority1 120
switch(config)#{
```

- This command restores the default **priority 1** level of **128**.

```
switch(config)# no ptp priority1
switch(config)#{
```

6.18.18 ptp priority2

The **ptp priority2** command sets the **priority 2** value for the clock. The range is from **0** to **255**. **Priority 2** is the fifth most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The **no ptp priority2** and **default ptp priority2** commands restore the **priority 2** default setting of **128**.

Command Mode

Global Configuration

Command Syntax

```
ptp priority2 priority_rate
no ptp priority2
default ptp priority2
```

Parameter

priority_rate Specifies the **priority 2** level for the PTP clock. Value ranges from **0** to **255**; default value is **128**.

Examples

- This command sets the **priority 2** level for the switch's PTP clock to **120**.

```
switch(config)# ptp priority2 120
switch(config)#{/pre>
```

- This command restores the default **priority 2** level of **128**.

```
switch(config)# no ptp priority2
switch(config)#{/pre>
```

6.18.19 ptp role

The **ptp role** command configures a port to operate either in the master mode or the dynamic mode when it is executed in the interface configuration mode.

The **no ptp role** command removes the master or dynamic mode if it was previously configured on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ptp role [dynamic | master]  
no ptp role  
default ptp role
```

Parameters

- **dynamic** the dynamic mode.
- **master** the master clock mode that has the most precise time.

Related Commands

- [ptp enable](#)
- [ptp enable](#)
- [show ptp interface](#)

Examples

- This command configures a port to operate in the master mode for **interface ethernet 1**.

```
switch(config)# interface ethernet 1  
switch(config-if-Et1)# ptp role master
```

- This command configures a port to operate in the dynamic mode for **interface ethernet 1**.

```
switch(config)# interface ethernet 1  
switch(config-if-Et1)# ptp role dynamic
```

6.18.20 ptp source

The **ptp source** command configures the source IP address for all PTP packets. The IP address can be in IPv4 or IPv6 format. The **no ptp source ip** command removes this configuration.

Command Mode

Global Configuration

Command Syntax

```
ptp source ip {ip|ipv6} ip_addr
```

```
no ptp source ip
```

```
default ptp source ip
```

Parameters

ip specifies an IPv4 source address.

ipv6 specifies an IPv6 source address.

ip_addr the source IP address.

Examples

- This command configures the source IP address 10.0.2.1 for all PTP packets.

```
switch(config)# ptp source ip 10.0.2.1  
switch(config)#
```

- This command configures the source IP address 2001:db8:ac10:fe01:: for all PTP packets.

```
switch(config)# ptp source ip 2001:db8:ac10:fe01:  
switch(config)#
```

- This command removes any configured source IP address for all PTP packets.

```
switch(config)# no ptp source ip  
switch(config)#
```

6.18.21 ptp sync timeout

A PTP synchronization timeout occurs if a sync message is not received for a specified period of time, calculated as a multiple of the PTP sync-message interval. The `ptp sync timeout` command configures the sync timeout multiplier. The range is **2** to **255**, with a default of **20** (20 times the sync interval). To configure the sync interval, use the `ptp sync-message interval` command.

The `no ptp sync timeout` and `default ptp sync timeout` commands restore the PTP sync timeout multiplier to its default value of **20**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ptp sync timeout interval_multiplier
```

```
no ptp sync timeout
```

```
default ptp sync timeout
```

Parameter

interval_multiplier The number of sync intervals that must pass without the configuration mode interface receiving a PTP sync message before a timeout occurs. Value ranges from **2** to **255**. Default value is **20**.

Example

These commands configure the sync timeout on **interface ethernet 5** to ten times the configured sync interval.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp sync timeout 10
switch(config-if-Et5)#

```

6.18.22 ptp sync-message interval

The `ptp sync-message interval` command configures the time for sending synchronization messages by specifying its log2 value. Default values and ranges depend on the PTP mode, which is set using the [ptp mode](#) command.

The `no ptp sync-message interval` and `default ptp sync-message interval` commands restore the sync interval to its default (1 second in **boundary** mode, 1/8 second in **gptp** mode) by removing the corresponding `ptp sync-message interval` command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp sync-message interval log_interval
no ptp sync-message interval
default ptp sync-message interval
```

Parameter

log_interval The interval between PTP synchronization messages sent from the master to the slave (base 2 log (seconds)). Values vary according to PTP mode: in **boundary** mode, the range is from **-7 (1/128 second)** to **3 (8 seconds)** and the default value is **0 (1 second)**. In **gptp** mode, the range is from **-3 (1/8 second)** to **17 (131072 seconds, approximately 36 hours)** with a default of **-3**.

Examples

- These commands set the interval for PTP synchronization messages on *interface ethernet 5* to **3 (8 seconds)**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp sync-message interval 3
switch(config-if-Et5)#

```

- In **boundary** mode, these commands restore the interval for PTP synchronization messages on *interface ethernet 5* to its default of **0 (1 second)**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp sync-message interval
switch(config-if-Et5)#

```

6.18.23 ptp transport

The **ptp transport** command configures the PTP transport type for a specific interface. Any values set in interface PTP configuration mode override the settings in the PTP configuration profile associated with the interface. The **no ptp transport** command removes the setting from the ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

```
ptp transport TRANSPORT_TYPE
no ptp transport
default ptp transport
```

Parameters

TRANSPORT_TYPE The transport mode in boundary clock mode. Options include:

- **ipv4** The IPv4 address used as the transport type on the interface.
- **ipv6** The IPv6 address used as the transport type on the interface.
- **layer2** The Layer 2 protocol used as the transport type on the interface.

Examples

- This command overrides the transport type in the profile and sets it to be IPv4 for the interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# ptp transport ipv4
switch(config-if-Et5) #
```

- This command removes the interval for PTP synchronization messages on **interface Ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no ptp transport
switch(config-if-Et5) #
```

6.18.24 ptp ttl

The **ptp ttl** command configures the Time To Live (TTL) value of the PTP packets. The **no ptp ttl** resets the TTL value to the default value of **1** hop by removing the **ptp ttl** command from the **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ptp ttl hop_count
no ptp ttl
default ptp ttl
```

Parameter

hop_count The TTL value measured in hops. Value ranges from **1** to **255**, default is **1**.

Examples

- This command sets the time to live of the PTP packets to **60** hops.

```
switch(config)# ptp ttl 60
switch(config)#
```

- This command resets the time to live of the PTP packets to the default value of **1** hop.

```
switch(config)# no ptp ttl
switch(config)#
```

6.18.25 ptp unicast-negotiation

The **ptp unicast-negotiation** command configures the master slave profiles for PTP devices.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ptp unicast-negotiation  
ptp unicast-negotiation remote-grantee
```

Parameters

- **candidate-grantor** become slave to another PTP device.
- **remote-grantee** become master to another PTP device.

Examples

- This command sets up an interface as a potential master.

```
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24  
switch(config-if)# ptp unicast-negotiation remote-grantee 10.0.0.1/24 profile fastProfile
```

- This command sets up an interface as a potential slave.

```
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1  
switch(config-if)# ptp unicast-negotiation candidate-grantor 10.0.0.1 profile fastProfile
```

6.18.26 show ptp

The **show ptp** command displays summary Precision Time Protocol (PTP) information and PTP status of switch ports.

Command Mode

EXEC

Command Syntax

```
show ptp
```

Example

This command displays summary PTP information.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1

| Et7 | Master | Yes | | 0:21:08 | | 1.000000094200 |

6.18.27 show ptpt foreign-master-record

The **show ptpt foreign-master-record** command displays information about foreign masters (PTP sources not designated as the switch's master from which the switch has received sync packets).

Command Mode

EXEC

Command Syntax

```
show ptpt foreign-master-record
```

Example

This command displays information about PTP foreign masters.

```
switch# show ptpt foreign-master-record
No Foreign Master Records switch#
```

6.18.28 show ptp interface counters

The **show ptp interface counters** command displays PTP interface counters for all interfaces.

Command Mode

EXEC

Command Syntax

```
show ptp [INTERFACE_NAME] counters
```

Parameters

INTERFACE_NAME Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e_range** Ethernet interface range specified by **e_range**.
- **loopback l_range** Loopback interface specified by **l_range**
- **management m_range** Management interface range specified by **m_range**.
- **port-channel p_range** Port-Channel Interface range specified by **p_range**.
- **vlan v_range** VLAN interface range specified by **v_range**.
- **VXLAN vx_range** VXLAN interface range specified by **vx_range**.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the PTP interface counters.

```
switch# show ptp interface ethernet 5 counters
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
Peer delay response follow up messages received: 0
switch#
```

6.18.29 show ptp interface

The `show ptp interface` command displays PTP information for all the interfaces on the device.

Command Mode

EXEC

Command Syntax

`show ptp [INTERFACE_NAME][STATUS_FILTER]`

Parameters

- **INTERFACE_NAME** Interface type and numbers. Options include:
 - **no parameter** Display information for all interfaces.
 - **ethernet e_range** Ethernet interface range specified by **e_range**.
 - **loopback l_range** Loopback interface specified by **l_range**.
 - **management m_range** Management interface range specified by **m_range**.
 - **port-channel p_range** Port-Channel Interface range specified by **p_range**.
 - **vlan v_range** VLAN interface range specified by **v_range**.
- Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **STATUS_FILTER** Filters interfaces by their configuration status. Options include:
 - **no parameter** all interfaces.
 - **enabled** PTP configured interfaces.

Example

This command displays PTP information for all the interfaces on the device.

```
switch# show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv6 switch#
```

6.18.30 show ptp local-clock

The **show ptp local-clock** command displays the Precision Time Protocol (PTP) clock information.

Command Mode

EXEC

Command Syntax

```
show ptp local-clock
```

Example

This command shows how to display the PTP local clock and offset.

```
switch# show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
    Class: 248
    Accuracy: 0x30
    OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0 switch#
```

6.18.31 show ptp masters

The **show ptp masters** command displays information about the switch's PTP master and grand master clocks.

Command Mode

Privileged EXEC

Command Syntax

```
show ptp masters
```

Example

This command displays information about the switch's PTP master and grand master clocks.

```
switch# show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
    Class: 248
    Accuracy: 0x30
    OffsetScaledLogVariance: 0xffff
    Priority1: 128
    Priority2: 128
switch#
```

6.18.32 show ptp monitor

The **show ptp monitor** command displays the list of up to 100 recorded entries of offset from master, mean path delay and skew values, along with current PTP mode, whether or not the feature is enabled, number of entries displayed and the configured thresholds for each metric. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

Command Mode

EXEC

Command Syntax

```
show ptp monitor
```

Example

This command displays the information recorded by PTP monitoring.

```
switch# show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5
Interface Time Offset from Mean Path Skew
Master (ns) Delay (ns)
----- -----
Et8 21:23:12.901 UTC Feb 22 2018 71 5849 1.003159918
Et1 21:23:12.901 UTC Feb 22 2018 113 3672 1.004990621
Et2 21:23:12.901 UTC Feb 22 2018 706 7799 1.002744199
Et1 21:23:12.901 UTC Feb 22 2018 803 5861 1.003432049
Et1 21:23:12.901 UTC Feb 22 2018 610 3415 0.998974658
```

6.18.33 show ptp source ip

The `show ptp source ip` command displays the PTP source IP for the device.

Command Mode

Privileged EXEC

Command Syntax

```
show ptp source ip
```

Example

This command shows the PTP source IP to be 10.0.0.2.1

```
switch# show ptp source ip  
PTP source IP: 10.0.0.2.1
```

This command shows the PTP source IP to be 2001:db8:ac10:fe01::.

```
switch# show ptp source ip  
PTP source IP: 2001:db8:ac10:fe01::
```

6.18.34 show ptpt unicast-negotiation

The `show ptpt unicast-negotiation` command displays PTP unicast negotiation information for the switch.

Command Mode

EXEC

Command Syntax

```
show ptpt unicast-negotiation profile  
show ptpt unicast-negotiation [DETAILS]
```

Parameters

DETAILS Details requested. Options include:

- **candidate-grantor** Display all configured candidate grantors, associated profile name and latest update.
- **remote-grantee** Display all configured remote grantees, associated profile name and latest update.
- **granted** Display to which remote grantees each port has granted and some detail.
- **requested** Display to which candidate grantors each port has requested and some detail.

Examples

- This command displays the unicast negotiation profiles configured on the switch.

```
switch# show ptpt unicast-negotiation profile  
Unicast Negotiation Profile fastProfile  
Announce interval: 0.25 seconds  
Announce duration: 500 seconds  
Sync interval: 0.125 seconds  
Sync duration: 300 seconds  
Delay Response interval: 0.125 seconds  
Delay Response duration: 300 seconds
```

- This command displays all configured candidate grantors, associated profile name and latest update.

```
switch# show ptpt unicast-negotiation candidate-grantor  
-----  
Interface Address Profile Grantor Status  
-----  
Ethernet1 4::1 fastProfile Master  
Ethernet1 4::2 fastProfile Candidate Master  
Ethernet2 4::2 fastProfile Blacklisted
```

- This command displays all configured remote grantees, associated profile name and latest update.

```
switch# show ptpt unicast-negotiation remote-grantee  
-----  
Interface Address Profile  
-----  
Ethernet1 4::1/96 fastProfile  
Ethernet1 4::2/96 fastProfile  
Ethernet2 4::2/96 fastProfile
```

- This command displays to which remote grantees each port has granted and some detail.

```
switch# show ptpt unicast-negotiation granted  
-----  
Interface Address Message Interval Duration Expires In  
-----  
Ethernet2 4::1 Announce 0.25 seconds 300 seconds 30 seconds  
Ethernet2 4::1 Sync 2.0 seconds 300 seconds 30 seconds
```

- This command displays to which candidate grantors each port has requested and some detail.

```
switch# show ptp unicast-negotiation requested
Interface      Address    Message     Interval       Duration      Expires In
-----        -----
Ethernet2     4::2       Announce   0.25 seconds  600 seconds  250 seconds
Ethernet2     4::2       Sync       2.0 seconds   300 seconds  denied
```

6.18.35 show ptpt unicast-negotiation profile

The **show ptpt unicast-negotiation profile** command displays all user configured profiles and their values.

Command Mode

EXEC

Command Syntax

```
show ptpt unicast-negotiation profile
```

Example

This command displays the PTP profiles.

```
switch# show ptpt unicast-negotiation profile
Unicast Negotiation Profile fastProfile
Announce interval: 0.25 seconds
Announce duration: 500 seconds
Sync interval: 0.125 seconds
Sync duration: 300 seconds
Delay Response interval: 0.125 seconds
Delay Response duration: 300 seconds
```

Switch Environment Control

The following sections describe the commands that display temperature, fan, and power supply status:

- [Environment Control Introduction](#)
- [Environment Control Overview](#)
- [Configuring and Viewing Environment Settings](#)
- [Environment Commands](#)

The switch chassis, fans, power supplies, line cards, and supervisors also provide LEDs that signal status and conditions that require attention. The Quick Start Guide for the individual switches provides information about their LEDs.

7.1 Environment Control Introduction

Arista switching platforms are designed to work reliably in common data center environments.

To ensure their reliable operation and to monitor or diagnose the switch's health, Arista provides a set of monitoring capabilities available through the CLI or SNMP entity MIBs to monitor and diagnose potential problems with the switching platform.

7.2 Environment Control Overview

This section contains the following topics:

- [Temperature](#)
- [Fans](#)
- [Power](#)

7.2.1 Temperature

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold:** All fans run at maximum speed, and a warning message is logged.
- **Critical Threshold:** The component is shut down immediately, and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch is shut down if the temperature remains above the critical threshold for three minutes.

7.2.2 Fans

Arista switches include fan modules that maintain internal components at proper operating temperatures. The number and type of fans vary with switch chassis type:

- **Fixed configuration switches** contain hot-swappable independent fans. Fan models with different airflow directions are available, but all fans within a switch must have the same airflow direction.
- **Modular switches** contain independent fans that circulate air from the front to the rear panel. The power supplies for modular switches also include fans that cool the power supply and supervisors.

The switch operates normally when one fan is not operating. Non-functioning modules should only be removed from the switch if they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an ***insufficient fan shutdown*** condition. Under normal operations, this condition initiates a switch power-down procedure.

Fans are accessible from the rear panel.

7.2.3 Power

Arista switches contain power supplies that provide power to internal components.

- **Fixed configuration switches** contain two power supplies, providing 1+1 redundancy.
- **Modular switches** contain four power supplies, providing a minimum of 2+2 redundancy.

Power supply LED indicators are visible from the rear panel.

7.3 Configuring and Viewing Environment Settings

This section contains the following topics:

- [Overriding Automatic Shutdown](#)
- [Viewing Environment Status](#)
- [Locating Components on the Switch](#)

7.3.1 Overriding Automatic Shutdown

This section contains the following topics:

- [Overheating](#)
- [Insufficient Fans](#)
- [Fan Speed](#)

7.3.1.1 Overheating

The switch can be configured to continue operating during temperature shutdown conditions. Ignoring a temperature shutdown condition is strongly discouraged because operating at high temperatures can damage the switch and void the warranty.

Temperature shutdown condition actions are specified by the [environment overheat action](#) command. The switch displays this warning when configured to ignore shutdown temperature conditions.

```
switch(config)# environment overheat action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment overheat action shutdown' command.
=====
switch(config)#

```

The ***running-config*** contains the **environment overheat action** command when set to **ignore**. When the command is not in ***running-config***, the switch shuts down when an overheating condition exists.

The following ***running-config*** file lists the **environment overheat action** command.

```
switch# show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)

ip route 0.0.0.0/0 10.255.255.1
!
environment overheat action ignore
!
end

```

7.3.1.2 Insufficient Fans

The switch can be configured to ignore the ***insufficient fan shutdown*** condition. This is strongly discouraged because continued operation without sufficient cooling may lead to a critical temperature condition that can damage the switch and void the warranty.

Insufficient-fans shutdown override is configured by the [environment insufficient-fans action](#) command. The switch displays this warning when configured to ignore insufficient-fan conditions.

```
switch(config)# environment insufficient-fans action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
has insufficient fans inserted is unsupported and should only be done
under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment insufficient-fans action shutdown' command.
=====
switch(config)#

```

The ***running-config*** contains the **environment insufficient-fans action** command when set to **ignore**. When ***running-config*** does not contain this command, the switch shuts down when it detects an insufficient-fans condition.

7.3.1.3 Fan Speed

The switch can be configured to override the automatic fan speed. The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

Fan speed override is configured by the [environment fan-speed](#) command. The switch displays this warning when its control of fan speed is overridden.

```
switch(config)# environment fan-speed override 50
=====
WARNING: Overriding the system fan speed is unsupported and should only
be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too low
and doing so without direction from Arista Networks can be grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
=====
switch(config) #
```

The **running-config** contains the [environment fan-speed override](#) command if it is set to override. When **running-config** does not contain this command, the switch controls the fan speed.

7.3.2 Viewing Environment Status

This section contains the following topics:

- [Power Status](#)
- [Temperature Status](#)
- [Fan Status](#)
- [System Status](#)

7.3.2.1 Power Status

The [show environment power](#) command displays the status of the power supplies.

Example

This command displays the status of the power supplies.

```
switch> show environment power
Power Input Output Output
Supply Model Capacity Current Current Power Status
----- -----
1 PWR-650AC 650W 0.44A 10.50A 124.0W Ok
```

7.3.2.2 Temperature Status

To display internal temperature sensor status, enter [show environment temperature](#).

```
switch> show environment temperature
System temperature status is: Ok
                                                Alert      Critical
Sensor Description          Temperature Threshold Threshold
----- -----
1   Front-panel temp sensor 22.000C    65C       75C
2   Fan controller 1 sensor 23.000C    75C       85C
3   Fan controller 2 sensor 28.000C    75C       85C
4   Switch chip 1 sensor   40.000C    105C      115C
5   VRM 1 temp sensor     48.000C    105C      110C
```

System temperature status is the first line that the command displays. **System temperature status** values indicate the following:

- **Ok:** All sensors report temperatures below the alert threshold.
- **Overheating:** At least one sensor reports a temperature above its alert threshold.
- **Critical:** At least one sensor reports a temperature above its critical threshold.
- **Unknown:** The switch is initializing.
- **Sensor Failed:** At least one sensor is not functioning.

7.3.2.3 Fan Status

The [show system environment cooling](#) command displays the cooling and fan status.

Example

This command displays the fan and cooling status:

```
switch> show system environment cooling
System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray Status Speed
-----
1 Ok 35%
2 Ok 35%
3 Ok 35%
4 Ok 35%
5 Ok 35%
switch>
```

7.3.2.4 System Status

The [show system environment all](#) command lists the temperature, cooling, fan, and power supply information the individual show environment commands display, as described in [Temperature Status](#), [Fans](#), and [Power](#).

Example

This command displays the temperature, cooling, fan, and power supply status:

```
switch> show system environment all
System temperature status is: Ok
System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray Status Speed
-----
1 Ok 35%
2 Ok 35%
3 Ok 35%
4 Ok 35%
5 Ok 35%

Power Supply Model Capacity Input Current Output Current Output Power Status
-----
1 PWR-650AC 650W 0.44A 10.50A 124.0W Ok

-----
```

7.3.3 Locating Components on the Switch

When a component requires service, the switch administrator may use the [locator-led](#) command to assist a technician in finding the component. The command causes the status LED on the specified component to flash and display a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. Use the [show locator-led](#) command to display all locator LEDs currently enabled on the switch.

Examples

- This command enables the locator LED on fan tray 3:

```
switch# locator-led fantray 3
Enabling locator led for FanTray3
```

- This command displays all locator LEDs enabled on the switch:

```
switch# show locator-led
There are no locator LED enabled
```

7.4 Environment Commands

Environment Control Configuration Commands

- [environment fan-speed](#)
- [environment insufficient-fans action](#)
- [environment overheat action](#)
- [locator-led](#)

Environment Display Commands

- [show environment power](#)
- [show environment temperature](#)
- [show locator-led](#)
- [show system environment all](#)
- [show system environment cooling](#)
- [show system environment power budget](#)

7.4.1 environment fan-speed

The **environment fan-speed** command determines how to control the speed of the switch fans. By default, the switch automatically controls the fan speed.

The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

The **no environment fan-speed** and **default environment fan-speed** commands restore the default action of automatic fan-speed control by removing the **environment fan-speed override** statement from ***running-config***.

Note: Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low. Doing so without direction from Arista Networks can be grounds for voiding your warranty.

Command Mode

Global Configuration

Command Syntax

```
environment fan-speed ACTION
no environment fan-speed
default environment fan-speed
```

Parameters

ACTION Fan speed control method. Valid settings include:

- **auto** Fan speed is controlled by the switch.
This option restores the default setting by removing the **environment fan-speed override** command from ***running-config***
- **override percent** Fan speed is set to the specified percentage of the maximum. Valid **percent** settings range from **30** to **100**.

Examples

- This command overrides the automatic fan speed control and configures the fans to operate at 50% of maximum speed.

```
switch(config)# environment fan-speed override 50
=====
WARNING: Overriding the system fan speed is unsupported and should
only be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too low
and doing so without direction from Arista Networks can be grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
=====
switch(config) #
```

- This command restores control of the fan speed to the switch.

```
switch(config)# environment fan-speed auto
switch(config) #
```

7.4.2 environment insufficient-fans action

The **environment insufficient-fans** command controls the switch response to the insufficient fan condition. By default, the switch initiates a shutdown procedure when it senses insufficient fans.

The switch operates normally when one fan is not operating. Non-functioning modules should only be removed from the switch if they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an **insufficient fan shutdown** condition. This condition normally initiates a power-down procedure.

The **no environment insufficient-fans** and **default environment insufficient-fans** commands restore the default shutdown response to the insufficient-fans condition by removing the **environment insufficient-fans action ignore** statement from **running-config**.

Note: Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Command Mode

Global Configuration

Command Syntax

```
environment insufficient-fans action REMEDY
```

```
no environment insufficient-fans action
```

```
default environment insufficient-fans action
```

Parameters

REMEDY Configures action when the switch senses an insufficient fan condition. Settings include:

- **ignore** Switch continues operating when insufficient fans are operating.
- **shutdown** Switch shuts the power down when insufficient fans are operating.

The **shutdown** parameter restores default behavior by removing the **environment insufficient-fans** command from **running-config**.

Examples

- This command configures the switch to continue operating after it senses insufficient fan condition.

```
switch(config)# environment insufficient-fans action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
has insufficient fans inserted is unsupported and should only be done
under the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment insufficient-fans action shutdown' command.
=====
```

- This command configures the switch to shut down when it senses an insufficient fan condition.

```
switch(config)# environment insufficient-fans action shutdown
switch(config)#
=====
```

7.4.3 environment overheat action

The **environment overheat** command controls the switch's response to an overheat condition. By default, the switch shuts down when it senses an overheat condition.

Note: Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold:** All fans run at maximum speed, and a warning message is logged.
- **Critical Threshold:** The component is shut down immediately, and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch normally shuts down if the temperature remains above the critical threshold for three minutes.

The **no environment overheat action**, and **default environment overheat action** commands restore the default shutdown response to the environment overheat condition by removing the **environment overheat action ignore** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
environment overheat action REMEDY
```

```
no environment overheat action
```

```
default environment overheat action
```

Parameters

REMEDY Reaction to an overheat condition. The default value is **shutdown**.

- **shutdown** Switch shuts power down by an overheat condition.
- **ignore** Switch continues operating during an overheat condition.

Examples

- This command configures the switch to continue operating after it senses an overheat condition.

```
switch(config)# environment overheat action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment overheat action shutdown' command.
=====
switch(config) #
```

- This command configures the switch to shut down when it senses an overheat condition.

```
switch(config)# environment overheat action shutdown
switch(config)#
```

7.4.4 locator-led

When a component requires service, the **locator-led** command activates a locator to assist a technician in finding the component. The command causes the status LED on the specified component to flash and display a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. The available locators vary by platform; to see a list of the locator LEDs available on the switch, use the **locator-led ?** command. To turn off the locator LED, use the **no locator-led** command.

Command Mode

Privileged EXEC

Command Syntax

```
locator-led {fantray tray_num | interface interface | module module_num | powersupply supply_num}  
no locator-led {fantray tray_num | interface interface | module module_num | powersupply supply_num}
```

Parameters

- **fantray *tray_num*** Activates the locator LED on specified fan tray.
- **interface *interface*** Activates the locator LED on specified interface.
- **module *module_num*** Activates the locator LED on specified module.
- **powersupply *supply_num*** Activates the locator LED on specified power supply.

Examples

- This command enables the locator LED on **fantray 3**.

```
switch# locator-led fantray 3  
Enabling locator led for FanTray3
```

- This command disables the locator LED on **fantray 3**.

```
switch# no locator-led fantray 3  
Disabling locator led for FanTray3
```

- This command displays the locator LEDs available on the switch.

```
switch# locator-led ?  
fantray      Fan tray LED  
interface   Interface LED  
module      Module LED  
powersupply Power supply LED
```

7.4.5 show environment power

The `show environment power` command displays the status of all power supplies in the switch.

Command Mode

EXEC

Command Syntax

```
show environment power [INFO_LEVEL]
```

Parameters

INFO_LEVEL Specifies level of detail that the command displays. Options include:

- **no parameter** Displays current and power levels for each supply.
- **detail** Also includes status codes that can report error conditions.

Example

This command displays the status of power supplies on the switch.

```
switch> show environment power
Power                         Input      Output      Output
Supply   Model     Capacity   Current    Current    Power    Status
-----  -----
1        PWR-760AC  760W      0.81A     11.00A    132.8W   Ok
2        PWR-760AC  760W      0.00A     0.00A     0.0W AC  Loss
```

7.4.6 show environment temperature

The `show environment temperature` command displays the operating temperature of all sensors on the switch.

Command Mode

EXEC

Command Syntax

```
show environment temperature [MODULE_NAME] [INFO_LEVEL]
```

Parameters

- **MODULE_NAME** Specifies modules for which data is displayed. This parameter is only available on modular switches. Options include:
 - **no parameter** All modules (identical to **all** option).
 - **fabric fab_num** Specified fabric module. Number range varies with switch model.
 - **linecard line_num** Line card module. Number range varies with switch model.
 - **supervisor super_num** Supervisor module. Number range varies with switch model.
 - **mod_num** Supervisor (1 to 2) or line card (3 to 18) module.
 - **all** All modules.
- **INFO_LEVEL** Specifies level of detail that the command displays. Options include:
 - **no parameter** Displays table that lists the temperature and thresholds of each sensor.
 - **detail** Displays data block for each sensor listing the current temperature and historic data.

Display Values

System temperature status is the first line that the command displays. Values report the following:

- **Ok** All sensors report temperatures below the alert threshold.
- **Overheating** At least one sensor reports a temperature above its alert threshold.
- **Critical** At least one sensor reports a temperature above its critical threshold.
- **Unknown** The switch is initializing.
- **Sensor Failed** At least one sensor is not functioning.

Examples

- This command displays a table that lists the temperature measured by each sensor.

```
switch> show environment temperature
System temperature status is: Ok
          Alert      Critical
Sensor  Description        Temperature Threshold Threshold
-----  -----
1       Front-panel temp sensor 30.750C    65C      75C
2       Fan controller 1 sensor 32.000C    75C      85C
3       Fan controller 2 sensor 38.000C    75C      85C
4       Switch chip 1 sensor   50.000C    105C     115C
5       VRM 1 temp sensor    60.000C    105C     110C
switch>
```

- This command lists the temperature detected by each sensor and includes the number of previous alerts, the time of the last alert, and the time of the last temperature change.

```
switch> show environment temperature detail
TempSensor1 - Front-panel temp sensor
          Current State  Count  Last Change
Temperature           30.750C
```

| | | | |
|--|--|------------|--|
| Max Temperature Alert | 35.000C False | 0 | 4 days, 23:35:24 ago never |
| TempSensor2 - Fan controller 1 sensor Temperature Max Temperature Alert | Current State 32.000C 36.000C False | Count 0 | Last Change 4 days, 23:32:46 ago never |
| TempSensor3 - Fan controller 2 sensor Temperature Max Temperature Alert | Current State 38.000C 41.000C False | Count 0 | Last Change 4 days, 23:37:56 ago never |
| TempSensor4 - Switch chip 1 sensor Temperature Max Temperature Alert | Current State 51.000C 53.000C False | Count 0 | Last Change 4 days, 23:35:16 ago never |
| TempSensor5 - VRM 1 temp sensor Temperature Max Temperature Alert | Current State 60.000C 62.000C False | Count 0 | Last Change 4 days, 22:54:51 ago never |

7.4.7 show locator-led

The **show locator-led** command displays the status of locator LEDs enabled on the switch.

Command Mode

Privileged EXEC

Command Syntax

```
show locator-led
```

Example

This command displays all locator LEDs enabled on the switch.

```
switch# show locator-led
There are no locator LED enabled switch#
```

7.4.8 show system environment all

The `show system environment all` command displays temperature, cooling, and power supply status.

Command Mode

EXEC

Command Syntax

```
show system environment all
```

Example

This command displays the switch's temperature, cooling, and power supply status

```
switch> show system environment all
System temperature status is: Ok
System temperature status is: Ok
Sensor Description Temperature Alert Critical
Sensor Description Temperature Alert Critical
----- ----- -----
1 Front-panel temp sensor 31.000C 65C 75C
2 Fan controller 1 sensor 32.000C 75C 85C
3 Fan controller 2 sensor 38.000C 75C 85C
4 Switch chip 1 sensor 50.000C 105C 115C
5 VRM 1 temp sensor 60.000C 105C 110C
----- ----- -----
System cooling status is: Ok
Ambient temperature: 31C
Airflow: port-side-intake
Fan Tray Status Speed
Fan Tray Status Speed
----- ----- -----
1 Ok 52%
2 Ok 52%
3 Ok 52%
4 Ok 52%
5 Ok 52%
----- ----- -----
Power Input Output Output
Supply Model Capacity Current Current Power Status
Power Supply Model Capacity Input Current Output Current Output Power Status
----- ----- -----
1 PWR-760AC 760W 0.81A 11.00A 132.6W Ok
2 PWR-760AC 760W 0.00A 0.00A 0.0W AC Loss
----- ----- -----
```

7.4.9 show system environment cooling

The `show system environment cooling` command displays fan status, air flow direction, and ambient temperature on the switch.

Command Mode

EXEC

Command Syntax

```
show system environment cooling [INFO_LEVEL]
```

Parameters

- **INFO_LEVEL** Specifies level of detail that the command displays. Options include:
 - **no parameter** Displays the fan status, air flow direction, and ambient switch temperature.
 - **detail** Also displays actual and configured fan speed of each fan.

Status

- System Cooling Status
 - **Ok** No more than one fan has failed or is not inserted.
 - **Insufficient fans** More than one fan has failed or is not inserted. This status is also displayed if fans with different airflow directions are installed. The switch shuts down if the error is not resolved.
 - **Ambient temperature** Temperature of the surrounding area.
 - **Airflow** Indicates the direction of the installed fans:
 - **port-side-intake** All fans flow air from the front (port side) to the rear of the chassis.
 - **port-side-exhaust** All fans flow air from the rear to the front (port side) of the chassis.
 - **incompatible fans** Fans with different airflow directions are inserted.
 - **Unknown** The switch is initializing.
- **Fan Tray Status** table Displays the status and operating speed of each fan. Status values indicate the following conditions:
 - **OK** The fan is operating normally.
 - **Failed** The fan is not operating normally.
 - **Unknown** The system is initializing.
 - **Not Inserted** The system is unable to detect the specified fan.
 - **Unsupported** The system detects a fan that the current software version does not support.

Example

This command displays the fan status, air flow direction, and ambient switch temperature.

```
switch> show system environment cooling
System cooling status is: Ok
Ambient temperature: 30C
Airflow: port-side-intake
Fan Tray  Status      Speed
-----  -----
1        Ok           51%
2        Ok           51%
3        Ok           51%
4        Ok           51%
5        Ok  51%
```

7.4.10 show system environment power budget

The **show system environment power budget** command displays the configured power budget for PoE switches and a table to show the current consumption.

Command Mode

EXEC

Command Syntax

```
show system environment power budget
```

Example

This command displays the configured power budget for a PoE switch and a table to show the current consumption.

```
switch> show system environment power budget
Budget is 300.0W out of 1425.2W of total power
Active devices using up to 60.0W

Device           Consumed
Name            Power
-----
Ethernet37      30.0W
Ethernet38      30.0W
Total           60.0W
```

Upgrades and Downgrades

This chapter describes the procedures for upgrading or downgrading the switch software.

This chapter contains these sections:

- [Upgrade/Downgrade Overview](#)
- [Smart System Upgrade](#)
- [Standard Upgrades and Downgrades](#)
- [Upgrade/Downgrade Commands](#)

8.1 Upgrade/Downgrade Overview

Upgrading or downgrading the Arista Extensible Operating System (EOS) is accomplished by replacing the EOS image and reloading the switch. It may be possible to minimize (or virtually eliminate) downtime and packet loss during an upgrade, depending on the switch model and the software change being made. There are two upgrade methods for the EOS:

Smart System Upgrade: SSU significantly decreases downtime and packet loss during upgrades. SSU is available on selected platforms and is ideal for leaf switches and other non-redundant deployments.

Standard Upgrades and Downgrades: In cases where an accelerated upgrade is not needed or an option (such as software downgrades and on unsupported platforms), performing a standard upgrade or downgrade using the steps described here will minimize downtime and packet loss.

Note: To upgrade the software on switches participating in an MLAG, see [Upgrading MLAG Peers](#).

8.2 Smart System Upgrade

Smart System Upgrade (SSU) dramatically speeds up system upgrades and minimizes network disruptions with:

- **Faster Reloads:** SSU streamlines and optimizes the upgrade process, significantly reducing the reload time.
- **Uninterrupted Connections:** Even while the system reboots, SSU keeps your network connections active by sending LACP PDUs. These PDUs are essential signals that maintain port channels, ensuring your devices stay connected.
- **Minimal Traffic Loss:** SSU uses protocols that support "graceful restart," allowing network services to restart without dropping connections, preventing interruptions to your data flow.

Features capable of hitless restart under SSU include:

- QinQ
- 802.3ad Link Aggregation/LACP
- 802.3x Flow Control

- BGP (you must enable BGP graceful restart; refer to [Configuring BGP](#).)
- MP-BGP (you must enable BGP graceful restart; refer to [Configuring BGP](#).)
- 128-way Equal Cost Multipath Routing (ECMP)
- VRF
- Route Maps
- L2 MTU
- QoS

Note: SSU and VRRP are not compatible. Use a different upgrade method if you have VRRP configured on the switch.

8.2.1 Upgrading the EOS image with Smart System Upgrade

Using SSU to upgrade the active EOS image requires a five-step process:

1. [Preparing the Switch for SSU](#).
2. [Transfer the Image File for SSU](#). Not required if the desired file already exists on the switch
3. [Modify boot-config](#).
4. [Start the SSU Process](#).
5. [Verify Success of the Upgrade](#).

8.2.1.1 Preparing the Switch for SSU

To prepare the switch for SSU, use the following steps:

- [Backing Up Critical Software](#)
- [Making Room on the Flash Drive](#)
- [Verifying Connectivity](#)
- [Verifying Configuration](#)
- [Configuring BGP](#)

Note: Configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure you have stable BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

Backing Up Critical Software

Before upgrading the EOS image, be sure you have copies of the currently running EOS version and the `running-config` file available in case of corruption during the upgrade process. To copy the `running-config` file, use the `copy running-config` command. In this example, the system copies the `running-config` contents to a file on the switch flash drive.

```
switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Making Room on the Flash Drive

Determine the size of the new EOS image. Verify enough space exists on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the `dir` command to check the bytes free figure.

```
switch# dir flash:  
Directory of flash:/  
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi  
-rwx 36 Nov 8 10:24 boot-config  
-rwx 37339 Jun 16 14:18 cfg_06162014  
606638080 bytes total (602841088 bytes free)
```

Verifying Connectivity

Ensure the switch has a management interface configured with an IP address and default gateway. See [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#). Confirm network connectivity to the switch using the `show interfaces status` command and pinging the default gateway.

```
switch# show interfaces status  
Port Name Status Vlan Duplex Speed Type  
Et3/1 notconnect 1 auto auto 1000BASE-T  
  
<-----OUTPUT OMITTED FROM EXAMPLE----->  
Ma1/1 connected routed unconf unconf Unknown  
  
switch# ping 1.1.1.10  
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.  
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms  
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms  
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms  
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms  
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Verifying Configuration

Verify the switch has a valid configuration for SSU using the `show reload fast-boot` command. If parts of the configuration block SSU execution, an error message displays explaining the issues. For SSU to proceed, correct the configuration conflicts before issuing the `reload fast-boot` command.

```
switch# show reload fast-boot  
switch# 'reload fast-boot' cannot proceed due to the following:  
Spanning-tree portfast is not enabled for one or more ports  
Spanning-tree BPDU guard is not enabled for one or more ports switch#
```

Note: You can still use the `show reload hitless` and `reload hitless` commands, but they have the same effect as the commands shown earlier.

Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the `graceful-restart` command. The default restart time value (**300** seconds) is appropriate for most configurations.

The BGP configuration mode issuing the `graceful-restart` command determines which BGP connections will restart gracefully.

Note: Configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, be sure you have stable BGP sessions and all BGP routing information has been learned and advertised before proceeding with SSU.

For all BGP connections, use the **graceful-restart** command in BGP configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# graceful-restart
switch(config-router-bgp) #
```

For all BGP connections in a specific VRF, use the **graceful-restart** command in BGP VRF configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# graceful-restart
switch(config-router-bgp-vrf-purple)# exit
switch(config-router-bgp) #
```

For all BGP connections in a specific BGP address family, use the **graceful-restart** command in BGP address-family configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# graceful-restart
switch(config-router-bgp-af)# exit
switch(config-router-bgp) #
```

8.2.1.2 Transfer the Image File for SSU

The target image must be copied to the file system on the switch, typically onto the flash drive:

1. Verify that the flash drive has enough space for two copies of the image plus an optional 240MB for diagnostic information.
2. Use the **copy** command to copy the image to the flash drive.
3. Confirm that the system transferred the new image file correctly.

The following command examples illustrate transferring an image file from various locations to the flash drive.

USB Memory

Command

```
copy usb1:/sourcefile flash:/destfile
```

Example

```
switch# copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

FTP Server

Command

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

Example

```
switch# copy ftp:/user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

SCP

Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

Example

```
switch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

HTTP

Command

```
copy http://http-source/sourcefile flash:/destfile
```

Example

```
switch# copy http://10.0.0.10/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

After transferring the file, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch# dir flash:  
Directory of flash:/  
-rwx 293168526 Nov 4 22:17 EOS4.14.2.swi  
-rwx 36 Nov 8 10:24 boot-config  
-rwx 37339 Jun 16 14:18 cfg_06162014  
-rwx 394559902 May 30 02:57 EOS4.13.1.swi  
  
606638080 bytes total (208281186 bytes free)  
switch# verify /md5 flash:EOS-4.14.4.swi  
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
```

8.2.1.3 Modify boot-config

After transferring and confirming the desired image file, use the **boot system** command to update the **boot-config** file to point to the new EOS image.

This command changes the **boot-config** file to point to the image file located in flash memory at **EOS-4.14.4.swi**.

```
switch# configure terminal  
switch(config)# boot system flash:/EOS-4.14.4.swi
```

Use the **show boot-config** command to verify that the **boot-config** file is correct:

```
switch(config)# show boot-config  
Software image: flash:/EOS-4.14.4.swi  
Console speed: (not set)  
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeaauMSa7/Qxbi211
```

Save the configuration to the **startup-config** file with the **write** command.

```
switch# write
```

8.2.1.4 Start the SSU Process

After updating the **boot-config** file, verify that your configuration supports SSU (if you have not already done so) using the **show reload fast-boot** command. If parts of the configuration are blocking SSU execution, an error message will be displayed explaining what they are.

```
switch# show reload fast-boot
switch#'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
```

Start the SSU process using the **reload fast-boot** command to reload the switch and activate the new image. The CLI will identify any changes that must be made to the configuration before starting SSU, prompt the saving of any modifications to the system configuration, and request confirmation before reloading.

```
switch# reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Copy completed successfully.
Proceed with reload? [confirm]y
```

Note: You can still use the **show reload hitless** and **reload hitless** commands, but they have the same effect as the commands shown earlier.

8.2.1.5 Verify Success of the Upgrade

Before making any configuration changes to the switch after reloading, verify that the SSU process is complete using the command **show boot stages log**. If it is, the last message should be **Hitless boot stages complete**.

```
switch# show boot stages log
Timestamp          Delta Begin Msg
2022-10-03 12:42:06 000.000000 Asu Hitless boot stages started
2022-10-03 12:42:06 000.001592 stage CriticalAgent started
2022-10-03 12:42:06 000.001834 event CriticalAgent:PhyEthtool completed
[ . . . ]
2022-10-03 12:43:02 056.316874 stage BootSanityCheck is complete
2022-10-03 12:43:02 056.317491 Asu Hitless boot stages complete
```

You can also verify the completion of the SSU process by checking the syslog for the following message:

```
LAUNCHER-6-BOOT_STATUS: 'reload fast-boot' reconciliation complete
```

To verify whether the SSU upgrade was successful, use the **show reload cause** command. Suppose a fatal error occurred during the upgrade process. In that case, the switch will have completely rebooted, and the fatal error details will be displayed along with the directory containing the diagnostic information.

If the SSU upgrade has succeeded, it will read **Hitless reload requested by the user**.

Fatal Error Display

```
switch# show reload cause
Reload Cause 1:
-----
Fatal error occurred during Asu Hitless boot. (stageMgr - LinkStatusUpdate timed out)

Reload Time:
-----
Reload occurred at Sun Oct 02 12:06:37 2022 PDT.
```

```
Recommended Action:  
-----  
The system rebooted due to a fatal error.  
If the problem persists, contact your customer support representative.  
  
Debugging Information:  
-----  
/mnt/flash/persist/fatalError-2022-10-02_120637
```

Successful Upgrade Display

```
switch# show reload cause  
Reload Cause 1:  
-----  
Hitless reload requested by the user.  
  
Reload Time:  
-----  
Reload occurred at Mon Oct 03 13:29:31 2022 PDT.  
  
Recommended Action:  
-----  
No action necessary.  
  
Debugging Information:  
-----  
None available.
```

The **show version** command confirms whether the correct image is loaded. The **Software image version:** line displays the version of the active image file.

```
switch# show version  
Arista DCS-7050QX-32-F  
Hardware version: 02.00  
Serial number: JPE14071098  
System MAC address: 001c.7355.556f  
Software image version: 4.14.5F-2353054.EOS4145F  
Architecture: i386  
Internal build version: 4.14.5F-2353054.EOS4145F  
Internal build ID: e8748ea7-916d-4217-878f-4bfe2adc7122  
Uptime: 4 minutes  
Total memory: 3981328 kB  
Free memory: 1342408 kB
```

Note: If a fatal error occurs during the SSU process, the new EOS image will still be loaded and booted.

8.2.2 Scheduling an SSU

SSU supports scheduling an upgrade with the **reload fast-boot in** command. If the switch has unsaved configuration changes, or saved configuration changes that block an SSU upgrade, the scheduled reload stops at the scheduled time.

Configuring a Scheduled SSU Upgrade

Use the **reload fast-boot in** command to schedule the upgrade at a specific time. The switch detects any unsaved configuration and prompts you to save the changes first. Replying *no* exits the command and the scheduled upgrade does not proceed.

```
switch# reload fast-boot in 10:00  
System configuration has been modified. Save? [yes/no/cancel/diff]:yes  
Copy completed successfully.  
Proceed with reload? [confirm]y
```

```
Reload scheduled for Mon Jan 20 19:31:09 2025 (in 9 hours 59 minutes)
No warnings or unsupported configuration found.
```

Specify the time to reboot in hours, for example, 10:00, as shown in the example.

Override the confirmation prompt by adding the optional parameter **force** and specify a reason using the **reason**.

```
switch# reload fast-boot in 10:00 force reason scheduled maintenance
Copy completed successfully.
Reload scheduled for Mon Jun 17 19:38:12 2024 (in 9 hours 59 minutes)
Reload reason: scheduled maintenance
No warnings or unsupported configuration found.
```

Note: EOS supports only one pending scheduled SSU, either normal or scheduled, at a time. To schedule a new SSU, cancel the existing scheduled SSU.

Cancelling a Scheduled SSU

To cancel a scheduled SSU reload, use the **reload cancel** command:

```
switch# reload cancel
Scheduled reload has been canceled.
```

Displaying Scheduled SSU Information

Use the following command to display information about scheduled SSU configurations:

```
switch# show reload fast-boot
Reload scheduled for Mon Jan 20 19:31:09 2025 (in 9 hours 59 minutes)
Reload reason: scheduled maintenance
No warnings or unsupported configuration found.
```

If no scheduled reload exists on the switch, the command returns the following output:

```
switch# show reload fast-boot
No reload is scheduled
No warnings or unsupported configuration found.
```

8.3

Standard Upgrades and Downgrades

Standard software upgrades and downgrades on Arista switches are accomplished by installing a different EOS image and reloading the switch. On switches with redundant supervisors, you must install the EOS image on both supervisors. Using the following procedures will minimize packet loss during a standard upgrade or downgrade.

These sections describe standard switch upgrade and downgrade procedures:

- [Upgrading or Downgrading the EOS on a Single-Supervisor Switch](#)
- [Upgrading or Downgrading the EOS on a Dual-Supervisor Switch](#)

8.3.1

Upgrading or Downgrading the EOS on a Single-Supervisor Switch

Modifying the active EOS image is a five-step process:

-
1. Prepare the switch for upgrade ([Prepare the Switch for SSU](#)).
 2. Transfer the image file to the switch ([Transfer the Image File](#)). (This is not required if the desired file is on the switch).
 3. Modify the `boot-config` file to point to the desired image file ([Modify boot-config for Single-Supervisor Switch](#)).
 4. Reload the switch ([Reload](#)).
 5. Verify the switch is running the new image ([Verify the New Image for Single-Supervisor Switch](#)).

8.3.1.1 Preparing the Switch for SSU

To prepare the switch for SSU, use the following steps:

- [Backing Up Critical Software](#)
- [Making Room on the Flash Drive](#)
- [Verifying Connectivity](#)
- [Verifying Configuration](#)
- [Configuring BGP](#)

Note: Configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, ensure you have stable BGP sessions are stable and all BGP routing information has been learned and advertised before proceeding with SSU.

Backing Up Critical Software

Before upgrading the EOS image, be sure you have copies of the currently running EOS version and the `running-config` file available in case of corruption during the upgrade process. To copy the `running-config` file, use the `copy running-config` command. In this example, the system copies the `running-config` contents to a file on the switch flash drive.

```
switch# copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Making Room on the Flash Drive

Determine the size of the new EOS image. Verify enough space exists on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the `dir` command to check the `bytes free` figure.

```
switch# dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
606638080 bytes total (602841088 bytes free)
```

Verifying Connectivity

Ensure the switch has a management interface configured with an IP address and default gateway. See [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#). Confirm network connectivity to the switch using the `show interfaces status` command and pinging the default gateway.

```
switch# show interfaces status
```

```

Port      Name       Status     Vlan      Duplex    Speed     Type
Et3/1          notconnect   1         auto      auto      1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1          connected    routed    unconf    unconf    Unknown

switch# ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms

```

Verifying Configuration

Verify the switch has a valid configuration for SSU using the `show reload fast-boot` command. If parts of the configuration block SSU execution, an error message displays explaining the issues. For SSU to proceed, correct the configuration conflicts before issuing the `reload fast-boot` command.

```

switch# show reload fast-boot
switch# 'reload fast-boot' cannot proceed due to the following:
  Spanning-tree portfast is not enabled for one or more ports
  Spanning-tree BPDU guard is not enabled for one or more ports
switch#

```

Note: You can still use the `show reload hitless` and `reload hitless` commands, but they have the same effect as the commands shown earlier.

Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the `graceful-restart` command. The default restart time value (**300** seconds) is appropriate for most configurations.

The BGP configuration mode issuing the `graceful-restart` command determines which BGP connections will restart gracefully.

Note: Configuring BGP graceful restart resets BGP sessions. If configuring BGP graceful restart as part of the SSU process, be sure you have stable BGP sessions and all BGP routing information has been learned and advertised before proceeding with SSU.

For all BGP connections, use the `graceful-restart` command in BGP configuration mode:

```

switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# graceful-restart
switch(config-router-bgp)#

```

For all BGP connections in a specific VRF, use the `graceful-restart` command in BGP VRF configuration mode:

```

switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# graceful-restart
switch(config-router-bgp-vrf-purple)# exit
switch(config-router-bgp)#

```

For all BGP connections in a specific BGP address family, use the **graceful-restart** command in BGP address-family configuration mode:

```
switch# config
switch(config)# router bgp 64496
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# graceful-restart
switch(config-router-bgp-af)# exit
switch(config-router-bgp) #
```

8.3.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for the image, use the CLI **copy** command to copy the image to the flash drive, then confirm that the system transferred the new image file correctly.

The following command examples illustrate transferring an image file from various locations to the flash drive.

USB Memory

Command

```
copy usb1:/sourcefile flash:/destfile
```

Example

```
switch# copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

FTP Server

Command

```
copy ftp://ftp-source/sourcefile flash:/destfile
```

Example

```
switch# copy ftp://user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

SCP

Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

Example

```
switch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

HTTP

Command

```
copy http://http-source/sourcefile flash:/destfile
```

Example

```
switch# copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

After transferring the file, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch# dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
-rwx 394559902 May 30 02:57 EOS-4.12.2.swi

606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

8.3.1.3 Modify boot-config for Single-Supervisor Switch

After transferring and confirming the desired image file, use the **boot system** command to update the **boot-config** file to point to the new EOS image.

This command changes the **boot-config** file to point to the image file located in flash memory at **EOS-4.12.2.swi**.

```
switch# configure terminal
switch(config)# boot system flash:/EOS-4.13.2.swi
```

Use the **show boot-config** command to verify that the **boot-config** file is correct:

```
switch(config)# show boot-config
Software image: flash:/EOS-4.13.2.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi211
```

Save the configuration to the **startup-config** file with the **write** command.

```
switch# write
```

8.3.1.4 Reload

After updating the **boot-config** file, reset the switch to activate the new image. The **reload** command resets the switch, resulting in temporary downtime and packet loss on single supervisor switches.

The terminal displays all rebooting messages when reloading from the console port. From any port except the console, the CLI displays this text:

```
switch# reload
The system is going down for reboot NOW!
```

 **Note:** The EOS boot process makes a copy of the **.swi** image file in the internal flash while booting, so sufficient space for **two copies** must be present when loading the new EOS image. If the switch reloads without adequate space on the flash drive, it boots to the Aboot prompt from which you can delete files from **/mnt/flash** to free up additional space. Exiting Aboot begins the boot process again.

8.3.1.5 Verify the New Image for Single-Supervisor Switch

After the switch finishes reloading, log into the switch and use the **show version** command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch# show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture: i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 14 hours and 48 minutes
Total memory: 4017088 kB
Free memory: 1569760 kB
```

8.3.2 Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

Modifying the active EOS image is a four-step process:

1. Prepare the switch for upgrade ([Prepare the Switch for Dual-Supervisor Switch](#)).
2. Transfer the image file to the primary supervisor ([Transfer the Image File to the Primary Supervisor](#)). (This is not required if the desired file is on the switch).
3. Use the **install** command to install the new EOS image and update **boot-config** ([Install the New EOS Image](#)).
4. Verify the switch is running the new image ([Verify the New Image](#)).

Note: Due to a change in the supervisor heartbeat timeout, booting one supervisor with a post-SSO image (version **4.10.0-SSO**, **4.11.X** and later) while the other supervisor is running a pre-SSO image will cause the supervisor running the pre-SSO image to reload. This causes a disruption as both supervisors are inactive for a short time. To minimize downtime, upgrade the images on both supervisors and reload the entire chassis using the **install** command.

8.3.2.1 Prepare the Switch for Dual-Supervisor Switch

To prepare the switch for an EOS upgrade, take the following steps:

- Back up all essential files.
- Address and ensure the following:
 - You are logged in to the primary supervisor.
 - Confirm that the primary supervisor is reachable and that the management interfaces are configured.
 - There is enough room on both supervisors for the new image file.
 - Any extensions running on the active supervisor are also available on the standby.

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the **running-config** file are available in case of corruption during the upgrade process. To copy the **running-config** file, use the **copy running-config** command. In the following example, the **running-config** file is copied to a file called **backup2** on the flash drive.

```
switch# copy running-config backup2
Copy completed successfully.
switch#
```

Be sure you log into the primary supervisor, not the standby. Use the **show redundancy status** command, and verify that **my status** reads **ACTIVE** and not **STANDBY**.

```
switch# show redundancy status
my status = Active
peer state = STANDBY HOT
Unit = Secondary
Unit ID = 1
Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
Ready for switchover
Last switchover time = 25 days, 19:51:34 ago
Last switchover reason = Other supervisor stopped sending heartbeats
```

Be sure the switch has a management interface configured with an IP address and default gateway. Refer to the sections [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#), and confirm that both management interfaces have an Up state and can ping the default gateway by using the **show interfaces status** command and **ping** command.

Note: If the management VRF interface is used, use the virtual management interface (management 0) instead of the IP address on the physical management interface.

```
switch# show interfaces status
Port      Name       Status     Vlan      Duplex    Speed      Type
Et3/1      notconnect   1          auto      auto     1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1      connected    routed    unconf    unconf   Unknown

switch# ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the **dir** command to check the bytes free figure).

```
switch# dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)

Standby supervisor:
switch# dir supervisor-peer:mnt/flash/
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)
```

Finally, ensure that any extensions running on the primary supervisor are also available on the secondary supervisor.

8.3.2.2 Transfer the Image File to the Primary Supervisor

Load the desired image to the file system on the primary supervisor, typically into the flash. Use the CLI **copy** command to load files to the flash on the primary supervisor, then confirm that the system transferred the new image file correctly.

The following command examples illustrate transferring an image file from various locations to the flash drive.

USB Memory

Command

```
copy usb1:/sourcefile flash:/destfile
```

Example

```
switch# copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

FTP Server

Command

```
copy ftp://ftp-source/sourcefile flash:/destfile
```

Example

```
switch# copy ftp://user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

SCP

Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

Example

```
switch# copy scp://user@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

HTTP

Command

```
copy http://http-source/sourcefile flash:/destfile
```

Example

```
switch# copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

After transferring the file, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum for each available image can be found on the EOS download page of the Arista website.

```
switch# dir flash:  
Directory of flash:/  
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi  
-rwx 36 Nov 8 10:24 boot-config  
-rwx 37339 Jun 16 14:18 cfg_06162014  
-rwx 394559902 May 30 02:57 EOS-4.12.2.swi  
  
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

```
606638080 bytes total (208281186 bytes free)
switch#53# verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

8.3.2.3 Install the New EOS Image

After the EOS image has been copied to the primary supervisor's flash drive, use the **install** command to update the **boot-config**, copy the new image to the secondary supervisor, and reload both supervisors. Both supervisors will briefly be unavailable when upgrading to a new image; using the **install** command minimizes packet loss during reload.

```
switch(config)# install source EOS-4.13.2.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

8.3.2.4 Verify the New Image

After the switch finishes reloading, log in to the switch and use the **show version** command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch# show version
Arista DCS-7504
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture: i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime: 1 hour and 36 minutes
Total memory: 4017088 kB
Free memory: 1473280 kB
switch#
```

8.4 Upgrade/Downgrade Commands

- **install**
- **reload fast-boot**
- **reload hitless**

8.4.1 install

The **install** command copies the specified EOS image onto the switch if the source is external, configures the **boot-config** file to point to the specified EOS image, copies the image to the standby supervisor on dual-supervisor switches, and optionally reloads the switch to run the new EOS.

Command Mode

Privileged EXEC

Command Syntax

```
install source source_path [destination destination_path][now][reload]
```

Parameters

- **source_path** - Specify the file path and name of EOS image. If no file path specified, the switch looks for the image on the flash drive of the primary supervisor.
- **destination destination_path** - Specify the destination file path and name of the EOS image. If no destination or name specified, the EOS image stores on the flash drive with its original file name.
- **now** - Specify to execute the command immediately without further prompts.
- **reload** - Reload the supervisor after installing the image and updated **boot-config** file. On dual-supervisor switches, reloads both supervisors, after which control returns to the primary supervisor.

Example

This command updates the **boot-config** file to point to the **EOS.swi** file on the primary supervisors flash drive, copies the image and **boot-config** file to the secondary supervisor, and reboots both.

```
switch(config)# install source EOS.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

8.4.2 reload fast-boot

Smart System Upgrade (SSU) allows critical switches to be upgraded with minimal downtime and packet loss by optimizing the reload procedure and leveraging protocols capable of graceful restart. The **reload fast-boot** command starts the SSU process using the EOS image specified by the **boot-config** file configured by the **boot system** command.

When entering the **reload fast-boot** command, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

Command Mode

Privileged EXEC

Command Syntax

reload fast-boot

Guidelines

- SSU supports upgrades and not downgrades.
- EOS does not support SSU if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image. Arista also recommends that an additional 240MB be available to store diagnostic information.

Examples

- Use the following command to start the Smart Software Upgrade process.

```
switch# reload fast-boot
Proceed with reload? [confirm]
```

- If the current switch configuration has issues that prevent SSU from performing, the switch lists the changes that must be made before SSU can begin..

```
switch# reload fast-boot
switch# 'reload fast-boot' cannot proceed due to the following:
Spanning-tree portfast is not enabled for one or more ports
Spanning-tree BPDU guard is not enabled for one or more ports
```

- After entering the **reload fast-boot** command, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

```
switch# reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Copy completed successfully.
Proceed with reload? [confirm]y
```

8.4.3 reload hitless

The **reload hitless** command is a legacy command now identical to the **reload fast-boot** command. It starts the Smart System Upgrade (SSU) process using the EOS image specified by the **boot-config** file configured by the using the **boot system** command.

Command Mode

Privileged EXEC

Command Syntax

reload hitless

Examples

- This command starts the SSU process.

```
switch# reload hitless  
Proceed with reload? [confirm]
```

- If the current switch configuration has issues that prevent SSU from performing, the switch lists the changes that must be made before SSU can begin.

```
switch# reload hitless  
switch#'reload hitless' cannot proceed due to the following:  
Spanning-tree portfast is not enabled for one or more ports  
Spanning-tree BPDU guard is not enabled for one or more ports
```

- When you enter the **reload hitless** command, the switch returns a message prompting to save the configuration if it contains unsaved modifications, then asks you to confirm the reload request.

```
switch# reload hitless  
System configuration has been modified. Save? [yes/no/cancel/diff]:y  
Copy completed successfully.  
Proceed with reload? [confirm]y
```

Security

The Security chapter contains the following sections:

- [User Security](#)
- [Control Plane Security](#)
- [Data Plane Security](#)

9.1 User Security

This section covers the following:

- [AAA Configuration](#)

9.1.1 AAA Configuration

This section describes Authentication, Authorization, and Accounting (AAA), and contains these topics:

- [Authentication, Authorization, and Accounting Overview](#)
- [Configuring the Security Services](#)
- [Server Groups](#)
- [Role-Based Authorization](#)
- [AAA and X.509 Authentication](#)
- [Activating Security Services](#)
- [TACACS+ Configuration Examples](#)
- [AAA Accounting for OpenConfig Remote Procedure Call \(RPC\) Messages Overview](#)
- [AAA Commands](#)

9.1.1.1 Authentication, Authorization, and Accounting Overview

This section contains the following topics:

- [Methods](#)
- [Configuration Statements](#)
- [Encryption](#)

9.1.1.1.1 Methods

The switch authenticates user identity and verifies user authorization to control access to EOS commands. Three data services conduct authentication, authorization, and accounting (AAA) activities: a local security database, TACACS+ servers, and RADIUS servers.

The [Configuring the Security Services](#) section provides details about these services.

9.1.1.1.2 Configuration Statements

Enabling AAA on the switch requires two steps:

1. Configure security service parameters.

The switch provides configuration commands for each security service:

- A local file supports authentication through **username** and **enable password** commands.
- TACACS+ servers provide security services through **tacacs-server** commands.
- RADIUS servers provide security services through **radius-server** commands.
- The [Configuring the Security Services](#) section describes the configuration commands for each security service.

2. Activate AAA services.

EOS uses **aaa authorization**, **aaa authentication**, and **aaa accounting** commands to manage the primary and backup services. The [Activating Security Services](#) section provides details on implementing a security environment.

9.1.1.1.3 Encryption

The switch uses clear-text passwords and server access keys to authenticate users and communicate with security systems. To safeguard against accidental disclosure of passwords and keys, **running-config** stores encrypted versions of these passwords and keys. The encryption method depends on the type of password or key.

Commands used to configure passwords or keys can accept either the clear-text password or an encrypted string generated by the designated encryption algorithm, using the clear-text password as the basis (seed) for encryption.

9.1.1.2 Configuring the Security Services

The switch can access three security data services to authenticate users and authorize switch tasks: a local file, TACACS+ servers, and RADIUS Servers.

This section contains the following topics:

- [Local Security File](#)
- [TACACS+](#)
- [RADIUS](#)
- [AAA with LDAP](#)

9.1.1.2.1 Local Security File

The local file uses passwords to:

- Authenticate users logging into the switch.
- Control access to configuration commands.
- Control access to the switch's root login.

The local file stores username-password combinations for user authentication. Passwords also control access to configuration commands and the switch's root login.

9.1.1.2.1.1 Passwords

The switch recognizes both clear text and encrypted strings as valid passwords.

- **Clear-text passwords** are the text you directly enter to access the CLI, configuration commands, or the switch's root login.
- **Encrypted strings** are SHA-512-encrypted strings generated using the clear text as the seed. The local file stores passwords in this format to prevent unauthorized disclosure. When you enter a clear-text password, the switch generates the corresponding secure hash and compares it to the stored version.

Note: The switch cannot decrypt the encrypted string to recover the original clear text.

Valid passwords can include characters A-Z, a-z, 0-9, and any of the following punctuation characters:

! @ # \$ % ^ & * () - _ = + { } [] ; : < > , . ? / ~ \

9.1.1.2.1.2 Usernames

Usernames govern access to the EOS and all switch commands. You typically access the switch through an SSH login using a previously defined username and password. Use the [username](#) command to create a new username or change an existing one.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

@ # \$ % ^ & * - _ = + ; < > , . ~ |

The default username is **admin**, which the section on [Admin Username](#) explains.

Examples

- These commands both create the username **john** and assign it the password **x245**. The password is entered in clear text because the **encrypt-type** parameter is omitted or zero.

```
switch(config)# username john secret x245
switch(config)# username john secret 0 x245
```

- This command creates the username **john** and assigns it to the text password corresponding to the encrypted string **\$1\$sU.7hptc\$TsJ1qsICL7ZYVbyXNG1wg1**. An MD5 encryption program generated this string using **x245** as the seed.

```
switch(config)# username john secret 5 $1$sU.7hptc$TsJ1qsICL7ZYVbyXNG1wg1
```

The CLI will prompt for a password; enter **x245** to authenticate the username.

- This command creates the username **jane** without a password. It also removes a password if the **jane** username exists.

```
switch(config)# username jane nopassword
```

- This command removes the username **william** from the local file.

```
switch(config)# no username william
```

9.1.1.2.1.3 Logins by Unprotected Usernames

The default switch configuration allows usernames that are not password-protected to log in only from the console. The **aaa authentication policy local allow-nopassword-remote-login** command configures the switch to allow unprotected usernames to log in from any port. To reverse this setting to the default state, use the **no** form of **aaa authentication policy local allow-nopassword-remote-login**.

Note: Allowing remote access to accounts without passwords is a severe security risk. Arista Networks recommends assigning strong passwords to all usernames.

Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config) # aaa authentication policy local allow-nopassword-remote-login
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config) # no aaa authentication policy local allow-nopassword-remote-login
```

9.1.1.2.1.4 Enable Command Authorization

The **enable** command controls access to Privileged EXEC and all configuration command modes. The enable password authorizes users to execute the **enable** command. When the enable password is set, the CLI displays a password prompt when a user attempts to enter **Privileged EXEC** mode.

```
main-host> enable  
Password:  
main-host#
```

If an incorrect password is entered three times in a row, the CLI displays the EXEC mode prompt.

If no enable password is set, the CLI does not prompt for a password when a user attempts to enter **Privileged EXEC** mode.

To set the enable password, use the **enable password** command.

Examples

- These equivalent commands assign **xyrt1** as the enable password.

```
switch(config) # enable password xyrt1  
switch(config) # enable password 0 xyrt1
```

- This command assigns the enable password to the clear text **12345** corresponding to the encrypted string **\$1\$8bPBrJnd\$Z8wbKLHpJEd7d4tc5Z/6h/**. An MD5 encryption program generated the string using **12345** as the seed.

```
switch(config) # enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/
```

- This command deletes the enable password.

```
switch(config) # no enable password
```

9.1.1.2.1.5 Root Account Password

The root account accesses the root directory in the underlying Linux shell. When it is not password protected, you can log into the root account only through the console port. After you assign a password to the root account, you can log in through any port.

To set the password for the root account, use the **aaa root** command.

Examples

- These equivalent commands assign **f4980** as the root account password.

```
switch(config)# aaa root secret f4980
switch(config)# aaa root secret 0 f4980
```

- This command assigns the text **ab234** corresponding to the encrypted string **\$1\$HW05LEY8\$QEVw6JqjD9VqDfh.O8r.b** as the root password.

```
switch(config)# aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b
```

- This command removes the password from the root account.

```
switch(config)# aaa root nopassword
```

- This command disables the root login.

```
switch(config)# no aaa root
```

9.1.1.2.2 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+), derived from the TACACS protocol defined in RFC 1492, is a network protocol that provides centralized user validation services. A remote database maintains TACACS+ information. EOS requires access to a TACACS+ server to support TACACS+ services.

TACACS+ manages multiple network access points from a single server. The switch defines a TACACS+ server connection by its address and port, allowing it to conduct multiple data streams to a single server by addressing different ports on the server.

These sections describe the steps to configure access to TACACS+ servers. Configuring TACACS+ access is most efficient when TACACS+ is functioning before you configure switch parameters.

9.1.1.2.2.1 Configuring TACACS+ Parameters

TACACS+ parameters define the settings the switch uses to communicate with TACACS+ servers. You can configure a set of values for individual TACACS+ servers that the switch accesses. Global parameters define settings for communicating with servers where you haven't configured individual parameters.

The switch supports the following TACACS+ parameters.

Encryption Key

The encryption key is code that the switch and the TACACS+ server share to facilitate communications.

- The **tacacs-server host** command defines the encryption key for a specified server.
- The **tacacs-server key** command defines the global encryption key.

Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name **TAC_1** using the encryption key **rp31E2v**.

```
switch(config)# tacacs-server host TAC-1 key rp31E2v
```

- This command configures **cv90jr1** as the global encryption key.

```
switch(config)# tacacs-server key 0 cv90jr1
```

- This command assigns **cv90jr1** as the global key, using the corresponding encrypted string.

```
switch(config)# tacacs-server key 7 020512025B0C1D70
```

Session Multiplexing

The switch supports multiplexing sessions on a single TCP connection.

- The **tacacs-server host** command configures the multiplexing option for a specified server.
- There is no global multiplexing setting.

Example

This command configures the switch to communicate with the TACACS+ server at **10.12.7.9** and indicates the server supports session multiplexing on a TCP connection.

```
switch(config)# tacacs-server host 10.12.7.9 single-connection
```

Timeout

The timeout is the period the switch waits for a successful connection to, or response from, the TACACS+ server. The default is **5** seconds.

- The **tacacs-server host** command defines the timeout for a specified server.
- The **tacacs-server timeout** command defines the global timeout.

Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name **TAC_1** and configures the timeout period as **20** seconds.

```
switch(config)# tacacs-server host TAC_1 timeout 20
```

- This command configures **40** seconds as the period that the server waits for a response from a TACACS+ server before issuing an error.

```
switch(config)# tacacs-server timeout 40
```

Port

The port specifies the port number through which the switch and the servers send information. The TACACS+ default port is **49**.

- The **tacacs-server host** command specifies the port number for an individual TACACS+ server.

- The global TACACS+ port number cannot be changed from the default value of **49**.

Example

This command configures the switch to communicate with the TACACS+ server at **10.12.7.9** through port **54**.

```
switch(config)# tacacs-server host 10.12.7.9 port 54
```

9.1.1.2.2.2 TACACS+ Status

To display the TACACS+ servers and their interactions with the switch, use the [show tacacs](#) command.

Example

This command lists the configured TACACS+ servers.

```
switch(config)# show tacacs

server1: 10.1.1.45
Connection opens: 15
Connection closes: 6
Connection disconnects: 6
Connection failures: 0
Connection timeouts: 2
Messages sent: 45
Messages received: 14
Receive errors: 2
Receive timeouts: 2
Send timeouts: 3

Last time counters were cleared: 0:07:02 ago
```

To reset the TACACS+ status counters, use the [clear aaa counters tacacs+](#) command.

Example

This command clears all TACACS+ status counters.

```
switch(config)# clear aaa counters tacacs
```

9.1.1.2.3 RADIUS

Remote Authentication Dial-In User Service (RADIUS) consists of a networking protocol that provides centralized AAA services for computers connecting to a network and then using network resources. RADIUS manages access to the Internet, internal networks, wireless networks, and integrated email services.

These sections describe the steps to configure access to RADIUS servers. Before configuring switch parameters, confirm your RADIUS server functionality.

9.1.1.2.3.1 RADIUS Vendor-Specific Attribute-Value Pairs

RADIUS servers and client companies extend basic RADIUS functionality through vendor-specific attributes. A dictionary file includes a list of RADIUS attribute-value pairs that Arista switches use to perform AAA operations through the RADIUS server.

Arista switches use the following attribute values:

-
- Arista Vendor number: **30065**
 - Attribute: Arista-AVPair 1 string

Acceptable string values for Arista-AVPair include:

- **shell:priv-lvl=<privilege level of a user, 0-15>**
- **shell:roles=<list of roles for a user>**

Example

A dictionary file that identifies Arista RADIUS vendor-specific attribute value pairs may look similar to the following example:

```
#  
# dictionary.arista  
#  
VENDOR          Arista      30065  
# Standard Attribute  
BEGIN-VENDOR    Arista  
ATTRIBUTE       Arista-AVPair   1     string  
END-VENDOR      Arista
```

9.1.1.2.3.2 Configuring RADIUS Defaults

RADIUS policies specify the settings the switch uses to communicate with RADIUS servers. Configure a set of values for each RADIUS server that the switch accesses. Global parameters define settings for communicating with servers without configured individual parameters.

The switch defines the following RADIUS parameters.

Encryption Key

The encryption key, shared between the switch and RADIUS servers, enables secure communication.

- The **radius-server host** command defines the encryption key for a specified server.
- The **radius-server key** command specifies the global encryption key.

Examples

- Configure the switch to communicate with the RADIUS server assigned the host name **RAD-1** using the encryption key **rp31E2v**.

```
switch(config)# radius-server host RAD-1 key rp31E2v
```

Configure **cv90jr1** as the global encryption key.

```
switch(config)# radius-server key 0 cv90jr1
```

- Assign **cv90jr1** as the key by specifying the corresponding encrypted string.

```
switch(config)# radius-server key 7 020512025B0C1D70
```

Timeout

Timeout is the duration the switch waits for a successful connection to, or response from, a RADIUS server. The default value is **5** seconds.

- The **radius-server host** command defines the timeout for a specified server.

- The **radius-server key** command defines the global timeout.

Examples

- Use the following command to configure the switch to communicate with the RADIUS server assigned the host name **RAD-1** and configures the timeout duration as **20** seconds.

```
switch(config)# radius-server host RAD-1 timeout 20
```

- Use the following command to configure **50** seconds as the duration the server waits for a response from a RADIUS server before issuing an error.

```
switch(config)# radius-server timeout 50
```

Retransmit

Retransmit is the number of times the switch attempts to access the RADIUS server after the first server timeout expires. The default value is **3** times.

- The **radius-server host** command defines the retransmit for a specified server.
- The **radius-server retransmit** command defines the global retransmit value.

Examples

- Use the following command to configure the switch to communicate with the RADIUS server assigned the host name **RAD-1** and configures the retransmit value as **2**.

```
switch(config)# radius-server host RAD-1 retransmit 2
```

- Use the following command to configure the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to **50** seconds, then the total period the switch waits for a response is $((5+1)*50) = 300$ seconds.

```
switch(config)# radius-server retransmit 5
```

Deadtime

Deadtime consists of the time period when the switch ignores a non-responsive RADIUS server or a server that does not answer retransmit attempts after timeout expiration. If no value specified, deadtime becomes disabled.

- The **radius-server host** command defines the deadtime for a specified server.
- The **radius-server deadtime** command defines the global deadtime setting.

Examples

- Use the following command to configure the switch to communicate with the RADIUS server assigned the host name **RAD-1** and configures the deadtime period as **90** minutes.

```
switch(config)# radius-server host RAD-1 deadtime 90
```

- Use the following command to configure the switch to ignore a server for two hours if the server does not respond to a request during the timeout-retransmit period.

```
switch(config)# radius-server deadtime 120
```

Port

The port specifies the port number through which the switch and servers send information.

- The **radius-server host** command specifies the port numbers for an individual RADIUS server.
- The global RADIUS port numbers cannot be changed from the default values of **1812** for an authorization port and **1813** for an accounting port.

Example

These commands configure the switch to communicate with the RADIUS server named **RAD-1** through port number **1850** for authorization and port number **1851** for accounting.

```
switch(config)# radius-server host RAD-1 auth-port 1850
switch(config)# radius-server host RAD-1 acct-port 1851
```

To remove the configuration for this server, use the **no radius-server host** command and specify the hostname or IP address with both the authorization and accounting port numbers.

9.1.1.2.3.3 Configuring a RADIUS Proxy

Enable a RADIUS proxy to send requests from a RADIUS client and forward them to a remote RADIUS server. In return, the RADIUS proxy receives the reply from the remote RADIUS server and forwards it to the client. Dynamic authorization requests initiated by remote servers also proxy to the correct clients based on the user name and calling station ID.

Use the **radius proxy** command to enter the RADIUS Proxy Configuration Mode.

```
switch(config)# radius proxy
switch(config-radius-proxy) #
```

Configuring RADIUS Client Groups

A client group consists of a set of IPv4 or IPv6 prefixes, addresses, or hostnames. RADIUS proxies the requests from these clients to the configured RADIUS server. A client may belong to a VRF and can be configured with the VRF key.

Example

Configure a client group, *MyClientGroup*, with the IPv4 address, *192.168.1.25*, VRF name, *default*, VRF key, *0*, and line, *password1234*, using the following commands:

```
switch(config)# radius proxy
switch(config-radius-proxy)# client group MyClientGroup
switch(config-radius-proxy-MyClientGroup)# client 192.168.1.25 vrf default key 0
password1234
```

Use one of the following parameters as the **key**:

- **0** - Indicates that the key string is not encrypted.
- **7** - Specifies that a hidden key follows.
- **8a** - Specifies that an AES-256-GCM encrypted key follows.
- **LINE** - Specify the text of the key.

Associating Server Groups with Client Groups

A client group can be associated with one or more server groups. The server groups proxy the client requests in the order of configuration. The following example, the client group, *MyClientGroup* sends all client requests and proxies the request in the order of the configured server groups.

Example

```
switch(config-radius-proxy)# client group MyClientGroup
switch(config-radius-proxy-MyClientGroup)# server group RADIUS1 RADIUS2 RADIUS3
```

Configuring a Global Client Key

The **client key** command configures a global key, up to 128 characters, for all clients in all client groups:

Example

Use the following command to configure a client key, *MySuperSecretKey*:

```
switch(config-radius-proxy)# client key MySuperSecretKey
```

Note: An individual client key takes precedence over a global client key.

Configuring Session Idle Timeout

The **client session idle-timeout** following command to configure the client session idle timeout, in seconds, for dynamic authorization. EOS uses 600 seconds by default. The configuration applies globally to the configuration.

Example

Use the following command to configure the session idle-timeout as 300 seconds:

```
switch(config-radius-proxy)# client session idle-timeout 300 seconds
```

Configuring Dynamic Authorization

The **dynamic-authorization** command enables dynamic authorization for RADIUS proxy server groups configured for client groups. Dynamic authorization uses port 3799 for UDP authorization requests and port 2083 for TLS authorization requests.

Example

Use the following command to enable dynamic authorization for RADIUS server groups:

```
switch(config-radius-proxy)# dynamic-authorization
```

Displaying RADIUS Proxy Information

The **show radius proxy client group** command displays information about the RADIUS proxy configuration on the switch.

Example

Use the following command to display configuration information about RADIUS proxy:

```
switch# show radius proxy client group
Radius Client Group          : MyClientGroup
Last time counters were cleared   : never

      Client                  : 192.168.1.25, authentication port 1812, accounting port
1813, vrf default
      Resolved IP address       : 192.168.1.25/32
          Messages received: 0
          Messages sent: 0
          Accept response sent: 0
          Reject response sent: 0
      Accounting start received: 0
      Interim updates received: 0
      Accounting stop received: 0
          Bad requests: 0
          CoA requests sent: 0
          DM requests sent: 0
          CoA ACKs received: 0
          DM ACKs received: 0
          CoA NAKs received: 0
          DM NAKs received: 0
          Bad responses: 0
      Connection errors: 0
```

Use the **show radius proxy server group** to display information about RADIUS proxy server groups:

```
switch# show radius proxy server group
Radius Server Group: MyServerGroup
    Radius Server 1: RADIUS
    Resolved IP address: 192.168.25.33
        Status: active
```

To clear the counters, use the **clear radius proxy counters client group** command.

9.1.1.2.3.4 DSCP Support for CPU-generated Traffic

The Differentiated Services Code Point (DSCP), a 6-bit field in the IP header, marks traffic to provide Quality of Service (QoS). The switch marks all protocol-specific traffic with the configured DSCP value, which EOS sets individually for the following network management protocols:

- RADIUS
- TACACS
- SNMP
- SSH
- sFlow

Configuring DSCP Value

The following commands apply to all platforms for configuring the DSCP value.

- This command configures the DSCP value of **62** for RADIUS-server.

```
switch(config)# radius-server qos dscp 62
```

- This command configures the DSCP value of **36** for TACACS-server.

```
switch(config)# tacacs-server qos dscp 36
```

- This command configures the DSCP value of **36** for snmp-server.

```
switch(config)# snmp-server qos dscp 36
```

- This command configures the DSCP value of **36** for sFlow.

```
switch(config)# sFlow qos dscp 36
```

- This command configures the DSCP value of **36** for snmp-server.

```
switch(config)# snmp-server qos dscp 36
```

9.1.1.2.3.5 RADIUS Status

The **show radius** command displays configured RADIUS servers and their interactions with the switch.

Examples

- This command lists the configured RADIUS servers.

```
switch(config)# show radius

server1: 10.1.1.45
Messages sent: 24
Messages received: 20
Requests accepted: 14
Requests rejected: 8
Requests timeout: 2
Requests retransmitted: 1
Bad responses: 1
Last time counters were cleared: 0:07:02 ago
```

To reset the RADIUS status counters, use the **clear aaa counters radius** command.

- This command clears all RADIUS status counters.

```
switch(config)# clear aaa counters radius
```

9.1.1.2.4 AAA with LDAP

The switches support AAA with the LDAP protocol for authentication and authorization. They use Transport Layer Security (TLS) communication with a remote LDAP server and interoperate with Microsoft's Active Directory when configured with LDAP plugins. LDAP authentication configuration is necessary for LDAP to function. The switch sends AAA requests to servers in the order of their configuration. Once marked unreachable, the switch will only retry a server after all other servers are also found unreachable.

Configuring LDAP Authentication

For all platforms, the **ldap** command is configured from the management **ldap** mode and requires configuration files to provide remote authentication.

Active Directory Server with LDAP Plugin Configured

The following file extract illustrates a configuration for the authentication for **rdn attribute user** and **search filter**.

```
aaa authentication login default group ldap local
```

```

aaa authorization exec default group ldap local
!
management ldap
    server host ldap-server.samplecompany.com
    !
    server defaults
        base-dn dc=samplecompany,dc=com
        rdn attribute user cn
        ssl-profile testProfile
        authorization group policy basic-role-example
        search username cn=ldap-admin-acct,OU=ServiceAccounts,OU=Sample,dc=samplecompany,dc=com password 0 secretString
        !
        group policy basic-role-example
            search filter objectclass group attribute member
            group "Network Admin" role network-admin
            group "Network Newbie" role network-operator
        !
    management security
        ssl profile testProfile
        fips restrictions
        trust certificate caCert
    !

```

The following file extract illustrates a configuration for the management **ldap** mode.

```

management ldap
    server host ldap-server.samplecompany.com
        ssl-profile testProfile2
        authorization group policy company1
    !
    Server host ldap-server.company2.com
    !
    server defaults
        base-dn dc=samplecompany,dc=com
        rdn attribute user cn
        ssl-profile testProfile1
        authorization group policy basic-role-example
        search username cn=ldap-admin-acct,OU=ServiceAccounts,OU=Sample,dc=samplecompany,dc=com password 0 secretString
        !
        group policy basic-role-example
            search filter objectclass group attribute member
            group "Network Admin" role network-admin
            group "Network Newbie" role network-operator
        !
        group policy company1
            search filter objectclass group attribute member
            group "Network Admin2" role network-admin
            group "Network Newbie2" role network-operator
        !

```

Use LDAP with the following settings as a minimum configuration.

```

aaa authentication login default group ldap
!
management ldap
    server host <ldap server hostname/ip>
    !
    server defaults
        base-dn <base distinguished name>
        rdn attribute user <relative distinguished attribute name>

```

```
search username <full distinguished name> password <password>
```

The configuration sets up AAA authentication with LDAP. The LDAP server supports IPv4, IPv6, hostnames, and VRFs for specifying the address. The **RDN**, relative distinguished name, is typically an attribute/value pair to specify a user. When a user attempts to connect to the switch, the admin username searches recursively for the **RDNs** that match the passed-in username from the base-dn folder to generate a shortened list of potential **DNs**, which are then searched for a match with the provided password.

Configuring LDAP Authorization

Active Directory Server with LDAP Plugin Configured

The following file extract illustrates a configuration of a user authorization.

```
aaa authorization exec default group ldap
!
management ldap
    server defaults
        authorization group policy basic-role-example
    !
    group policy basic-role-example
        search filter objectclass group attribute member
        group "Network Admin" role network-admin
        group "Network Newbie" role network-operator
```

The **group/role** maps an LDAP group to an EOS role for RBAC. The matching process ensures that the first matched group results in the role being assigned to the user. Use the **before** and **after** commands to insert rules in the appropriate priority.

The LDAP admin account uses the **search filter** command to search for LDAP groups that contain the user, where **objectclass** defines the object that contains the LDAP group, and **attribute** is the entry attribute name that contains the DN of the group member.

TLS Communication

LDAP supports TLS communication using SSL profiles. A trust certificate, or multiple intermediate certificates, is required to verify the root of trust of the LDAP server. If **ssl profiles** are configured and the server does not support TLS or fails x509 verification, the system will not use the server for authentication. Other **ssl profiles** supported commands are:

- fips restrictions
- crl
- tls version
- cipher-list

Active Directory Server with LDAP Plugin Configured

The following file extract illustrates a configuration for TLS communication.

```
management ldap
    !
    server defaults
        ssl-profile testProfile
management security
    ssl profile testProfile
        trust certificate <root of trust>
```

9.1.1.3 Server Groups

A server group is a collection of servers associated with a single group name. Subsequent authorization and authentication commands can access all servers in a group by invoking the group name. The switch supports **TACACS+** and **RADIUS** server groups.

The **aaa group server** commands create server groups and place the switch in a **server-group** configuration mode to assign servers to the group. Commands referencing an existing group place the switch in a **server-group** configuration mode to modify the group.

These commands create named server groups and enter the appropriate command mode for the specified group:

- **aaa group server radius**
- **aaa group server tacacs+**

The **server (server-group-RADIUS configuration mode)** commands add servers to the configuration mode server group. Before they are added to a group, servers must have been previously configured with a **radius-server host** or **tacacs-server host** command.

Examples

- This command creates the TACACS+ server group named **TAC-GR** and enters **server-group** configuration mode for the new group.

```
switch(config)# aaa group server tacacs+ TAC-GR  
switch(config-sg-tacacs+-TAC-GR) #
```

- These commands add two servers to the **TAC-GR** server group. To add servers to this group, the switch must be in **sg-tacacs+-TAC-GR** configuration mode.

The CLI remains in **server-group** configuration mode after adding the **TAC-1** server (port **49**) and the server located at **10.1.4.14** (port **151**) to the group.

```
switch(config-sg-tacacs+-TAC-GR) # server TAC-1  
switch(config-sg-tacacs+-TAC-GR) # server 10.1.4.14 port 151  
switch(config-sg-tacacs+-TAC-GR) #
```

- This command exits **server-group** configuration mode.

```
switch(config-sg-tacacs+-TAC-GR) # exit  
switch(config) #
```

- This command creates the RADIUS server group named **RAD-SV1** and enters **server-group** configuration mode for the new group.

```
switch(config)# aaa group server radius RAD-SV1  
switch(config-sg-radius-RAD-SV1) #
```

- These commands add two servers to the **RAD-SV1** server group. To add servers to this group, the switch must be in **sg-radius-RAD-SV1** configuration mode.

The CLI remains in server-group configuration mode after adding the RAC-1 server (authorization port **1812**, accounting port **1813**) and the server located at **10.1.5.14** (authorization port **1812**, accounting port **1850**) to the group.

```
switch(config-sg-radius-RAD-SV1) # server RAC-1  
switch(config-sg-radius-RAD-SV1) # server 10.1.5.14 acct-port 1850  
switch(config-sg-radius-RAD-SV1) #
```

9.1.1.4 Role-Based Authorization

Role-based authorization is a method of restricting access to CLI commands through the assignment of profiles, called **roles**, to user accounts. Each role consists of rules that permit or deny access to a set of commands within specified command modes.

All roles are accessible to the local security file through a **username** parameter and to remote users through **RADIUS** or **TACACS+** servers. You can apply each role to multiple user accounts, but only one role to each user.

9.1.1.4.1 Role Types

The switch defines two types of roles: user-defined and built-in.

- User-defined roles are created and edited through CLI commands.
- Built-in roles are supplied with the switch and are not user-editable.

Built-in roles supplied by the switch are **network-operator** and **network-admin**.

9.1.1.4.2 Role Structure

A role is an ordered list of rules that restricts access to specified commands from users to whom it is applied. Roles consist of deny and permit rules. Each rule references a set of command modes and contains a regular expression that specifies one or more CLI commands. Commands are compared sequentially to the rules within a role until a rule's regular expression matches the command.

- Commands that match a regular expression in a permit rule are executed.
- Commands that match a regular expression in a deny rule are disregarded.
- Commands that do not match a regular expression are evaluated against the next rule in the role.

Upon its entry in the CLI, a command is compared to the first rule of the role. Commands that match the rule are **executed** (permit rule) or **disregarded** (deny rule). Commands that do not match the rule are compared to the next rule. This process continues until the command either matches a rule or the rule list is exhausted. The switch disregards commands that do not match any rule.

9.1.1.4.3 Role Rules

Role rules have four components: sequence number, filter type, mode expression, and command expression.

Sequence Number

The sequence number designates a rule's placement in the role. Sequence numbers range in value from 1 to 256. Rule commands that do not include a sequence number append the rule at the end of the list, deriving its sequence number by adding 10 to the sequence number of the last rule in the list.

Example

These rules have sequence numbers **10** and **20**.

```
10 deny mode exec command reload
20 deny mode config command (no |default )?router
```

Filter Type

The filter type specifies the disposition of matching commands. The filter types are **permit** and **deny**. Commands matching permit rules are executed, and commands matching deny rules are disregarded.

Example

These rules are deny and permit rules, respectively.

```
10 deny mode exec command reload  
20 permit mode config command interface
```

Mode Expression

The mode expression specifies the command mode under which the command expression is effective. The mode expression may be a regular expression or a designated keyword. Rules support the following mode expressions:

- **exec** - EXEC and Privileged EXEC modes
- **config** - Global Configuration Mode
- **config-all** - All configuration modes, including Global Configuration Mode
- **short_name** - short key name of a command mode (exact match)
- **long_name** - long key name of a command mode (regular expression match of one or more modes)
- **no parameter** - all command modes

The **prompt** command configures the CLI to display a configuration mode's key name:

- %P - long key name
- %p - short key name

Examples

- These commands use the prompt command to display short key name (**if**) and long key name (**if-Et1**) for **interface ethernet 1**.

```
switch(config)# prompt switch%p  
switch(config)# interface ethernet 1  
switch(config-if)# exit  
switch(config)# prompt switch%p  
switch(config)# interface ethernet 1  
switch(config-if-Et1)#[
```

The command supports the use of regular expressions to reference multiple command modes.

- These regular expressions correspond to the listed command modes:
 - **if-Vlan(1|2)** - matches **interface-VLAN 1** or **interface-VLAN 2**.
 - **if** - matches all interface modes.
 - **acl-text1** - matches ACL configuration mode for **text1** ACL.

Command Expression

The command expression is a regular expression that corresponds to one or more CLI commands.

Examples

These regular expressions correspond to the specified commands:

- **reload** - reload command
- **(no | default)? router** - commands that enter routing protocol configuration modes
- **(no | default)?(ip|mac) access-list** - commands that enter ACL configuration modes

- `(no | default)?(ip|mac) access-group` - commands that bind ACLs to interfaces
- `lacp | spanning-tree` - LACP and STP commands
- `.*` - all commands

9.1.1.4.4 Creating and Modifying Roles

This section contains the following topics:

- [Built-in Role](#)
- [Managing Roles](#)
- [Modifying Roles](#)

9.1.1.4.4.1 Built-in Role

The switch provides the following two built-in roles:

- **network-operator** - Allows all commands in EXEC (Privileged) modes. Commands in all other modes are denied.
- **network-admin** - Allows all CLI commands in all modes.

The **network-admin** role is typically assigned to the **admin** user to allow it to run any command.

Built-in roles are not editable.

Example

These `show users roles` commands display the contents of the built-in roles.

```
switch(config)# show users roles network-operator
The default role is network-operator
role: network-operator
    10 deny mode exec command bash\\|
    20 permit mode exec command .*
switch(config)# show users roles network-admin
The default role is network-operator
role: network-admin
    10 permit command .*
switch(config)#

```

9.1.1.4.4.2 Managing Roles

Creating and Opening a Role

Roles are created and modified in **Role** configuration mode. To create a role, enter the **role** command with the role's name. The switch enters **Role** configuration mode. If the name of an existing role follows the command, subsequent commands edit that role.

Example

This command places the switch in **Role** configuration mode to create a role named **sysuser**.

```
switch(config)# role sysuser
switch(config-role-sysuser)#

```

Saving Role Changes

Role configuration mode is a group-change mode; changes are saved by exiting the mode.

Examples

- These commands create a role, then add a deny rule to the role. Because the changes are not yet saved, the role remains empty, as shown by **show users roles**.

```
switch(config)# role sysuser
switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# show users roles sysuser
The default role is network-operator

switch(config-role-sysuser) #
```

- Type **exit** to save all current changes and exit the role configuration mode.

```
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
switch(config) #
```

Note: To preserve role changes after system restarts, you need to save the **running-config** to the **startup-config** after exiting role mode.

Discarding Role Changes

The **abort** command exits the **Role** configuration mode without saving pending changes.

Example

These commands enter the **Role** configuration mode to add deny rules but discard the changes before saving them to the role.

```
switch(config)# role sysuser
switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# abort
switch(config)# show users roles sysuser
The default role is network-operator

switch(config) #
```

9.1.1.4.4.3 Modifying Roles

Adding Rules to a Role

The **deny (Role)** command adds a deny rule to the configuration mode role. The **permit (Role)** command adds a permit rule to the configuration mode role.

To append a rule to the end of a role, enter the rule without a sequence number while in Role Configuration Mode. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

Example

These commands enter the first three rules into a new role.

```
switch(config)# role sysuser
```

```

switch(config-role-sysuser)# deny mode exec command reload
switch(config-role-sysuser)# deny mode config command (no |default )?router
switch(config-role-sysuser)# permit command .*
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    30 permit command .*
switch(config)#

```

Inserting a Rule

To insert a rule into a role, enter the rule with a sequence number between the existing rules numbers.

Example

This command inserts a rule between the first two rules by assigning it the sequence number 15.

```

switch(config)# role sysuser
switch(config-role-sysuser)# 15 deny mode config-all command lacp
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    15 deny mode config-all command lacp
    20 deny mode config command (no |default )router
    30 permit command .*
switch(config)#

```

Deleting a Rule

To remove a rule from the current role, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule be deleted.
- Enter **default**, followed by the sequence number of the rule to be deleted.
- Enter **default**, followed by the rule to be deleted.

Examples

- These equivalent commands remove rule **30** from the list.

```

switch(config-role-sysuser)# no 30
switch(config-role-sysuser)# default 30
switch(config-role-sysuser)# no permit command .*

switch(config-role-sysuser)# default permit command .*

```

- This role results from entering one of the preceding commands.

```

switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    15 deny mode config-all command lacp|spanning-tree
    20 deny mode config command (no |default )router
switch(config)#

```

Redistributing Sequence Numbers

Sequence numbers determine the order of the rules in a role. After a list editing session where existing rules are deleted, and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Redistributing rule numbers changes adjusts the sequence number of rules to provide a constant difference between adjacent rules. The **resequence (Role)** command adjusts the sequence numbers of role rules.

Example

The **resequence** command renames rules in the sysuser role. The sequence number of the first rule is **100**; subsequent rules' sequence numbers are incremented by **20**.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config-all command lACP|spanning-tree
    25 deny mode config command (no |default )?router
    30 permit command .*
switch(config)# role sysuser
switch(config-role-sysuser)# resequence 100 20
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    100 deny mode exec command reload
    120 deny mode config-all command lACP|spanning-tree
    140 deny mode config command (no |default )?router
    160 permit command .*
switch(config)#

```

9.1.1.4.5 Assigning a Role to a Username

Roles are assigned to local users through the **username** command and to remote users through RADIUS or TACACS+ servers. Each user is assigned one role, which can be assigned to multiple local and remote users.

9.1.1.4.5.1 Default Roles

Users that are not explicitly assigned a role are assigned the default role. The **aaa authorization policy local default-role** command designates the default role. The **network-operator** built-in role is the default role when the default role is not configured.

Examples

- These commands assign **sysuser** as the default role. The output displays the name of the default role (The default role is sysuser).

```
switch(config)# aaa authorization policy local default-role sysuser
switch(config)# show users roles
The default role is sysuser

switch(config)#

```

- These commands restore **network-operator** as the default role by deleting the **aaa authorization policy local default-role** statement from **running-config**. The output displays the default role name (The default role is network-operator).

```
switch(config)# no aaa authorization policy local default-role

```

```
switch(config)# show users roles
The default role is network-operator
switch(config)#

```

9.1.1.4.5.2 Local Security File (Username Command)

Roles are assigned to users with the **username** command's **role** parameter. A username whose **running-config username** statement does not include a **role** parameter is assigned the default role.

The **role** parameter function in a command creating a username is different from its function in a command to edit an existing name.

Assigning a Role to a New Username

A **username** command creating a username explicitly assigns a role to the username by including the **role** parameter; commands without a **role** parameter assign the default role to the username.

Example

These commands create two usernames. The first user is assigned a role; the second user assumes the default role.

```
switch(config)# username FRED secret 0 axced role sysuser1
switch(config)# username JANE nopassword
switch(config)# show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE nopassword
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#

```

Editing the Role of an Existing Username

A **username** command may edit the role of a previously configured username without altering its password. However, username commands that do not include a **role** parameter do not change the role assignment of a username.

Examples

- These commands assign a role to a previously configured username.

```
switch(config)# username JANE role sysuser2
switch(config)# show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE role sysuser2 nopassword
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#

```

- These commands reverts a username to the default role by removing its role assignment.

```
switch(config)# no username FRED role
switch(config)# show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE role sysuser2 nopassword

```

```
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config) #
```

Displaying the Role Assignments

The **show users accounts** command displays role assignment of the configured users. The **show users detail** command displays roles of users that are currently logged into the switch.

Examples

- This command displays the configured users and their role assignments.

```
switch(config) # show users accounts
user: FRED
    role: <unknown>
    privilege level: 1
user: JANE
    role: sysuser2
    privilege level: 1
user: admin
    role: network-admin
    privilege level: 1
switch(config) #
```

- This command displays information about the active AAA login sessions.

```
switch(config) # show aaa session
Session Username Roles          TTY      State Duration Auth           Remote Host
-----  -----  -----  -----  -----  -----  -----  -----
2       admin   network-operator  ttys0   E     0:01:21 local
4       Fred    sysadmin        telnet  E     0:02:01 local   sf.example.com
6       Jane   sysuser2        ssh    E     0:00:52 group radius ny.example.com
9       admin   network-admin   ssh    E     0:00:07 local   bj.example.com
10      max    network-admin   telnet E     0:00:07 local   sf.example.com
```

9.1.1.4.5.3 Radius Servers

A role can be assigned to a remote user authenticated through a RADIUS server. Roles are assigned through the vendor-specific Attribute-Value (AV) pair named **Arista-AVPair**. When RADIUS authentication is enabled, the switch extracts the remote user's role upon successful authentication.

Example

This file extract is sample FreeRADIUS server code that includes the AV pair that assigns roles to three remote users.

```
# Sample RADIUS server users file
"Jane"
    Cleartext-Password := "Abc1235"
    Arista-AVPair = "shell:roles=sysuser2",
    Service-Type = NAS-Prompt-User
"Mary"
    Cleartext-Password := "xYz$2469"
    Arista-AVPair = "shell:roles=sysadmin",
    Service-Type = NAS-Prompt-User
"Fred"
    Cleartext-Password := "rjx4#222"
    Arista-AVPair = "shell:roles=network-operator",
    Service-Type = NAS-Prompt-User
```

The **aaa authentication login** command selects the user authentication service (see [Configuring Service Lists](#)).

Example

This command configures the switch to authenticate users through all RADIUS servers.

```
switch(config)# aaa authentication login default group radius
```

9.1.1.4.5.4 Enable Role-Based Access Control

To enable Role-Based Access Control (RBAC) on the switch, apply the following configuration:

```
switch(config)# aaa authorization commands all default local
```

9.1.1.5 AAA and X.509 Authentication

Configure AAA to support X.509 Certificates for Secure Shell (SSH) connections to securely send commands over an unsecured network. X.509 certificates use a type of public key authentication, and must be enabled on the switch.

When a user attempts to log into the network using an X.509 certificate, EOS performs a check to ensure that the certificate grants permissions and compares the username to names extracted from the certificate. By default, an exact match must be located. The configuration extracts subject alternative names (SANs) from the X.509 certificate, and EOS supports uniform resource identifiers (URIs), an email format as defined in [RFC822](#), and the **otherName** format for Microsoft Active Directory User Principal Name (UPN). If a match cannot be located, the common name is extracted and checked.

Table 7: Default Behavior of Validating Usernames

| Name Extracted from the Certificate | | |
|-------------------------------------|---------------|----------------------|
| Login User Name | Username | username@example.com |
| Username | Valid Match | Match Failure |
| username@example.com | Match Failure | Valid Match |

Successful login attempts must match one of the names on the certificate.

Before configuring X.509 authentication, enable public-key authentication and keyboard interactive on the switch.

```
switch(config)# management ssh
switch(config-mgmt-ssh)# authentication protocol public-key keyboard-interactive
```

Configuring a Secure Socket Layer (SSL) Profile for X.509 Authentication

You must add at least one trusted certificate (CA) to allow X.509 authentication, and specify a Certificate Revocation List (CRL) with revoked certificates.

To enable X.509 on a switch, configure an SSL profile, *x509-profile*, to link to the SSH configuration:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile x509-profile
```

Add the trusted certificate, *trusted-cert*, to the configuration:

```
switch(config-mgmt-sec-profile-x509-profile)# trust trusted-cert
```

Add the name of the applicable Certificate Revocation List (CRL), *my-crl*:

```
switch(config-mgmt-sec-profile-x509-profile) # revocation crt name my-crl
```

Next, enable public-key authentication on the switch, and add the SSL profile, *x509-profile*:

```
switch(config) # management ssh
switch(config-mgmt-ssh) # authentication x509
switch(config-mgmt-ssh-auth-x509) # server ssl profile x509-profile
```

Configuring X.509 to Omit Domains from the Usernames

Names extracted from the X.509 certificates include domain names, and in some cases, you may want to omit the domain name from the X.509 certificates when comparing the usernames with the login name. To omit the domain name, use the following commands:

```
switch(config) # management ssh
switch(config-mgmt-ssh) # authentication x509
switch(config-mgmt-ssh-auth-x509) # username domain omit
```

When configured, the following login behavior occurs on the switch:

Table 8: Default Behavior when Omitting Domains from Usernames

| Name Extracted from the Certificate | | |
|-------------------------------------|---------------|----------------------|
| Login User Name | Username | username@example.com |
| Username | Valid Match | Valid Match |
| username@example.com | Match Failure | Match Failure |

Configuring an Online Certificate Status Profile (OCSP) for X.509 Certificates

Instead of using a CRL to perform certificate validation, use an OCSP query to an authorized server for the revocation status of a certificate. Performing an OCSP lookup requires access to a remote OCSP server, or a local OCSP server. Configure an OCSP profile with the appropriate settings for your network.

Note: The OCSP server must be reachable from the default VRF.

Use the following commands to enable OCSP on the switch, and add the OCSP profile, *myOCSP*:

```
switch(config) # management security
switch(config-mgmt-security) # ocsp profile myOCSP
```

Link an OCSP profile to an SSL profile by adding the parameter, **revocation ocsp profile**.

Specify a timeout in seconds from one (1) to 600 with a default timeout of 30 seconds.

```
switch(config-mgmt-sec-ocsp-profile-myOCSP) # timeout 120
```

Override the OCSP responder and use a URL to a OCSP server for all OCSP queries instead of the values in the X.509 certificate:

```
switch(config-mgmt-sec-ocsp-profile-myOCSP) # url http://www.myocspserver.com
```

Note: EOS only supports HTTP requests for OCSP queries.

Add an extension request and response nonce behavior to the configuration. By default, a response contains a nonce but doesn't treat the absence of one as a failure. Configure this parameter to require a nonce in the request or not send one at all. In this case, disable the nonce request:

```
switch(config-mgmt-sec-ocsp-profile-myOCSP) # extension nonce request disabled
```

Configure certificates in the chain that require validation using OCSP. By default, the profile uses **all**. This requires the entire chain up to but not including the root CA to validate with OCSP. If set to **leaf**, only the client certificate must be validated using OCSP. If set to **none**, then OCSP only performs validation on certificates with an OCSP responder specified.

```
switch(config-mgmt-sec-ocsp-profile-myOCSP) # chain certificate requirement responder all
```

Specify a VRF for OCSPP queries using the parameter, **vrf** and add it to the OCSP profiles:

```
switch(config) # management security
switch(config-mgmt-security) # ocsp profile myOCSP
switch(config-mgmt-security-myOCSP) # vrf VRF2
```

Link an OCSP profile to an SSL profile using the parameter, **revocation ocsp profile** when configuring the SSL profile. If the SSL profile links to a nonexisting OCSP profile, the SSL profile becomes invalid. If no OCSP profile links to the SSL profile, no OCSP profile checking occurs for the SSL profile. The following commands link the SSL profile, *MySSLProfile*, to the OCSP profile, *MyOCSP*:

```
switch(config) # management security
switch(config-mgmt-security) # ssl profile MySSLProfile
switch(config-mgmt-security-MySSLProfile) # revocation ocsp profile myOCSP
```

Displaying X.509 Certification Configuration

Use the following command to display the X.509 Authentication configuration:

```
switch(config) # show run section management ssh
management ssh
    authentication X.509
    server ssl profile x509-profile
    username domain omit
```

The command, **show management ssh**, includes additional information about the X.509 authentication configuration:

```
switch(config) # show management ssh
User certificate authentication methods: x509-certificates
SSL profile: X509-profile invalid. See "show management security ssl profile" output for details.
```

To display details about the SSL profile configured for SSH authentication, use the **show management security ssl profile** command:

```
switch(config) # show management security ssl profile
Profile          State   Additional Information
-----
ARISTA_DEFAULT_PROFILE valid
x509-profile      invalid Profile has no data
```

To display the SSL profile, the OCSP profile, and VRF information, use the following command:

```
switch(config)# show run section management security
management security
  ocsp profile myOCSP
    chain certificate requirement responder leaf
    extension nonce request response
    timeout 20
    url http://127.0.0.1:8080
    vrf VRF2
  !
  ssl profile X509-profile
  ...
  revocation ocsp profile revoke-ocsp
  ...
```

In the output, only the leaf certificate validates, and an extension request requires a nonce. The timeout occurs after 20 seconds, and the URL for certificate validation set to the local address.

9.1.1.5.1 X.509 Automatic Certificate Management

X.509 automatic certificate management provides support for retrieving signed X.509v3 certificates from a server using the Enrollment over Secure Transport (EST) protocol. EOS only supports EST as the client protocol.

EOS supports the following capabilities for an EST protocol profile:

- Server URL
- Separate authentication credentials for initial enrollment and re-enrollment
- Request retry behavior
- Server authentication with explicit trust anchor

EOS supports the following capabilities for a certificate profile:

- Distinguished Name
- Subject Alternative Name
- Private key on the switch
- Certificate Signing Requests with digest algorithm
- A renewal interval before certificate expiration
- Assigning an EST protocol profile to the certificate profile

EOS also supports the following additional functionalities:

- Automatic retrieval of the initial signed certificates from the EST server
- Automatic certificate renewal
- Displaying information about the current certificate status and EST protocol profiles
- Using automatically retrieved certificates in SSL profiles

9.1.1.5.1.1 Configuring X.509 Automatic Certificate Management

X.509 Automatic Certificate Management provides two dedicated configuration modes for certificate and Enrollment over Secure Transport (EST) protocol profiles under the Management Security Configuration mode.

- **profile** - Configure certificate options for automatic certificate management.
- **protocol** - Configure EST protocol options for automatic certificate management.

Use **protocol** options to specify the details, such as server identity, validation, or retry behavior, for the EST protocol used to retrieve the certificate.

Use **profile** options to specify the parameters for the certificate such as a distinguished name and subject alternative name. Each certificate profile manages a single certificate and multiple certificate profiles can apply to a single protocol profile. However, a single certificate profile cannot apply to multiple protocol profiles.

Configuring an EST Protocol Profile

An EST protocol profile communicates with an EST server based on the configured parameters. Create a new protocol profile or modify an existing EST protocol profile and configure a name for each profile. Use the following commands to create a profile, *EST_1*, on the switch:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#{
```

Configuring EST Protocol Profile Connections

The parameter, **connection**, configures the request send and retry behavior, and includes the maximum number of retries with the configured interval between retries. A device continues to send certificate signing requests to the switch until retrieving the certificate or exceeding the number of configured retries. The maximum number of retries resets to the maximum value for each new retry initiation or the retry count changes. By default, the switch allows an infinite number of retries and the interval between each request doubles exponentially to a maximum of 24 hours.

Use the following commands to configure 10 as the maximum number retries with an exponentially increasing interval of 5 seconds:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#{ connection retry count 10 interval 5 backoff exponential
```

Adding the **backoff exponential** parameters doubles the interval between each retry attempt up to 24 hours. Omitting the keywords sets a constant interval, for example:

```
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#{ connection retry interval 10
```

Configuring EST Protocol Profile Credentials

The **credentials** parameter configures initial enrollment and re-enrollment using a username and secret pair or JSON Web Tokens (JWT). HTTP authentication uses the credentials when sending requests to the server. Configuring a username and secret pair uses basic HTTP authentication and bearer authentication for JWTs. You cannot configure username-secret pairs with JWTs on the same EST protocol profile. Use the following commands to configure a username, *user_1*, with a secret, *myS3cr3t*, for the EST protocol profile, *EST_1*:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#{ credentials enroll username user_1 secret myS3cr3t
```

Use the following commands to add the credentials for re-enrollment:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#{ credentials re-enroll username user_1 secret myS3cr3t
```

Configuring the EST Server

The **server** parameters identify the EST server and manage the authentication process by setting the server URL and then validating the server. The server URL must begin with `https://` and only contains the relevant identifying information. When retrieving a new certificate, the server checks the URL against the subject names in the EST server certificate and against the configured hostname or IP address. Otherwise, the server rejects the connection.

The URL can contain an IPv4 or IPv6 address or a DNS and may also contain a port.

Use the following commands to set the server URL to `https://my-est-server.com`

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# server url https://my-est-server.com
```

An SSL option can be used to select an SSL profile with trusted certificates to validate the EST server identity. Use the following commands to use an SSL profile, `SSL_Lab`, and configure the EST protocol profile, `EST_1`:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# server ssl profile SSL_Lab
```

Disabling an EST Protocol Profile

The **disabled** parameter temporarily pauses retrieving credentials from the server configured for the selected EST protocol profile. Use this option when EST server errors detected on the network and prevent sending unnecessary requests while resolving issues with the server without changing the EST protocol profile parameters.

Use the following commands to temporarily disable the profile, `EST_1`:

```
switch(config)# management security
switch(mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-est-EST1)# disabled
```

To re-enable the protocol profile, use the **no** parameter:

```
switch(config)# management security
switch(mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-est-EST1)# no disabled
```

9.1.1.5.1.2 Configuring EST Certificate Profiles

Use EST certificate profiles to manage certificates for EST and configure each profile with a unique name. A certificate profile can only manage one certificate. For example, use the following commands to create a certificate profile, `CertAlpha`:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

Configuring a Certificate Profile with a Digest Algorithm

Configure the certificate profile to use a digest algorithm to sign Certificate Signing Requests. Select one of the three available algorithms:

- `sha256` - Use a 256 bit SHA digest algorithm, the default value.
- `sha384` - Use a 384 bit SHA digest algorithm.

- **sha512** - Use a 512 bit SHA digest algorithm.

Use the following commands add a 512 bit SHA digest algorithm to the certificate profile, *CertAlpha*:

```
switch(config) # management security
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # digest sha512
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

Configuring a Key for a Certificate Profile

The **key** parameter configures the private and public key pair used for creating the certificate. By default, no value exists. Create or copy a key file and store it in the **sslkey** directory. For instance, use the following command to copy the key file, *key.pem* from the */tmp* directory on the switch to the **sslkey** directory:

```
switch# copy file:/tmp/ssl/key.pem sslkey:
```

To generate a 2048-bit RSA key with the name, *key.pem*, and save it to the **sslkey** directory, use the following command:

```
switch# security pki generate rsa 2048 key.pem
```

Add the key to the certificate profile using the following commands:

```
switch(config) # management security
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # key key.pem
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

The certificate profile configuration requires adding a key. If left empty or contains an invalid key, the configuration marks the profile as mis-configured and does not send certificate signing requests.

Changing the key for the certificate while associated with a certificate profile triggers a **rekey** operation which sends a re-enrollment request to the EST server and uses the new key for creating a new certificate. The old key and certificate pair authenticates the client as well as using the re-enrollment credentials to authenticate.

Configuring Parameters for a Certificate Profile

The **parameters** option configures the **distinguished name** and the **subject alternative name** for the certificate. The **distinguished name** parameter configures the following:

- Common Name
- Country
- Email
- Locality
- Organization
- Organization Unit
- State

Each field can have only one value, and the field contains no values until configured. Quotation marks (" ") can be used for names with more than one word. For example, use the following commands to include the common name, "Switch 1", and the organization, Arista:

```
switch(config) # management security
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # parameters distinguished-name
common-name "Switch 1"
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # parameters distinguished-name
organization Arista
```

```
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

To clear the values from the configuration, use the **no** | **default** versions of the command.

The **subject alternative name** includes the following fields:

- DNS - Specify a DNS name.
- Email - Add the email address.
- IP address - Add the IPv4 or IPv6 address.
- URI - Specify URIs for the configuration.

By default, these fields contain no values.

Use the following commands to add the IPv4 address, 192.168.1.1, the IPv6 address, 3FFF:FFFF::1, the email address, *mail@yourcompany.com*, and the URI, *http://example.com/path/etc* to the certificate profile, *CertAlpha*:

```
switch(config) # management security
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # parameters subject-alter
native-name ip 192.0.2.1 192.0.2.2 3FFF:FFFF::1"
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # parameters subject-alter
native-name email mail@example.com
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # parameters subject-alter
native-name uri https://example.com/path/one
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

To clear the values from the configuration, use the **no** | **default** versions of the command.

Configure at least one option for **parameters**, either the distinguished name or the subject alternative name. If left empty, the configuration marks the profile as mis-configured and does not send certificate signing requests.

Changing the key for the certificate while associated with a certificate profile triggers a **rekey** operation which sends a re-enrollment request to the EST server and uses the new key for creating a new certificate. The old key and certificate pair authenticates the client as well as using the re-enrollment credentials to authenticate.

Assigning a Certificate Profile to an EST Protocol Profile

The **protocol** parameter assigns a certificate profile to an EST profile. Use the following commands to add the *CertAlpha* certificate protocol to the *EST_1* protocol profile:

```
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # protocol instance EST_1
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

You must configure this parameter to assign a valid EST protocol profile to a certificate profile. Multiple certificate profiles can be assigned to a single EST protocol profile.

Renewing Certificates

The **renewal** parameter sets the time to renew the certificate. Configure this parameter as the number of seconds before a certificate expires. By default, the certificate expires after two hours. Use the following commands to configure the renewal time as 3600 seconds, one hour before the certificate expires:

```
switch(config-mgmt-security) # auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) # renewal 3600 seconds
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

Using the **no** version of the command resets the renewal time to 7200 seconds (2 hours).

9.1.1.5.1.3 Displaying Certificate Profile Information

The **show certificate profile** command displays information about the current status of the certificate profile as well as additional statistics about previous retrievals if you add the **detail** keyword.

```
switch# show management security auto-certificate profile CertAlpha
Auto certificate profile CertAlpha:
  Key:          clientkey.pem
  State:        Valid
  Next request in 89 days, 21:59:47 at: 2025-02-05 01:45:51

switch# show management security auto-certificate profile CertAlpha detail
Auto certificate profile CertAlpha:
  Key:          clientkey.pem
  State:        Valid
  Next request in 89 days, 21:59:37 at: 2025-02-05 01:45:51
  Initial enrollment statistics:
    Number of successes: 1
    Number of failures:  0
  Renewal statistics:
    Number of successes: 0
```

The output displays the following information about the certificate profile:

- **Key** - Displays the current key associated with the retrieved certificate.
- **State** - Displays the current state of the certificate profile. The certificate profile state may be one of the following transient values:
 - **Initiating** - Temporary state displayed after creating a new certificate profile.
 - **Configuration changed** - Temporary state displayed after changing a certificate profile configuration.
 - **Invalid configuration** - Displayed when the certificate profile has an invalid configuration and preventing certificate retrievals for this profile.
 - **Needs enrolling** - Displayed when the certificate requires enrollment but the process has not begun.
 - **Enrolling** - Displayed during the certificate initial enrollment process and changes after retrieving a valid certificate or the process fails after running out of retry attempts.
 - **Needs renewing** - Displayed when the certificate requires renewing but the process has not begun
 - **Renewing** - Displayed when the certificate renewal process begins and changes after receiving a valid certificate or the process fails after running out of retry attempts.
 - **Valid** - Displayed when the certificate profile has a valid configuration and has a valid certificate.
 - **Invalid** - Displayed when the certificate renewal process fails or runs out of retry attempts.
- **Last Error** - Displays a timestamp and description of the last error that prevented retrieval of the certificate. Only displays if an error has occurred.
- **Next request** - Displays the timestamp of the next planned request for certificate renewal if a valid certificate profile exists. Or displays the next retrieval attempt with a timestamp if an error occurs during retrieval. Otherwise, displays **Never**.

When adding the **detail** keyword, the output displays the following additional information:

- **Initial enrollment statistics** - Displays counters for successful and failed initial enrollment request attempts.
- **Renewal statistics** - Displays counters for successful and failed renewal request attempts.

Displaying Invalid Configuration Information

The following output displays information about an invalid certificate profile configuration:

```
switch# show management security auto-certificate profile CertAlpha
Auto certificate profile CertAlpha:
  Key:          clientkey.pem
  State:        Invalid configuration
```

```

Last error:
Message:      Protocol instance not set
Time:        2024-11-07 04:59:19
Next request at:    Never

switch# show management security auto-certificate profile CertAlpha detail
Auto certificate profile CertAlpha:
Key:      clientkey.pem
State:    Invalid configuration
Last error:
Message:      Protocol instance not set
Time:2024-11-07 04:59:19
Next request at:    Never
Initial enrollment statistics:
Number of successes: 0
Number of failures:  0
Renewal statistics:
Number of successes: 0
Number of failures:  0

```

The profile does not have a valid protocol instance in the configuration and the configuration fails.

Displaying Request Errors

The output displays information about a certificate profile encountering errors when sending requests to the server:

```

switch# show management security auto-certificate profile certProfileCharlie
Auto certificate profile certProfileCharlie:
Key:      clientkey.pem
State:    Enrolling
Last error:
Message:      HTTP connection refused
Time:2024-11-07 05:37:49
Next request in 0:00:07 at: 2024-11-07 05:37:57

switch# show management security auto-certificate profile certProfileCharlie detail
Auto certificate profile certProfileCharlie:
Key:      clientkey.pem
State:    Enrolling
Last error:
Message:      HTTP connection refused
Time:2024-12-10 05:17:52
Next request in 0:00:04 at: 2024-11-07 05:37:57
Initial enrollment statistics:
Number of successes: 0
Number of failures:  4
Renewal statistics:
Number of successes: 0
Number of failures:  0

```

The certificate request has encountered errors when attempting to reach the EST server.

Displaying All Certificate Profiles

Use the **show management security auto-certificate profile detail** to display details about all certificate profiles on the switch:

```

switch# show management security auto-certificate profile detail
Auto certificate profile certProfileCharlie:
Key:      clientkey.pem
State:    Enrolling
Last error:
Message:      HTTP connection refused
Time:        2024-11-07 05:46:19
Next request in 0:04:41 at: 2024-11-07 05:54:51
Initial enrollment statistics:
Number of successes: 0
Number of failures:  4
Renewal statistics:
Number of successes: 0
Number of failures:  0

```

```

Auto certificate profile certProfileAlpha:
  Key:                      clientkey.pem
  State:                     Valid
  Next request in 89 days, 19:55:41 at: 2025-02-05 01:45:51
  Initial enrollment statistics:
    Number of successes: 1
    Number of failures:  0
  Renewal statistics:
    Number of successes: 0
    Number of failures:  0
Auto certificate profile certProfileDelta:
  Key:                      clientkey.pem
  State:                     Invalid configuration
  Last error:
  Message:                  No parameters set
  Time:                      2024-11-07 05:43:07
  Next request at:           Never
  Initial enrollment statistics:
    Number of successes: 0
    Number of failures:  0
  Renewal statistics:
    Number of successes: 0
    Number of failures:  0
Auto certificate profile certProfileBravo:
  Key:                      clientkey.pem
  State:                     Enrolling
  Last error:
  Message:                  HTTP connection refused
  Time:                      2024-11-07 05:45:05
  Next request in 0:11:59 at: 2024-11-07 06:02:09
  Initial enrollment statistics:
    Number of successes: 0
    Number of failures:  6
  Renewal statistics:
    Number of successes: 0
    Number of failures:  0

```

9.1.1.5.1.4 Displaying EST Protocol Profile Information

The **show management security auto-certificate protocol est** command displays information about the current status of an EST profile. Include the keyword, **detail** to list the certificate profiles managed by each EST protocol profile.

```

switch# show management security auto-certificate protocol est EST_1
Automatic Certificate Management policy EST_1:
  State:       Valid

switch# show management security auto-certificate protocol est EST_1 detail
Automatic Certificate Management policy EST_1:
  State:       Valid
  Managed certificate profile:
    certProfileAlpha:
      Certificate state:  Valid
    certProfileDelta:
      Certificate state: Invalid configuration

```

The output displays the following information about EST protocol profiles:

- **State** - Displays the current state of the EST protocol profile. The state can be one of the following values:
 - **Configuration changed** - Displays a temporary state present after changing the EST protocol profile configuration.
 - **Valid** - Displays when the switch has a valid EST protocol profile configured.
 - **Invalid** - Displays when the switch has an invalid EST protocol profile configured.
 - **Disabled** - Displays when the EST protocol profile has been temporarily disabled using the **disable** command.

- **Last error** - Displays a timestamp and description of the last error encountered causing the EST protocol profile to be invalid.

The following output for an invalid EST protocol profile displays an error message about the configuration:

```
switch# show management security auto-certificate protocol est EST_2
Automatic Certificate Management policy EST_2:
    State:      Invalid
    Last error:
    Message: Invalid SSL profile
    Time:      2024-11-07 06:28:20

switch# show management security auto-certificate protocol est EST_2 detail
Automatic Certificate Management policy EST_2:
    State:      Invalid
    Last error:
    Message: Invalid SSL profile
    Time:      2024-11-07 06:28:20
    Managed certificate profile:
        certProfileBravo:
            Certificate state:   Needs enrolling
```

9.1.1.6 Activating Security Services

After configuring the access databases, **aaa authentication**, **aaa authorization**, and **aaa accounting** commands designate active and backup services for handling access requests.

These sections describe the methods of selecting the switch's database to authenticate users and authorize access to network resources.

9.1.1.6.1 Authenticating Usernames and the Enable Password

Service lists specify the services the switch uses to authenticate usernames and the enable password.

9.1.1.6.1.1 Service List Description

Service list elements are service options, ordered by their priority.

Note: When the local file is one of the service list elements, any attempts to locally authenticate a username not included in the local file will result in the switch continuing to the next service list element.

Example

The following is an example service list for username authentication:

1. **Location_1** server group - specifies a server group (see [Server Groups](#)).
2. **Location_2** server group - specifies a server group.
3. TACACS+ servers - specifies all hosts for which a **tacacs-server host** command exists.
4. Local file - specifies the local file.
5. None - specifies that no authentication is required and all access attempts succeed.

The switch initially attempts to authenticate a username using the **Location_1** server group. If a server within that group is available, authentication proceeds through it. If not, the switch continues checking subsequent server groups until it finds an available one, or it resorts to option 5 (None), permitting access without authentication.

9.1.1.6.1.2 Configuring Service Lists

Service lists specify the services the switch uses to authenticate usernames and the enable password, and they are incorporated into the following **aaa authentication** commands:

- **aaa authentication login** specifies services the switch uses to authenticate usernames.
- **aaa authentication enable** specifies services the switch uses to authenticate the enable password.

Examples

- This command configures the switch to authenticate usernames through the **TAC-1** server group. The local database is the backup method if **TAC-1** servers are unavailable.

```
switch(config)# aaa authentication login default group TAC-1 local
```

- This command configures the switch to authenticate usernames through all **TACACS+** servers and, if the **TACACS+** servers are not available, all RADIUS servers. If the RADIUS servers are unavailable, the switch does not authenticate any login attempts.

```
switch(config)# aaa authentication login default group tacacs+ group radius none
```

- This command configures the switch to authenticate the enable password through all **TACACS+** servers and, if the **TACACS+** servers are unavailable, through the local database.

```
switch(config)# aaa authentication enable default group TACACS+ local
```

9.1.1.6.2 AAA Time-based Lockout

AAA time-based lockout enables managing remote user unsuccessful login attempts for a specified period.

- The **aaa authentication policy lockout failure** command locks out remote user access for a specified period after several specific consecutive unsuccessful login attempts within a lockout period. In the following example, a user is allowed 4 attempts to log in within 1 day (the default window). After four consecutive unsuccessful logins, the system locks out their user account for 360 seconds.

```
switch(config)# aaa authentication policy lockout failure 4 duration 360
```

- The **show aaa authentication lockout** command displays the status of locked-out users.

```
switch# show aaa authentication lockout
```

- The **clear aaa authentication lockout** command clears a user's locked status, thus restoring access within a lockout period.

```
switch# clear aaa authentication lockout
```

9.1.1.6.3 Authorization

Authorization commands control EOS shell access, CLI command access, and configuration access through the console port. The switch also supports role-based authorization, which allows access to specified CLI commands by assigning command profiles (or roles) to usernames. See [Role-Based Authorization](#) for details.

During the exec authorization process, TACACS+ server responses may include attribute-value (AV) pairs. The switch recognizes the mandatory AV pair named **priv-lvl=x** (where **x** is between **0** and **15**).

A TACACS+ server that sends any other mandatory AV pair is denied access to the switch by default. The switch's receipt of optional AV pairs does not affect decisions to permit or deny access to the TACACS+ server. The **tacacs-server policy** command programs the switch to allow access to TACACS+ servers that send unrecognized mandatory AV pairs.

The following **aaa authorization** commands configure authorization to switch services:

- To specify the method of authorizing the opening of an EOS shell, enter **aaa authorization exec**.
- To specify the method of authorizing CLI commands, enter **aaa authorization commands**.

Examples

- This command specifies that TACACS+ servers authorize users attempting to open a CLI shell.

```
switch(config)# aaa authorization exec default group tacacs+
```

- This command programs the switch to authorize configuration commands (privilege level **15**) through the local file and to deny command access to users not listed in the local file.

```
switch(config)# aaa authorization commands all default local
```

- This command programs the switch to permit all commands entered on the CLI.

```
switch(config)# aaa authorization commands all default none
```

- This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)# tacacs-server policy unknown-mandatory-attribute ignore
```

All commands are typically authorized through **aaa authorization commands**. However, the **no aaa authorization config-commands** command disables the authorization of configuration commands. In this state, authorization to execute configuration commands can be managed by controlling access to global configuration commands. The default setting authorizes configuration commands through the policy specified for all other commands.

- Use the **aaa authorization config-commands** command to enable the authorization of configuration commands with the policy specified for all other commands.
- To require authorization of commands entered on the console, enter **aaa authorization serial-console**.

By default, EOS does not verify the authorization of commands entered on the console port.

Examples

- This command disables the authorization of configuration commands.

```
switch(config)# no aaa authorization config-commands
```

- This command enables the authorization of configuration commands.

```
switch(config)# aaa authorization config-commands
```

- This command configures the switch to authorize commands entered on the console using the method specified through a previously executed **aaa authorization** command.

```
switch(config) # aaa authorization serial-console
```

9.1.1.6.4 Accounting

The accounting service collects information for billing, auditing, and reporting. The switch supports TACACS+ and RADIUS accounting by reporting user activity to either the TACACS+ server or the RADIUS server as accounting records.

The switch supports two types of accounting:

- EXEC**: Provides information about user CLI sessions.
- Commands**: Command authorization for all commands, including configuration commands associated with a privilege level.

The accounting mode determines when accounting notices are sent. Mode options include:

- start-stop**: a **start** notice is sent when a process begins; a **stop** notice is sent when it ends.
- stop-only**: a **stop** accounting record is generated upon the successful completion of a process.

The **aaa accounting** command enables accounting.

Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config) # aaa accounting commands all default start-stop group tacacs+
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config) # aaa accounting exec console stop group tacacs+
```

9.1.1.7 TACACS+ Configuration Examples

These sections describe two sample TACACS+ host configurations.

9.1.1.7.1 Single Host Configuration

The example single host configuration consists of a TACACS+ server with these attributes:

- IP address: **10.1.1.10**.
- encryption key: **example_1**.
- port number: **49** (global default).
- timeout: **5** seconds (global default).

The switch authenticates the username and enable command against all TACACS+ servers which, in this case, is one host. If the TACACS+ server is unavailable, the switch authenticates with the local file.

-
1. This step configures TACACS+ server settings; port number and timeout are global defaults.

```
switch(config)# tacacs-server host 10.1.1.10 key example_1
```

2. This step configures the login authentication service.

```
switch(config)# aaa authentication login default group tacacs+ local
```

3. This step configures the **enable** command password authentication service.

```
switch(config)# aaa authentication enable default group tacacs+ local
```

9.1.1.7.2 Multiple Host Configuration

The example multiple host configuration consists of three TACACS+ servers at these locations:

- IP address **10.1.1.2** - port **49**.
- IP address **172.16.4.12** - port **4900**.
- IP address **192.168.2.10** - port **49**.

The configuration combines the servers into these server groups:

- **Bldg_1** group consists of the servers at **10.1.1.2** and **172.16.4.12**.
- **Bldg_2** group consists of the servers at **192.168.2.10**.

All servers use these global TACACS+ defaults:

- encryption key - **example_2**.
- timeout - **10 seconds**.

The switch authenticates these access methods:

- username access against **Bldg_1** group then, if they are not available, against the local file.
- enable command against **Bldg_2** group, then **Bldg_1** group, then against the local file.

1. TACACS+ Host Commands:

These commands configure the IP address and ports for the three TACACS+ servers. The port for the first and third server is default **49**.

```
switch(config)# tacacs-server host 10.1.1.12
switch(config)# tacacs-server host 172.16.4.12 port 4900
switch(config)# tacacs-server host 192.168.2.10
```

2. Global Configuration Commands:

These commands configure the global encryption key and timeout values.

```
switch(config)# tacacs-server key example_2
switch(config)# tacacs-server timeout 10
```

3. Group Server Commands:

The **aaa group server** commands create the server groups and place the CLI in server group configuration mode, during which the servers are placed in the group. The port number must be included if it is not the default port, as in the line that adds **192.168.1.1**.

```
switch(config)# aaa group server tacacs+ Bldg_1
switch(config-sg-tacacs+-Bldg_1)# server 10.1.1.2
switch(config-sg-tacacs+-Bldg_1)# server 192.168.1.1 port 4900
switch(config-sg-tacacs+-Bldg_1)# exit
switch(config)# aaa group server tacacs+ Bldg_2
switch(config-sg-tacacs+-Bldg_2)# server 192.168.2.2
switch(config-sg-tacacs+-Bldg_2)# exit
switch(config)#

```

4. Login and enable configuration authentication responsibility commands.

These commands configure the username and enable command password authentication services.

```
switch(config)# aaa authentication login default group Bldg_1 local
switch(config)# aaa authentication enable default group Bldg_1 group Bldg_2 local

```

9.1.1.8 AAA Accounting for OpenConfig Remote Procedure Call (RPC) Messages Overview

OpenConfig allows network engineers to collaboratively develop programming interfaces and tools to manage networks dynamically and in a vendor-neutral manner.

EOS supports AAA Accounting for gRPC Network Management Interface (gNMI), gRPC Network Operations (gNOI) Interface, and gRPC Network Security Interface (gNSI) RPCs by logging the accounting records to a TACACS+ server, RADIUS server, or to a syslog server.

9.1.1.9 AAA Commands

Local Security File Commands

- [aaa root](#)
- [enable password](#)
- [show privilege](#)
- [show users](#)
- [show users accounts](#)
- [username](#)
- [username ssh-key](#)

Accounting, Authentication, and Authorization Commands

- [aaa accounting](#)
- [aaa accounting dot1x](#)
- [aaa accounting system](#)
- [aaa authentication dot1x](#)
- [aaa authentication enable](#)
- [aaa authentication login](#)
- [aaa authentication policy local allow-nopassword-remote-login](#)
- [aaa authentication policy lockout failure](#)
- [aaa authentication policy log](#)
- [aaa authorization commands](#)
- [aaa authorization config-commands](#)

-
- aaa authorization exec
 - aaa authorization policy local default-role
 - aaa authorization serial-console
 - clear aaa authentication lockout
 - clear aaa counters
 - clear aaa counters radius
 - clear aaa counters tacacs+
 - clear radius proxy counters client group
 - show aaa
 - show aaa authentication lockout
 - show aaa counters
 - show aaa methods
 - show management ldap
 - show users detail

Automatic X.509 Certificate Management Commands

- auto-certificate protocol connection
- auto-certificate protocol credentials
- auto-certificate protocol disabled
- auto-certificate protocol server
- auto-certificate profile
- auto-certificate profile
- auto-certificate profile parameters
- show management security auto-certificate profile
- show management security auto-certificate protocol est

Server (RADIUS and TACACS+) Configuration Commands

- ip radius source-interface
- ip tacacs source-interface
- radius proxy
- radius proxy client group client
- radius proxy client group server
- radius proxy client key
- radius proxy client session
- radius proxy dynamic-authorization
- radius-server deadtime
- radius-server host
- radius-server key
- radius-server retransmit
- radius-server timeout
- show radius
- show radius proxy client group
- show radius proxy server group
- show tacacs
- tacacs-server host
- tacacs-server key
- tacacs-server policy
- tacacs-server timeout

Server Group Configuration Commands

- `aaa group server radius`
- `aaa group server tacacs+`
- `server (server-group-RADIUS configuration mode)`
- `server (server-group-TACACS+ configuration mode)`

Role-Based Authorization Configuration Commands

- `deny (Role)`
- `no <sequence number> (Role)`
- `permit (Role)`
- `resequence (Role)`
- `role`
- `show users roles`

9.1.1.9.1 aaa accounting dot1x

The **aaa accounting dot1x** command enables the accounting of requested 802.1X services for network access.

The **no aaa accounting dot1x** and **default aaa accounting dot1x** commands disable the specified method list by removing the corresponding **aaa accounting dot1x** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
aaa accounting dot1x default [METHOD_1][METHOD_2][METHOD_N]  
no aaa accounting dot1x default  
default aaa accounting dot1x default
```

Parameters

- **MODE** - The accounting mode that defines when to send accounting notices. Options include the following:
 - **start-stop** - Send a *start* notice when a process begins, and a *stop* notice when it ends.
- **METHOD_X** - The server groups (methods) that receives accounting records from the switch. The switch sends the method list to the first available listed group.
- No parameter specified if **MODE** is set to **none**. If **MODE** not set to **none**, the command must provide at least one method. Each method consists of one of the following:
 - **group name** the server group identified by *name*.
 - **group radius** server group that includes all defined RADIUS hosts.
 - **logging** server group that includes all defined TACACS+ hosts.

Examples

- This example configures **IEEE 802.1X** accounting on the switch.

```
switch(config)# aaa accounting dot1x default start-stop group radius  
switch(config)#
```

- This example disables **IEEE 802.1X** accounting on the switch.

```
switch(config)# no aaa accounting dot1x default  
switch(config)#
```

9.1.1.9.2 aaa accounting system

The **aaa accounting system** command performs accounting for all system-level events.

The **no aaa accounting system** and **default aaa accounting system** commands clear the specified method list by removing the corresponding **aaa accounting system** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
aaa accounting system default [METHOD_1][METHOD_2] ... [METHOD_N]
```

```
no aaa accounting system default
```

```
default aaa accounting system default
```

Parameters

- **MODE** The accounting mode that defines when to send accounting notices. Options include the following:
 - **none** - Do not send notices.
 - **start-stop** - Send a *start* notice when a process begins, and send a *stop* notice when it ends.
 - **stop-only** - Generate a *stop* accounting record after a process successfully completes.
- **METHOD_X** - The server groups (methods) that receives accounting records from the switch. The switch sends the method list to the first available listed group.
- No parameter specified if **MODE** is set to **none**. If **MODE** not set to **none**, the command must provide at least one method. Each method consists of one of the following:
 - **group name** - The server group identified by the *name*.
 - **group radius** - The server group that includes all defined RADIUS hosts.
 - **group tacacs+** - The server group that includes all defined TACACS+ hosts.
 - **logging** Log all accounting messages to Syslog..

Examples

- This command configures AAA accounting to not use any accounting methods for system events.

```
switch(config)# aaa accounting system default none
switch(config)#{
```

- This command configures the switch to maintain stop accounting records for system events to all defined RADIUS hosts.

```
switch(config)# aaa accounting system default stop-only group radius
switch(config)#{
```

9.1.1.9.3 aaa accounting

The **aaa accounting** command configures accounting method lists for a specified authorization type. Each list consists of a prioritized list of methods. The accounting module uses the first available listed method for the authorization type.

The **no aaa accounting** and **default aaa accounting** commands clear the specified method list by removing the corresponding **aaa accounting** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
aaa accounting TYPE CONNECTION MODE [METHOD_1][METHOD_2] ... [METHOD_N]
```

```
no aaa accounting TYPE CONNECTION
```

```
default aaa accounting TYPE CONNECTION
```

Parameters

- **TYPE** - Authorization type for which the command specifies a method list. Options include:
 - **EXEC** - Records user authentication events.
 - **COMMANDS ALL** - Records all entered commands.
 - **COMMANDS level** - Records entered commands of the specified *level* (ranges from **0** to **15**).
- **CONNECTION** - The connection type of sessions that report method lists. Options include the following:
 - **console** - Console connection.
 - **default** - All connections not covered by other command options.
- **MODE** - The accounting mode that defines when to send accounting notices. Options include the following:
 - **none** - No notices sent.
 - **start-stop a start** - Send a notice when a process begins, and send a *stop* notice when it ends.
 - **stop-only a stop** - Generate an accounting record after a process successfully completes.
- **METHOD_X** server groups (methods) to receive accounting records. The switch sends the method list to the first available listed group.
- If you set the **MODE** to **none**, no parameter value is specified. If you do not set the **MODE** to **none**, the command must provide at least one method. Each method consists of one of the following:
 - **group name** - The server group identified by *name*.
 - **group radius** - The server group that includes all defined RADIUS hosts.
 - **group tacacs+** - The server group that includes all defined TACACS+ hosts.
 - **logging** - Log all accounting messages to Syslog.

Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting commands all default start-stop group tacacs+
switch(config)#
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting exec console stop group tacacs+
switch(config)#{/pre>
```

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting commands all default start-stop group tacacs+
switch(config)#{/pre>
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)# aaa accounting exec console stop group tacacs+
switch(config)#{/pre>
```

9.1.1.9.4 aaa authentication dot1x

The **aaa authentication dot1x** command configures the default authentication list of requested 802.1X services for network access.

The **no aaa authentication dot1x** and **default aaa authentication dot1x** commands remove the default authentication list for IEEE 802.1X.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication dot1x default group {group_name | radius}  
no aaa authentication dot1x default  
default aaa authentication dot1x
```

Parameters

- **default** configures the default authentication list of requested 802.1X services for network access.
- **group** configures server group.
- **group_name** server group name; multiple group names can be entered in a single command.
- **radius** list of all defined RADIUS hosts.

Example

This command configures the switch in the **auth1** group for IEEE 802.1X authentication.

```
switch(config)# aaa authentication dot1x default group auth1  
switch(config) #
```

9.1.1.9.5 aaa authentication enable

The **aaa authentication enable** command configures the service list that the switch references to authorize access to Privileged EXEC command mode.

The list consists of a prioritized list of service options. Available service options include the following:

- A named server group
- All defined TACACS+ hosts
- All defined RADIUS hosts
- Local authentication
- No authentication

The switch authorizes access by using the first listed service option available. When the local file is a service list element, attempts to locally authenticate a username not in the local file results in the switch continuing to the next service list element.

EOS supports a **console list** for authorizing usernames through the console and a default list for authorizing usernames through all other connections.

- If no console list exists, the console connection uses the **default** list.
- If no default list exists, the list sets to **local**.

The **no aaa authentication enable** and **default aaa authentication enable** commands revert the list configuration to the **default** by removing the corresponding **aaa authentication enable** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication enable [console | default] METHOD_1 [METHOD_2] ... [METHOD_N]
no aaa authentication enable [console | default]
default aaa authentication enable [console | default]
```

Parameters

console - Uses the console authentication list.

default - Uses the default authentication list.

METHOD_X authentication service method list. The command must provide at least one method. Each method consists of one of the following:

- **group name** the server group identified by *name*.
- **group radius** a server group that consists of all defined RADIUS hosts.
- **group tacacs+** a server group that consists of all defined TACACS+ hosts.
- **local** local authentication.
- **none** users are not authenticated; all access attempts succeed.

Example

This command configures the switch to authenticate the enable password through all configured TACACS+ servers. Local authentication is the backup if TACACS+ servers are unavailable.

```
switch(config)# aaa authentication default enable group TACACS+ local  
switch(config)#{
```

9.1.1.9.6 aaa authentication login

The **aaa authentication login** command configures service lists the switch references to authenticate usernames. Service lists consist of service options ordered by usage priority. The switch authenticates usernames through the first available service option. Supported service options include the following:

- A named server group
- All defined TACACS+ hosts
- All defined RADIUS hosts
- Local authentication
- No authentication.

When the local file contains a service list element, attempts to locally authenticate a username not in the local file results in the switch continuing to the next service list element.

The switch supports a **console** list for authenticating usernames through the console and a default list for authenticating usernames through all other connections.

- When the **console** list is not configured, the console connection uses the **default** list.
- When the **default** list is not configured, it is set to *local*.

The **no aaa authentication login** and **default aaa authentication login** commands revert the specified list configuration to its default by removing the corresponding **aaa authentication login** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication login CONNECTION SERVICE_1 [SERVICE_2] ... [SERVICE_N]
no aaa authentication login CONNECTION
default aaa authentication login CONNECTION
```

Parameters

- **CONNECTION** connection type of sessions for which authentication list is used.
 - **default** the default authentication list.
 - **console** the authentication list for console logins.
- **SERVICE_X** an authentication service. Settings include:
 - **group name** identifies a previously defined server group.
 - **group radius** a server group that consists of all defined RADIUS hosts.
 - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
 - **local** local authentication.
 - **none** The switch does not perform authentication. All access attempts succeed.

Examples

-
- This command configures the switch to authenticate usernames through the **TAC-1** server group. The local database is the backup method if **TAC-1** servers are unavailable.

```
switch(config)# aaa authentication login default group TAC-1 local  
switch(config)#
```

- This command configures the switch to authenticate usernames through all TACACS+ servers, then all RADIUS servers if the TACACS+ servers are not available. If the RADIUS servers are also unavailable, the switch allows access to all login attempts without authentication.

```
switch(config)# aaa authentication login default group tacacs+ group radius none  
switch(config)#
```

9.1.1.9.7 aaa authentication policy local allow-nopassword-remote-login

The **aaa authentication policy local allow-nopassword-remote-login** command permits usernames without passwords to log in from any port. The default switch setting only allows unprotected usernames to log in from the console.

The **no aaa authentication policy local allow-nopassword-remote-login** and **default aaa authentication policy local allow-nopassword-remote-login** commands return the switch to the default setting of allowing unprotected usernames to log in only from the console.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication policy local allow-nopassword-remote-login  
no aaa authentication policy local allow-nopassword-remote-login  
default aaa authentication policy local allow-nopassword-remote-login
```

Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config)# aaa authentication policy local allow-nopassword-remote-login  
switch(config)#
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config)# no aaa authentication policy local allow-nopassword-remote-login  
switch(config)#
```

9.1.1.9.8 aaa authentication policy lockout failure

The **aaa authentication policy lockout failure** command configures the switch to block the remote user from access after a specified number of unsuccessful login attempts within a lockout period.

The **no aaa authentication policy lockout failure** and the **default aaa authentication policy lockout failure** commands disable the lockout period configuration.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication policy lockout failure failure_count duration duration_time {window window_time}
```

```
no aaa authentication policy lockout failure
```

```
default aaa authentication policy lockout failure
```

Parameters

- ***failure_count*** - The number of failed logins allowed during access. Specify a valid number between 1 and 255.
- ***duration duration_time*** - The time in seconds to block a user account from login. Specify a value between 1 and **4294967295** seconds.
- ***window window_time*** the time in seconds to track failed logins within this duration. The value is between 1 and **4294967295** seconds while the default is 1 day.

Examples

- This command configures the system to allow four attempts to log in within a duration of 1 day by default. If the user has 4 unsuccessful consecutive logins, EOS locks the person out of the account for 360 seconds.

```
switch(config)# aaa authentication policy lockout failure 4 duration 360
```

- This command configures the system to allow five attempts to log in within a duration of 1 day by default. If the user has 5 unsuccessful consecutive logins, EOS locks the person out of the account for 60 seconds.

```
switch(config)# aaa authentication policy lockout failure 5 window 10 duration 60
```

9.1.1.9.9 aaa authentication policy log

The **aaa authentication policy log** command configures the switch to generate syslog messages for login authentication success or failure events.

The **no aaa authentication policy log** and the **default aaa authentication policy log** commands restore the default behavior of not generating syslog messages for these events.

Command Mode

Global Configuration

Command Syntax

```
aaa authentication policy {on-failure | on-success} log  
no aaa authentication policy {on-failure | on-success} log  
default aaa authentication policy {on-failure | on-success} log
```

Parameters

- **on-failure** - Generates syslog messages for failed login events.
- **on-success** - Generates syslog messages for successful login events.

Example

This command configures the switch to log successful and failed login attempts.

```
switch(config)# aaa authentication policy on-success log  
switch(config)# aaa authentication policy on-failure log
```

9.1.1.9.10 aaa authorization commands

The **aaa authorization commands** command configures the service list that authorizes CLI command access. All switch commands are assigned a privilege level that corresponds to the lowest level command mode from which it can be executed:

- **Level 1:** Commands accessible from **EXEC** mode.
- **Level 15:** Commands accessible from any mode except **EXEC**.

Command usage is authorized for each privilege level specified in the command.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option available. The available service options include the following:

- A named server group.
- All defined TACACS+ hosts.
- All defined RADIUS hosts.
- Local authorization.
- No authorization.

The list is set to **none** for all unconfigured privilege levels, allowing all CLI access attempts to succeed.

The **no aaa authorization commands** and **default aaa authorization commands** commands revert the list contents to **none** for the specified privilege levels.

Command Mode

Global Configuration

Command Syntax

```
aaa authorization commands PRIV default SERVICE_1[SERVICE_2] ... [SERVICE_N]
```

```
no aaa authorization commands PRIV default
```

```
default aaa authorization commands PRIV default
```

Parameters

- **PRIV** Privilege levels of the commands. Options include the following:
 - **level** - Numbers between **0** and **15**. Number, range, and comma-delimited list of numbers and ranges.
 - **all** - Commands of all levels.
- **SERVICE_X** Authorization service. Command must list at least one service. Options include the following:
 - **group name** - The server group identified by name.
 - **group tacacs+** - A server group that consists of all defined TACACS+ hosts.
 - **local** - Local authorization.
 - **none** - The switch does not perform authorization. All access attempts succeed.

Examples

- This command authorizes configuration commands (privilege level **15**) through the local file. The switch denies command access to users not listed in the local file.

```
switch(config)# aaa authorization commands all default local  
switch(config)#[/pre]
```

- This command authorizes all commands entered on the CLI.

```
switch(config)# aaa authorization commands all default none  
switch(config)#[
```

9.1.1.9.11 aaa authorization config-commands

The **aaa authorization config-commands** command enables authorization of commands in any configuration mode, such as Global Configuration and all interface configuration modes. The policy specified by the **aaa authorization commands** setting authorizes the commands. EOS enables authorization by default, so issuing this command has no effect unless **running-config** contains the **no aaa authorization config-commands** command.

The **no aaa authorization config-commands** command disables configuration command authorization. When disabled, **running-config** contains the **no aaa authorization config-commands** command. The **default aaa authorization config-commands** command restores the default setting by removing the **no aaa authorization config-commands** from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
aaa authorization config-commands  
no aaa authorization config-commands  
default aaa authorization config-commands
```

Examples

- This command enables the authorization of configuration commands.

```
switch(config)# aaa authorization config-commands  
switch(config)#{
```

- This command disables the authorization of configuration commands.

```
switch(config)# no aaa authorization config-commands  
switch(config)#{
```

9.1.1.9.12 aaa authorization exec

The **aaa authorization exec** command configures the service list that the switch references to authorize access to open an EOS CLI shell.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option to which the switch can connect. When the switch cannot communicate with an entity that provides a specified service option, it attempts to use the next option in the list.

The available service options include the following:

- A named server group.
- All defined TACACS+ hosts.
- All defined RADIUS hosts.
- Local authentication.
- No authentication.

EOS supports a **console** list to authorize access to a CLI shell through the console and a **default** list to authorize access for all other connections.

- If no console list exists, the console connection uses the **default** list and you enable **aaa authorization serial-console**. Otherwise, uses **none**.
- If no default list exists, the list sets to **local**.

The **no aaa authorization exec** and **default aaa authorization exec** commands set the list contents to **none**.

Command Mode

Global Configuration

Command Syntax

```
aaa authorization exec default METHOD_1 [METHOD_2] ... [METHOD_N]
```

```
no aaa authorization exec default
```

```
default aaa authorization exec default
```

Parameters

- **METHOD_X** authorization service (method). The switch uses the first listed available method.

The command must provide at least one method. Each method is composed of one of the following:

- **group name** - The server group identified by name.
- **group radius** - A server group that consists of all defined RADIUS hosts.
- **group tacacs+** - A server group that consists of all defined TACACS+ hosts.
- **local** - Local authentication.
- **none** - The switch does not perform authorization. All access attempts succeed.

Guidelines

During the EXEC authorization process, the TACACS+ server response may include attribute-value (AV) pairs. The switch recognizes **priv-lvl=x** (where **x** is an integer between **0** and **15**), which is a mandatory AV pair. A TACACS+ server that sends any other mandatory AV pair cannot access the switch. The receipt of optional AV pairs by the switch has no effect on decisions to permit or deny access to the TACACS+ server.

Example

This command specifies that the TACACS+ servers authorize users attempting to open an EOS CLI shell.

```
switch(config)# aaa authorization exec default group tacacs+
```

```
switch(config) #
```

9.1.1.9.13 aaa authorization policy local default-role

The **aaa authorization policy local** command specifies the name of the default role. A role provides a data structure that supports local command authorization through assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The default role is assigned to the following users:

- Local or remote users assigned to an unconfigured role.
- Local users without an assigned role.

If you do not specify the default-role for a user, EOS assigns **network-operator** to qualified users as the default role. The network-operator role authorizes assigned users access to all CLI commands in EXEC and Privileged EXEC modes.

The **no aaa authentication policy local default-role** and **default aaa authentication policy local default-role** commands remove the **authentication policy local default-role** statement from **running-config**. Removing this statement restores **network-operator** as the default role.

Command Mode

Global Configuration

Command Syntax

```
aaa authorization policy local default-role role_name
no aaa authorization policy local default-role
default aaa authorization policy local default-role
```

Parameter

role_name - Specify the name of the default role.

Related Command

The **role** command places the switch in **role** configuration mode for creating and editing roles.

Examples

- This command configures the sysuser as the default role.

```
switch(config)# aaa authorization policy local default-role sysuser
switch(config)#
```

- This command restores **network-operator** as the default role.

```
switch(config)# no aaa authorization policy local default-role
switch(config)#
```

- This command displays the contents of the **network-operator** role.

```
switch# show users roles network-operator
The default role is network-operator
role: network-operator
    10 deny mode exec command bash\\|
    20 permit mode exec command .*
switch#
```

9.1.1.9.14 aaa authorization serial-console

The **aaa authorization serial-console** command configures the switch to authorize commands entered through the console. By default, commands entered through the console do not require authorization.

The **no aaa authorization serial-console** and **default aaa authorization serial-console** commands restore the default setting.

Command Mode

Global Configuration

Command Syntax

```
aaa authorization serial-console  
no aaa authorization serial-console  
default aaa authorization serial-console
```

Example

This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed [aaa authorization commands](#) command.

```
switch(config)# aaa authorization serial-console  
switch(config)#[/pre>
```

9.1.1.9.15 aaa group server radius

The **aaa group server radius** command enters the Server-group-RADIUS Configuration Mode for the specified group name. The command creates the specified group if not previously created.

A server group consists of a collection of servers associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a [radius-server host](#) command.

The **no aaa group server radius** and **default aaa group server radius** commands delete the specified server group from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
aaa group server radius group_name
no aaa group server radius group_name
default aaa group server radius group_name
```

Parameters

group_name - Specify a name, as a text string, to assign to the group. Cannot be identical to a name already assigned to a TACACS+ server group.

Commands Available in Server-group-RADIUS Configuration Mode

[server \(server-group-RADIUS configuration mode\)](#).

Related Command

[aaa group server tacacs+](#).

Example

This command creates the RADIUS server group named **RAD-SV1** and enters **Server-group-RADIUS** configuration mode for the new group.

```
switch(config)# aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1) #
```

9.1.1.9.16 aaa group server tacacs+

The **aaa group server tacacs+** command enters Server-group-TACACS+ Configuration Mode for the specified group name. The command creates the specified group if not previously created.

A server group consists of a collection of servers associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a [tacacs-server host](#) command.

The **no aaa group server tacacs+** and **default aaa group server tacacs+** commands delete the specified server group from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
aaa group server tacacs+ group_name
no aaa group server tacacs+ group_name
default aaa group server tacacs+ group_name
```

Parameters

group_name - Specify a name, as a text string, to assign to the group. Cannot be identical to a name already assigned to a RADIUS server group.

Commands Available in Server-group-TACACS+ Configuration Mode

[server](#) (server-group-TACACS+ configuration mode)

Related Command

[aaa group server radius](#)

Example

This command creates the TACACS+ server group named TAC-GR and enters the Server-group-TACAS+ Configuration Mode for the new group.

```
switch(config)# aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR) #
```

9.1.1.9.17 aaa root

The **aaa root** command specifies the password security level for the root account and can assign a password to the account.

The **no aaa root** and **default aaa root** commands disable the root account by removing the **aaa root** command from *running-config*. The root account is disabled by default.

Command Mode

Global Configuration

Command Syntax

```
aaa root SECURITY_LEVEL [ENCRYPT_TYPE] [password]
```

```
no aaa root
```

```
default aaa root
```

Parameters

- **SECURITY_LEVEL** - Specify the password assignment level. Settings include the following:
 - **secret** Assigns the password to the root account.
 - **nopassword** - Does not assign a password to the root account.
- **ENCRYPT_TYPE** encryption level of the **password** parameter. This parameter is present only when **SECURITY_LEVEL** is **secret**. Settings include:
 - **no parameter** the password is entered as clear text.
 - **0** the password is entered as clear text. Equivalent to **no parameter**.
 - **5** the password is entered as an MD5-encrypted string.
 - **sha512** the password is entered as an SHA-512-encrypted string.
- **password** text that authenticates the username. The command includes this parameter only if **SECURITY_LEVEL** is **secret**.
 - **password** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
 - **password** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

Examples

- These equivalent commands assign **f4980** as the root account password.

```
switch(config)# aaa root secret f4980
switch(config)# aaa root secret 0 f4980
```

- This command assigns the text (**ab234**) that corresponds to the encrypted string of **\$1\$HW05LEY8\$QEVw6JqjD9VqDfh.O8r.b** as the root password.

```
switch(config)# aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b
switch(config)#
```

- This command removes the password from the root account.

```
switch(config)# aaa root nopassword
switch(config)#
```

-
- This command disables the root login.

```
switch(config)# no aaa root  
switch(config)#{
```

9.1.1.9.18 auto-certificate protocol connection

The **auto-certificate protocol connection** command configures parameters for Enrollment over Secure Transport (EST) profiles used for Automatic Certificate Management.

Command Mode

Management Security Configuration

EST Protocol Profile Configuration

Command Syntax

```
auto-certificate protocol est profile_name connection retry [count retries | interval seconds]
```

Parameters

- **est profile_name** - Configure a name for the EST profile.
- **connection** - Configure the options for connecting to the EST server.
 - **retry** - Configure the retry behavior.
 - **count retries** - Configure the number of attempted retries before giving up on the connection. If unconfigured, the connection attempts an infinite number of retries. Configure the number of retries between 0 and 4294967295.
 - **interval seconds** - Configure the time interval, in seconds, between retries. Use a value between 1 and 4294967295 seconds.

Example

Use the following commands to configure the number of retries to 100 with an interval of 2 seconds, on the EST profile, *EST_1*:

```
switch(config)# management security  
switch(config-mgmt-security)# auto-certificate protocol est EST_1  
switch(config-mgmt-sec-auto-cert Proto-est-EST_1)# connection retry count 100  
switch(config-mgmt-sec-auto-cert Proto-est-EST_1)# connection retry interval 2 seconds
```

9.1.1.9.19 auto-certificate protocol credentials

The **auto-certificate protocol credentials** command configures the enrollment and re-enrollment usernames and pairs or JSON Web Tokens (JWTs). The EST profile only uses the credentials for HTTP authentication requests to the server.

The **no | default** versions of the command disables the credentials configuration on the switch.

Command Mode

Management Security Configuration

EST Protocol Profile Configuration

Command Syntax

```
auto-certificate protocol est profile_name credentials [enroll | re-enroll] [secret | token | username] [0 | 7 | 8a] line]
```

Parameters

- **protocol est profile_name** - Configure an EST protocol profile name.
- **credentials** - Configure credentials for EST authentication.
- **[enroll | re-enroll]** - Configure credentials for initial enrollment and re-enrollment.
 - **secret** - Configure a password for HTTP basic authentication.
 - **token** - Configure a token for HTTP basic authentication.
 - **username** - Configure a username for HTTP basic authentication.
 - **0** - Indicates an unencrypted key string follows.
 - **7** - Specifies a hidden key follows.
 - **8a** - Specifies an AES-256-GCM encrypted key follows.
 - **line** - Configure a clear text key string.

Example

Use the following commands to create enrollment credentials for EST protocol profile, *EST_1*, with an unencrypted secret, *password1234*:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# credentials enroll secret 0 password1234
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)#

```

9.1.1.9.20 auto-certificate protocol disabled

The **auto-certificate protocol disabled** command temporarily pauses retrieving certificates from the server by disabling the profile and prevents sending unnecessary requests to the server. This may be helpful when troubleshooting server connections and does not require reconfiguration of the EST protocol profile. The **no** version of the command re-enables the profile.

Command Mode

Management Security

EST Protocol Profile Configuration

Command Syntax

```
auto-certificate protocol est profile_name disabled
```

Parameters

- **disabled** - Temporarily disable sending EST requests to the server.

Examples

Use the following commands to disable EST protocol profile, *EST_1*:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# disabled
```

To re-enable the profile, use the following commands:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# no disabled
```

9.1.1.9.21 auto-certificate protocol server

The **auto-certificate protocol server** command configures EST server behavior and options such as SSL profiles, server URLs, and VRFs.

The **no** | **default** versions of the command removes the configuration from the EST Protocol Profile.

Command Mode

Management Security

EST Protocol Profile Configuration

Command Syntax

```
auto-certificate protocol est profile_name server [ssl ssl_profile] [url server_url] [vrf vrf]
```

Parameters

- **protocol est profile_name** - Configure a name for the EST protocol profile.
- **server** - Configure EST server options:
 - **ssl ssl_profile** - Specify an SSL profile name to add to the configuration.
 - **url server_url** - Specify an EST server URL to retrieve certificates. The URL must start with **https://**.
 - **vrf vrf** - Specify the VRF to perform EST requests.

Example

Use the following commands to add a URL, *https://myestserver.mycompany.com*, to the EST protocol profile, *EST_1*

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate protocol est EST_1
switch(config-mgmt-sec-auto-cert-proto-est-EST_1)# server url https://myestserver.mycompany.com
```

9.1.1.9.22 auto-certificate profile

The **auto-certificate profile** command allows configuration of Automatic Certificate Management and profiles for X.509 certificates. X.509 automatic certificate management provides support for retrieving signed X.509v3 certificates from a server using the Enrollment over Secure Transport (EST) protocol. EOS only supports EST as the client protocol.

The **no** | **default** versions of the command remove the configuration from the ***running-config***.

Command Mode

Management Security Configuration

Certificate Profile Configuration

Command Syntax

```
auto-certificate profile profile_name [digest [sha256 | sha384 | sha512]] [key key_name] [protocol instance protocol_instance_name] [renewal expire_seconds seconds]
```

Parameters

- **profile *profile_name*** - Specify a name for the auto-certificate profile.
- **digest [sha256 | sha384 | sha512]** - Specify a digest algorithm to sign Certificate Signing Requests.
 - **sha256** - Use a 256 bit SHA digest algorithm, the default value.
 - **sha384** - Use a 384 bit SHA digest algorithm.
 - **sha512** - Use a 512 bit SHA digest algorithm.
- **key *key_name*** - Configure a key for the certificate.
- **protocol instance *protocol_instance_name*** - Configure automatic certificate management for the certificate.
- **renewal *expire_seconds*** - Configure a renewal time for the certificate in seconds with a range of 1 to 4294967295, with a default value of 7200.

Example

Use the following commands to add a digest algorithm, *sha512*, to the certificate profile, *CertACM*:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate profile CertACM
switch(config-mgmt-sec-auto-cert-prof-CertACM) digest sha512
```

9.1.1.9.23 auto-certificate profile parameters

The **auto-certificate profile parameters** command configures the certificate attributes including distinguished name and subject alternative name. By default, all fields do not have values until configured. Use quotation marks (" ") for attributes with multiple words, such as "Switch 1". Repeating the commands with different values replaces the existing values. For the configuration to be valid, you must configure at least one parameter.

The **no | default** versions of the command clears the field values from the **running-config**.

Command Mode

Management Security Configuration

Certificate Profile Configuration

Command Syntax

```
auto-certificate profile profile_name parameters [distinguished-name [common-name common_name] [country country_code] [email email_address] [locality locality_name] [organization name] [organization-unit unit_name] [state state_name]]  
auto-certificate profile profile_name parameters [subject-alternative-name [dns dns_name] [email email_address] [ ip ip_address] [uri uri]]]
```

Parameters

- **profile profile_name** - Specify the name of the certificate profile.
- **parameters distinguished-name** - Configure the distinguished name for the certificate.
 - **common-name common_name** - Specify the common name used in the subject of the certificate.
 - **country country_code** - Specify the two-letter country code used in the subject of the certificate.
 - **email email_address** - Specify the email address.
 - **locality locality_name** - Specify the locality.
 - **organization name** - Specify the organization name.
 - **organization-unit organization-unit** - Specify the organization-unit name.
 - **state state_name** - Specify the state name.
- **profile profile_name** - Specify the name of the certificate profile.
- **parameters subject-alternative-name** - Configure the subject alternative name extensions.
 - **dns dns_name** - Specify the DNS name to use in the configuration.
 - **email email_address** - Specify the email address.
 - **ip ip_address** - Specify the IP address as an IPv4 or IPv6 address.
 - **uri uri** - Specify the URI to use in the configuration.

Example

Use the following commands to add the IPv4 address, 192.168.1.1, the IPv6 address, 3FF.FFFF::1, the email address, *mail@yourcompany.com*, and the URI, *http://example.com/path/etc* to the certificate profile, *CertAlpha*:

```
switch(config)# management security
switch(config-mgmt-security)# auto-certificate profile CertAlpha
switch(config-mgmt-sec-auto-cert-prof-CertAlpha)# parameters subject-alternative-name ip 192.0.2.1
  192.0.2.2 3FFF:FFFF::1"
switch(config-mgmt-sec-auto-cert-prof-CertAlpha)# parameters subject-alternative-name email
  mail@example.com
switch(config-mgmt-sec-auto-cert-prof-CertAlpha)# parameters subject-alternative-name uri https://
example.com/path/one
switch(config-mgmt-sec-auto-cert-prof-CertAlpha) #
```

9.1.1.9.24 clear aaa authentication lockout

The **clear aaa authentication lockout** command clears the locked status of a user and allows access within a lockout period. If no user specified, the command clears the locked status of all users.

Command Mode

Privileged EXEC

Command Syntax

```
clear aaa authentication lockout [user user_name]
```

Parameter

user *user_name* - Specify the name of the user.

Example

- This command clears the locked status of the user **Alice**.

```
switch# clear aaa authentication lockout user Alice
```

9.1.1.9.25 clear aaa counters radius

The **clear aaa counters radius** command resets the counters tracking the statistics for the RADIUS servers that the switch accesses. The [show radius](#) command displays the counters reset by the **clear aaa counters radius** command.

Command Mode

Privileged EXEC

Command Syntax

```
clear aaa counters radius
```

Example

These commands display the effect of the **clear aaa counters radius** command on the RADIUS counters.

```
switch# show radius
RADIUS server      : radius/10
    Connection opens:      204
    Connection closes:     0
    Connection disconnects: 199
    Connection failures:   10
    Connection timeouts:   2
        Messages sent:    1490
        Messages received: 1490
        Receive errors:    0
        Receive timeouts:   0
        Send timeouts:      0

Last time counters were cleared: never
switch# clear aaa counters radius
switch# show radius
RADIUS server      : radius/10
    Connection opens:      0
    Connection closes:     0

    Connection failures:   0
    Connection timeouts:   0
        Messages sent:    0
        Messages received: 0
        Receive errors:    0
        Receive timeouts:   0
        Send timeouts:      0

Last time counters were cleared: 0:00:03 ago
```

9.1.1.9.26 clear aaa counters tacacs+

The **clear aaa counters tacacs+** command resets the counters tracking the statistics for the TACACS+ servers that the switch accesses. The **show tacacs** command displays the counters reset by the **clear aaa counters tacacs+** command.

Command Mode

Privileged EXEC

Command Syntax

```
clear aaa counters tacacs+
```

Example

These commands display the effect of the **clear aaa counters tacacs+** command on the tacacs+ counters.

```
switch# show tacacs
TACACS+ server : tacacs/49
    Connection opens: 15942
    Connection closes: 7
    Connection disconnects: 1362
    Connection failures: 0
    Connection timeouts: 0
        Messages sent: 34395
    Messages received: 34392
        Receive errors: 0
    Receive timeouts: 2
        Send timeouts: 0

Last time counters were cleared: never

TACACS+ source-interface: Enabled
    TACACS+ outgoing packets will be sourced with an IP address associated with the

```

9.1.1.9.27 clear aaa counters

The **clear aaa counters** command resets the counters tracking the number of service transactions performed by the switch since the last reset of the counters. The [show aaa counters](#) command displays the counters reset by the **clear aaa counters** command.

Command Mode

Privileged EXEC

Command Syntax

clear aaa counters [SERVICE_TYPE]

Example

These commands display the effect of the **clear aaa counters** command on the AAA counters.

```
switch# clear aaa counters
switch# show aaa counters
Authentication
    Successful:      0
    Failed:         0
    Service unavailable: 0

Authorization
    Allowed:        1
    Denied:         0
    Service unavailable: 0

Accounting
    Successful:      0
    Error:           0
    Pending:         0

Last time counters were cleared: 0:00:44 ago
```

9.1.1.9.28 clear radius proxy counters client group

The `clear radius proxy client group` command clears RADIUS proxy client packet counters.

Command Mode

Privileged EXEC

Command Syntax

```
clear radius proxy client group group_name
```

Parameters

- *group_name* - Clear all RADIUS proxy client group packet counters or specify a group name to clear counters for a specific group.

Example

Use the following command to clear RADIUS proxy client packet counters:

```
switch# clear radius proxy client group
```

9.1.1.9.29 deny (Role)

The **deny** command adds a deny rule to the configuration mode role. Deny rules prohibit access of specified commands from usernames with the applied role. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command's authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the roles last rule.

Deny rules use regular expressions to denote commands. A **mode** parameter specifies command modes with restricted commands. Modes use either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The **no <sequence number> (Role)** command also removes the specified rule from the role.

Command Mode

Role Configuration

Command Syntax

[**SEQ_NUM**] **deny** [**MODE_NAME**] command *command_name*

no **deny** [**MODE_NAME**] command *command_name*

default **deny** [**MODE_NAME**] command *command_name*

Parameters

- **SEQ_NUM** - A sequence number assigned to the rule. Options include:
 - **no parameter** - The number derived by adding 10 to the number of the roles last rule.
 - **1 - 256** - A number assigned to an entry.
- **MODE_NAME** - The command mode that prohibits command access. Values include:
 - **no parameter** All command modes.
 - **mode short_name** - Specify an exact match of a modes short key name.
 - **mode long_name** - A regular expression matching long key name of one or more modes.
 - **mode config** - The **Global** configuration mode.
 - **mode config-all** - All configuration modes, including **global** configuration mode.
 - **mode exec** - **EXEC** and **Privileged EXEC** modes.
- **command_name** Regular expression that denotes the name of one or more commands.

Guidelines

These CLI **prompt** format commands program the prompt to display the following mode keys:

- **%p** Short mode key.
- **%P** Long mode key.

Deny statements save to the **running-config** only when exiting the **Role** configuration mode.

Related Command

The **role** command places the switch in **Role** configuration mode.

Example

These commands append a **deny** rule at the end of the **sysuser** role that restricts access to the **reload** command from **EXEC** and **Privileged EXEC** mode.

```
switch(config)# role sysuser
switch(config-mode-sysuser)# deny mode exec command reload
switch(config-mode-sysuser)#

```

9.1.1.9.30 enable password

The `enable password` command creates a new enable password or changes an existing password.

The `no enable password` and `default enable password` commands delete the `enable password` by removing the `enable password` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
enable password [ENCRYPT_TYPE] password
```

```
no enable password
```

```
default enable password
```

Parameters

- **ENCRYPT_TYPE** encryption level of the **password** parameter. Settings include:
 - **no parameter** the password is entered as clear text.
 - **0** the password is entered as clear text. Equivalent to <no parameter>.
 - **5** the password is entered as an MD5 encrypted string.
 - **sha512** the password is entered as an SHA-512-encrypted string.
- **password** text that authenticates the username.
 - **password** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
 - **password** must be an appropriately encrypted string if **ENCRYPT_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

Examples

- These equivalent commands assign **xyrt1** as the enable password.

```
switch(config)# enable password xyrt1
switch(config)# enable password 0 xyrt1
```

- This command assigns the enable password to the clear text (**12345**) that corresponds to the encrypted string **\$1\$8bPBrJnd\$Z8wbKLHpJEd7d4tc5Z/6h/**. The string was generated by an MD5-encryption program using **12345** as the seed.

```
switch(config)# enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/
switch(config)#

```

- This command deletes the enable password.

```
switch(config)# no enable password
switch(config)#

```

9.1.1.9.31 ip radius source-interface

The **ip radius source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound RADIUS packets. When a source interface is not specified, the switch selects an interface.

The **no ip radius source-interface** and **default ip radius source-interface** commands remove the **ip radius source-interface** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip radius [vrf_inst] source-interface slot_number
no ip radius [vrf_inst] source-interface
default ip radius [vrf_inst] source-interface
```

Parameters

- **vrf_inst** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **int_name** Interface type and number. Options include:
 - **Ethernet e_num** - Ethernet interface specified by **slot_number**.
 - **Loopback slot_number** - Loopback interface specified by **slot_number**.
 - **Management slot_number** - Management interface specified by **slot_number**.
 - **Port-channel slot_number** - Port-channel interface specified by **slot_number**.
 - **Tunnel tunnel_number** -
 - **Vlan v_num** VLAN interface specified by **v_num**.

Example

This command configures the source address for outbound RADIUS packets as the IPv4 address assigned to the loopback interface.

```
switch(config)# ip radius source-interface loopback 0
switch(config) #
```

9.1.1.9.32 ip tacacs source-interface

The **ip tacacs source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound TACACS+ packets. When a source interface is not specified, the switch selects an interface.

The **no ip tacacs source-interface** and **default ip tacacs source-interface** commands remove the **ip tacacs source-interface** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip tacacs [VRF_INST] source-interface INT_NAME  
no ip tacacs [VRF_INST] source-interface  
default ip tacacs [VRF_INST] source-interface
```

Parameters

- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **INT_NAME** Interface type and number. Options include:
 - **interface ethernet e_num** Ethernet interface specified by **e_num**.
 - **interface loopback l_num** Loopback interface specified by **l_num**.
 - **interface management m_num** Management interface specified by **m_num**.
 - **interface port-channel p_num** Port-channel interface specified by **p_num**.
 - **interface vlan v_num** VLAN interface specified by **v_num**.

Example

This command configures the source address for outbound TACACS+ packets as the IPv4 address assigned to the loopback interface.

```
switch(config)# ip tacacs source-interface loopback 0  
switch(config) #
```

9.1.1.9.33 no <sequence number> (Role)

The **no <sequence number>** command removes the rule with the specified sequence number from the configuration-mode role. The **default <sequence number>** command also removes the specified rule.

Command Mode

Role Configuration

Command Syntax

```
no sequence_num  
default sequence_num
```

Parameters

sequence_num sequence number of rule to be deleted. Values range from **1** to **256**.

Guidelines

Role statement changes are saved to ***running-config*** only upon exiting **Role** configuration mode.

Related Command

The **role** command places the switch in **Role** configuration mode.

Example

These commands display the rules in the **sysuser** role, remove rule **30** from the role, then display the edited role.

```
switch(config)# show users roles sysuser  
The default role is network-operator  
  
role: sysuser  
    10 deny mode exec command reload  
    20 deny mode config command (no |default )?router  
    30 deny mode config command (no |default )?(ip|mac) access-list  
    40 deny mode if command (no |default )?(ip|mac) access-group  
    50 deny mode config-all command lacp|spanning-tree  
    60 permit command .*  
switch(config)# role sysuser  
switch(config-role-sysuser)# no 30  
switch(config-role-sysuser)# exit  
switch(config)# show users roles sysuser  
The default role is network-operator  
  
role: sysuser  
    10 deny mode exec command reload  
    20 deny mode config command (no |default )?router  
    40 deny mode if command (no |default )?(ip|mac) access-group  
    50 deny mode config-all command lacp|spanning-tree  
    60 permit command .*  
switch(config) #
```

9.1.1.9.34 radius proxy

The **radius proxy** command enters the RADIUS Proxy Configuration Mode on a switch.

Command Mode

RADIUS Proxy Configuration Mode

Command Syntax

```
radius proxy
```

Parameters

None

Example

Use the following command to enter the RADIUS proxy configuration mode on a switch.

```
switch(config)# radius proxy  
switch(config-radius-proxy)#{/pre>
```

9.1.1.9.35 radius proxy client group client

The `radius proxy client group client` command configures RADIUS Proxy client groups on the switch.

Command Mode

RADIUS Proxy Configuration Mode

Command Syntax

```
radius proxy client group group_name client [host host_name] | [ipv4 ipv4_addr] | [ipv6 ipv6_addr]
```

Parameters

- **group *group_name*** - Specify a name for the client group.
- **client** - Specify the following client parameters:
 - ***host_name*** - Specify the hostname of the client hostname configuration.
 - **[*ipv4 [ipv4_addr | ipv4_prefix*]** - Specify an IPv4 address or IPv4 prefix.
 - **[*ipv6 [ipv6_addr | ipv6_prefix*]** - Specify an IPv6 address or IPv6 prefix.

Example

Use the following command to enter the RADIUS Proxy configuration mode on a switch and add the IPv4 address, 192.168.1.25 as the client.

```
switch(config)# radius proxy  
switch(config-radius-proxy)# client group MyGroup  
switch(config-rp-cg-MyGroup)# client ipv4 192.168.1.25
```

9.1.1.9.36 radius proxy client group server

The `radius proxy client group server` command configures RADIUS Proxy server groups on the switch.

Command Mode

RADIUS Proxy configuration mode

Command Syntax

```
radius proxy client group group_name server group_name
```

Parameters

- **group *group_name*** - Specify a name for the client group.
- **server *group_name*** - Specify the server group name.

Example

Use the following command to enter the RADIUS Proxy configuration mode on a switch and add the server group, *RADIUS_SG1* as the RADIUS server group.

```
switch(config)# radius proxy
switch(config-radius-proxy)# client group MyGroup
switch(config-rp-cg-MyGroup)# server group RADIUS_SG1
```

9.1.1.9.37 radius proxy client key

The **radius proxy client key** command enters the RADIUS Proxy Configuration Mode on a switch and allows the configuration of a global client key.

Command Mode

RADIUS Proxy configuration mode

Command Syntax

```
radius proxy client key [0 | 7 | 8a] line
```

Parameters

- **0** - Specify if the key string is unencrypted.
- **7** - Specify if a hidden key follows.
- **8a** - Specifies that an AES-256-GCM encrypted key follows.
- **line** - Specifies that the key text is unobfuscated.

Example

Use the following command to enter the RADIUS Proxy configuration mode on a switch and add a key of 0 with the key text, *SuperSecretKey*:

```
switch(config)# radius proxy
switch(config-radius-proxy)# client key 0 SuperSecretKey
```

9.1.1.9.38 radius proxy client session

The **radius proxy client session** command enters the RADIUS proxy configuration mode on a switch and allows the configuration of a client session idle-timeout parameter.

Command Mode

RADIUS proxy configuration mode

Command Syntax

```
radius proxy client session idle-timeout seconds
```

Parameters

- **idle-timeout seconds** - Configure the minimum time to wait before clearing the client session.

Example

Use the following command to enter the RADIUS proxy configuration mode on a switch and add a session idle-timeout of 300 seconds:

```
switch(config)# radius proxy
          switch(config-radius-proxy)# client session idle-timeout 300 seconds
```

9.1.1.9.39 radius proxy dynamic-authorization

The **radius proxy client key** command enters the RADIUS proxy configuration mode on a switch and enables dynamic authorization for RADIUS proxy server groups.

Command Mode

RADIUS proxy configuration mode

Command Syntax

```
radius proxy dynamic-authorization
```

Example

Use the following command to enter the RADIUS Proxy Configuration Mode on a switch and enable dynamic authorization:

```
switch(config)# radius proxy
          switch(config-radius-proxy)# dynamic-authorization
```

9.1.1.9.40 radius-server deadtime

The **radius-server deadtime** command defines global deadtime period, when the switch ignores a non-responsive RADIUS server. A non-responsive server is one that fails to answer any attempt to retransmit after a timeout expiry. Deadtime is disabled if a value is not configured.

The **no radius-server deadtime** and **default radius-server deadtime** commands restore the default global deadtime period of three minutes by removing the **radius-server deadtime** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
radius-server deadtime dead_interval
no radius-server deadtime
default radius-server deadtime
```

Parameter

dead_interval period that the switch ignores non-responsive servers (minutes). Values range from **1** to **1000**. Default is **3**.

Example

This command programs the switch to ignore a server for two hours if it fails to respond to a request during the period defined by timeout and retransmit parameters.

```
switch(config) # radius-server deadtime 120
switch(config) #
```

9.1.1.9.41 radius-server host

The **radius-server host** command sets parameters for communicating with a specific RADIUS server. These values override global settings when the switch communicates with the specified server.

A RADIUS server is defined by its server address, authorization port, and accounting port. Servers with different address-authorization port-accounting port combinations have separate configurations.

The **no radius-server host** and **default radius-server** commands remove settings for the RADIUS server configuration at the specified address-authorization port-accounting port location by deleting the corresponding **radius-server host** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
radius-server host ADDR [VRF_INST][AUTH][ACCT][TIMEOUT][DEAD][RETRAN][ENCRYPT]  
no radius-server host [ADDR][VRF_INST][AUTH][ACCT]  
default radius-server host [ADDR][VRF_INST][AUTH][ACCT]
```

Parameters

- **ADDR** RADIUS server location. Options include:
 - *ipv4_addr* server's IPv4 address.
 - *host_name* server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
 - **no parameter** default port of **1812**.
 - **auth-port number** number ranges from **1** to **65535**.
- **ACCT** Accounting port number.
 - **no parameter** default port of **1813**.
 - **acct-port number** numbers range from **1** to **65535**.
- **TIMEOUT** timeout period (seconds). Ranges from **1** to **1000**.
 - **no parameter** assigns global timeout value (see [radius-server timeout](#)).
 - **timeout number** assigns number as the timeout period. Ranges from **1** to **1000**.
- **DEAD** period (minutes) when the switch ignores a non-responsive RADIUS server.
 - **no parameter** assigns global deadtime value (see [radius-server deadtime](#)).
 - **deadtime number** specifies deadtime, where number ranges from **1** to **1000**.
- **RETRAN** attempts to access RADIUS server after the first timeout expiry.
 - **no parameter** assigns global retransmit value (see [radius-server retransmit](#)).
 - **retransmit number** specifies number of attempts, where number ranges from **1** to **100**.
- **ENCRYPT** encryption key that switch and server use to communicate.
 - **no parameter** assigns global encryption key (see [radius-server key](#)).

- **key *key_text*** where *key_text* is in clear text.
- **key 5 *key_text*** where *key_text* is in clear text.
- **key 7 *key_text*** where *key_text* is provided in an encrypted string.

Examples

- This command configures the switch to communicate with the RADIUS server located at **10.1.1.5**. The switch uses the global timeout, deadtime, retransmit, and key settings to communicate with this server, and communicates through port **1812** for authorization and **1813** for accounting.

```
switch(config)# radius-server host 10.1.1.5  
switch(config)#
```

- This command configures the switch to communicate with the RADIUS server assigned the host name **RAD-1**. Communication for authorization is through port **1850**; communication for accounting is through port **1813** (the default).

```
switch(config)# radius-server host RAD-1 auth-port 1850  
switch(config)#
```

9.1.1.9.42 radius-server key

The **radius-server key** command defines the global encryption key the switch uses when communicating with any RADIUS server for which a key is not defined.

The **no radius-server key** and **default radius-server key** commands remove the global key from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
radius-server key [ENCRYPT_TYPE] encrypt_key
```

```
no radius-server key
```

```
default radius-server key
```

Parameters

- **ENCRYPT_TYPE** encryption level of *encrypt_key*.
 - **no parameter** encryption key is entered as clear text.
 - **0** encryption key is entered as clear text. Equivalent to **no parameter**.
 - **7 encrypt_key** is an encrypted string.
- **encrypt_key** shared key that authenticates the username. The **encrypt_key** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
 - **encrypt_key** must be an encrypted string if **ENCRYPT_TYPE** specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

Related Command

[radius-server host](#)

Examples

- This command configures **cv90jr1** as the global encryption key.

```
switch(config)# radius-server key 0 cv90jr1
switch(config)#
```

- This command assigns **cv90jr1** as the key by specifying the corresponding encrypted string.

```
switch(config)# radius-server key 7 020512025B0C1D70
switch(config)#
```

9.1.1.9.43 radius-server retransmit

The **radius-server retransmit** command defines the global retransmit count, which specifies the number of times the switch attempts to access the RADIUS server after the first timeout expiry.

The **no radius-server retransmit** and **default radius-server retransmit** commands restore the global retransmit count to its default value of three by deleting the **radius-server retransmit** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
radius-server retransmit count
no radius-server retransmit
default radius-server retransmit
```

Parameters

count retransmit attempts after first timeout expiry. Values range from **1** to **100**. Default is **3**.

Related Command

[radius-server host](#)

Example

This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to **50** seconds, then the total period that the switch waits for a response is $((5+1)*50) = 300$ seconds.

```
switch(config)# radius-server retransmit 5
switch(config)#
```

9.1.1.9.44 radius-server timeout

The `radius-server timeout` command defines the global timeout the switch uses when communicating with any RADIUS server for which a timeout is not defined.

The `no radius-server timeout` and `default radius-server timeout` commands restore the global timeout default period of five seconds by removing the `radius-server timeout` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
radius-server timeout time_period  
no radius-server timeout  
default radius-server timeout
```

Parameters

time_period timeout period (seconds). Values range from **1** to **1000**. Default is **5**.

Related Commands

- [radius-server host](#)
- [radius-server key](#)
- [radius-server deadtime](#)
- [radius-server retransmit](#)

Example

This command configures the switch to wait **50** seconds for a RADIUS server response before issuing an error.

```
switch(config)# radius-server timeout 50  
switch(config) #
```

9.1.1.9.45 resequence (Role)

The **resequence** command assigns sequence numbers to rules in the configuration mode role. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

The maximum sequence number is 256.

Command Mode

Role Configuration

Command Syntax

```
resequence start_num inc_num
```

Parameters

- ***start_num*** sequence number assigned to the first rule. Value ranges from **1** to **256**. Default is **10**.
- ***inc_num*** numeric interval between consecutive rules. Value ranges from **1** to **256**. Default is **10**.

Guidelines

Role statement changes are saved to **running-config** only upon exiting **Role** configuration mode.

Related Command

The **role** command places the switch in **Role** configuration mode.

Example

The **resequence** command renames the rules in the **sysuser** role, starting the first rule at **15** and incrementing subsequent lines by **5**.

```
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    40 deny mode if command (no |default )?(ip|mac) access-group
    50 deny mode config-all command lacp|spanning-tree
    60 permit command .*
switch(config)# role sysuser
switch(config-role-sysuser)# resequence 15 5
switch(config-role-sysuser)# exit
switch(config)# show users roles sysuser
The default role is network-operator

role: sysuser
    15 deny mode exec command reload
    20 deny mode config command (no |default )?router
    25 deny mode if command (no |default )?(ip|mac) access-group
    30 deny mode config-all command lacp|spanning-tree
    35 permit command .*
switch(config)#

```

9.1.1.9.46 permit (Role)

The **permit** command adds a permit rule to the configuration mode role. Permit rules authorize access to specified commands for usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands compare sequentially to rules within a role until it matches a rule. The first matching rule determines a command's authorization. EOS derives sequence numbers for commands without numbers by adding 10 to the number of the role's last rule.

Permit rules use regular expression to denote commands. A **mode** parameter specifies the command modes for authorized commands. EOS denotes modes either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The **no <sequence number> (Role)** command also removes the specified rule from the role.

Command Mode

Role Configuration

Command Syntax

```
[SEQ_NUM] permit [MODE_NAME] command command_name
no permit [MODE_NAME] command ] command_name
default permit [MODE_NAME] command command_name
```

Parameters

- **SEQ_NUM** - The sequence number assigned to the rule. Options include the following:
 - **no parameter** - A number derived by adding 10 to the number of the roles last rule.
 - **<1 - 256>** - A number assigned to the entry.
- **MODE_NAME** - The command mode that authorizes command access. Values include the following:
 - **no parameter** - All command modes.
 - **mode short_name** - The exact match of a modes short-key name.
 - **mode long_name** - A regular expression matching long-key name of one or more modes.
 - **mode config** - The **Global** configuration mode.
 - **mode config-all** All configuration modes, including **global** configuration mode.
 - **mode exec** EXEC and Privileged EXEC modes.
- **command_name** Regular expression that denotes the name of one or more commands.

Guidelines

These CLI **prompt** format commands program the prompt to display the following mode keys:

- **%p** Short-mode key.
- **%P** Long-mode key.

Permit statements save to the **running-config** only when exiting **Role** configuration mode.

Related Commands

The **role** command places the switch in the **Role** Configuration Mode.

Example

These commands append a **permit** rule at the end of the sysuser role that authorizes all commands from **VLAN 1** or **VLAN 2** interface configuration modes.

```
switch(config)# role sysuser
switch(config-mode-sysuser)# permit mode if-vl(1|2) command .*
switch(config-mode-sysuser)#

```

9.1.1.9.47 role

The **role** command places the switch in Role Configuration Mode, which is a group-change mode that modifies a role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The **role** command specifies the name of the role that subsequent commands modify and creates a role if it references a nonexistent role. All changes in a group change mode edit session are pending until the session ends:

- The **exit** command saves pending changes to **running-config** and returns the switch to Global Configuration Mode. Changes are also saved by entering a different configuration mode.
- The **abort** command discards pending changes, returning the switch to Global Configuration Mode.

The **no role** and **default role** commands delete the specified role by removing the role and its statements from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
role role_name
no role role_name
default role role_name
```

Parameter

role_name Name of role.

Commands Available in Role Configuration Mode:

- **deny (Role)**
- **permit (Role)**
- **no <sequence number> (Role)**
- **resequence (Role)**

Related Commands

[show users roles](#)

Examples

- This command places the switch in **Role** configuration mode to modify the speaker role.

```
switch(config)# role speaker
switch(config-role-speaker) #
```

- This command saves changes to **speaker** role, then returns the switch to **Global** configuration mode.

```
switch(config-role-speaker) # exit
switch(config) #
```

- This command discards changes to **speaker**, then returns the switch to **Global** configuration mode.

```
switch(config-role-speaker) # abort
```

```
switch(config) #
```

9.1.1.9.48 server (server-group-RADIUS configuration mode)

The **server (server-group-RADIUS configuration mode)** command adds the specified RADIUS server to the configuration-mode group. Servers must be configured with the [radius-server host](#) command before adding them to the server group.

A RADIUS server is defined by its server address, authorization port, and accounting port. A group can contain multiple servers with the same IP address that have different authorization or accounting ports.

The **no server** and **default server** commands remove the specified server from the group.

Command Mode

Server-Group-RADIUS Configuration

Command Syntax

```
server LOCATION [VRF_INST][AUTH][ACCT]  
no server LOCATION [VRF_INST][AUTH][ACCT]  
default server LOCATION [VRF_INST][AUTH][ACCT]
```

Parameters

- **LOCATION** RADIUS server location. Options include:
 - **ipv4_addr** server's IPv4 address.
 - **host_name** server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
 - **no parameter** default port of **1812**.
 - **auth-port number** *number* ranges from **1** to **65535**.
- **ACCT** Accounting port number.
 - **no parameter** default port of **1813**.
 - **acct-port number** *number* ranges from **1** to **65535**.

Related Commands

The [aaa group server radius](#) command places the switch in **Server-group-RADIUS** configuration mode.

Example

These commands add two servers to the **RAD-SV1** server group.

```
switch(config)# aaa group server radius RAD-SV1  
switch(config-sg-radius-RAD-SV1)# server RAC-1  
switch(config-sg-radius-RAD-SV1)# server 10.1.5.14 acct-port 1851  
switch(config-sg-radius-RAD-SV1) #
```

9.1.1.9.49 server (server-group-TACACS+ configuration mode)

The **server (server-group-TACACS+ configuration mode)** command adds the specified TACACS+ server to the configuration-mode group. Servers must be configured with the [tacacs-server host](#) command before adding them to the server group.

A TACACS+ server is defined by its server address and port number. Servers with different address-port combinations have separate statements in *running-config*.

The **no server** and **default server** commands remove the specified server from the group.

Command Mode

Server-group-TACACS+ Configuration

Command Syntax

```
server LOCATION [VRF_INST][PORT]
no server LOCATION [VRF_INST][PORT]
default server LOCATION [VRF_INST][PORT]
```

Parameters

- **LOCATION** TACACS+ server location. Options include:
 - *ipv4_addr* server's IPv4 address.
 - *ipv6_addr* server's IPv6 address.
 - *host_name* server's DNS host name (FQDN).
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **PORT** TCP connection port number.
 - **no parameter** default port of **49**.
 - **port number**. *number* ranges from **1** to **65535**.

Related Command

The [aaa group server tacacs+](#) command places the switch in **Server-group-TACACS+** configuration mode.

Example

These commands add two servers to the TAC-GR server group with default port number **49**.

```
switch(config)# aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)# server TAC-1
switch(config-sg-tacacs+-TAC-GR)# server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR) #
```

9.1.1.9.50 show aaa

The **show aaa** command displays the user database. The command displays the encrypted enable password first, followed by a table of usernames and their corresponding encrypted password.

The command does not display unencrypted passwords.

Command Mode

Privileged EXEC

Command Syntax

```
show aaa
```

Example

This command displays the local user database.

```
switch# show aaa
Enable password (encrypted): $1$UL4gDWy6$3KqCPYPGRvxRxUq3qA/Hs/
Username    Encrypted passwd
-----
admin
janis      $1$VVnDH/Ea$iwsfnrGNO8nbDsf0tazp9/
thomas     $1$/MmXTUil$.fJxLfcumzppNSEDVWDq9.
switch#
```

9.1.1.9.51 show aaa authentication lockout

The **show aaa authentication lockout** command displays the status of locked-out users who could not log within the specified time and number of login attempts.

Command Mode

Privileged EXEC

Command Syntax

```
show aaa authentication lockout
```

Example

This command displays the status of Alice, who is the locked out user. Alice's last failed login was at 17:50:06, and her lockout will be cleared at 17:51:06, in 58 seconds. When the duration of 58 seconds elapses, Alice's name will no longer be displayed.

```
switch# show aaa authentication lockout
User      Start Time          End Time          Expires In
-----+-----+-----+-----+-----+
alice    Fri Jul 12 17:50:06 2020  Fri Jul 12 17:51:06 2020  0:00:58
```

9.1.1.9.52 show aaa counters

The **show aaa counters** command displays the number of service transactions performed by the switch since the last time the counters were reset.

Command Mode

Privileged EXEC

Command Syntax

```
show aaa counters
```

Example

This command displays the number of AAA transactions.

```
switch# show aaa counters
Authentication
    Successful:      30
        Failed:       0
    Service unavailable: 0

Authorization
    Allowed:        188
        Denied:       0
    Service unavailable: 0

Accounting
    Successful:      0
        Error:         0
    Pending:         0

Last time counters were cleared: never
```

9.1.1.9.53 show aaa methods

The **show aaa methods** command displays all the named method lists defined in the specified Authentication, Authorization, and Accounting (AAA) service.

Command Mode

Privileged EXEC

Command Syntax

```
show aaa methods [SERVICE_TYPE [accounting | authentication | authorization | all]]
```

Parameters

SERVICE_TYPE the service type of the method lists that the command displays.

- **accounting** accounting services.
- **authentication** authentication services.
- **authorization** authorization services.
- **all** accounting, authentication, and authorization services.

Example

This command configures the named method lists for all AAA services.

```
switch# show aaa methods all
Authentication method lists for LOGIN:
  name=default methods=group tacacs+, local
Authentication method list for ENABLE:
  name=default methods=local
Authorization method lists for COMMANDS:
  name=privilege0-15 methods=group tacacs+, local
Authentication method list for EXEC:
  name=exec methods=group tacacs+, local
Accounting method lists for COMMANDS:
  name=privilege0-15 default-action=none
Accounting method list for EXEC:
  name=exec default-action=none
switch#
```

9.1.1.9.54 show management ldap

The **show management ldap** command displays information about the LDAP configuration.

Command Mode

EXEC

Command Syntax

```
show management ldap
```

Examples

- The following command shows general information for LDAP.

```
switch# show management ldap
LDAP server: prod-dc-hq1.aristanetworks.com/389
  Binds requested: 6
  Binds successful: 6
  Binds failed: 0
  Binds timed out: 0
  FIPS is ON
```

```
Last time counters were cleared: 1:16:41 ago
```

- The authentication action in LDAP is the **bind**, which is equivalent to attempting a log-in. There will be two binds per login attempt, one for the admin account and one for the user account.

```
switch# show management security ssl profile
  Profile          State
  ----- -----
  testProfile      valid

To verify a user accounts authorization being performed by ldap, use "show users detail":
switch# show users detail
Session   Username Roles      TTY  State Duration  Auth      Remote Host
----- -----
  1006     erahn    network-admin vty3 E      0:00:05   group ldap fd7a:629f:52a4:dc25:b08d:feff:feed:2ce7
```

- The FIPS mode is controlled by the SSL profile in AAA. To validate an SSL profile use the following:
 - To validate the role for a current session the **vty** information in the TTY column must be matched against the Line column in the following command. The row with a "*" character at the start is the current session where the command was run:

```
switch# show users
  Line      User           Host(s)  Idle      Location
  1 con 0  admin          idle     01:19:00  -
  2 vty 10  srv-sw-ldaptest  idle     01:19:00  172.16.124.151
* 3 vty 3  erahn         idle     00:00:04  fd7a:629f:52a4:dc25:b08d:feff:feed:2ce7
```

9.1.1.9.55 show management security auto-certificate profile

The **show management security auto-certificate profile** displays information about auto-certificate profiles configured on the switch. Add the **detail** parameter to displayed detailed information about the profiles.

Command Mode

EXEC

Command Syntax

```
show management security auto-certificate profile profile_name detail
```

Parameters

- profile_name*** - Specify a specific profile name to display certificate profile information.
- detail*** - Display detailed information about certificate profiles.

Examples

Use the following command to display certificate profile information:

```
switch# show management security auto-certificate profile CertAlpha
  Auto certificate profile CertAlpha:
  Key:      clientkey.pem
  State:    Valid
  Next request in 89 days, 21:59:47 at: 2025-02-05 01:45:51
```

Use the following command to display detailed certificate profile information:

```
switch# show management security auto-certificate profile CertAlpha detail
  Auto certificate profile CertAlpha:
  Key:      clientkey.pem
  State:    Valid
  Next request in 89 days, 21:59:37 at: 2025-02-05 01:45:51
  Initial enrollment statistics:
  Number of successes: 1
  Number of failures:  0
```

Renewal statistics:
Number of successes: 0

9.1.1.9.56 show management security auto-certificate protocol est

The **show management security auto-certificate protocol est** command displays information about all Enrollment over Secure Transport (EST) protocol profiles configured on the switch.

Command Mode

EXEC

Command Syntax

```
show management security auto-certificate protocol est [profile_name] [detail]
```

Parameters

- ***profile_name*** - Specify a profile to display EST protocol information.
- **detail** - Displays detailed information about all or a single EST protocol.

Examples

Use the following command to display EST protocol information:

```
switch# show management security auto-certificate protocol est EST_2
Automatic Certificate Management policy EST_2:
State: Invalid
Last error:
Message: Invalid SSL profile
Time: 2025-05-07 06:28:20
```

Use the following command to display detailed EST protocol information:

```
switch# show management security auto-certificate protocol est EST_2 detail
Automatic Certificate Management policy EST_2:
State: Invalid
Last error:
Message: Invalid SSL profile
Time: 2025-05-07 06:28:20
Managed certificate profile:
certProfileBravo:
Certificate state: Needs enrolling
```

9.1.1.9.57 show privilege

The **show privilege** command displays the current privilege level for the CLI session.

Command Mode

EXEC

Command Syntax

show privilege

Example

This command displays the current privilege level.

```
switch> show privilege  
Current privilege level is 15 switch>
```

9.1.1.9.58 show radius

The **show radius** command displays statistics for the RADIUS servers that the switch accesses.

Command Mode

EXEC

Command Syntax

```
show radius
```

Example

This command displays statistics for connected RADIUS servers.

```
switch# show radius
RADIUS server          : radius/10
    Connection opens:      204
    Connection closes:     0
    Connection disconnects: 199
    Connection failures:   10
    Connection timeouts:   2
    Messages sent:        1490
    Messages received:     1490
    Receive errors:        0
    Receive timeouts:       0
    Send timeouts:         0

Last time counters were cleared: never switch#
```

9.1.1.9.59 show radius proxy client group

The **show radius proxy client group** command displays information about RADIUS proxy configurations.

Command Mode

Privileged EXEC

Command Syntax

```
show radius proxy client group group_name
```

Parameters

- ***group_name*** - Display all RADIUS proxy client groups or specify a group name to see details about a specific group.

Example

Use the following command to display details about RADIUS proxy clients:

```
switch# show radius proxy client group
    Radius Client Group          : MyClientGroup
    Last time counters were cleared   : never
    Client                         : 192.168.1.25, authentication port 1812,
accounting port 1813, vrf default
    Resolved IP address           : 192.168.1.25/32
    Messages received:           0
    Messages sent:               0
    Accept response sent:        0
    Reject response sent:       0
    Counting start received:     0
    Interim updates received:    0
    Accounting stop received:    0
    Bad requests:                0
    CoA requests sent:           0
    DM requests sent:            0
    CoA ACKs received:           0
    DM ACKs received:            0
    CoA NAKs received:           0
    DM NAKs received:            0
    Bad responses:                0
    Connection errors:           0
```

9.1.1.9.60 show radius proxy server group

The **show radius proxy server group** command displays information about RADIUS proxy server group configurations.

Command Mode

Privileged EXEC

Command Syntax

```
show radius proxy server group group_name
```

Parameters

- ***group_name*** - Display all RADIUS proxy server groups or specify a group name to see details about a specific group.

Example

Use the following command to display details about RADIUS proxy clients:

```
switch# show radius proxy server group
    Radius Server Group: MyServerGroup
        Radius Server 1: RADIUS
        Resolved IP address: 192.168.25.33
            Status: active
```

9.1.1.9.61 show tacacs

The **show tacacs** command displays statistics for the TACACS+ servers that the switch accesses.

Command Mode

EXEC

Command Syntax

```
show tacacs
```

Example

This command displays statistics for connected TACACS+ servers.

```
switch# show tacacs
TACACS+ server          : tacacs/49
    Connection opens:      15942
    Connection closes:     7
    Connection disconnects: 1362
    Connection failures:    0
    Connection timeouts:    0
        Messages sent:      34395
        Messages received:   34392
        Receive errors:       0
        Receive timeouts:     2
        Send timeouts:        0

Last time counters were cleared: never

TACACS+ source-interface: Enabled
    TACACS+ outgoing packets will be sourced with an IP address associated with the
    Loopback0 interface
```

9.1.1.9.62 show users accounts

The **show users accounts** command displays the names, roles, and privilege levels of users that are listed in *running-config*. The SSH public key is also listed for names for which an SSH key is configured.

Command Mode

Privileged EXEC

Command Syntax

```
show users accounts
```

Example

This command displays the usernames that are configured on the switch.

```
switch# show users accounts
user: FRED
    role: <unknown>
    privilege level: 1
    ssh public key: ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQDjUg2VDiBX7In0q
HtN5PyHOWtYvIoeZsxF5YmesQ/rh++mbpT504dL7So+Bpr9T/0qIj+zilat8fx/JlO42+3pjfkHY/+l
sT2EPNjG7K7uJv1wSGmhC3+90dNmJtr5YV1JFjjQ5m+5Pa+PGe3z4JIV1lY2NhLrV2fXtbcLdjnj6F
AlhXjiLt51DJhG13uUxGBJe0+N1GvpEsTJVJvMdJuS6weMi+xSXc9yQimVD2weJBHsYFnghST2j0pAy
F2S7/EOU13pY42RztDSs42nMNNrutPT0q5Z17aAKvhpd0dDlc+qIwrCrXbeIChHem7+0N8/zA3alBK4
eKSFSZBd3Pb admin@switch
switch#
user: JANE
    role: sysuser2
    privilege level: 1
user: admin
    role: network-admin
    privilege level: 1
```

9.1.1.9.63 show users detail

The **show users detail** command displays information about active AAA login sessions. Information includes username, roles, TTY, state of the session (pending or established), duration, authentication method, and if available, remote host and remote username.

Command Mode

Privileged EXEC

Command Syntax

```
show users detail
```

Example

This command displays information about the active AAA login sessions.

| Session | Username | Roles | TTY | State | Duration | Auth | Remote Host |
|---------|----------|----------------|--------|-------|----------|--------------|----------------|
| 2 | admin | network-admin | ttyS0 | E | 0:01:21 | local | |
| 4 | joe | sysadmin | telnet | E | 0:02:01 | local | sf.example.com |
| 6 | alice | sysadmin | ssh | E | 0:00:52 | group radius | ny.example.com |
| 7 | bob | sysadmin | ssh | E | 0:00:48 | group radius | la.example.com |
| 8 | kim | network-admin1 | ssh | E | 0:00:55 | group radius | de.example.com |
| 9 | admin | network-admin | ssh | E | 0:00:07 | local | bj.example.com |
| 10 | max | network-admin | telnet | E | 0:00:07 | local | sf.example.com |

9.1.1.9.64 show users roles

The **show users roles** command displays the name of the default role and the contents of the specified roles. Commands that do not specify a role display the rules in all built-in and configured roles.

Command Mode

Privileged EXEC

Command Syntax

```
show users roles [ROLE_LIST]
```

Parameters

ROLE_LIST Roles that the command displays. Options include:

- **no parameter** Command displays all roles.
- **role_name** Name of role displayed by command.

Related Command

The [role](#) command places the switch in **Role** configuration mode, which is used to create new roles or modify existing roles.

Example

This command displays the contents of all user-defined and built-in roles.

```
switch# show users roles
The default role is network-operator

role: network-admin
    10 permit command .*
role: network-operator
    10 deny mode exec command bash\\\
        20 permit mode exec command .*
role: sysuser
    15 deny mode exec command reload
    20 deny mode config command (no |default )?router
    25 deny mode if command (no |default )?(ip|mac) access-group
    30 deny mode config-all command lacp|spanning-tree
    35 permit command .*
    40 deny mode exec command .*
    50 permit mode exec command show|clear (counters|platform)|configure
```

9.1.1.9.65 show users

The **show users** command displays the usernames that are currently logged into the switch.

Command Mode

Privileged EXEC

Command Syntax

```
show users
```

Example

This command displays the users that are logged into the switch.

```
switch# show users
  Line      User      Host(s)        Idle      Location
  1 vty 2    john     idle           1d 10.22.6.113
  2 vty 4    jane     idle          21:33:00  10.22.26.26
* 3 vty 6    ted      idle          00:00:01  10.17.18.71
```

9.1.1.9.66 tacacs-server host

The **tacacs-server host** command sets communication parameters for communicating with a specific TACACS+ server. These values override global settings when the switch communicates with the specified server.

A TACACS+ server is defined by its server address and port number. Servers with different combinations of address-port-VRF-multiplex settings have separate statements in **running-config**.

The **no tacacs-server host** and **default tacacs-server host** commands remove settings for the TACACS+ server configuration at the specified address-port-VRF combination by deleting the corresponding **tacacs-server host** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
tacacs-server host SERVER_ADDR [MULTIPLEX][VRF_INST][PORT][TIMEOUT][ENCRYPT]  
no tacacs-server host [SERVER_ADDR][MULTIPLEX][VRF_INST][PORT]  
default tacacs-server host [SERVER_ADDR][MULTIPLEX][VRF_INST][PORT]
```

Parameters

- **SERVER_ADDR** TACACS+ server location. Options include:
 - **ipv4_addr** server's IPv4 address.
 - **ipv6_addr** server's IPv6 address.
 - **host_name** server's DNS host name (FQDN).
- **MULTIPLEX** TACACS+ server support of multiplex sessions on a TCP connection.
 - **no parameter** server does not support multiplexing.
 - **single-connection** server supports session multiplexing.
- **VRF_INST** specifies the VRF instance used to communicate with the specified server.
 - **no parameter** switch communicates with the server using the default VRF.
 - **vrf vrf_name** switch communicates with the server using the specified user-defined VRF.
- **PORT** port number of the TCP connection.
 - **no parameter** default port of **49**.
 - **port number** port number ranges from **1** to **65535**.
- **TIMEOUT** timeout period (seconds).
 - **no parameter** assigns the globally configured timeout value (see [tacacs-server timeout](#)).
 - **timeout number** timeout period (seconds). Number ranges from **1** to **1000**.
- **ENCRYPT** encryption key the switch and server use to communicate. Settings include:
 - **no parameter** assigns the globally configured encryption key (see [tacacs-server key](#)).
 - **key key_text** where **key_text** is in clear text.
 - **key 5 key_text** where **key_text** is in clear text.
 - **key 7 key_text** where **key_text** is an encrypted string.

Examples

- This command configures the switch to communicate with the TACACS+ server located at **10.1.1.5**. The switch uses the global timeout, encryption key, and port settings.

```
switch(config)# tacacs-server host 10.1.1.5  
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server assigned the host name **TAC_1**. The switch defines the timeout period as **20** seconds and the encryption key as **rp31E2v**.

```
switch(config)# tacacs-server host TAC_1 timeout 20 key rp31E2v  
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server located at **10.12.7.9**, indicates that the server supports multiplexing sessions on the same TCP connection, and that access is through port **54**.

```
switch(config)# tacacs-server host 10.12.7.9 single-connection port 54  
switch(config)#
```

9.1.1.9.67 tacacs-server key

The **tacacs-server key** command defines the global encryption key the switch uses when communicating with any TACACS+ server for which a key is not defined.

The **no tacacs-server key** and **default tacacs-server key** commands remove the global key from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
tacacs-server key [ENCRYPT_TYPE] encrypt_key
```

```
no tacacs-server key
```

```
default tacacs-server key
```

Parameters

- **ENCRYPT_TYPE** encryption level of *encrypt_key*.
 - **no parameter** encryption key is entered as clear text.
 - **0** encryption key is entered as clear text. Equivalent to **no parameter**.
 - **7 encrypt_key** is an encrypted string.
- **encrypt_key** shared key that authenticates the username.
 - **encrypt_key** must be in clear text if **ENCRYPT_TYPE** specifies clear text.
 - **encrypt_key** must be an encrypted string if **ENCRYPT_TYPE** specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

Related Command

[tacacs-server host](#)

Examples

- This command configures **cv90jr1** as the encryption key.

```
switch(config)# tacacs-server key 0 cv90jr1
switch(config)#
```

- This command assigns **cv90jr1** as the key by specifying the corresponding encrypted string.

```
switch(config)# tacacs-server key 7 020512025B0C1D70
switch(config)#
```

9.1.1.9.68 tacacs-server policy

The **tacacs-server policy** command programs the switch to permit access to TACACS+ servers that send mandatory attribute-value (AV) pairs that the switch does not recognize. By default, the switch denies access to TACACS+ servers when it receives unrecognized AV pairs from the server.

The switch recognizes the following mandatory AV pairs:

priv-lvl=x where x is an integer between **0** and **15**.

The **no tacacs-server policy** and **default tacacs-server policy** commands restore the switch default of denying access to servers from which it receives unrecognized mandatory AV pair by deleting the **tacacs-server policy** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
tacacs-server policy unknown-mandatory-attribute ignore  
no tacacs-server policy unknown-mandatory-attribute ignore  
default tacacs-server policy unknown-mandatory-attribute ignore
```

Parameters

Example

This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)# tacacs-server policy unknown-mandatory-attribute ignore  
switch(config)#
```

9.1.1.9.69 tacacs-server timeout

The **tacacs-server timeout** command defines the global timeout the switch uses when communicating with any TACACS+ server for which a timeout is not defined.

The **no tacacs-server timeout** and **default tacacs-server timeout** commands restore the global timeout default period of five seconds by removing the **tacacs-server timeout** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
tacacs-server timeout time_period  
no tacacs-server timeout  
default tacacs-server timeout
```

Parameters

time_period timeout period (seconds). Values range from **1** to **1000**. Default is **5**.

Related Command

[tacacs-server host](#)

Example

This command configures the switch to wait **20** seconds for a TACACS+ server response before issuing an error.

```
switch(config)# tacacs-server timeout 20  
switch(config)#End
```

9.1.1.9.70 username ssh-key

The **username ssh-key** command configures an SSH key for the specified username. Command options allow the key to be entered directly into the CLI or referenced from a file.

The specified username must be previously configured through a [username](#) command.

The **no username ssh-key** and **default username ssh-key** commands delete the SSH key for the specified username by removing the corresponding **username ssh-key** command from **running-config**.

The **no username ssh-key role** and **default username ssh-key role** commands perform the following:

- delete the SSH key for the specified username by removing the corresponding **username ssh-key** command from **running-config**.
- delete the role assignment from the specified username by editing the corresponding **username** statement in **running-config**.

Command Mode

Global Configuration

Command Syntax

```
username name sshkey KEY
no username name sshkey [role]
default username name sshkey [role]
```

Parameters

- **name** username text that the user enters at the login prompt to access the CLI.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

`@ # $ % ^ & * - _ = + ; < > , . ~ |`

- **KEY** SSH key. Options include:

- **key_text** username is associated with ssh key specified by **key_text** string.
- **file key_file** username is associated with SSH key in the specified file.

Example

These commands create the username **john**, assign it the password **x245**, then associate it to the SSH key listed in the file named **john-ssh**.

```
switch(config)# username john secret x245
switch(config)# username john sshkey file john-ssh
switch(config)#

```

9.1.1.9.71 username

The **username** command adds a username to the local file and optionally assigns a password to the username. If the command specifies an existing username, the command replaces the password in the local file. The command can also define a username without a password or remove the password from a username.

The **no username** command deletes the specified username by removing the corresponding **username** statement from **running-config**. The **default username** command removes user-specified usernames, but restores the **admin** username to its default parameters.

The **no username role** command assigns the default role assignment to the specified **username** statement by editing the corresponding **username** statement in **running-config**. The **default username role** command reverts the specified username to its default role by editing the corresponding **username** statement in **running-config**. For the **admin** username, this restores **network-admin** as its role, even if the **admin** username has been deleted and then created again.

Command Mode

Global Configuration

Command Syntax

```
username name [PRIVILEGE_LEVEL] SECURITY [ROLE_USER]  
no username name [role]  
default username name [role]
```

All parameters except **name** can be placed in any order.

Parameters

- **name** username text that the user enters at the login prompt to access the CLI.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

@ # \$ % ^ & * - _ = + ; < > , . ~ |

- **PRIVILEGE_LEVEL** user's initial session privilege level. This parameter is used when an authorization command includes the local option.
 - **no parameter** the privilege level is set to **1**.
 - **privilege rank** where rank is an integer between **0** and **15**.
- **SECURITY** password assignment option.
 - **nopassword** **name** is not password protected.
 - **secret password** **name** is protected by specified password (clear-text string).
 - **secret 0 password** **name** is protected by specified password (clear-text string).
 - **secret 5 password** **name** is protected by specified password. (MD5-encrypted string).
 - **secret sha5 password** **name** is protected by specified password (SHA-512-encrypted string).
- **ROLE_USER** specifies the role for performing command authorization. Options include:
 - **no parameter** user is assigned default role [aaa authorization policy local default-role](#).
 - **role** **role_name** specifies role assigned to the user.

Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The secret 5 option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

The **SECURITY** parameter is mandatory for unconfigured usernames. For previously configured users, the command can specify a **PRIVILEGE_LEVEL** or **ROLE** without a **SECURITY** setting.

The **admin** username is provided by the initial configuration, but it can be deleted, and its parameters are editable. The initial **admin** configuration is:

```
username admin privilege 1 role network-admin nopassword
```

Note: when deleting the **admin** username, it is advisable to create at least one other username on the switch before saving the configuration.

Examples

- These equivalent commands create the username **john** and assign it the password **x245**. The password is entered in clear text because the **ENCRYPTION** parameter is either omitted or zero.

```
switch(config)# username john secret x245
switch(config)# username john secret 0 x245
```

- This command creates the username **john** and assigns it to the text password that corresponds to the encrypted string **\$1\$sU.7hptc\$TsJ1qs1CL7ZYVbyXNG1wg1**. The string was generated by an MD5-encryption program using **x245** as the seed.

```
switch(config)# username john secret 5 $1$sU.7hptc$TsJ1qs1CL7ZYVbyXNG1wg1
switch(config)#
```

A user authenticates the username **john** by entering **x245** when the CLI prompts for a password.

- This command creates the username **jane** without securing it with a password or removes a password if the **jane** username exists.

```
switch(config)# username jane nopassword
switch(config)#
```

- This command removes the username **william** from the local file.

```
switch(config)# no username william
switch(config)#
```

9.2 Control Plane Security

This section contains the following topics:

- [Transport Layer Security](#)
- [802.1X Port Security](#)

9.2.1 Transport Layer Security

Transport Layer Security (TLS), the successor to Secure Sockets Layer (SSL), is a security protocol used to communicate between client and server. It establishes an encrypted communication channel to secure data.

By default, EOS uses a self-signed certificate for client and server connections. However, some browsers or TLS libraries may refuse connections to the default self-signed certificates on EOS, and in such cases, Arista recommends installing the TLS server certificates that meet the following criteria:

- RSA key sizes must be greater than or equal to **2048** bits.
- There must be less than **825** days to expiry.
- The certificate must use the **SHA-2** family of hashing functions.

Note: Although Arista switches use TLS, the terms TLS and SSL are used interchangeably in this document.

The following are the two main components used by TLS for the authentication of identity before any communication starts.

- Certificate
- Key

An SSL certificate is required to establish a secure connection between the client and server. The certificate includes all of the details necessary for authentication. Cryptographic keys are used to provide a secure channel of communication. TLS uses two cryptographic keys: a private key known only to the server and a public key embedded in the certificate. The keys are used to validate the certificate.

This chapter contains the following sections.

- [Overview](#)
- [Configuration](#)
- [Rotating Certificate and Key Pair](#)
- [Resetting Diffie-Hellman Parameters](#)
- [Configuring the TLS Handshake Settings](#)
- [Syslog with TLS Support](#)
- [Displaying Certificate and Key Information](#)
- [TLS Commands](#)

9.2.1.1 Overview

We can manage and configure SSL certificates, keys, and profiles with the SSL certificate, key, and profile management framework. SSL is an application-layer protocol that transfers the data securely between the

client and server using a combination of authentication, encryption, and data integrity. SSL uses certificates and private-public key pairs to provide this security. A user can configure an SSL profile, which includes a certificate, key, and trusted CA certificates used in SSL communication. A user can manage certificates, keys, and also multiple SSL profiles. An SSL profile can be configured and attached to any other EOS configuration which supports SSL communication. The individual EOS configuration using this framework includes details of using the SSL profile in their configuration.

The only private keys supported are those using the RSA algorithm. Encode both the certificate and keys in the Privacy Enhanced Mail (PEM) format.

Example

This is a code sample of a PEM encoded certificate.

```
$cat server.crt
-----BEGIN CERTIFICATE-----

9.2.1.2 Configuration

- Configuring Certificates
- Configuring Keys
- Configuring a certificate with a RSA key in SSL Profile

9.2.1.2.1 Configuring Certificates

Copying a Certificate to the Switch

The `copy file: certificate:` command copies the certificate to the `certificate:` file system from any supported source URLs of the copy command. The source file may contain multiple PEM-encoded certificates but must not contain other entities such as keys.

Example

This command copies a server.crt certificate to the `certificate:` file system.

```
switch(config)# copy file:/tmp/ssl/server.crt certificate:  
Copy completed successfully.  
switch(config) #
```

Errors while Copying the Certificates

Examples

- The PEM-encoded entities in the source file must all be certificates. If the source file contains different types of entities (e.g., a certificate and a key), the copy fails and displays an error message.

```
switch(config)# copy file:/tmp/ssl/mixed.crt certificate:  
% Error copying file:/tmp/ssl/mixed.crt to certificate: (Multiple types of entities  
in  
certificate file not supported)  
switch(config) #
```

- The source file must contain valid PEM-encoded certificates. If the file contains invalid certificates, the copy fails and displays an error message.

```
switch(config)# copy file:/tmp/ssl/bad.crt certificate:  
% Error copying file:/tmp/ssl/bad.crt to certificate: (Invalid certificate)  
switch(config) #
```

- Only certificates with RSA public keys are supported. The copy fails if the certificate does not have an RSA public key and displays an error message.

```
switch(config)# copy file:/tmp/ssl/dsa.crt certificate:  
% Error copying file:/tmp/ssl/dsa.crt to certificate: (Certificate does not have RSA  
key)  
switch(config) #
```

Deleting a Certificate

The `delete certificate` command deletes a certificate configuration from the `certificate:` file system on the switch.

Example

This command deletes the `server.crt` certificate from the switch.

```
switch(config) #delete certificate:server.crt
switch(config) #
```

Generating Certificates

The following commands help the user to generate a self-signed certificate or Certificate Signing Request (CSR).

Examples

- This command creates either a self-signed certificate or a Certificate Signing Request (CSR). The following example demonstrates using the existing private key `test.key` for certificate generation. During this process, the system prompts you to provide details like the common name, two-letter country code, etc. A common-name entry is mandatory. While you can view the generated CSR directly on the CLI, a self-signed certificate gets saved to the designated certificate: file system location.

```
switch# security pki certificate generate self-signed test.crt key test.key
Common Name for use in subject: test
[...]
certificate:test.crt generated switch#
```

- This command specifies the digest and the certificate's validity (in days). The validity applies only to self-signed certificates.

```
switch# security pki certificate generate signing-request key test.key digest sha256 validity
365
Common Name for use in subject: test
[...]
certificate:test.crt generated switch#
```

- This command adds the certificate parameters such as common-name, country, email, and others.

```
switch# security pki certificate generate signing-request key test.key parameters common-name
Test [country US ...]
certificate:test.crt generated switch#
```

9.2.1.2.2 Configuring Keys

Copying a Key to the Switch

The `copy` command copies an RSA key to the `sslkey:` file system. The key can be copied from any supported source URLs of the `copy` command. The source file must contain only one key. Password-protected keys are not supported.

Example

This command copies a `server.key` RSA key to the `sslkey:` file system.

```
switch# copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
switch#
```

Errors While Copying the Keys

Examples

- Only one PEM-encoded key per file is supported. The copy fails and displays an error message if the source file contains multiple PEM-encoded keys.

```
switch# copy file:/tmp/ssl/multi.key sslkey:  
% Error copying file:/tmp/ssl/multi.key to sslkey: (Multiple PEM entities in  
single file not supported)
```

- The source file must contain a valid PEM-encoded RSA key. If the file contains an invalid RSA key, the copy fails and displays an error message.

```
switch# copy file:/tmp/ssl/bad.key sslkey:  
% Error copying file:/tmp/ssl/bad.key to sslkey: (Invalid RSA key)
```

- Password-protected keys are not supported. If the source file contains a password-protected key, the copy fails and displays an error message.

```
switch# copy file:/tmp/ssl/pass.key sslkey:  
% Error copying file:/tmp/ssl/pass.key to sslkey: (Password protected  
keys are not supported)
```

Deleting a Key

The **delete** command deletes the key configuration from the switch.

Example

This command deletes the server.key key from the switch.

```
switch# delete sslkey:server.key
```

Generating Keys

The following commands generate the RSA keys.

Examples

- This command generates a 2048-bit RSA private key and saves it to sslkey:test.key.

```
switch# security pki key generate rsa 2048 test.key
```

- This command generates a 4096-bit self-signed certificate RSA key and a 2048-bit certificate signing request RSA key.

```
switch# security pki certificate generate self-signed test.crt key test.key generate rsa 4096  
switch# security pki certificate generate signing-request key test.key generate rsa 2048
```

9.2.1.2.3 Configuring a certificate with a RSA key in SSL Profile

An SSL profile is configured with a certificate and its corresponding RSA key. The public key information in the certificate must match the RSA key. This certificate and RSA key pair are used to authenticate to the peer during SSL negotiation. The individual EOS features that use SSL profile configuration will decide whether the certificate and key configuration is optional or mandatory.

Examples

- ```
switch# config
switch(config) # management security
switch(config-mgmt-security) # ssl profile server
switch(config-mgmt-sec-ssl-profile-server) # certificate server.crt key server.key
```

- In this case, if the RSA key configured in the SSL profile does not match with the configured certificate, the SSL profile state becomes invalid, and an error message is displayed.

```
switch(config-mgmt-security) # ssl profile server
switch(config-mgmt-sec-ssl-profile-server) # certificate server.crt key client.key
switch(config-mgmt-sec-ssl-profile-server) # show management security ssl profile
Profile State Error

server invalid Certificate 'server.crt' does not match
with key
```

### 9.2.1.2.3.1 Configuring SSL Profile with a Certificate Authority (CA)

During SSL negotiation with mutual authentication, the peer (or client) certificate is verified by checking if it is signed by one of these trusted certificates. The full bundle of certificates leading to the trusted certificates must be included for peer certificates that do not have a chain to a trusted certificate. The individual EOS features that use SSL profile configuration will decide whether the trusted certificate configuration is optional or mandatory.

#### Example

```
switch# config
switch(config) # management security
switch(config-mgmt-security) # ssl profile server
switch(config-mgmt-sec-ssl-profile-server) # trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server) # trust certificate ca2.crt
```

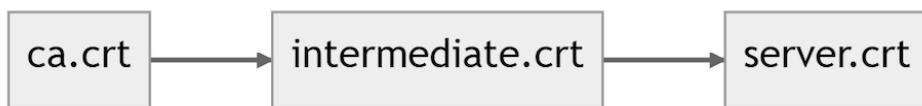

### 9.2.1.2.3.2 Configuring Certificate Chains

Certificate chains establish a chain of trust for the SSL Profile server certificate, ensuring its authenticity to a remote party. Several chain certificate commands can be issued to build a certificate chain with many intermediate CAs, regardless of the order. Use the **chain certificate** command to configure the certificate chain for an SSL profile. The **no** form of the command deletes the certificate configuration.

#### Examples

Assume that **server.crt** is issued by an intermediate CA **intermediate.crt** and **intermediate.crt** itself is issued by the root CA **ca.crt**, as shown in the following figure.

**Figure 9-1: Certificate Chain Example**

- These commands configure the certificate chain shown schematically in the preceding figure.

```
switch# (config) # management security
switch# (config-mgmt-security) # ssl profile server
switch# (config-mgmt-sec-ssl-profile-server) # certificate server.crt key server.key
switch# (config-mgmt-sec-ssl-profile-server) # chain certificate intermediate.crt
switch# (config-mgmt-sec-ssl-profile-server) # exit
switch(config) #
```

- Configure the other peer to trust **ca.crt** to verify the certificate chain during the TLS handshake, as shown below.

```
switch# config
switch# (config) # management security
switch# (config-mgmt-security) # ssl profile client
switch# (config-mgmt-sec-ssl-profile-client) # certificate client.crt key client.key
switch# (config-mgmt-sec-ssl-profile-client) # trust certificate ca.crt
```

- To check the revocation status of the server certificate chain, the client can add the Certificate Revocation List (CRLs) to its SSL profile configuration. One CRL needs to be specified for every CA in the chain, even if it's not revoking any certificate.

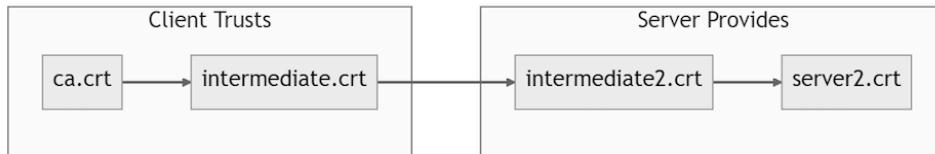

```
switch# config
switch# (config) # management security
switch# (config-mgmt-security) # ssl profile client
switch# (config-mgmt-sec-ssl-profile-client) # crl intermediate.crl
switch# (config-mgmt-sec-ssl-profile-client) # crl ca.crl
```

**Note:** Both the **chain certificate** and **crl** commands look into the *certificate:* file system to find the right PEM file.

Several **chain certificate** commands can be used to build a certificate chain with multiple intermediate CAs, regardless of the order. The following [diagram](#) shows an example certificate chain.

**Figure 9-2: Certificate Chain Example 2**

Configure this SSL profile in the following way. Note that the order of intermediate CAs does not matter.

```
switch(config) # management security
switch(config-mgmt-security) # ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2) # certificate server2.crt key server2.key
switch(config-mgmt-sec-ssl-profile-server2) # chain certificate intermediate2.crt
switch(config-mgmt-sec-ssl-profile-server2) # chain certificate intermediate.crt
switch(config-mgmt-sec-ssl-profile-server2) # exit
switch(config-mgmt-security) # exit
switch(config) #
```

You can divide a certificate chain into two segments, each configured on a separate peer. As long as this division occurs somewhere between the client and the server, they can collaborate to assemble a complete chain. The provided example illustrates precisely this scenario, demonstrating how to configure server and client SSL profiles with a split certificate chain.

Server side:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2)# certificate server2.crt key server2.key
switch(config-mgmt-sec-ssl-profile-server2)# chain certificate intermediate2.crt
switch(config-mgmt-sec-ssl-profile-server2)# exit
switch(config-mgmt-security)# exit
switch(config)#

```

Client side:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile client
switch(config-mgmt-sec-ssl-profile-client)# certificate client.crt key client.key
switch(config-mgmt-sec-ssl-profile-client)# trust certificate ca.crt
switch(config-mgmt-sec-ssl-profile-client)# trust certificate intermediate.crt
switch(config-mgmt-sec-ssl-profile-client)# exit
switch(config-mgmt-security)# exit
switch(config)#

```

### Incorrect Configuration Example

The following configuration will not work, as it results in invalid SSL profiles.

Server:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile server2
switch(config-mgmt-sec-ssl-profile-server2)# certificate server2.crt key server2.key
switch(config-mgmt-sec-ssl-profile-server2)# chain certificate intermediate.crt
switch(config-mgmt-sec-ssl-profile-server2)# show management security ssl profile
 Profile State Additional Info

 server3 invalid Profile has invalid certificate chain
switch(config-mgmt-sec-ssl-profile-server3)# exit
switch(config-mgmt-security)# exit
switch(config)#

```

Client:

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile client3
switch(config-mgmt-sec-ssl-profile-client3)# certificate client3.crt key client3.key
switch(config-mgmt-sec-ssl-profile-client3)# trust certificate intermediate.crt
switch(config-mgmt-sec-ssl-profile-client3)# show management security ssl profile
 Profile State Additional Info

 client3 invalid Profile has invalid trusted certificate
 chain
switch(config-mgmt-sec-ssl-profile-client3)# exit
switch(config-mgmt-security)# exit
switch(config)#

```

#### 9.2.1.2.3 Local Certificate Checks

EOS conducts various checks on the certificates in an SSL profile before allowing its use. You can modify, add to, or relax these checks locally. Here are some checks EOS performs before communicating with the peer:

##### Examples

- Check whether the certificate has an extended key usage attribute:

```
switch(config-mgmt-sec-ssl-profile-client)# certificate requirement extended-key-usage
```

- Check whether all the trusted certificates or certificates in the chain have CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client) # trust certificate requirement basic-constraints ca
true
switch(config-mgmt-sec-ssl-profile-client) # chain certificate requirement basic-constraints ca
true
```

- Do not mark an expired certificate as invalid.

```
switch(config-mgmt-sec-ssl-profile-client) # certificate policy expiry-date ignore
```

#### 9.2.1.2.3.4 Displaying SSL profile status and SSL profile errors

The **show management security ssl profile** command displays the SSL profile status information. To view a specific SSL profile status, use the name of the SSL profile. Otherwise, all SSL profile statuses are displayed.

##### Example

This command displays the status of the SSL profile server.

```
switch# show management security ssl profile server
Profile State

server valid
```

If the SSL profile contains errors, an **invalid** state is displayed, and the errors are listed in the third column. After fixing the error, the SSL profile becomes **valid**.

##### Examples

- When the certificate **server.crt** does not match with the key, EOS displays the following error message.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'server.crt' does not match
with key
```

- EOS displays the following error message when a trusted certificate **ca2.crt** does not exist.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'ca2.crt' does not exist
```

- EOS displays the following error message when a trusted certificate **foo.crt** is not a self-signed root certificate.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'foo.crt' is trusted and not
a root certificate
```

- When the certificate **server.crt** is expired, EOS displays the following error message.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'server.crt' has expired
```

- EOS displays the following error message when the certificate chain is missing an intermediate certificate.

```
switch# show management security ssl profile server
 Profile State Error

 server invalid Profile has invalid certificate chain
 Certificate 'intermediate.crt' does not exist
```

### 9.2.1.3 Rotating Certificate and Key Pair

The SSL profile uses a certificate and key pair. Rotation commands can rotate the certificate and key pair. For example, to rotate ***cert.pem*** and ***key.pem*** in the SSL profile ***profile01***, use the following commands.

```
switch01# show running-config section ssl
management security
ssl profile profile01
certificate cert.pem key key.pem
```

Using the command **security pki certificate generate signing-request rotation ssl profile**, generate a new key and signing request for SSL profile ***profile01***. The command also generates a unique rotation ID for later certificate import.

```
switch01# security pki certificate generate signing-request rotation ssl profile profile01 key
 generate rsa 2048 parameters common-name switch01
Rotation ID: 2ad7771e8cbc11ebba37483ef8d9c4b
Certificate Signing Request:

g7cwXktsMluy2otK21fkFcRvd9OHxssJ2Mf7914AliDe2sfixHX+35SytR8bahTk
z09HPCkxJmf1+cdhS9SWXrXpHHwXiCj1pqZulBFXtgnVs2Kmd3NnRA==
-----END CERTIFICATE REQUEST-----
```

The following example illustrates the command's complete syntax. The **import-timeout** argument specifies the timeout period for the rotation ID. If the system does not import a certificate within this period, the rotation ID expires and the system deletes it.

```
switch# security pki certificate generate signing-request rotation ssl profile <profile-name>
key generate rsa <2048|3072|4096>
[import-timeout <minutes>] (default: 60 mins)
[digest <sha256|sha384|sha512>] (default: sha256) parameters common-name <common-name>
[country <country-code>]
[state <state-name>]
[locality <locality-name>]
[organization <org-name>]
[organization-unit <org-unit-name>]
[email <email>]
[subject-alternative-name [ip <ip1 ip2 ...>]
[dns <nml1 nm2 ...>] [dns <nml1 nm2 ...>]
```

Use the **show security pki certificate rotation** command to view the status of rotation IDs.

#### Example

```
switch# show security pki certificate rotation
Rotation ID Profile Name State Expiry

```

Copy the Certificate Signing Request (CSR) and submit the CSR to a trusted Certificate Authority (CA) for signing. Import the signed certificate using the **security pki certificate rotation import <rotation-id>** command. Use the previously generated rotation ID with the signing request.

```
switch# security pki certificate rotation import 2ad7771e8cbc11ebba37483ef8d9c4b
Enter TEXT certificate. Type 'EOF' on its own line to end.

-----END CERTIFICATE-----
EOF
Success
```

Commit the rotation ID using the **security pki certificate rotation commit <rotation-id>** command. This command will rotate **cert.pem** and **key.pem** of SSL profile **profile01** with new certificate and key.

```
switch# security pki certificate rotation commit 2ad7771e8cbc11ebba37483ef8d9c4b
Success
```

**Note:** For keys generated outside of EOS, use the following command to rotate the certificate and key pairs in place of the earlier workflow:

```
switch# security pki certificate rotation commit ssl profile profile01
Enter TEXT private key. Type 'EOF' on its own line to end.

-----END CERTIFICATE-----
EOF
Success

```

After rotating the certificate and key pair, use the **show management security ssl certificate cert.pem** and **show management security ssl key key.pem** commands to display the new contents.

#### 9.2.1.4 Resetting Diffie-Hellman Parameters

The Diffie-Hellman parameters file facilitates the exchange of symmetric keys during SSL negotiations. When the system is booted, it auto-generates a Diffie-Hellman parameters file if one does not exist. Use the **reset** command to reset the auto-generated Diffie-Hellman parameters file. The individual features that use SSL profile configuration will decide whether they also use the Diffie-Hellman parameters file. The switch uses 2048-bit Diffie-Hellman parameters with no options to select the size.

**Note:** Not all features that use SSL profile configuration will use the Diffie-Hellman parameters file.

##### Example

This command resets the Diffie-Hellman parameters file.

```
switch# reset ssl diffie-hellman parameters
```

#### 9.2.1.4.1 Displaying the Diffie-Hellman parameters

The **show management security ssl diffie-hellman** command displays the Diffie-Hellman parameters.

### Example

This command displays the Diffie-Hellman parameters.

```
switch# show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
 Generator: 2
 Prime: dc47b5edc0d2b41451432f79f45efab452bba7b1ab118c194d671d6752ed1c550
 664ed8f052ad0fdad623c1d54ae5aee5e728d2bd7a6221636b787a4c08d1fef8c
 6dcdb10759d38f8b70b47d1c7972d69b0b295a2ee6ab44cf7352cb133e85197c8
 9f1fc27aac7e8e02afb4fb01calcb05558a7bef505b73a8d06cdfe403576b
```

### 9.2.1.5 Configuring the TLS Handshake Settings

During a TLS handshake, both peers send each other a list of the TLS versions they support to agree on and use the highest common version. The following allowable versions can be configured in an SSL profile using the **tls versions** command. By default, **TLSv1**, **TLSv1.1**, and **TLSv1.2** are enabled.

### Examples

- This command forces the use of **TLSv1.2**. If the other peer does not support this version, the TLS handshake fails.

```
switch# config
switch#(config) # management security
switch(config-mgmt-security) # ssl profile client
switch(config-mgmt-sec-ssl-profile-client) #
switch(config-mgmt-sec-ssl-profile-client) # tls versions 1.2
```

- These commands add support for **TLSv1.1** on top of the already configured **TLSv1.2**.

```
switch(config-mgmt-sec-ssl-profile-client) # tls versions add 1.1
switch(config-mgmt-sec-ssl-profile-client) # tls versions 1.1 1.2
```

The TLS handshake establishes a secure communication channel by negotiating the cipher suite and the TLS version. The client initiates this process by providing the server a list of supported cipher suites. Based on the client's list and capabilities, the server selects a mutually supported cipher suite. This selection ensures both parties utilize the same cryptographic algorithms for secure data exchange.

The default **cipher-list** setting employs an OpenSSL cipher string (**HIGH:!eNULL:!aNULL:!MD5**). This configuration permits only key lengths longer than 128 bits and excludes cipher suites using MD5.

To view the complete list of cipher suites included in this setting, execute the following shell command: **openssl ciphers HIGH:!eNULL:!aNULL:!MD5**.

### Example

This command builds a cipher suite list.

```
switch(config-mgmt-sec-ssl-profile-client) # cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-client) # cipher-list SHA256:SHA384
```

```
switch(config-mgmt-sec-ssl-profile-client)# cipher-list ECDHE-ECDSA-AES256-GCM-SHA384
```

### 9.2.1.5.1 Enabling the Federal Information Processing Standards (FIPS) Mode

Federal Information Processing Standards (FIPS) is a cryptographic standard that restricts the cryptographic functions and protocol versions used by OpenSSL.

#### Example

This command enables the FIPS mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)# fips restrictions
```

### 9.2.1.6 Syslog with TLS Support

Collecting syslog information on a remote syslog server requires defining an SSL profile. This profile ensures the secure transmission of syslog data to the server over a TLS connection.

#### Configuring Syslog with TLS Support

The following command configures a remote syslog server with an SSL profile. It configures a syslog server with the hostname **test.example.com** using the SSL profile (**test-profile**) for communications over port **1234**.

```
switch(config)# logging host test.example.com 1234 protocol tls ssl-profile test-profile
```

#### SSL Profile Example (Minimal)

The following commands set up a minimal profile to support remote logging over TLS. Ensure the proper configuration of the remote server to enable TLS communication.

```
switch(config-mgmt-security)# ssl profile test-profile
switch(config-mgmt-sec-ssl-profile-test-profile)# certificate clientCert key clientKey
switch(config-mgmt-sec-ssl-profile-test-profile)# trust certificate serverCA
```

### 9.2.1.7 Displaying Certificate and Key Information

- [Displaying Certificate Information](#)
- [Displaying Key Information](#)

#### 9.2.1.7.1 Displaying Certificate Information

##### Displaying the Directory Information

The **dir** command displays the directory output of certificate file systems.

### Example

This command displays the directory output of certificate: file-system.

```
switch# dir certificate:
Directory of certificate:/
-rw- 3319 Apr 10 11:50 server.crt
No space information available
```

### Displaying the certificate information

The **show management security ssl certificate** command displays the certificate information. To display a specific certificate, specify the certificate name. Omitting a name displays all available certificates.

### Example

This command displays the **server.crt** certificate information.

```
switch# show management security ssl certificate server.crt
Certificate server.crt:
Version: 1
Serial Number: 9
Issuer:
 Common name: ca
 Email address: ca@foo.com
 Organizational unit: Foo Org
 Organization: Foo
 Locality: SC
 State: CA
 Country: US
Validity:
 Not before: Aug 11 21:44:17 2014 GMT
 Not After: May 14 21:44:17 2069 GMT
Subject:
 Common name: server
 Email address: server@arista.com
 Organizational unit: Foo Org
 Organization: Foo
 Locality: SC
 State: CA
 Country: US
Subject public key info:
Encryption Algorithm: RSA
Size: 2048 bits
Public exponent: 65537
Modulus:
e04e3ff8e1c64dbcb141fe96133f998e90a322c671b9f28307bf873

635a831d5ec96d841
```

### Displaying Certificate Revocation List (CRL) Information

The **show management security ssl crl** command displays the installed Certificate Revocation List (CRL) information. To view a specific CRL, use its name. Omitting a name displays all the CRLs.

**Example**

This command displays the *intermediate.crl* information.

```
switch# show management security ssl crl intermediate.crl
CRL intermediate.crl:
 CRL Number: 11
 Issuer:
 Common name: intermediate
 Email address: intermediate@foo.com
 Organizational unit: Foo Org
 Organization: Foo
 State: CA
 Country: US
 Validity:
 Last Update: Jul 19 19:27:34 2016 GMT
 Next Update: Dec 05 19:27:34 2043 GMT
```

**9.2.1.7.2 Displaying Key Information****Displaying the Directory Information**

The **dir** command displays the directory output of SSL key file systems.

**Example**

This command displays the directory output of *sslkey*: file-system.

```
switch# dir sslkey:
Directory of sslkey:/
-rw- 1675 Apr 10 12:55 server.key
No space information available
```

**Displaying the RSA Key Information**

The **show management security ssl key** command displays the RSA key information. To view a specific RSA key, use the name of the key; otherwise, all the keys are displayed. For security reasons, only the public part of the key is displayed.

**Example**

This command displays the *server.key* key information.

```
switch# show management security ssl key server.key
Key server.key:
 Encryption Algorithm: RSA
 Size: 2048 bits
 Public exponent: 65537
 Modulus:
 e04e3ff8e1c64dbcb141fe96133f998e90a322c671b9f28307bf873
 2239f69804a77fbb8f146841eb6253b7bb50bf6c66bbf3097ec695b

```

---

### 9.2.1.8 TLS Commands

#### Configuration Commands

- [copy file: certificate:](#)
- [copy file: sslkey:](#)
- [delete certificate:](#)
- [delete sslkey:](#)
- [dir certificate:](#)
- [dir sslkey:](#)
- [reset ssl diffie-hellman parameters](#)
- [security pki certificate generate](#)
- [security pki key generate](#)
- [ssl profile](#)

#### Show Commands

- [show management security ssl certificate](#)
- [show management security ssl crl](#)
- [show management security ssl diffie-hellman](#)
- [show management security ssl key](#)
- [show management security ssl profile](#)

### 9.2.1.8.1 copy file: certificate:

The **copy file: certificate:** command copies the certificate to the **certificate: file** system. The certificate can be copied from any supported source URL of the **copy** command.

#### Command Mode

Global Configuration

#### Command Syntax

```
copy file: file_name certificate:
```

#### Parameter

***file\_name*** location or the path of the file or the directory to save the certificate.

#### Guidelines

The following requirements apply to copying certificates:

- A single source file can contain multiple PEM encoded entities, but they must all be certificates. If including other types such as SSL keys, the copy fails and displays an error message.

```
switch(config)# copy file:/tmp/ssl/mixed.crt certificate:
% Error copying file:/tmp/ssl/mixed.crt to certificate: (Multiple types of entities in
certificate file not supported)
switch(config)#[/pre]

```

- The source file must contain valid PEM encoded certificates. If the file contains invalid certificates, the copy fails and displays an error message.

```
switch(config)# copy file:/tmp/ssl/bad.crt certificate:
% Error copying file:/tmp/ssl/bad.crt to certificate: (Invalid certificate)
switch(config)#[/pre]

```

- EOS only supports certificates with RSA public keys. If the certificate does not have an RSA public key, the copy fails and displays an error message.

```
switch(config)# copy file:/tmp/ssl/dsa.crt certificate:
% Error copying file:/tmp/ssl/dsa.crt to certificate: (Certificate does not have RSA key)
switch(config)#[/pre]

```

- This command copies a server.crt certificate to the **certificate: file** system.

```
switch(config)# copy file:/tmp/ssl/server.crt certificate:
Copy completed successfully.[/pre]

```

### 9.2.1.8.2 copy file: sslkey:

The **copy file: sslkey:** command copies the SSL key to the **sslkey: file** system. The key can be copied from any supported source URL of the **copy** command.

#### Command Mode

Global Configuration

#### Command Syntax

```
copy file: file_name sslkey:
```

#### Parameter

**file\_name** location or the path of the file or the directory to save the key.

#### Guidelines

The following requirements apply to copying SSL keys:

- EOS only supports one PEM encoded key per file. If the source file contains multiple PEM encoded keys, the copy fails and displays an error message.

```
switch# copy file:/tmp/ssl/multi.key sslkey:
% Error copying file:/tmp/ssl/multi.key to sslkey: (Multiple PEM entities in single file not
supported)
```

- The source file must contain a valid PEM encoded RSA key. If the file contains an invalid RSA key, the copy fails and displays an error message.

```
switch# copy file:/tmp/ssl/bad.key sslkey:
% Error copying file:/tmp/ssl/bad.key to sslkey: (Invalid RSA key)
```

- EOS does not support password protected keys. If the source file contains a password protected key, the copy fails and displays an error message.

```
switch# copy file:/tmp/ssl/pass.key sslkey:
% Error copying file:/tmp/ssl/pass.key to sslkey: (Password protected keys are not supported)
```

#### Example

This command copies an SSL key in the file *server.key* to the **sslkey: file** system.

```
switch(config)# copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
switch(config) #
```

### 9.2.1.8.3 delete certificate:

The **delete certificate:** command deletes a specified certificate from the **certificate: file** system on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

`delete certificate: certificate_name`

#### Parameter

***certificate\_name*** name of the certificate to delete.

#### Example

This command deletes the **server.crt** certificate from the switch.

```
switch(config)# delete certificate:server.crt
```

---

#### 9.2.1.8.4 delete sslkey:

The **delete sslkey:** command deletes a SSL key from the **sslkey: file** system on a switch.

##### Command Mode

Global Configuration

##### Command Syntax

`delete sslkey: key_name`

##### Parameter

***key\_name*** name of the key.

##### Example

This command deletes the **server.key** SSL key on the switch.

```
switch(config) # delete sslkey:server.key
```

### 9.2.1.8.5 dir certificate:

The **dir certificate:** command displays the directory output of the **certificate: file** system on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

dir certificate:

#### Example

This command shows the directory output of **certificate: file** system on the switch.

```
switch(config)# dir certificate:
Directory of certificate:/
-rw- 3319 Apr 10 11:50 server.crt
No space information available
```

---

### 9.2.1.8.6   **dir sslkey:**

The **dir sslkey:** command displays the directory output of **sslkey: file** system on the switch.

#### **Command Mode**

Global Configuration

#### **Command Syntax**

**dir sslkey:**

#### **Example**

This command shows the directory output of **sslkey: file** system on the switch.

```
switch(config)# dir sslkey:
Directory of sslkey:/
-rw- 1675 Apr 10 12:55 server.key
No space information available
```

### 9.2.1.8.7 reset ssl diffie-hellman parameters

The **reset ssl diffie-hellman parameters** command resets the Diffie-Hellman parameters file after a system reboot.

#### Command Mode

Global Configuration

#### Command Syntax

```
reset ssl diffie-hellman parameters
```

#### Example

This command resets the Diffie-Hellman parameters file.

```
switch(config)# reset ssl diffie-hellman parameters
switch(config)#{
```

### 9.2.1.8.8 security pki certificate generate

The **security pki certificate generate** command generates a self-signed certificate or a Certificate Signing Request (CSR) certificate. The CLI displays the generated CSR, and a self-signed certificate saves to the **certificate: file** system.

Many other parameters can be entered and applied to the certificate as shown in the following examples.

#### Command Mode

Global Configuration

#### Command Syntax

```
security pki certificate generate {self-signed |signing-request} certificate_name Key key_name
```

#### Parameters

- **certificate\_name** - name of the certificate to generate. Options include the following:
  - Self-signed request to generate self-signed certificate.
  - Signing-request request to generate signing-request.
  - **digest** - Signs the certificate or key with the following cryptographic hash algorithm (**sha256**, **sha384**, **sha512**).
  - **key\_name** - Name of the key to modify.
- **parameters** - Signing request parameters for a certificate. Option include the following:
  - **common-name** - Common name to use in the subject.
  - **country** - Two-letter country code to use in the subject.
  - **email** - Email address to use in the subject.
  - **locality** - Locality name to use in the subject.
  - **organization** - Organization name to use in the subject.
  - **organization-unit** - Organization Unit Name for use in the subject.
  - **state** - State to use in the subject.
  - **subject-alternative-name** - Subject alternative name extension.
  - **rotation** - Generate a unique rotation ID.
- **validity** - Validity of the certificate in days. Value ranges from **1** to **30000**.

#### Examples

- This command generates a self-signed certificate or CSR certificate. This example uses an existing private key (**test.key**) to generate the certificates.

```
switch(config)# security pki certificate generate self-signed test.crt key test.key
```

- This command specifies the digest and the validity, in days, of the certificate or key.

```
switch(config)# security pki certificate generate signing-request key test.key digest sha256
validity 365
```

- This command adds the certificate parameters such as common-name, country, email, and others.

```
switch(config)# security pki certificate generate signing-request key test.key parameters
common-name Test [country US ...]
```

### 9.2.1.8.9 security pki key generate

The **security pki key generate** command generates a RSA key used to validate a specific certificate.

The key generated can be modified and saved by entering the value of the length in the **generate rsa length** parameter.

#### Command Mode

Global Configuration

#### Command Syntax

```
security pki key generate [rsa [2048 | 3072 | 4096] key_name
```

#### Parameters

- **rsa** - Use the Rivest-Shamir-Adleman (RSA) algorithm. Options include the following.
  - **2048** - Use 2048-bit keys.
  - **3072** - Use 3072-bit keys.
  - **4096** - Use 4096-bit keys.
- **key\_name** - The name of the key to generate.

#### Examples

- This command generates a a 2048-bit long RSA private key,**test.key**, and saves it to **sslkey:test.key**.

```
switch(config)# security pki key generate rsa 2048 test.key
```

- This command modifies the generated RSA key length value.

```
switch(config)# security pki certificate generate self-signed test.crt key
test.key generate rsa 4096
switch(config)# security pki certificate generate signing-request key test.key
generate rsa 2048
```

### 9.2.1.8.10 show management security ssl certificate

The **show management security ssl certificate** command displays information about the certificate. Provide the name of the certificate to view more information about the certificate. If you do not provide a name, this command displays information about all of the certificates.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl certificate [certificate_name]
```

#### Parameter

**certificate\_name** - The name of the certificate (optional).

#### Example

This command displays the **server.crt** certificate information.

```
switch# show management security ssl certificate server.crt
Certificate server.crt:
Version: 1
Serial Number: 9
Issuer:
 Common name: ca
 Email address: ca@myorg.com

```

### 9.2.1.8.11 show management security ssl crl

The **show management security ssl crl** command displays the basic information about the installed Certificate Revocation List (CRLs). To view information of a specific CRL provide the name of the CRL. If you do not provide a name, this command displays information about all of the CRLs.

**Note:** The command only displays basic information and does not display any information on the revocation status of certificates.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl crl
```

#### Example

This command displays the basic information of the **intermediate.crl** CRL.

```
switch# show management security ssl crl intermediate.crl
CRL intermediate.crl:
 CRL Number: 11
 Issuer:
 Common name: intermediate
 Email address: intermediate@mycompany.com
 Organizational unit: mycompany Org
 Organization: mycompany
 State: CA
 Country: US
 Validity:
 Last Update: Jul 19 19:27:34 2016 GMT
 Next Update: Dec 05 19:27:34 2043 GMT
```

---

### **9.2.1.8.12 show management security ssl diffie-hellman**

The **show management security ssl diffie-hellman** command displays the Diffie-Hellman parameter information.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show management security ssl diffie-hellman
```

#### **Example**

This command displays the Diffie-Hellman parameter information.

```
switch# show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
 Generator: 2

```

### 9.2.1.8.13 show management security ssl key

The **show management security ssl key** command displays the RSA key information. To view information of a specific key, provide the name of the key in the command. If you do not provide a name, this command displays information about all of the keys.

**Note:** For security reasons, the output displays only the public part of the key.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl key [key_name]
```

#### Parameter

***key\_name*** name of the key (optional).

#### Example

This command displays the **server.key** key information.

```
switch# show management security ssl key server.key
Key server.key:
Encryption Algorithm: RSA
Size: 2048 bits
Public exponent: 65537
Modulus:

```

### 9.2.1.8.14 show management security ssl profile

The **show management security ssl profile** command displays the SSL profile status information. To display information about a specific SSL profile, provide the name of the profile. If you do not provide a name, this command displays profile status of all the SSL profiles.

If the SSL profile contains errors, the state displays as invalid and lists the errors are listed in the third column.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl profile [profile_name]
```

#### Parameter

**profile\_name** - Name of the SSL profile (optional).

#### Examples

- This command displays the SSL profile status of profile server.

```
switch# show management security ssl profile server
Profile State

server valid
```

- If the certificate **server.crt** does not match with the key, the following error displays.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'server.crt' does not match
 with key
```

- If a trusted certificate **ca2.crt** does not exist ,the following error displays.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'ca2.crt' does not exist
```

- If a trusted certificate **mycert.crt** is not a self-signed root certificate, the following error displays.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'mycert.crt' is trusted and not
 a root certificate
```

- If the certificate **server.crt** expired, the following error displays.

```
switch# show management security ssl profile server
Profile State Error

server invalid Certificate 'server.crt' has expired
```

- If the certificate chain is missing an intermediate certificate, the following error occurs.

```
switch# show management security ssl profile server
Profile State Error

server invalid Profile has invalid certificate chain
```

Certificate 'intermediate.crt' does not exist

### 9.2.1.8.15 ssl profile

The **ssl profile** command places the switch in the SSL profile configuration mode. Various SSL profile management configurations are allowed in this mode. For example, this mode allows to configure a SSL profile with a certificate and its corresponding RSA key.

Similarly, other configurations such as trust certificate, chain certificate, crl, tls, cipher-list can be configured to a SSL profile in this mode.

The **no** form of the command deletes the SSL profile management configuration from **running-config**.

#### Command Mode

Management Security Mode

SSL Profile Mode

#### Command Syntax

```
ssl profile profile_name
```

#### Parameter

**profile\_name** name of the profile.

#### Examples

- These commands place the switch in SSL profile mode.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#[/pre>
```

- These commands configure SSL profile server with a certificate and its corresponding RSA key. The **no** command deletes the certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key server.key
switch(config-mgmt-sec-ssl-profile-server)# no certificate server.crt key server.key
```

- These commands configure the trust certificate ca1.crt to an SSL profile. The **no** command deletes a trusted certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)# no trust certificate ca1.crt
```

- These commands configure the intermediate.crt chain certificate to an SSL profile. The **no** command deletes a chain certificate configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# certificate server.crt key server.key
switch(config-mgmt-sec-ssl-profile-server)# chain certificate intermediate.crt
switch(config-mgmt-sec-ssl-profile-server)# no chain certificate intermediate.crt
```

- These commands provides Certificate Revocation List (CRL) to a SSL profile to check the revocation status of the certificate chain. The **no** command deletes the CRL configuration.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# crl intermediate.crl
switch(config-mgmt-sec-ssl-profile-server)# crl ca.crl
switch(config-mgmt-sec-ssl-profile-server)# no crl ca.crl
```

- These commands configure **TLSv1.2** to be used in the SSL profile.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# tls versions 1.2
```

- These commands build a cipher suite list.

```
switch# config
switch(config)# management security
switch(config-mgmt-security)# ssl profile server
switch(config-mgmt-sec-ssl-profile-server)# cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-server)# cipher-list SHA256:SHA384
switch(config-mgmt-sec-ssl-profile-server)# cipher-list ECDHE-ECDSA-AES256-GCM-SHA384
```

- This command check that the certificate has an extended key usage attribute.

```
switch(config-mgmt-sec-ssl-profile-client)# certificate requirement extended-key-usage
```

- These commands check that all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client)# trust certificate requirement basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client)# chain certificate requirement basic-constraints ca true
```

- This command enables the Federal Information Processing Standards (FIPS) mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)# fips restrictions
```

## 9.2.2 802.1X Port Security

This section explains the basic concepts behind 802.1X port security, including switch roles, how the switches communicate, and the procedure used for authenticating clients.

- [802.1X Port Security Introduction](#)
- [802.1X Port Security Description](#)
- [Configuring 802.1X Port Security](#)
- [802.1X AAA Unresponsive VLAN](#)
- [802.1X Web Authentication](#)
- [Displaying 802.1X Information](#)
- [802.1X Port Security Commands](#)

### 9.2.2.1 802.1X Port Security Introduction

802.1X is an IEEE standard protocol that prevents unauthorized devices from accessing the network.

---

802.1X defines three device roles,

- Supplicant (client).
- Authenticator (switch).
- Authentication server (RADIUS).

Before authentication can succeed, the switch port is in unauthorized mode and blocks all traffic, but after authentication has succeeded, normal data can flow through the switch port.

Port security controls who can send or receive traffic from an individual switch port. An end node cannot send or receive traffic through a port until a RADIUS server authenticates the node.

This security prevents unauthorized individuals from connecting to a switch port to access the network. Only designated valid users on a RADIUS server can use the switch to access the network.

#### 9.2.2.2 Overview of 802.1X Port Security

802.1X port security controls can send traffic through and receive traffic from the individual switch ports. A supplicant must authenticate using EAPOL packets with the switch before obtaining full access to the port. Arista switches act as an authenticator, passing the messages from 802.1X supplicants through to the RADIUS server and vice versa. 802.1X can operate in three different modes:

- **Single Host Mode** - Once the 802.1X supplicant authenticates on the port, the port only allows the traffic from the supplicant's MAC address.
- **Multi-Host Mode**: Once the 802.1X supplicant authenticates on the port, the port allows any traffic from any source MAC.
- **Multi-Host Authenticated Mode** - Allows multiple 802.1X supplicants and allows the incoming traffic from all authenticated supplicants MAC addresses through the port.

The Single Host and the Multi-Host modes allow only one 802.1X supplicant to authenticate for one port. After successfully authenticating, no other 802.1X supplicant can authenticate unless the current one logs off. However, the Multi-Host Authenticated Mode allows multiple 802.1X supplicants to authenticate and provide access to the network.

In addition to 802.1X authentication, EOS supports MAC-Based Authentication (MBA) and allows devices without 802.1X to access the network. The authenticator uses the MAC address of such devices as username/password in its RADIUS request packets. Depending on the MAC-Based Authentication configuration on the RADIUS server, the server permits or denies authentication to the supplicant. Unlike 802.1X supplicants, a single port allows multiple MBA supplicants. The MBA configuration does not require the 802.1X host modes. MBA supplicants permit or reject unauthenticated traffic based on the host mode.

EOS also supports Dynamic VLAN assignment, which permits the RADIUS server to assign the desired VLAN for the supplicant, using the tunnel attributes with the Access-Accept message. The RADIUS server assigns VLANs to the 802.1X and MBA supplicants. EOS supports only one VLAN per port. When the first host authenticates, the authenticator port assigns the respective VLAN through dynamic VLAN assignment, and subsequently, all other hosts must belong to that VLAN as well.

802.1X features support 802.1Q trunk ports that permit the user to use Port-Based Network Access Control (PNAC) on a port. With this feature, traffic arriving at an 802.1X-enabled port with a VLAN tag authenticates the 802.1X and MBA supplicants.

By default, traffic from any unauthenticated device on an 802.1X-enabled port drops. However, by configuring the Authentication Failure VLAN on the authenticator switch, the 802.1X or MBA supplicant traffic can be put into a specific VLAN, if the supplicant fails to authenticate via the RADIUS server.

**Note:** EOS supports one configurable VLAN for failure events such as failure due to server timeout, server unreachable, server AUTH-FAIL, or Quarantine.

#### 9.2.2.2.1 Switch Roles for 802.1X Configurations

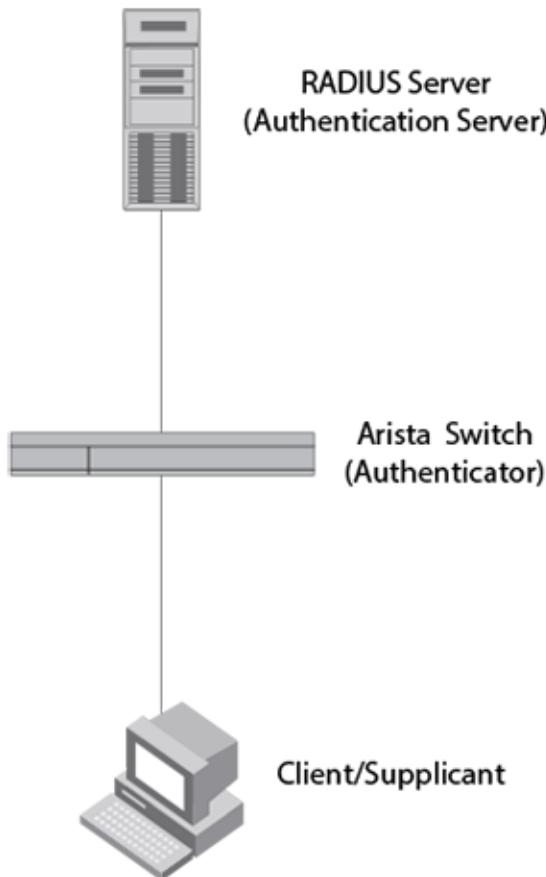

The 802.1X standard specifies the roles of **Supplicant (client)**, **Authenticator**, and **Authentication Server** in a network. [Switch Roles for 802.1X Configurations](#) illustrates these roles.

**Authentication Server** - The switch that validates the client and specifies if the client may access services on the switch. The switch supports Authentication Servers running RADIUS.

**Authenticator** - The switch that controls access to the network. In an 802.1X configuration, the switch serves as the Authenticator. As the Authenticator, it moves messages between the client and the Authentication Server. The Authenticator either grants or does not grant network access to the client based on the identity data provided by the client, and the authentication data provided by the Authentication Server.

**Supplicant/Client** - The client provides a username or password data to the Authenticator. The Authenticator sends this data to the Authentication Server. Based on the supplicants information, the Authentication Server determines whether the supplicant can use services given by the Authenticator. The Authentication Server sends this data to the Authenticator, which then provides services to the client, based on the authentication result.

**Figure 9-3: Authenticator, Supplicant, and Authentication Server in an 802.1X configuration**

---

#### **9.2.2.2.2 Authentication Process**

The authentication that occurs between a supplicant, authenticator, and authentication server include the following processes.

- Either the authenticator (a switch port) or the supplicant starts an authentication message exchange. The switch starts an exchange when it detects a change in the status of a port, or if it gets a packet on the port with a source MAC address that is not included in the MAC address table.
- An authenticator starts the negotiation by sending an EAP-Request/Identity packet. A supplicant starts the negotiation with an EAPOL-Start packet, to which the authenticator answers with a EAP-Request/Identity packet.
- The supplicant answers with an EAP-Response/Identity packet to the authentication server via the authenticator.
- The authentication server responds with an EAP-Request packet to the supplicant via the authenticator.
- The supplicant responds with an EAP-Response.
- The authentication server transmits either an EAP-Success packet or EAP-Reject packet to the supplicant.
- If an EAP-Reject is received, the supplicant will receive an EAP-Reject message and their traffic will not be forwarded.

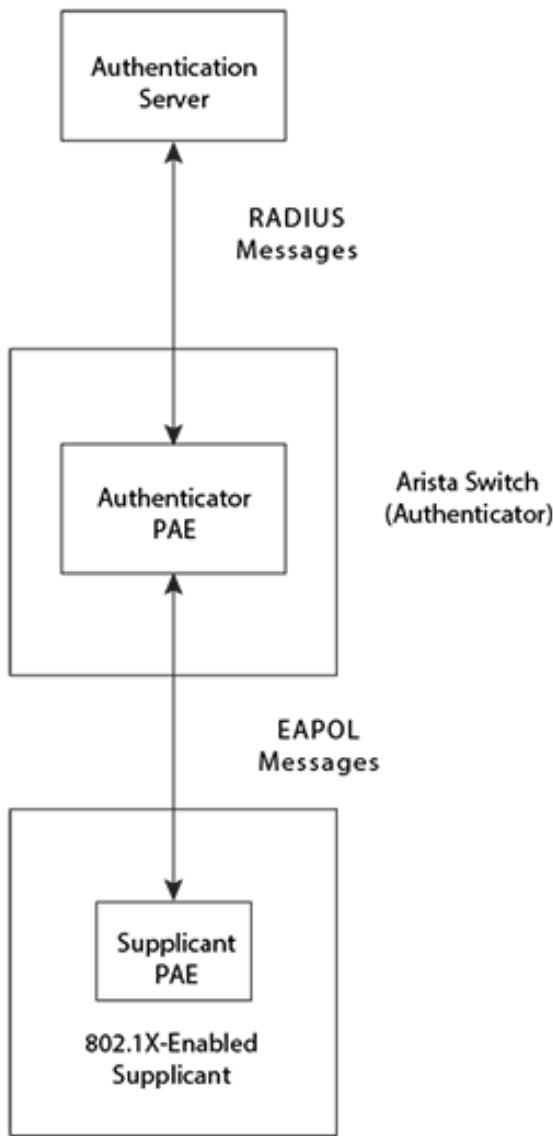

#### **9.2.2.2.3 Communication Between the Switches**

802.1X port security uses the Extensible Authentication Protocol (EAP), defined in **RFC 2284** and the RADIUS authentication protocol For communication between the switches.

The 802.1X standard defines a method for encapsulating and sending EAP messages over a LAN. This type of encapsulated EAP is known as EAP over LAN (EAPOL). The standard also specifies a method for transferring the EAPOL information between the client or Supplicant, Authenticator, and Authentication Server.

Suplicants and Authenticators pass the EAPOL messages between the Port Access Entity (PAE). The following figure displays the relationship between the Authenticator PAE and the Suplicant PAE.

**Figure 9-4: Authenticator PAE and Suplicant PAE**

**Authenticator PAE** - The Authenticator PAE communicates with the Suplicant PAE to receive the Suplicants identifying information. Behaving as a RADIUS client, the Authenticator PAE passes the Suplicants information to the Authentication Server, which decides whether to grant the Suplicant access. If the Suplicant passes authentication, the Authenticator PAE allows it access to the port.

**Suplicant PAE** - The Suplicant PAE provides information about the client to the Authenticator PAE and replies to requests from the Authenticator PAE. The Suplicant PAE may initiate the authentication procedure with the Authenticator PAE, as well as send logoff messages.

#### 9.2.2.2.4 Dot1x Dropped Counters

The Dot1x Dropped Counters count the packets dropped by dot1x interfaces. The dropped counter will not represent all the dropped packets in case of high volume dropping, and the CPU queue drop counter will

---

reflect the rest of the dropped packet counter. This is due to the fact that EOS limits the bandwidth for the packets that get sent to the CPU.

The following counters are supported and increment depending on the **dot1x interface** configuration mode:

- EAPOL unauthorized port (indicates the dropped packet number due to the unauthorized EAPOL port when Mac Base Authorization is disabled).
- EAPOL unauthorized host ( indicates the dropped packet number due to the unauthorized EAPOL host).
- MBA unauthorized host (counts the dropped packet due to the unauthorized host when Mac Base Authorization is enabled.)

#### 9.2.2.5 Enabling 802.1X Port Control

To enable 802.1X port authentication on the switch, use the following command:

```
switch(config) # dot1x system-auth-control
```

Port mode can be set to access or trunk port and 802.1X port access entity set to authenticator:

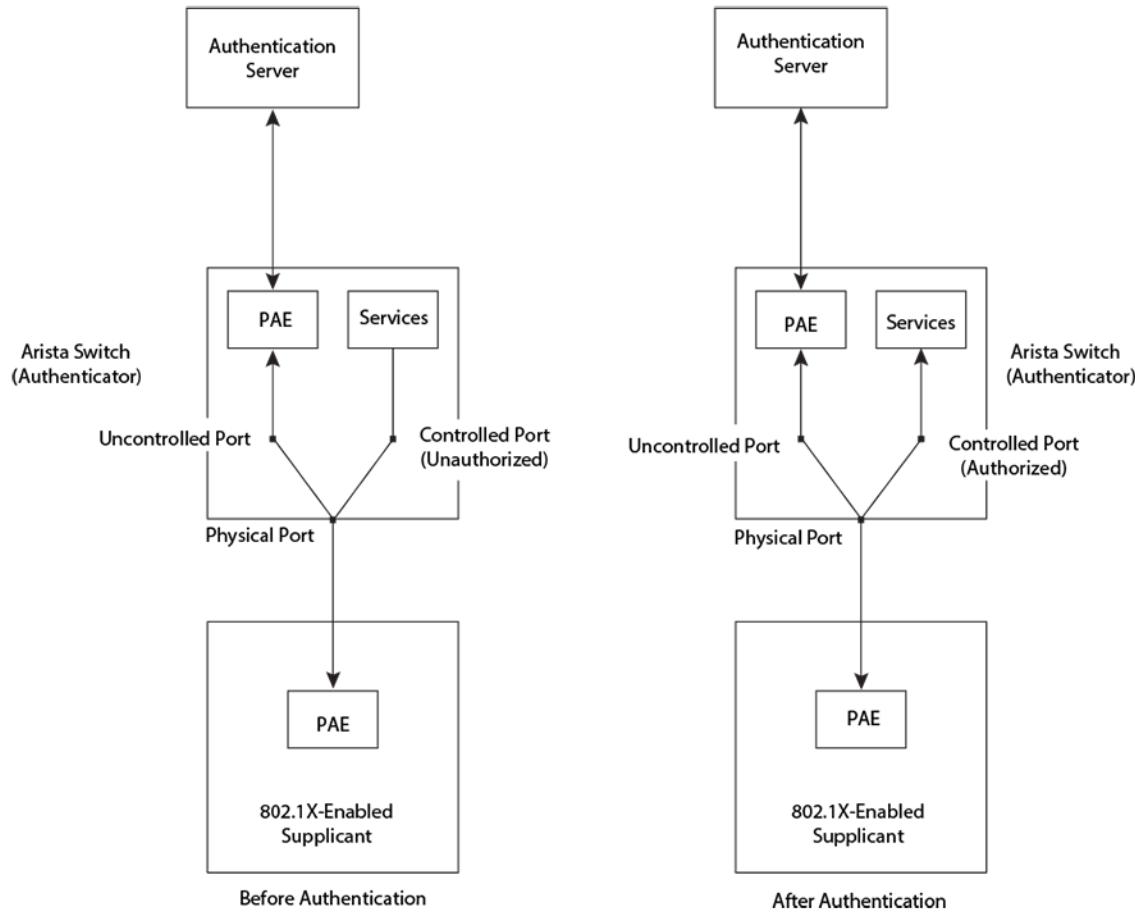

```
switch(config-if-Et1) # switchport mode access
switch(config-if-Et1) # dot1x pae authenticator
```

#### 9.2.2.6 Controlled and Uncontrolled Ports

A physical port on the switch used with 802.1X has two virtual access points that include a controlled port and an uncontrolled port. The controlled port grants full access to the network. The uncontrolled port only gives

access for EAPOL traffic between the client and the Authentication Server. When a client is authenticated successfully, the controlled port is opened to the client.

**Figure 9-5: Ports Before and After Client Authentication**

#### 9.2.2.2.6.1 Control Port State

Before authenticating the port, the port is unauthorized. In this state, the 802.1X agent only processes EAPOL packets and drops all other packets. After the port successfully authenticates, the port becomes authorized and allows all packets to pass. The authentication exchange controls the state transition between the supplicant and the authentication server. However, you can control the state by using any one of the following commands:

**dot1x port-control force-authorized**

**force-authorized** - disables 802.1X authentication and directly put the port to the authorized state. This is the default setting.

**dot1x port-control force-unauthorized**

**force-unauthorized** - also disables 802.1X authentication and directly put the port to unauthorized state, ignoring all attempts by the client to authenticate.

**dot1x port-control auto**

**auto** - enables 802.1X authentication and put the port to unauthorized state first. The port state remains in an unauthorized state or transit to authorized state according to authentication result and configuration.

#### 9.2.2.2.6.2 Uncontrolled Port State

The Authenticator only opens one uncontrolled port before authenticating a client. The client and the Authentication Server swap EAPOL frames through the uncontrolled port. No other traffic passes through the controlled port in the unauthorized state.

During authentication, the Suplicant PAE and the Authenticator PAE exchange EAPOL messages, and the Authenticator PAE and the Authentication Server exchange RADIUS messages. If the client successfully authenticates, the controlled port becomes authorized, and traffic from the client can flow through the port normally.

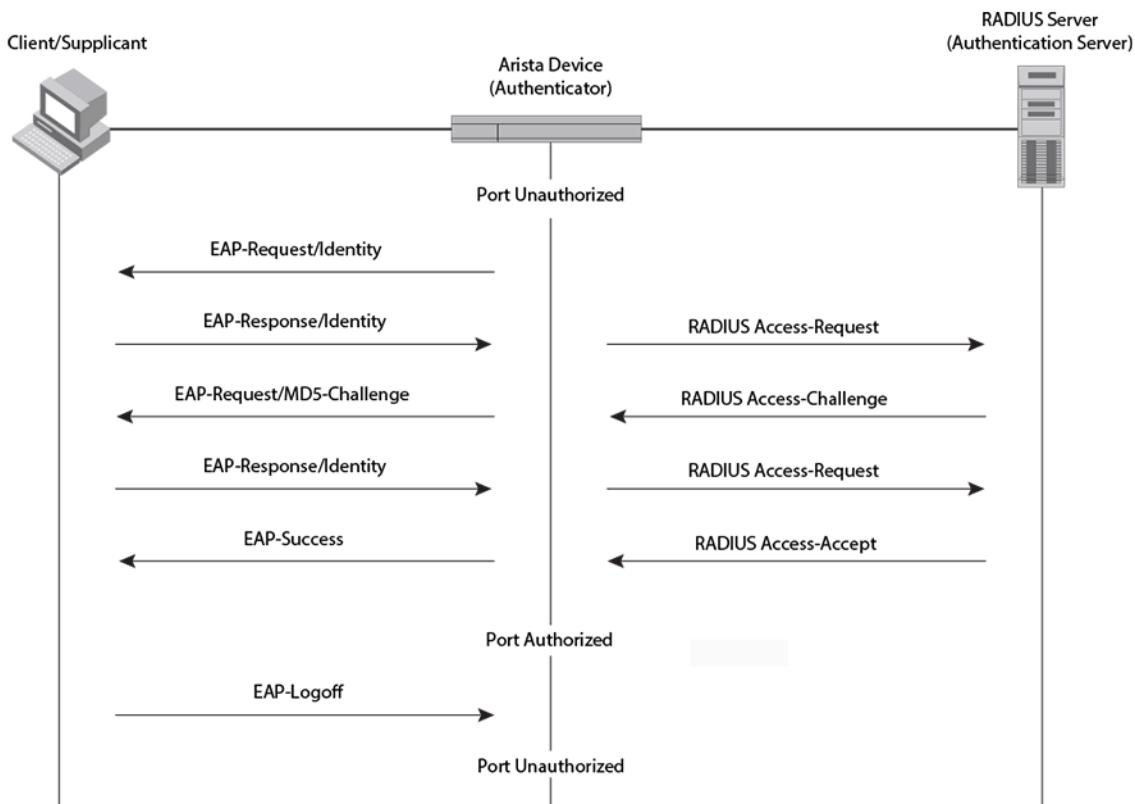

By default, all controlled ports on the switch become authorized and allow all traffic. When initially authenticating, the controlled port on the interface initially sets to the unauthorized state. If a client connected to the port authenticates successfully, the controlled port sets in the authorized state.

#### 9.2.2.7 Message Exchange During Authentication

The following figure illustrates an exchange of messages between an 802.1X-enabled client, an Authenticator switch, and a RADIUS server operating as an Authentication Server.

Arista switches support MD5-challenge TLS and other EAP-encapsulated authentication types in EAP Request or Response messages. In other words, the switches are transparent to the authentication scheme used.

**Figure 9-6: Message Exchange During Authentication**

### 9.2.2.2.8 Authenticating Multiple Clients Connected to the Same Port

Arista switches support 802.1X authentication for ports with more than one client connected to them. [Figure 9-7: Multiple clients connected to a 802.1X-enabled port](#) illustrates a sample configuration where multiple clients are connected to a single 802.1X port. 802.1X authentication may use multi-host mode, or, on selected switches, single-host mode. In both modes, the port authenticates the packets received from any one client, and drops the packets received from other clients, until authentication of the connected client by the RADIUS server.

#### 9.2.2.2.8.1 Single-host Mode

In single-host mode, the 802.1X client has authenticated on the RADIUS server and does not require further authentication. However, the port accepts packets only from the MAC address of the authenticated client.

#### 9.2.2.2.8.2 Multi-Host Mode

In multi-host mode, once the 802.1X client authenticates with the RADIUS server, the port accepts all packets from any connected client, and these packets do not require any authentication.

### 9.2.2.2.9 802.1X MAC-based Authentication

802.1X MAC-based authentication allows programming a set of MAC addresses into the RADIUS server. These MAC addresses (MAC-based authentication supplicants) do not connect to 802.1X profiles but are still allowed access to the network. The authenticator identifies devices that do not support 802.1X and uses the MAC address of these devices as username and password in its RADIUS request packets.

In MAC-based authentication, every supplicant attempting to access the authenticator port individually authenticates, as opposed to authenticating just one supplicant on a given VLAN or port with 802.1X. Different behavior occurs for MAC-based authentication supplicants when an 802.1X supplicant authenticates in single-host and multi-host 802.1X modes.

To enable Mac-based authentication, use the following command:

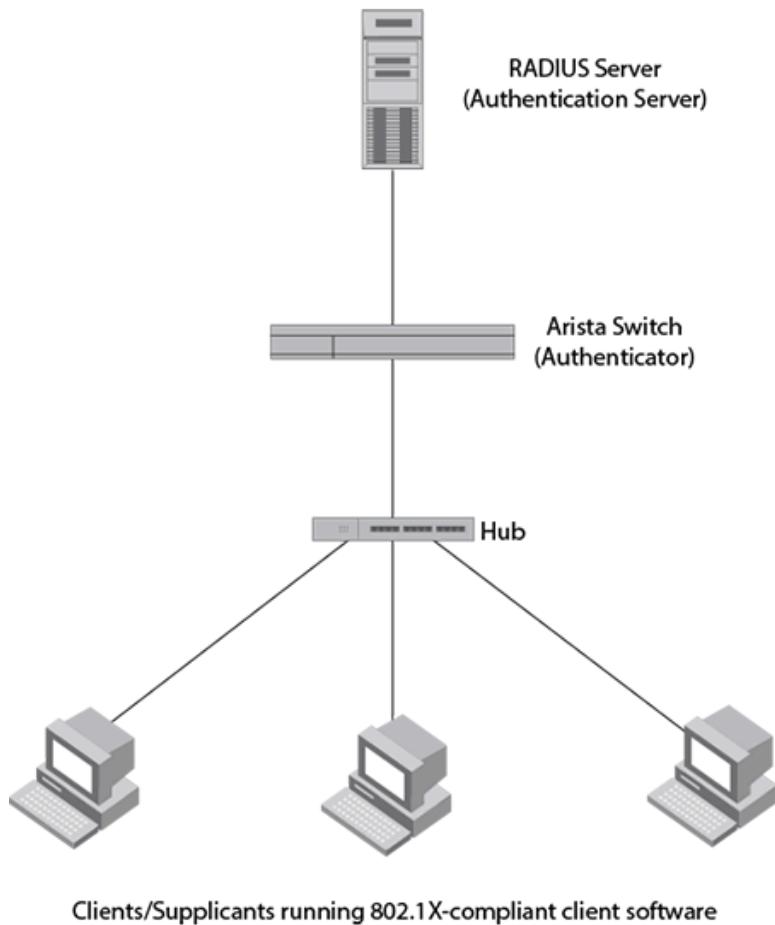

```
switch(config)#dot1x mac based authentication
```

**Note:** By adding this command to the existing 802.1X configuration on the port, a typical 802.1X interface configuration with MAC-Based Authentication enabled may look something like this:

```
switch(config-if-Et1/1)# show active
speed forced 1000full
dot1x pae authenticator
dot1x port-control auto
dot1x mac based authentication
```

**Figure 9-7: Multiple clients connected to a 802.1X-enabled port**

### Mac-Based Authentication Delay

Use the `mac based authentication delay` command to configure a MAC-based Authentication delay. By default, the delay triggers after **5** seconds.

#### Command Syntax

```
mac based authentication delay 0-300 seconds
```

### Mac-based Authentication Hold-Period

When an AAA server rejects a MAC-based Authentication, a default hold period of **60** seconds occurs before the MAC-based Authentication retries again even if the host continues to send traffic. However, the hold-period can be configured manually using the `mac based authentication hold period` command.

#### Command Syntax

```
mac based authentication hold period 0-300 seconds
```

**Note:** Configuring a low value for the hold-period can significantly increase the load on a AAA server when MAC-based Authentication is not enabled for a host.

### 9.2.2.2.10 Dot1x Web Authentication FQDN Allowlist

When using dot1x captive portal authentication, supplicants receive the WEB-AUTH-START page to begin redirecting the HTTPS requests to a captive portal as a second step in the authentication process. The Dot1x Web Authentication Fully Qualified Domain Name (FQDN) Allowlist provides a list of FQDN masks that bypass the redirection and allows the supplicant to access URLs on these hosts before completing the second step of the authentication process.

The Dot1x Web Authentication captures the IP address that the supplicant attempts to access and performs a reverse DNS resolution to check if the FQDN matches an entry on the configured Allowlist.

## 9.2.2.3 802.1X AAA Unresponsive VLAN

### Overview

Devices connected to 802.1X controlled ports must perform authentication before their generic traffic is allowed into the network. During this process, the switch contacts a configured AAA server that determines if the device's access to the network is accepted or denied. When the AAA server is unresponsive, the default behavior is to deny all authentication attempts. The AAA Unresponsive VLAN feature allows the user to specify different behavior for this case, accepting authentication attempts and assigning devices to the native VLAN or a specified VLAN. As in other failure scenarios, the switch tries to authenticate the supplicant after the quiet period has passed.

### 9.2.2.3.1 Configuring 802.1X AAA Unresponsive VLAN

Configure the [aaa unresponsive action traffic allow vlan](#) command to enable the dot1x AAA unresponsive VLAN feature on the switch. When configured, the switch changes the action taken with authentication attempts when the AAA server becomes unresponsive. Unresponsiveness occurs when the AAA communication times out.

### Example

These commands places the switch in the dot1x configuration mode and enables the dot1x AAA unresponsive VLAN feature on the switch.

```
switch(config) # dot1x
switch(config-dot1x) # aaa unresponsive action traffic allow vlan
```

### 9.2.2.3.2 Limitations

- AAA unresponsive VLAN does not act on devices that tried to authenticate using VLAN-tagged frames.
- When AAA unresponsive VLAN is enabled without a VLAN, devices get assigned to the native VLAN – even phones that would otherwise be assigned to the phone VLAN. If phones should be assigned to the phone VLAN when AAA is unavailable, the knob `aaa unresponsive phone vlan action allow` should be additionally used.

## 9.2.2.4 802.1X Web Authentication

The 802.1X Web authentication feature provides authentication for a supplicant through a Web page, referred to as a captive portal. Redirection to a captive portal provides support for guest devices or supplicants where 802.1X is not sufficient and an additional Web based authentication is required.

#### 9.2.2.4.1 Configuring 802.1X Web Authentication

Use the following global command under the 802.1X node to enable the 802.1X Web authentication:

**captive portal url *URL*[ssl profile *profile*]**

Enabling the 802.1X Web authentication starts the redirection agent (Dot1xWeb) and the internal HTTP redirector. Then, 802.1X acts on the RADIUS web-auth-start VSAs. If specifying a URL, the URL redirects the authentication when AAA does not provide a specific URL. If providing a valid SSL profile, the 802.1X Web internal HTTPS redirector uses the configured certificate and key.

For ACL based Web Authentication, an additional parameter provides more functionality:

```
switch(config-dot1x)# captive portal access-list ipv4 test-ACL
```

An ACL can be defined locally on the switch and be configured to use for Web Authentication, for cases, when AAA is not able to send ACL with web auth = start.

Here are the details about the radius VSAs.

| AttributeName         | Attribute ID | Type    | Value                     |
|-----------------------|--------------|---------|---------------------------|
| Arista-WebAuth        | 6            | integer | start = 1<br>complete = 2 |
| Arista-Captive-Portal | 10           | string  | any valid url             |

#### Show Commands

The **show** commands that display the state of a host includes the new values for WebAuth stage as well.

#### Example

```
switch(config)# show dot1x hosts
Interface: Ethernet36
Supplicant MAC Auth Method State VLAN Id
----- ----- -----
00:1c:73:73:f9:38 MAC-BASED-AUTH WEB-AUTH-START
00:1c:73:73:f9:39 MAC-BASED-AUTH WEB-AUTH-FAILED
```

#### 9.2.2.4.2 Limitations

The following limitations apply to the 802.1X feature.

- Only one device per port is supported (MAC ACLs are not supported), connected in wired fashion.
- HTTPS redirection is only attempted when the connection is to the default TCP port **443**.
- Limitations present in versions lower than **RIO RELEASE**.
  - HTTPS is not supported.
- Limitations present in versions EOS Release **4.25.0** and **4.25.1**.
  - There is no downloadable ACL support - only implicit ACL support is available. This might not suffice if there is a need to allow multiple intranet websites.
  - There is only support of one Captive portal at a time.
- Limitations in version EOS Release **4.25.0**.
  - IPv4 Management IP needs to be configured on the management interface. If the management ip address is changed, then captive portal configuration needs to be reconfigured.

- SVI needs to be configured for the VLAN where the host is going to be after the first phase of authentication - be it EAPOL or MBA.

### 9.2.2.5 Configuring 802.1X Port Security

Basic steps to implementing 802.1X Port-based Network Access Control and RADIUS accounting on the switch:

1. A RADIUS server is required on one or more of your network servers or management stations. 802.1X is not supported with the TACACS+ authentication protocol.
2. You must create supplicant accounts on the RADIUS server:
  - The account for a supplicant connected to an authenticator port must have a username and password combination when set to the 802.1X authentication mode.
    - An account for the supplicant connected to an authenticator port and placed in the MAC address-based authentication mode needs use the MAC address of the node as both the username and password.
    - Connected clients to an 802.1X authenticator port will require 802.1X client software.
3. The RADIUS client must be configured by entering the IP addresses and encryption keys of the authentication servers on your network.
4. The port access control settings must be configured on the switch. This includes the following:
  - Specifying the port roles.
  - Configuring 802.1X port parameters.
  - Enabling 802.1X Port-based Network Access Control.

#### Guidelines

- Do not set a port that is connected to a RADIUS authentication server to the authenticator role as an authentication server cannot authenticate itself.
- A supplicant connected to an authenticator port set to the 802.1X username and password authentication method must have 802.1X client software.
- To prevent unauthorized individuals from accessing the network through unattended network workstations, end users of 802.1X port-based network access control should always log off when they are finished with a work session.
- The RADIUS client should be configured on the switch before activating port-based access control.

### 9.2.2.5.1 Configuring 802.1X Authentication Methods

Configure external client authentication methods for IEEE 802.1X port security. Arista currently supports RADIUS authentication. Use the [aaa authentication dot1x](#) command to configure the switch to use a RADIUS server for client authentication.

#### Example

This command configures the switch to use RADIUS authentication.

```
switch(config)# aaa authentication dot1x default group radius
switch(config) #
```

### 9.2.2.5.2 Configuring Dot1x Dropped Counters

Use the `statistics packets dropped` command to configure the dot1x dropped counters on the switch in the `dot1x` configuration mode. By default, EOS turns off the dot1x dropped counters. The `no` form of the command disables them from the running configuration.

#### Example

These commands places the switch in the `dot1x` mode and enables the dot1x dropped counters.

```
switch(config-dot1x) # statistics packets dropped
```

### 9.2.2.5.3 Globally Enabling IEEE 802.1X

To enable IEEE 802.1X port authentication globally on the switch, use the `dot1x system-auth-control` command.

#### Example

This command enables IEEE 802.1X globally on the switch.

```
switch(config) # dot1x system-auth-control
switch(config) #
```

### 9.2.2.5.4 Designating Authenticator Ports

To set the port access entity (PAE) type of an Ethernet or management interface to the **authenticator**, use the `dot1x pae authenticator` command.

#### Example

These commands configure the PAE type to **authenticator** on the Ethernet interface **1** to enable IEEE 802.1X on the port.

```
switch(config) # interface ethernet 1
switch(config-if-Et1) # dot1x pae authenticator
switch(config-if-Et1) #
```

#### Example

For ports to act as authenticator ports to connected supplicants, those ports must be designated using the `dot1x port-control` command.

The **auto** option of the `dot1x port-control` command designates an authenticator port for immediate use, blocking all traffic that is not authenticated by the AAA server.

#### Example

This command configures Ethernet **1** to immediately begin functioning as an authenticator port.

```
switch(config) # interface ethernet 1
switch(config-if-Et1) # dot1x port-control auto
switch(config-if-Et1) #
```

The **force-authorized** option of the `dot1x port-control` command sets the state of the port to **authorized** without authentication, allowing traffic to continue uninterrupted.

### Example

These commands designate Ethernet **1** as an authenticator port that forwards packets without authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x port-control force-authorized
switch(config-if-Et1)#{/pre}

```

To designate a port as an authenticator but prevent it from authorizing any traffic, use the **force-unauthorized** option of the [dot1x port-control](#) command.

### Example

The **force-unauthorized** option of the [dot1x port-control](#) command places the specified port in the unauthorized state, which will deny any access requests from users of the ports.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x port-control force-unauthorized
switch(config-if-Et1)#{/pre}

```

## 9.2.2.5.5 Specifying the Authentication Mode for Multiple Clients

By default, Arista switches authenticate in multi-host mode, allowing packets from any source MAC address once 802.1X authentication has taken place. To configure the switch for single-host mode (allowing traffic only from the authenticated clients MAC address), use the [dot1x host-mode](#) command.

### Example

These commands configure Ethernet interface **1** to use single-host mode for 802.1X authentication.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x host-mode single-host
switch(config-if-Et1)#{/pre}

```

## 9.2.2.5.6 Configuring Re-authentication

The [dot1x reauthentication](#) command enables the authenticator ports to re-authenticate with the default values..

The [dot1x timeout reauth-period](#) command allows the customization of the re-authentication period of authenticator ports.

### Examples

- These commands configure the configuration mode interface to require re-authentication from clients at regular intervals.

```
switch(config)# interface Ethernet 1
switch(config-if-Eth)#{/pre}

```

- These commands configure the Ethernet interface **1** authenticator to require re-authentication from clients every **6** hours (**21600** seconds).

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
switch(config-if-Et1)#{/pre}

```

- 
- These commands deactivate re-authentication on the Ethernet interface **1**.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# no dot1x reauthentication
switch(config-if-Et1)#{/pre>
```

#### 9.2.2.5.7 Setting the EAP Request Maximum

The `dot1x reauthorization request limit` command configures the number of times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

##### Example

These commands set the number of times the authenticator sends an EAP request packet to the client before restarting authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x reauthorization request limit 4
switch(config-if-Et1)#{/pre>
```

The default value is **2**.

#### 9.2.2.5.8 Disabling Authentication on a Port

To disable authentication on an authenticator port, use the `no` form of the `dot1x port-control` command.

##### Example

These commands disable authentication on Ethernet interface **1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no dot1x port-control
switch(config-if-Et1)#{/pre>
```

#### 9.2.2.5.9 Setting the Quiet Period

If the switch fails to immediately authenticate the client, the `dot1x timeout quiet-period` command specifies the time the switch waits before trying again. This timer also indicates how long a client that failed authentication is blocked.

##### Example

These commands set the 802.1X quiet period for Ethernet interface **1** to **30** seconds.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x timeout quiet-period 30
switch(config-if-Et1)#{/pre>
```

The default value is **60** seconds.

#### 9.2.2.5.10 Setting the Dot1x Timeout Reauth-period

The `dot1x timeout reauth-period` command specifies the time period in seconds that the configuration mode interface waits before requiring re-authentication from clients.

### Example

These commands configure the timeout reauth-period to **21600** seconds.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
```

The default value is **3600** seconds.

#### 9.2.2.5.11 Setting the Transmission Timeout

The authenticator sends an Extensible Authentication Protocol (EAP) request to the supplicant, and the supplicant sends a response that the authenticator forwards to an authentication server. If the authenticator doesn't receive a reply to the EAP request, it waits a specified time before retransmitting the request. To configure the wait time, use the **dot1x timeout tx-period** command.

### Example

These commands configure Ethernet interface **1** to wait **30** seconds before retransmitting EAP requests to the supplicant.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout tx-period 30
switch(config-if-Et1) #
```

The default value is **5** seconds.

#### 9.2.2.5.12 Enabling Authentication Failure VLAN

Configure Authentication Failure VLAN on a dot1x-enabled port using the **dot1x authentication failure action traffic allowCLI** command under the **interface-config** mode. Set **VLAN10** as authentication failure VLAN:

```
switch(config-if-Et1/1)# dot1x authentication failure action traffic allow vlan 10
```

When configuring a VLAN with **no authentication failure** VLAN on a dot1x-enabled port, the default action drops any unauthorized traffic on the port. This behavior can also be specified using the following command:

### Example

```
switch(config-if-Et1/1)# dot1x authentication failure action traffic drop
```

#### 9.2.2.5.13 802.1X Guest VLANs

802.1X provides a guest VLAN that allows access to hosts unable to communicate over EAPoL and then perform actions to become EAPoL capable. Then, the host can move out of the guest VLAN. A typical use case includes situations where hosts perform PXE booting and become capable of responding to EAPoL requests.

**Note:** You cannot configure Guest VLANs and MBA on the same network.

### Example

---

To configure a guest VLAN on Ethernet6/1 and VLAN 25, use the following commands:

```
switch(config) # interface Ethernet6/1
switch(config-if-Et6/1) # dot1x
switch(config-dot1x) # eapol unresponsive action traffic allow vlan 25
```

Disable the feature on an interface and override the global configuration:

```
switch(config-dot1x) # eapol unresponsive action traffic disable
```

#### 9.2.2.5.14 Clearing 802.1X Statistics

The `clear dot1x statistics` command resets the 802.1X counters.

##### Examples

- This command clears the 802.1X counters on all interfaces.

```
switch# clear dot1x statistics all
switch#
```

- This command clears the 802.1X counters on Ethernet interface 1.

```
switch# clear dot1x statistics interface ethernet 1
switch#
```

#### 9.2.2.5.15 Configuring Dot1x Web Authentication FQDN Allowlist

Use the following command to add a hostname to the captive portal redirection bypass list:

```
switch(config) # dot1x
switch(config-dot1x) # captive-portal bypass fqdn_wildcard
```

Repeat the configuration statement to add more FQDNs to the list. The wildcard \* can be used once at the start of the FQDN and must be followed by a dot, for example \*.myfqdn.com.

##### Example

Use the following commands to add the FQDN, \*.mycompany.com to the FQDN Allowlist:

```
switch(config) #dot1x
switch(config-dot1x) #captive-portal bypass *.mycompany.com
```

#### Clearing Dot1x Captive Portal Resolutions

Use the `clear dot1x captive-portal resolutions` command to clear all reverse DNS entries and active bypass and redirect decisions.

```
switch# clear dot1x captive portal resolutions
```

#### Displaying Dot1x Web Authentication FQDN Allowlist Information

Use the `show captive-portal bypass` command to display the active bypass entries:

```
switch# show captive-portal bypass
```

```
Captive portal bypass:
*.eng.mycompany.com matched by 10.0.1.3, 1.0.2.4
web5.it.mycompany.com matched by 10.0.5.7
```

Use the **show captive-portal resolutions** command to display all reverse DNS resolution entries in use by the captive portal, including redirected IP addresses.

| switch# show dot1x captive-portal resolutions |                                                |                     |
|-----------------------------------------------|------------------------------------------------|---------------------|
| Address                                       | Hostnames                                      | Expiration          |
| 1.0.2.4                                       | www1.eng.mycompany.com                         | 2033-05-17 20:33:20 |
| 10.0.5.7                                      | web4.it.mycompany.com<br>web5.it.mycompany.com | 2033-05-17 20:33:23 |
| 10.10.1.3                                     | -                                              | 2033-05-17 20:33:26 |
| 10.20.1.3                                     | (pending)                                      |                     |
| 80.0.6.3                                      | www1.eng.mycompany.com                         | 2033-05-17 20:33:21 |

## 9.2.2.6 Displaying 802.1X Information

You can display information about 802.1X on the switch and on individual ports.

### 9.2.2.6.1 Displaying 802.1X statistics

Use the **show dot1x statistics** command to display 802.1X statistics for the specified port or ports.

#### Example

- This command displays IEEE 802.1X statistics for Ethernet interface **5**.

```
switch# show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5

RxStart = 0 RxLogoff = 0 RxRespId = 0
RxResp = 0 RxInvalid = 0 RxTotal = 0
TxReqId = 0 TxReq = 0 TxTotal = 0
RxVersion = 0 LastRxSrcMAC = 0000.0000.0000 switch#
```

- This command displays the dot1x dropped counters for all the dot1x interfaces.

```
switch# show dot1x all statistics
Dot1X Authenticator Port Statistics for Ethernet51/1

RX start = 1 RX logoff = 0 RX response ID = 1
RX response = 10 RX invalid = 0 RX total = 12
TX request ID = 2 TX request = 11 TX total = 13
RX version = 2 Last RX src MAC = ded6.404b.ec94
Data packet drop counters:
EAPOL unauthorized port = 2
EAPOL unauthorized host = 1
MBA unauthorized host = 0

Dot1X Authenticator Port Statistics for Ethernet49

RX start = 1 RX logoff = 0 RX response ID = 1
RX response = 10 RX invalid = 0 RX total = 12
TX request ID = 2 TX request = 11 TX total = 13
RX version = 2 Last RX src MAC = ded6.404b.ec94
Data packet drop counters:
EAPOL unauthorized port = 2
EAPOL unauthorized host = 1
MBA unauthorized host = 0
```

### 9.2.2.6.2 Displaying 802.1X supplicant information

Use the **show dot1x hosts** command to display information for all the supplicants.

#### Example

This command displays 802.1X supplicant information.

```
switch# show dot1x hosts
 Interface: Ethernet1/1
 Supplicant MAC Auth Method State VLAN Id

 e2:29:cb:11:2f:4a EAPOL SUCCESS 300
 e2:29:cb:11:2f:4b MAC-BASED-AUTH SUCCESS 300
```

### 9.2.2.6.3 Displaying MAC Address Tables

Use the **show mac address-table** command to display the MAC address of the supplicants allowed to pass the traffic through the port.

#### Example

```
switch# show mac address-table
 Mac Address Table

 Vlan Mac Address Type Ports Moves Last Move

 300 e229.cb11.2f4a STATIC Et1/1
 300 e229.cb11.2f4b STATIC Et1/1
 Total Mac Addresses for this criterion: 2
```

### 9.2.2.6.4 Displaying Port Security Configuration Information

The **show dot1x** command shows information about the 802.1X configuration on the specified port or ports.

#### Example

This command displays IEEE 802.1X configuration information for Ethernet interface **5**.

```
switch# show dot1x interface ethernet 5
Dot1X Information for Ethernet5

 PortControl : auto
 QuietPeriod : 60 seconds
 TxPeriod : 5 seconds
 ReauthPeriod : 3600 seconds
 MaxReauthReq : 2 switch#
```

### 9.2.2.6.5 Displaying the Status of the 802.1X Attributes for each Port

Use the **show dot1x interface *interface-id*** command to display the status of the 802x1 attributes for each port.

#### Example

```
switch(config-if-Et1/1)# show dot1x interface ethernet1/1
 Dot1X Information for Ethernet1

```

```

PortControl : force-authorized
HostMode : multi-host
QuietPeriod : 60 seconds
TxPeriod : 5 seconds
ReauthPeriod : 0 seconds
MaxReauthReq : 2
ReauthTimeoutIgnore: No
AuthFailVlan : 10

```

### 9.2.2.6.6 Displaying 802.1X Information for all Ports

Use the **show dot1x all brief** command to display IEEE 802.1X status for all ports.

#### Example

The following commands display a summary of IEEE 802.1X status.

```

switch# show dot1x all brief
Interface Client Status
----- -----
Ethernet5 None Unauthorized switch#

```

### 9.2.2.6.7 Displaying VLANs

Use the **show vlan** command to display dynamically assigned VLANs on the port.

#### Example

```

switch# show vlan
 VLAN Name Status Ports
 ----- -----
 1 default active
 2 VLAN0002 active Et7, Et17, Et18, Et41
 300* VLAN0300 active Et1/1, Et6, Et19, Et20, Et29
 Et30, Et31, Et32, Et42, Et43, Et44
* indicates a Dynamic VLAN

```

### 9.2.2.6.8 Displaying EAPOL Fallback to MBA Authentication and MBA Timeout Information

Use the **show dot1x interface *interface ID* details** command to display information about the EAPOL fallback to MBA authentication and MBA timeout details.

#### Example

```

switch(config-if-Et1)# show dot1x interface Ethernet1 details
Dot1X Information for Ethernet1

Port control: auto
Host mode: multi-host authenticated
Quiet period: 60 seconds
TX period: 5 seconds
Maximum reauth requests: 2
Ignore reauth timeout: No
Auth failure VLAN: 101
Unauthorized access VLAN egress: Yes
Unauthorized native VLAN egress: Yes
EAPOL: enabled
MAC-based authentication: disabled
EAPOL authentication failure fallback: MBA, timeout 200 seconds

Dot1X Authenticator Client

```

---

```
Port status: Authorized
Supplicant MAC Reauth Period (in seconds)

0022.0100.0001 120
```

### 9.2.2.7 802.1X Port Security Commands

#### Global Configuration Commands

- [dot1x system-auth-control](#)

#### Dot1x Configuration Commands

- [aaa unresponsive action traffic allow vlan](#)
- [captive portal](#)
- [dot1x eapol](#)

### 9.2.2.7.1 aaa unresponsive action traffic allow vlan

The **aaa unresponsive action traffic allow vlan** enables the the dot1x AAA unresponsive VLAN feature on the switch.

The **no aaa unresponsive action traffic allow vlan** command disbales the dot1x AAA unresponsive VLAN feature from the *running-config*.

#### Command Mode

Dot1x Configuration Mode

#### Command Syntax

```
aaa unresponsive action traffic allow vlan VLAN-ID
```

```
no unresponsive action traffic allow vlan
```

#### Parameters

- **unresponsive** Configure AAA timeout options.
- **action** Set action for supplicant when AAA times out.
- **traffic** Set action for supplicant traffic when AAA times out.
- **allow** Allow traffic when AAA times out.
- **vlan** Allow traffic in VLAN when AAA times out.
- **VLAN-ID** Identifier for a Virtual LAN. Value ranges from **1** to **4094**.

#### Example

These commands places the switch in the dot1x configuration mode and enables the dot1x AAA unresponsive VLAN feature on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# aaa unresponsive action traffic allow vlan 50
```

### 9.2.2.7.2 captive portal

The `captive portal` command enables the 802.1X Web Authentication on the switch.

The `no captive portal` command removes the 802.1X Web Authentication configuration from the *running-config*.

#### Command Mode

Dot1x Configuration Mode

#### Command Syntax

```
captive portal url URL ssl profile profile access-list ipv4 ACL name bypass
fqdn_wildcard request timeout seconds
```

```
no captive portal url URL ssl profile profile access-list ipv4 ACL name bypass
fqdn_wildcard request timeout seconds
```

#### Parameters

- **url** - Configure captive portal URL.
- **ssl** - Configure SSL related option.
- **access-list** - Configure access control list.
- **bypass** - Configure Fully Qualified Domain Names (FQDN) for the redirection bypass list.
- **request timeout seconds** - Configure the request timeout from 1 to 120 seconds. By default, the configuration uses 60 seconds. Specifies the time that the agent waits for an HTTP/HTTPS GET request.

#### Examples

- This command enables 802.1X Web Authentication on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# captive portal ssl profile test-ssl_profile
```

- This command enables the ACL based Web authentication.

```
switch(config)# dot1x
switch(config-dot1x)# captive portal access-list ipv4 test-ACL
```

- This command enables captive portal bypass redirection with the FQDN, `www.mycompany.com`.

```
switch(config)# dot1x
switch(config-dot1x)# captive portal bypass www.mycompany.com
```

### 9.2.2.7.3 clear dot1x statistics

The **clear dot1x statistics** command resets the 802.1X counters on the specified interface or all interfaces.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear dot1x statistics INTERFACE_NAME
```

#### Parameters

**INTERFACE\_NAME** Interface type and number. Options include:

- **all** Display information for all interfaces.
- **interface ethernet e\_num** Ethernet interface specified by **e\_num**.
- **interface loopback l\_num** Loopback interface specified by **l\_num**.
- **interface management m\_num** Management interface specified by **m\_num**.
- **interface port-channel p\_num** Port-Channel Interface specified by **p\_num**.
- **interface vlan v\_num** VLAN interface specified by **v\_num**.

#### Example

This command resets the 802.1X counters on all interfaces.

```
switch# clear dot1x statistics all
switch#
```

---

#### 9.2.2.7.4    dot1x eapol

The **dot1x eapol** command places the switch into 802.1X Configuration Mode and configures the EAPoL actions for Guest VLAN access. The [**no** | **default**] options reverts the configuration to match the global configuration.

##### Command Mode

Dot1x Configuration Mode

##### Command Syntax

```
dot1x eapol unresponsive action traffic allow [vlan vlan_id]
```

##### Parameters

- **eapol** - Configure Dot1x EAPOL attributes.
- **unresponsive** - Configure unresponsive hosts.
- **action** - Configure the action in case of EAPOL unresponsive hosts.
- **traffic** - Configure the traffic action in case of EAPOL unresponsive hosts.
- **allow** - Allow traffic in case of EAPOL unresponsive hosts.
- **vlan *vlan\_id*** - Specify the VLAN to allow traffic in case of EAPOL unresponsive hosts.

##### Example

To configure a guest VLAN on Ethernet6/1 and VLAN 25, use the following commands:

```
switch(config)#interface Ethernet6/1
switch(config-if-Et6/1)#dot1x
switch(config-dot1x)#eapol unresponsive action traffic allow vlan 25
```

### 9.2.2.7.5 dot1x mac based authentication

The **dot1x mac based authentication** command enables MAC-based authentication on the existing 802.1X authenticator port.

The **no dot1x mac based authentication** and the **default dot1x mac based authentication** commands restore the switch default by disabling the corresponding dot1x mac based authentication command for the specific 802.1X authenticator port.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dot1x mac based authentication
no dot1x mac based authentication
default dot1x mac based authentication
```

#### Related Command

[show dot1x hosts](#)

#### Example

These commands configure MAC-based authentication on **Ethernet interface 1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x mac based authentication
switch(config-if-Et1)#[/pre]
```

---

### 9.2.2.7.6 dot1x mac based authentication delay

The **dot1x mac based authentication delay** command enables MAC-based authentication delay. By default, the delay is triggered after **5** seconds.

The **no dot1x mac based authentication delay** and the **default dot1x mac based authentication delay** commands restore the switch default by disabling the corresponding dot1x mac based authentication delay command.

#### Command Mode

Dot1x Configuration

#### Command Syntax

```
dot1x mac based authentication delay delay-time seconds
no dot1x mac based authentication delay
default dot1x mac based authentication delay
```

#### Parameters

- **delay-time** Delay in seconds. The value is from **0** to **300**.
- **seconds** Unit in seconds.

#### Example

These commands configure a MAC-based authentication delay of **30** seconds on a switch.

```
switch(config)# dot1x
switch(config-dot1x)# mac based authentication delay 30 seconds
```

### 9.2.2.7.7 dot1x mac based authentication hold period

The **dot1x mac based authentication hold period** command enables MAC-based authentication hold period. By default, the hold period is **60** seconds.

The **no dot1x mac based authentication hold period** and the **default dot1x mac based authentication hold period** commands restore the switch default by disabling the corresponding dot1x mac based authentication hold period command.

#### Command Mode

Dot1x Configuration

#### Command Syntax

```
dot1x mac based authentication hold period hold period-time seconds
no dot1x mac based authentication hold period
default dot1x mac based authentication hold period
```

#### Parameters

- **hold period-time** Hold period in seconds. The value is from **1** to **300** in seconds.
- **seconds** Unit in seconds.

#### Example

These commands configure a MAC-based authentication hold period of **100** seconds on a switch.

```
switch(config)# dot1x
switch(config-dot1x)# mac based authentication hold period 100 seconds
```

---

### 9.2.2.7.8 dot1x pae authenticator

The **dot1x pae authenticator** command sets the port access entity (PAE) type of the configuration mode interface to **authenticator**, which enables IEEE 802.1X on the port. EOS disables IEEE 802.1X on all ports by default.

The **no dot1x pae authenticator** and **default dot1x pae authenticator** commands restore the switch default by deleting the corresponding **dot1x pae authenticator** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x pae authenticator
no dot1x pae authenticator
default dot1x pae authenticator
```

#### Examples

- These commands configure **interface ethernet 2** as a port access entity (PAE) authenticator, enabling IEEE 802.1X on the port.

```
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et1)# dot1x pae authenticator
switch(config-if-Et1)#{
```

- These commands disable IEEE 802.1X authentication on **interface ethernet 2**.

```
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et1)# no dot1x pae authenticator
switch(config-if-Et1)#{
```

### 9.2.2.7.9 dot1x reauthentication

The **dot1x reauthentication** command configures the configuration mode interface to require re-authentication from clients at regular intervals. Use the **dot1x timeout reauth-period** command to set the interval.

The **no dot1x reauthentication** and **default dot1x reauthentication** commands restore the default setting by deleting the corresponding **dot1x reauthentication** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x reauthentication
no dot1x reauthentication
default dot1x reauthentication
```

#### Example

These commands configure the **interface Ethernet 1** authenticator to require periodic re-authentication from clients.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1) #
```

---

### 9.2.2.7.10 dot1x reauthorization request limit

The **dot1x reauthorization request limit** command configures how often the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

The **no dot1x reauthorization request limit** and **default dot1x reauthorization request limit** commands restore the default value of 2 by deleting the corresponding **dot1x reauthorization request limit** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x reauthorization request limit attempts
no dot1x reauthorization request limit
default dot1x reauthorization request limit
```

#### Parameter

**attempts** Maximum number of attempts. Values range from **1** to **10**; default value is **2**.

#### Examples

- This command sets the 802.1X EAP-request retransmit limit to **6**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x reauthorization request limit 6
switch(config-if-Et1)#{/pre}
```

- This command restores the default request repetition value of **2**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no dot1x reauthorization request limit
switch(config-if-Et1)#{/pre}
```

### 9.2.2.7.11 dot1x system-auth-control

The **dot1x system-auth-control** command enables 802.1X authentication on the switch.

The **no dot1x system-auth-control** and **default dot1x system-auth-control** commands disables 802.1X authentication by removing the **dot1x system-auth-control** command from ***running-config***.

#### Command Mode

Global Configuration

#### Command Syntax

```
dot1x system-auth-control
no dot1x system-auth-control
default dot1x system-auth-control
```

#### Examples

- This command enables 802.1X authentication on the switch.

```
switch(config)# dot1x system-auth-control
switch(config)#
```

- This command disables 802.1X authentication on the switch.

```
switch(config)# no dot1x system-auth-control
switch(config)#
```

---

### 9.2.2.7.12 dot1x timeout quiet-period

If the switch fails to immediately authenticate the client, the switch waits a specified time configured with the **dot1x timeout quiet-period** command. This timer also indicates the blocked time for a client with failed authentication.

The **no dot1x timeout quiet-period** and **default dot1x timeout quiet-period** commands restore the default quiet period of **60** seconds by removing the corresponding **dot1x timeout quiet-period** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout quiet-period quiet_time
no dot1x timeout quiet-period
default dot1x timeout quiet-period
```

#### Parameter

**quiet\_time** Interval in seconds. Values range from **1** to **65535**. Default value is **60**.

#### Example

These commands set the 802.1X quiet period for Ethernet interface **1** to **30** seconds.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout quiet-period 30
switch(config-if-Et1) #
```

### 9.2.2.7.13 dot1x timeout reauth-period

The **dot1x timeout reauth-period** command specifies the time period that the configuration mode interface waits before requiring re-authentication from clients.

The **no dot1x timeout reauth-period** and **default dot1x timeout reauth-period** commands restore the default period of **60** minutes by removing the corresponding **dot1x timeout reauth-period** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout reauth-period reauth_time
```

```
no dot1x timeout reauth-period
```

```
default dot1x timeout reauth-period
```

#### Parameter

*reauth\_time* The number of seconds the interface passes traffic before requiring re-authentication. Values range from **1** to **65535**. Default value is **3600**.

#### Example

These commands configure the interface Ethernet **1** authenticator to require re-authentication from clients every **6** hours (**21600** seconds).

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x reauthentication
switch(config-if-Et1)# dot1x timeout reauth-period 21600
switch(config-if-Et1)#

```

---

#### 9.2.2.7.14 dot1x timeout tx-period

The authenticator establishes authentication and re-authentication by sending Extensible Authentication Protocol (EAP) requests to the supplicant, and the supplicant sends a reply which the authenticator forwards to an authentication server. If the authenticator does not receive a reply to the EAP request, it waits a specified time before retransmitting the request. The `dot1x timeout tx-period` command configures the wait time.

The `no dot1x timeout tx-period` and `default dot1x timeout tx-period` commands restore the default wait time by removing the corresponding `dot1x timeout tx-period` command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout tx-period tx_time
no dot1x timeout tx-period
default dot1x timeout tx-period
```

#### Parameter

**tx\_time** Values range from **1** to **65535**. Default value is **5**.

#### Example

These commands configure interface Ethernet **1** to wait **30** seconds before retransmitting EAP requests to the supplicant.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x timeout tx-period 30
switch(config-if-Et1)#{/pre}
```

### 9.2.2.7.15 dot1x host-mode

When multiple clients are connected to an Ethernet interface providing 802.1X authentication, the port can accept packets from all MAC addresses once the supplicant has been authenticated (multi-host mode), or it can accept only those packets originating from the MAC address of the authenticated client (single-host mode) or multiple authenticated clients (multi-host authenticated mode). The **dot1x host-mode** command specifies the host mode for authentication of multiple clients on the configuration mode interface.

The **no dot1x host-mode** and **default dot1x host-mode** commands restore the switch default (multi-host mode) by removing the corresponding dot1x host-mode command for the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dot1x host-mode [multi-host | single-host | multi-host authenticated]
no dot1x host-mode
default dot1x host-mode
```

#### Parameters

- **multi-host** Configures the interface to use multi-host mode (the default).
- **single-host** Configures the interface to use single-host mode.
- **multi-host authenticated** Configures the interface to use multi-host authenticated mode.

#### Example

These commands configure **interface Ethernet 1** to use single-host mode for 802.1X authentication.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dot1x host-mode single-host
switch(config-if-Et1)#{/pre>
```

---

### 9.2.2.7.16 dot1x port-control

The **dot1x port-control** command configures the configuration mode interface as an authenticator port and specifies whether it will authenticate traffic.

The **no dot1x port-control** and **default dot1x port-control** commands configure the port to pass traffic without authorization by removing the corresponding **dot1x port-control** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x port-control STATE
```

```
no dot1x port-control
```

```
default dot1x port-control
```

#### Parameters

**STATE** Specifies whether the interface will authenticate traffic. The default value is **force-authorized**. Options include:

- **auto** Configures the port to authenticate traffic using Extensible Authentication Protocol messages.
- **force-authorized** Configures the port to pass traffic without authentication.
- **force-unauthorized** Configures the port to block all traffic regardless of authentication.

#### Examples

- These commands configure **interface Ethernet 1** to pass traffic without authentication. This is the default setting.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control force-authorized
switch(config-if-Et1) #
```

- These commands configure **interface Ethernet 1** to block all traffic.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control force-unauthorized
switch(config-if-Et1) #
```

- These commands configure **interface Ethernet 1** to authenticate traffic using EAP messages.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# dot1x port-control auto
switch(config-if-Et1) #
```

### 9.2.2.7.17 show dot1x all brief

The **show dot1x all brief** command displays the IEEE 802.1X status for all ports.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x all brief
```

#### Example

This command displays the IEEE 802.1X status.

```
switch# show dot1x all brief
Interface Client Status

Ethernet5 None Unauthorized
switch#
```

### 9.2.2.7.18 show dot1x hosts

The **show dot1x hosts** command displays 802.1X information for all the supplicants.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x hosts [ethernet]
```

#### Parameter

**ethernet e\_num** Ethernet interface specified by **e\_num**.

#### Related Command

[dot1x mac based authentication](#)

#### Examples

- This command displays 802.1X information for all the supplicants.

```
switch# show dot1x hosts
Legend:
* - Statically configured VLAN

Port Supplicant MAC Username Auth State Fallback VLAN VLAN
Name

Et1/4 36d4.b67b.67c6 user101 EAPOL SUCCESS NONE 123 DATA
Et2/4 36d4.b67b.67c7 user102 EAPOL SUCCESS NONE 124 VLAN0124
Et1/4 36d4.b67b.68e3 36:d4:b6:7b:68:e3 MBA SUCCESS NONE 1* default
```

- Use the following command to display 802.1X details for an interface:

```
switch# show dot1x hosts interface Ethernet2/4 detail

Supplicant: user1 (36d4.b67b.67c8)
Operational:
Supplicant MAC: 36d4.b67b.67c8
Supplicant IP: 192.168.1.4 sourceLldp
User name: user1
Interface: Ethernet2/4
Authentication method: EAPOL
Supplicant state: SUCCESS
Fallback Applied: AUTH-FAIL-VLAN
Reauthentication behaviour: DO-NOT-RE-AUTH
Reauthentication interval: 0 seconds
VLAN ID: 200 (static)
VLAN Name: VLAN0200
Device type: Phone
Accounting-Session-Id: 1x00000005
Captive portal:

AAA Server Returned:
Arista-WebAuth:
Filter-Id: WEB-AUTH-ACL
NAS-Filter-Rule: permit in ip from 11.0.0.0/8 to 12.0.0.0/8
 deny in ip from 10.1.0.0/16 to 20.1.0.0/16
Session-Timeout: 28800 seconds
Idle-Timeout: 200 seconds
```

### 9.2.2.7.19 show dot1x statistics

The **show dot1x statistics** command displays 802.1X statistics for the specified port or ports.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x INTERFACE_NAME statistics
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-Channel Interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
  -
- **Output Fields**
  - **RxStartNumber** of EAPOL-Start frames received on the port.
  - **TxReqIdNumber** of EAP-Request/Identity frames transmitted on the port.
  - **RxVersionVersion** number of the last EAPOL frame received on the port.
  - **RxLogoffNumber** of EAPOL-Logoff frames received on the port.
  - **RxInvalidNumber** of invalid EAPOL frames received on the port.
  - **TxReqNumber** of transmitted EAP-Request frames that were not EAP-Request/Identity.
  - **LastRxSrcMAC** The source MAC address in the last EAPOL frame received on the port.
  - **RxRespId** The number of EAP-Response/Identity frames received on the port.
  - **RxTotal** The total number of EAPOL frames transmitted on the port.
  - **TxTotal** The total number of EAPOL frames transmitted on the port.

#### Example

This command displays the 802.1X statistics for **interface ethernet 5**.

```
switch# show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5

RxStart = 0 RxLogoff = 0 RxRespId = 0
RxStart= 0 RxInvalid = 0 RxTotal = 0
TxReqId = 0 TxReq = 0 TxTotal = 0
RxVersion = 0 LastRxSrcMAC = 0000.0000.0000 switch#
```

---

### 9.2.2.7.20 show dot1x

The **show dot1x** command displays 802.1X information for the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x INTERFACE_NAME INFO
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-Channel Interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
- **INFO** Type of information the command displays. Values include:
  - **no parameter** displays summary of the specified interface.
  - **detail** displays all 802.1X information for the specified interface.

#### Examples

- This command displays 802.1X summary information for **interface ethernet 5**.

```
switch# show dot1x interface ethernet 5
Dot1X Information for Ethernet5

PortControl : auto
QuietPeriod : 60 seconds
TxPeriod : 5 seconds
ReauthPeriod : 3600 seconds
MaxReauthReq : 2 switch#
```

- This command displays detailed 802.1X information for **interface ethernet 5**.

```
switch# show dot1x interface ethernet 5 detail
Dot1X Information for Ethernet5

PortControl : auto
QuietPeriod : 60 seconds
TxPeriod : 5 seconds
ReauthPeriod : 3600 seconds
MaxReauthReq : 2

Dot1X Authenticator Client
Port Status : Unauthorized switch#
```

### 9.2.2.7.21 show dot1x captive-portal bypass

The **show dot1x captive-portal bypass** command displays information about dot1x captive portal bypass configurations.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x captive-portal bypass address [ipv4 | ipv6]
```

#### Parameters

- **[ipv4 | ipv6]** - Display dot1x captive portal bypass information for a specific IP address.

Use the following command to display information about dot1x captive portal bypass entries:

```
switch# show captive-portal bypass
Captive portal bypass:
*.eng.mycompany.com matched by 10.0.1.3, 1.0.2.4
web5.it.mycompany.com matched by 10.0.5.7
```

---

### 9.2.2.7.22 show dot1x captive-portal resolutions

The **show dot1x captive-portal resolutions** command displays information for all reverse DNS resolution entries in use by the captive portal.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x captive-portal resolutions address [ipv4 | ipv6]
```

#### Parameters

- **[ipv4 | ipv6]** - Display dot1x captive portal resolutions information for a specific IP address.

The table displays the following information:

- **Address** - Displays the IP address the supplicant attempted to access and used to find the hostname through reverse DNS.
- **Hostnames** - Displays the hostnames reported by the DNS server. The entry displays *pending* if the resolution has not completed, and - if the resolution completed but no hostname found or if the resolution timed out.
- **Expiration** - The DNS server provided a valid resolution and provided a time-to-live (TTL) before updating the resolution.

Use the following command to display information about dot1x captive portal resolution entries:

```
switch#show dot1x captive-portal resolutions
 Address Hostnames Expiration
 ----- -----
 1.0.2.4 www1.eng.arista.com 2033-05-17 20:33:20
 10.0.5.7 web4.it.arista.com 2033-05-17 20:33:23
 web5.it.mycompany.com
 10.10.1.3 -
 10.20.1.3 (pending)
 80.0.6.3 www1.eng.mycompany.com 2033-05-17 20:33:21
```

### 9.2.2.7.23 statistics packets dropped

The **statistics packets dropped** command to configure the dot1x dropped counters on the switch in the **dot1x** configuration mode. By default, EOS disable the dot1x dropped counters. The **no** form of the command disables the dot1x dropped counters from the running configuration.

The **no statistics packets dropped** command disables the dot1x dropped counters from the running configuration.

#### Command Mode

Dot1x Configuration

#### Command Syntax

```
statistics packets dropped
no statistics packets dropped
```

#### Example

These commands places the switch in the **dot1x** mode and enables the dot1x dropped counters.

```
switch(config-dot1x)# statistics packets dropped
```

---

## 9.3 Data Plane Security

This section contains the following topics:

- [IP NAT](#)
- [Media Access Control Security](#)
- [Internet Protocol Security \(IPsec\)](#)
- [Macro-Segmentation Service \(CVX\)](#)

### 9.3.1 IP NAT

Network Address Translation (NAT) is a router process that modifies the address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers with interfaces connecting to the local networks and interfaces connecting to a remote network.

#### Inside and Outside Addresses

NAT configurations categorize IP addresses into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network, while outside refers to addresses on an external network outside the organizational network.

#### 9.3.1.1 Static IP NAT

Static NAT configurations create a one-to-one mapping and translate a particular address to another address. This type of configuration creates a permanent entry in the NAT table as long as the configuration is present, enabling both inside and outside hosts to initiate a connection.

Static NAT options include source NAT, destination NAT, and Twice Network Address Translation (Twice NAT).

- Source NAT modifies the source address in the IP header of a packet exiting the interface and can optionally change the source port referenced in the TCP/UDP headers.
- Destination NAT modifies the destination address in the IP header of a packet entering the interface and can optionally change the destination port referenced in the TCP/UDP headers.
- Twice NAT modifies both the source and destination IP addresses of packets traversing the interface. The process optionally changes L4 port information within TCP/UDP headers. Implement Twice NAT to prevent conflicts when inside network addresses overlap with outside network addresses. When a packet exits the interface, local source and destination addresses are translated to global source and destination addresses. When a packet enters the interface, global source and destination addresses are translated to local source and destination addresses.

### 9.3.1.1.1 Configuring Static NAT

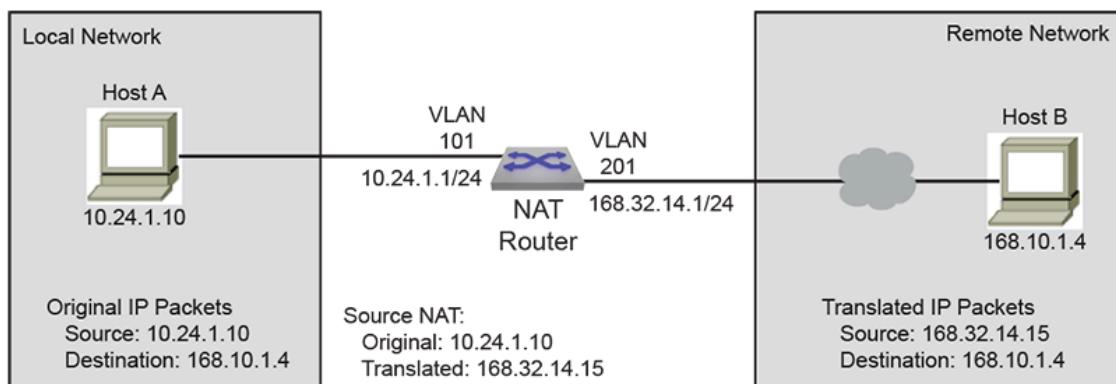

#### Configuring Source NAT

Enable the NAT of a source address (source NAT) using the `ip nat source static` command for the configuration mode interface. Applying source NAT to interfaces that connect to local hosts shields the hosts' IP address when sending IP packets to remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

**Note:** The switch uses a common NAT table for the entire switch, not a per interface. For example, if a customer has the same inside local address translated to different inside global addresses depending on which interface it exits. It might be translated to exit interface B's inside global address even though it exits through interface A. The way to avoid this is to use an access list that differentiates based on the destination IP address.

Figure 9-8: Source NAT Example

#### Example

These commands configure **VLAN 201** to translate source address **10.24.1.10** to **168.32.14.15**.

```
switch(config)# interface vlan 201
switch(config-if-V1201)# ip nat source static 10.24.1.10 168.32.14.15
switch(config-if-V1201) #
```

The `ip nat source static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for source NAT must specify a source IP address of **any**. Source port or protocol matching is not permitted. The destination may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but only installed in hardware once the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

#### Example

These commands configure **VLAN 101** to translate the source address **10.24.1.10** to **168.32.14.15** for all packets with IP destination addresses in the **168.10.1.1/24** subnet.

```
switch(config)# ip access-list ACL1
switch(config-acl-ACL1)# permit ip any 168.10.1.0/24
switch(config-acl-ACL1)# exit
switch(config)# interface vlan 101
switch(config-if-V1101)# ip nat source static 10.24.1.10 access-list ACL1 168.32.14.15
```

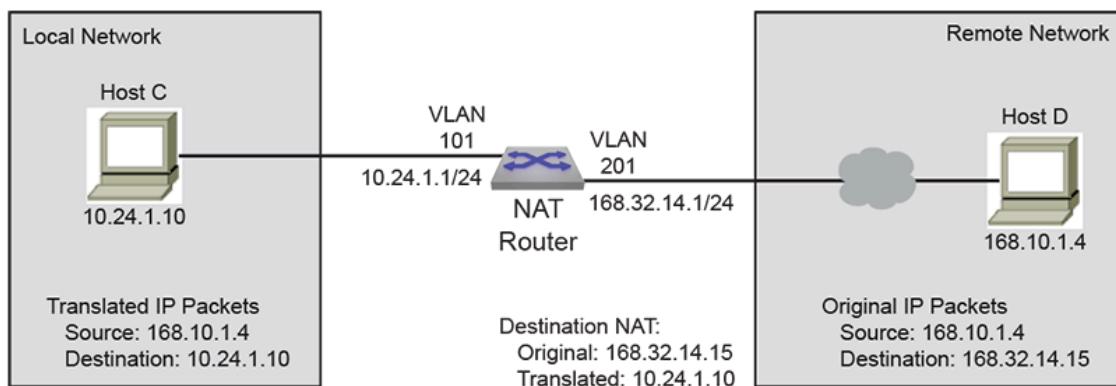

```
switch(config-if-V1101) #
```

## Configuring Destination NAT

Enable the NAT of a destination address (destination NAT) using the `ip nat destination static` command for the configuration mode interface. Applying destination NAT to interfaces that connect to remote hosts shields the IP address of the recipient host when receiving IP packets from remote destinations.

This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

**Figure 9-9: Destination NAT Example**

## Example

These commands configure **VLAN 201** to translate destination address **168.32.14.15** to **10.24.1.10**.

```
switch(config) # interface vlan 201
switch(config-if-V1201) # ip nat destination static 168.32.14.15 10.24.1.10
switch(config-if-V1201) #
```

The `ip nat destination static` command may include an ACL to limit packet translation. Only packets whose source IP address matches the ACL are cleared. ACLs configured for destination NAT must specify a destination IP address of **any**. Destination port or protocol matching is not permitted. The source may be an IP subnet. Commands referencing nonexistent ACLs are accepted by the CLI but not installed in hardware until the ACL is created. Modifying a referenced ACL causes the corresponding hardware entries to be replaced by entries that match the new command.

## Example

These commands configure **VLAN 201** to translate the destination address **168.32.14.15** to **10.24.1.10** for all packets with the source of host **168.10.1.4**.

```
switch(config) # ip access-list ACL2
switch(config-acl-ACL2) # permit ip 168.10.1.4/32 any
switch(config-acl-ACL2) # exit
switch(config) # interface vlan 201
switch(config-if-V1201) # ip nat destination static 168.32.14.15 access-list ACL2 10.24.1.10
switch(config-if-V1201) #
```

## Configuring Twice NAT

Network address translation of both source and destination addresses on the same interface (twice NAT) is enabled by creating one source NAT rule and one destination NAT rule on the same interface and associating them through a NAT group using the **ip nat source static** and **ip nat destination static** commands.

The **ip nat source static** command translates the actual local source address to a source address, which can be used outside the local network to reference the source. The **ip nat destination static** command translates an internally used destination address to the actual IP address that is the packet's destination.

The source and destination NAT rules must reference the same NAT group, and both should either specify only IP addresses or specify both IP addresses and L4 port information. An error message will be displayed if L4 port information is configured in one rule but not in the other.

Each NAT rule installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. Twice NAT does not support using access control lists to filter packets for translation.

### Example

These commands configure **interface ethernet 2** to translate the local source address **10.24.1.10** to the global source address **168.32.14.15**, and to translate the local destination address **10.68.104.3** to the global destination address **168.25.10.7** for all packets moving through the interface. The use of NAT **group 3** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3 168.25.10.7 group 3
```

### 9.3.1.1.2 Static NAT Configuration Considerations

#### Egress VLAN Filter for Static NAT

When a static source NAT is configured on an interface, the source IP translation happens only for those packets going 'out' of this interface. If a packet is egressing on an interface that does not have NAT configured, then the source IP is not translated.

When static SNAT is configured on two interfaces, the translation specified for one interface can be applied to a packet going out on the other interface.

#### Examples

- In this example, the packets with source IP **20.1.1.1** going out of **E1** will still have the source IP translated to **172.1.1.1** even though the rule is configured in **E2** and not on **E1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 171.1.1.1
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 20.1.1.1 172.1.1.1
```

- To prevent this, use an ACL to filter the traffic that needs NAT on the interfaces.

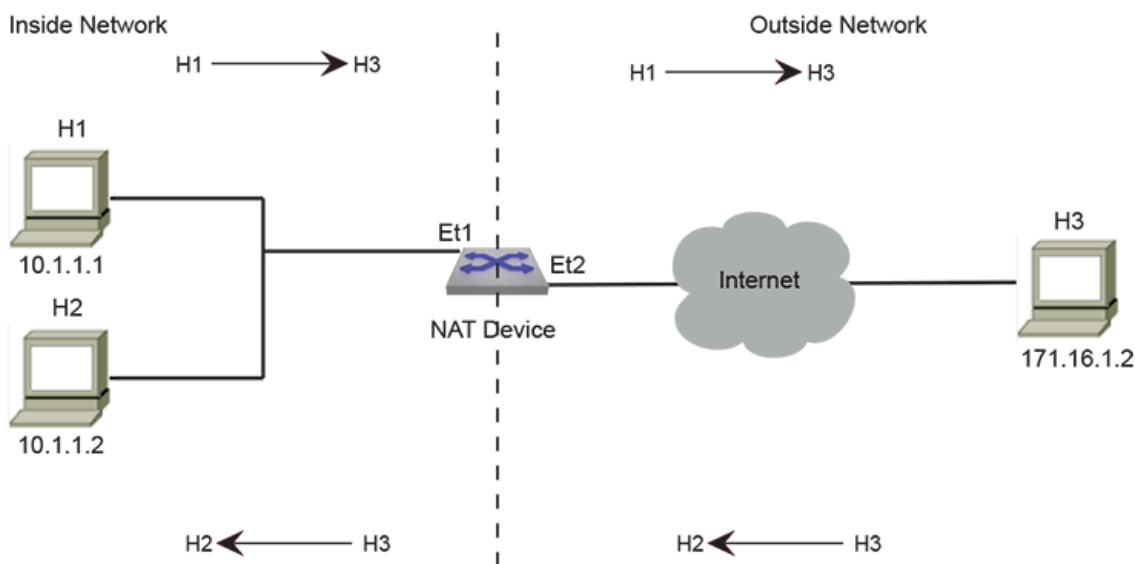

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip any 171.1.1.0/24
switch(config)# ip access-list acl2
switch(config-acl-acl2)# permit ip any 172.1.1.0/24
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source static 10.1.1.1 access-list acl1 171.1.1.1
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 20.1.1.1 access-list acl2 172.1.1.1
```

- ACL filtering is not supported when using twice NAT.

### 9.3.1.2 Dynamic NAT

Dynamic NAT offers a solution when fewer outside addresses are available than the number of internal hosts requiring external access. The process creates a dynamic entry in the NAT table when a host initiates an outbound connection. This entry establishes a one-to-one mapping between the internal private address and the available outside address. The specific outside address assigned to a host can vary and depends on the addresses available in the pool at the time of the connection request. Dynamic NAT sessions initiate only from inside networks. NAT should be configured on a Layer 3 interface, either a routed port or a Switch Virtual Interface (SVI). Dynamic NAT entries are removed from the translation table if the host doesn't communicate for a specific period. The address returns to the pool for use by another host.

**Figure 9-10: Dynamic NAT Scenario**

Dynamic NAT options:

- Many-to-Many NAT

Many-to-Many NAT maps local addresses to a global address selected from a pool of global addresses. After the pool is configured, the first available address from the pool is picked dynamically on receiving the first packet.

- Many-to-One NAT (PAT)

PAT is a form of dynamic NAT where multiple local addresses are mapped to a single global address (many-to-one) using different source ports. This method is also called NAT Overloading, Network Address Port Translation (NAPT), and Masquerade. The global address can be the IP address configured on the outside interface.

Hardware entries that translate packets are created when the CLI command is processed. Entries for forward and reverse traffic are created for unicast traffic. The hardware entry for reverse traffic is not created for multicast traffic.

Commands may include ACLs to filter packets that are cleared. Source NAT uses ACLs to filter packets based on the destination IP address, while destination NAT uses ACLs to filter packets based on the source IP address. When using NAT, inside usually refers to a private network, while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces and the flow that matches the criteria specified for translation.

The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded from dynamic pools containing the same global addresses.

Commands may include ACLs to filter packets that are cleared. Source NAT uses ACLs to filter packets based on destination IP address. Destination NAT uses ACLs to filter packets based on source IP address. When using NAT, inside usually refers to a private network, while outside usually refers to a public network.

A switch with NAT configured translates forwarded traffic between inside and outside interfaces and the flow that matches the criteria specified for translation.

**Note:** The same IP address can't be used for the NAT static configuration and in the pool for dynamic NAT configurations. Public IP addresses must be unique. The global addresses used in static translations aren't excluded from dynamic pools containing the same global addresses.

**Note:** Dynamic NAT with ACL destination port is not supported on the 7050SX3 switch.

### 9.3.1.2.1 Configuring Dynamic NAT

#### Prerequisites

- Configure an ACL to specify IP addresses for translation.
- Determine if you should use an IP address as the translated source address.
- Decide on a public IP address pool for address translation.

#### Configure the Address Pool

The addresses used for translation are configured by issuing the [ip nat pool](#) command in global configuration mode.

#### Example

This command configures the pool of addresses using start address, and end address.

```
switch(config)# ip nat pool p1 10.15.15.15 10.15.15.25
switch(config)#{
```

#### Set the IP Address

The [ip address](#) command configures **VLAN 201** with an IP address.

#### Examples

- This command configures an IPv4 address for **VLAN 201**.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip address 10.0.0.1/24
switch(config-if-Vl201)#{
```

- This command configures the dynamic NAT source address and sets the NAT overload for pool **P2**.

```
switch(config-if-Vl201)# ip nat source dynamic access-list ACL2 pool p2
switch(config-if-Vl201)#

```

## Configuring Dynamic NAT Priority

For each Dynamic NAT configuration, you can specify the priority from lowest to highest in an interface mode. The **ip nat source dynamic** command allows you to configure dynamic NAT priority from the source IP address. Multiple dynamic NAT configurations have the same priority irrespective of the order. If a priority is not specified in NAT rule, by default, the priority is **0** (lowest priority).

Service FTP dynamic NAT rules with a single IP in the pool are considered to be of the highest priority.

**Note:** Priorities in address-only and non-address-only NAT rules are independent of each other.

### Example

This command configures the dynamic NAT priority of the access-list in the pool with the order **a5 > a4 > a3 > a2 > a1 > a0**.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip address 10.0.0.1/24
switch(config-if-Vl201)# ip nat source dynamic access-list a0 pool p0
switch(config-if-Vl201)# ip nat source dynamic access-list a1 pool p1 priority 1
switch(config-if-Vl201)# ip nat source dynamic access-list a2 pool p2 priority 2
switch(config-if-Vl201)# ip nat source dynamic access-list a3 pool p3 priority 3
switch(config-if-Vl201)# ip nat source dynamic access-list a4 pool p4 priority 4
switch(config-if-Vl201)# ip nat source dynamic access-list a5 pool p5 priority 5
switch(config-if-Vl201)#

```

## Configuring Dynamic NAT with Overload

The following configures a dynamic NAT profile with overload.

### Example

This command configures the dynamic NAT for overload.

```
ip nat profile patName
 ip nat source dynamic access-list accessList1 overload
!
ip access-list accessList1
20 permit ip host 1.1.1.2 any log

```

## Define the NAT Source Address for Translation

The **ip nat source dynamic** command specifies a dynamic translation from the source IP address to the pool and to overload the pool address (or addresses).

### Example

This command configures the dynamic NAT source address and sets the pool **P2** NAT overload.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# ip nat source dynamic access-list ACL2 pool p2
switch(config-if-Et3/1)#

```

## Specify the Timeout Values

The [ip nat translation tcp-timeout](#) or [ip nat translation udp-timeout](#) commands alter the translation timeout period for NAT translation table entries.

### Examples

- This command globally sets the timeout for TCP to 600 seconds.

```
switch(config)# ip nat translation tcp-timeout 600
switch(config)#{
```

- This command globally sets the timeout for UDP to 800 seconds.

```
switch(config)# ip nat translation udp-timeout 800
switch(config)#{
```

## 9.3.1.2.2 Verify the NAT Configuration

### Display the Address Pools

The [show ip nat pool](#) command displays the configuration of the address pool.

#### Example

This command displays all the address pools configured on the switch.

```
switch# show ip nat pool
Pool StartIp EndIp Prefix
p1 10.15.15.15 10.15.15.25 24
p2 10.10.15.15 10.10.15.25 22
p3 10.12.15.15 10.12.15.25 12
switch#
```

## 9.3.1.2.3 Clearing IP NAT Table Entries

Use the [clear ip nat flow translation](#) command to remove all or the specified NAT table entries.

#### Example

This command clears all dynamic entries from the NAT table.

```
switch# clear ip nat flow translation
switch#
```

## 9.3.1.2.4 Dynamic NAT Configuration Considerations

### Configuring Dynamic NAT Using Pools in a L2 Adjacent Network

When configuring many-to-one dynamic NAT using a NAT pool, and the next hop router for the NAT device is on the same network (L2 adjacent), you must configure the IP addresses in the NAT pool as a secondary address on the interface.

#### Example:

---

The IP addresses in the NAT pool are configured as the secondary address on the interface.

```
switch(config)# ip nat pool p1 10.1.1.1 10.1.1.4 prefix-length 24
switch(config)# interface ethernet 1
switch(config-if-Et1)# ip nat source dynamic access-list a1 pool p1
switch(config-if-Et1)# ip address 10.1.1.1/24 secondary
switch(config-if-Et1)# ip address 10.1.1.2/24 secondary
switch(config-if-Et1)# ip address 10.1.1.3/24 secondary
switch(config-if-Et1)# ip address 10.1.1.4/24 secondary
```

## Configuring Dynamic NAT Using Pool in a L3 Network

If the next hop of the NAT device is on a different subnet, configure a static Null route for the IP addresses in the NAT pool. Redistribute the static route using BGP/OSPF.

### Examples

- Outside Interface

```
switch(config)# interface port-channel 319
switch(config-if-Po319)# ip nat source dynamic access-list dynamic-nat-m2m pool natpl-dynamic-
nat-m2m
switch(config)# ip access-list dynamic-nat-m2m
switch(config-acl-dynamic-nat-m2m)# 10 permit ip 192.168.93.0/24 any
switch(config)# ip nat pool natpl-dynamic-nat-m2m prefix-length 24
switch(config-natpool-p1)# range 11.3.3.2 11.3.3.10
```

- Static Null Route for Virtual IP

```
switch(config)# ip route 11.0.0.0/8 Null0
switch(config)# router ospf 1
switch(config-router-ospf)# redistribute static
```

## Configuring Dynamic NAT Using Overload with ECMP Routes

Do not configure Dynamic many-to-one NAT using overload (PAT) on interfaces that form an ECMP group. When one interface in the group goes down, the return packet for established connections will continue to go to the IP address of the interface that went down and will not be forwarded to the inside host. For this type of scenario, use Dynamic NAT with pool configurations.

### 9.3.1.2.5 Dynamic NAT Peer State Synchronization

The NAT peer state synchronization provides redundancy and resiliency for dynamic NAT across a pair of devices to avoid a single NAT device failure. Both devices in redundant pair are active and they track new sessions and create or delete NAT entries dynamically. Essentially, an active NAT entry is maintained on both devices, irrespective of who created the NAT entry.

#### Configuring Dynamic NAT Peer State Synchronization

Ensure the following prerequisites are in place before configuring NAT peer state synchronization on devices in a redundant pair.

- Both devices in redundant pairs must be reachable across an IP address within the same subnet.
- NAT version on both devices in redundant pair must be compatible.
- Dynamic NAT configuration must be identical across both devices in redundant pairs.

The following configuration output indicates a valid running configuration of the NAT peer state synchronization on one device.

```
ip nat pool POOL61 prefix-length 24
 range 170.24.0.2 170.24.0.200

ip access-list NatACL61
 10 permit ip 61.0.0.0/16 any

interface Port-Channel5
 mtu 9214
 no switchport
 ip address 10.0.0.1/31
 ip nat source dynamic access-list NatACL61 pool POOL61

ip nat synchronization
 peer-address 11.11.11.1
 local-interface Vlan1111
 port-range 1024 2048
```

The following limitations are applicable during NAT peer state synchronization.

- To prevent virtual IP address conflicts during dynamic NAT peer state synchronization, ensure the configured port ranges for each switch are disjoint, meaning they do not overlap.
- NAT peer state synchronization does not support asymmetrical TCP setup (SYN—SYNACK—ACK should always be hashed to the same peer).
- Peer state synchronization for NAT only occurs for connections in the TCP-established state.

The following command specifies the description of the device itself.

```
switch(config)# ip nat synchronization
switch(config-nat-synchronization)# description <description>
```

The following command specifies the time the switch waits before timing out existing connections.

```
switch(config)# ip nat synchronization
switch(config-nat-synchronization)# expiry-interval 6
```

The following command specifies the IP address of the peer device from where the synchronization is coming.

```
switch(config)# ip nat synchronization
switch(config-nat-synchronization)# peer address 202.1.1.2
```

This command displays details of the connections of advertised translations to peer devices.

```
switch(config)# show ip nat synchronization advertised-translations
Source IP Destination IP Translated IP TGT Type Interface/Profile

10.1.3.10:21800 191.1.1.10:80 139.1.1.1:21800 SRC DYN Port-Channel100
10.1.2.10:13750 191.1.1.10:80 139.1.1.1:13750 SRC DYN Port-Channel100
10.1.2.10:33757 191.1.1.10:80 139.1.1.1:5951 SRC DYN Port-Channel100
10.1.5.10:37111 191.1.1.10:80 139.1.1.1:7561 SRC DYN Port-Channel100
```

The following command displays the details of discovered translations advertised by the peer devices.

```
switch(config)# show ip nat synchronization discovered-translations
Source IP Destination IP Translated IP TGT Type Interface/Profile

10.1.3.10:28606 191.1.1.10:80 139.1.1.1:28606 SRC DYN Port-Channel100
10.1.6.10:39697 191.1.1.10:80 139.1.1.1:39697 SRC DYN Port-Channel100
10.1.6.10:20583 191.1.1.10:80 139.1.1.1:31683 SRC DYN Port-Channel100
```

---

```
10.1.6.10:28419 191.1.1.10:80 139.1.1.1:28419 SRC DYN Port-Channel100
```

### 9.3.1.3 Applying NAT profile on a Tunnel Interface

The following commands apply the configured NAT profile on a tunnel interface.

#### Example

This command applies the NAT configuration profile **natNameProfile** to the tunnel **Tunnel0**.

```
interface Tunnel0
 ip address 10.1.1.1/24
 tunnel source 2.1.1.1
 tunnel destination 2.1.1.2
 ip nat service-profile natNameProfile
```

### 9.3.1.4 IP NAT Commands

#### IP NAT Commands

- [clear ip nat flow translation](#)
- [ip address](#)
- [ip nat destination static](#)
- [ip nat pool](#)
- [ip nat source dynamic](#)
- [ip nat source static](#)
- [ip nat translation counters](#)
- [ip nat translation low-mark](#)
- [ip nat translation max-entries](#)
- [ip nat translation tcp-timeout](#)
- [ip nat translation udp-timeout](#)
- [show ip nat access-list interface](#)
- [show ip nat pool](#)
- [show ip nat synchronization advertised-translations](#)
- [show ip nat synchronization discovered-translations](#)
- [show ip nat synchronization peer](#)
- [show ip nat translation](#)

### 9.3.1.4.1 clear ip nat flow translation

The `clear ip nat flow translation` command clears all or the specified NAT table entries.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip nat flow translation [HOST_ADDR [DEST_ADDR]][INTF][PROT_TYPE]
```

#### Parameters

**DEST\_ADDR** must immediately follow **HOST\_ADDR**. All other parameters, including **HOST\_ADDR** may be placed in any order.

- **HOST\_ADDR** Host address to be modified. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **address local\_ipv4** IPv4 address.
  - **address local\_ipv4 local\_port** IPv4 address and port (port value ranges from 1 to 65535).
- **DEST\_ADDR** Destination address of translated packet. Destination address can be entered only when the **HOST\_ADDR** is specified. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **global\_ipv4** IPv4 address.
  - **global\_ipv4 global\_port** IPv4 address and port (port value ranges from 1 to 65535).
- **INTF** Route source. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **interface ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **interface loopback l\_num** Loopback interface specified by **l\_num**.
  - **interface management m\_num** Management interface specified by **m\_num**.
  - **interface port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **interface vlan v\_num** VLAN interface specified by **v\_num**.
- **PROT\_TYPE** Filters packets based on protocol type. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **tcp** TCP packets with specified destination address are cleared.
  - **udp** UDP packets with specified destination address are cleared.

#### Examples

- This command clears all dynamic entries from the NAT translation table.

```
switch# clear ip nat flow translation
switch#
```

- This command clears a specific NAT IP address **172.22.30.52**.

```
switch# clear ip nat flow translation address 172.22.30.52
switch#
```

- This command clears the inside entry that maps the private address **10.10.10.3** to Internet address **172.22.30.52**.

```
switch# clear ip nat flow translation address 172.22.30.52 10.10.10.3
```

---

```
switch#
```

### 9.3.1.4.2 ip address

The **ip address** command configures the IPv4 address and connected subnet on the configuration mode interface. Each interface can have one primary address and multiple secondary addresses.

The **no ip address** and **default ip address** commands remove the IPv4 address assignment from the configuration mode interface. Entering the command without specifying an address removes the primary and all secondary addresses from the interface. The primary address cannot be deleted until all secondary addresses are removed from the interface.

Removing all IPv4 address assignments from an interface disables IPv4 processing on that port.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

**ip address [ipv4\_subnet][**PRIORITY**]**

**no ip address [ipv4\_subnet][**PRIORITY**]**

**default ip address [ipv4\_subnet][**PRIORITY**]**

#### Parameters

- **ipv4\_subnet** IPv4 and subnet address (CIDR or address-mask notation). **Running-config** stores value in CIDR notation.
- **PRIORITY** interface priority. Options include:
  - **no parameter** The address is the primary IPv4 address for the interface.
  - **secondary** The address is the secondary IPv4 address for the interface.

#### Guidelines

The **ip address** command is supported on routable interfaces.

#### Example

This command configures an IPv4 address for **VLAN 200**.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# ip address 10.0.0.1/24
switch(config-if-VL200) #
```

### 9.3.1.4.3 ip nat destination static

The **ip nat destination static** command enables NAT of a specified destination address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat destination static** and **default ip nat destination static** commands disables NAT translation of the specified destination address by removing the corresponding **ip nat destination static** command from *running config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE][group group_number]
no ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat destination static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE][group group_number]
```

#### Parameters

- **ORIGINAL** Destination address to be modified. Options include:
  - **local\_ipv4** IPv4 address.
  - **local\_ipv4 local\_port** IPv4 address and port (port value ranges from 1 to 65535)
- **FILTER** Access control list that filters packets. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **access-list list\_name** List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Destination address of translated packet. Options include:
  - **global\_ipv4** IPv4 address.
  - **global\_ipv4 global\_port** IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT\_TYPE** Filters packets based on protocol type. Options include:
  - **no parameter** All packets with specified destination address are cleared.
  - **protocol tcp** TCP packets with specified destination address are cleared.
  - **protocol udp** UDP packets with specified destination address are cleared.
- **groupgroup\_number** Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.

## Examples

- These commands configure **VLAN 201** to translate destination address **10.24.1.10** to **168.32.14.15**.

```
switch(config)# interface vlan 201
switch(config-if-Vl201)# ip nat destination static 10.24.1.10 168.32.14.15
switch(config-if-Vl201)#{/pre>
```

- These commands configure **VLAN 201** to translate the source address **10.24.1.10** to **168.32.14.15** for all packets with IP destination addresses in the **168.10.1.1/32** subnet.

```
switch(config)# ip access-list ACL2
switch(config-acl-ACL2)# permit ip 168.10.1.1/32 any
switch(config-acl-ACL2)# exit
switch(config)# interface vlan 201
switch(config-if-Vl201)#
switch(config-if-Vl201)#{/pre>
```

- These commands configure **interface Ethernet 2** to translate the local source address **10.24.1.10** to the global source address **168.32.14.15**, and to translate the local destination address **10.68.104.3** to the global destination address **168.25.10.7** for all packets moving through the interface. The use of NAT **group 3** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3 168.25.10.7 group 3
switch(config-if-Et2)#{/pre>
```

---

#### 9.3.1.4.4 ip nat pool

The `ip nat pool` command identifies a pool of addresses using start address, end address, and either netmask or prefix length. If its starting IP address and ending IP address are the same, there is only one address in the address pool.

The `no ip nat pool` removes the `ip nat pool` command from *running config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip nat pool pool_name [ADDRESS_SPAN] SUBNET_SIZE
no ip nat pool pool_name
default ip nat pool pool_name
```

##### Parameters

- ***pool\_name*** Name of the IP address pool.
- ***ADDRESS\_SPAN*** Options include:
  - ***start\_addr*** The first IP address in the address pool (IPv4 addresses in dotted decimal notation).
  - ***end\_addr*** The last IP address in the address pool. (IPv4 addresses in dotted decimal notation).
- ***SUBNET\_SIZE*** This functions as a sanity check to ensure it is not a network or broadcast network. Options include:
  - ***netmask ipv4\_addr*** The netmask of the address pool's network (dotted decimal notation).
  - ***prefix-length 0 to 32*** The number of bits of the netmask (of the address pool's network) that are ones (how many bits of the address indicate network).

##### Examples

- This command configures the pool of addresses using start address, end address, and prefix length of **24**.

```
switch(config)# ip nat pool pool1 10.15.15.15 10.15.15.25 prefix-length 24
switch(config)
```

- This command removes the pool of addresses.

```
switch(config)# no ip nat pool pool1 10.15.15.15 10.15.15.25 prefix-length 24
switch(config)
```

### 9.3.1.4.5 ip nat source dynamic

The `ip nat source dynamic` command enables NAT of a specified source address for packets sent and received on the configuration mode interface. This command installs hardware translation entries for forward and reverse traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

The `no ip nat source dynamic` and `default ip nat source dynamic` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat source dynamic` command from *running config*.

**Note:** Ethernet and Port-channel interfaces should be configured as routed ports.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip nat source dynamic access-list acl_name POOL_TYPE
no ip nat source dynamic access-list acl_name
default ip nat source dynamic access-list acl_name
```

#### Parameters

- ***acl\_name*** Access control list that controls the internal network addresses eligible for NAT.
- **POOL\_TYPE** Options include:
  - **overload** Translates multiple local addresses to a single global address. When overloading is enabled, conversations using the same IP address are distinguished by their TCP or UDP port number.
  - **pool *pool\_name*** The name of the IP address pool. The pool is defined using the [ip nat pool](#) command.

The pool option is required even if the pool has just one address. NAT uses that one address for all of the translations.
- **pool\_fullcone** Enables full cone NAT where all requests from the same internal IP address and port are mapped to the same external IP address and port.

#### Examples

- This command configures the dynamic NAT source address and sets the NAT overload for pool **P2**.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# ip nat source dynamic access-list ACL2 pool p2
switch(config-if-Et3/1)#

```

- This command disables the NAT source translation on interface Ethernet **3/1**.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# no ip nat source dynamic access-list ACL2
switch(config-if-Et3/1)#

```

### 9.3.1.4.6 ip nat source static

The **ip nat source static** command enables NAT of a specified source address for the configuration mode interface. This command installs hardware translation entries for forward and reverse unicast traffic. When the rule specifies a multicast group, the command does not install the reverse path in hardware. The command may include an access control list to filter packets for translation.

When configuring twice NAT, an arbitrary NAT group number is used to associate the source NAT and destination NAT rules. This number must be the same in both rules.

The **no ip nat source static** and **default ip nat source static** commands disables NAT translation of the specified source address by removing the corresponding **ip nat source** command from **running\_config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
no ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
default ip nat source static ORIGINAL [FILTER] TRANSLATED [PROT_TYPE] [group group_number]
```

#### Parameters

- **ORIGINAL** Source address to be modified. Options include:
  - **original\_ipv4** IPv4 address.
  - **original\_ipv4 original\_port** IPv4 address and port (port value ranges from 1 to 65535).
- **FILTER** Access control list that filters packets. Options include:
  - **no parameter** All packets with specified source address are cleared.
  - **access-list list\_name** List that specifies the packets that are cleared. Not supported when configuring twice NAT.
- **TRANSLATED** Source address of translated packet. Options include:
  - **translated\_ipv4** IPv4 address.
  - **translated\_ipv4 translated\_port** IPv4 address and port (port value ranges from 1 to 65535). When configuring twice NAT, source and destination NAT rules must either both specify a port translation or both not specify a port translation.
- **PROT\_TYPE** Filters packets based on protocol type. Options include:
  - **no parameter** All packets with specified source address are cleared.
  - **protocol tcp** TCP packets with specified source address are cleared.
  - **protocol udp** UDP packets with specified source address are cleared.
- **group group\_number** Used only when configuring twice NAT, the NAT group number associates a source NAT rule with a destination NAT rule on the same interface. The group number (values range from 1 to 255) is arbitrary, but must be the same in both rules.

#### Restrictions

- If **ORIGINAL** includes a port, **TRANSLATED** must also include a port.
- If **ORIGINAL** does not include a port, **TRANSLATED** cannot include a port.

### Examples

- These commands configure **VLAN 101** to translate source address **10.24.1.10** to **168.32.14.15**.

```
switch(config)# interface vlan 101
switch(config-if-Vl101)# ip nat source static 10.24.1.10 168.32.14.15
switch(config-if-Vl101)#{/pre}

```

- These commands configure **VLAN 101** to translate the source address **10.24.1.10** to access-list **ACL1** **168.32.14.15** for all packets with IP destination addresses in the **168.10.1.1/32** subnet.

```
switch(config)# ip access-list ACL1
switch(config-acl-ACL1)# permit ip any 168.10.1.1/24
switch(config-acl-ACL1)# exit
switch(config)# interface vlan 101
switch(config-if-Vl101)# ip nat source static 10.24.1.10 access-list ACL1
168.32.14.15
switch(config-if-Vl101)#{/pre}

```

- These commands configure Ethernet interface **2** to translate the local source address **10.24.1.10** to the global source address **168.32.14.15**, and to translate the local destination address **10.68.104.3** to the global destination address **168.25.10.7** for all packets moving through the interface. The use of NAT **group 3** is arbitrary, but must be the same in both rules.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# ip nat source static 10.24.1.10 168.32.14.15 group 3
switch(config-if-Et2)# ip nat destination static 10.68.104.3 168.25.10.7 group 3
switch(config-if-Et2)#{/pre}

```

### 9.3.1.4.7 ip nat translation counters

The **ip nat translation counters** command enables the feature to count packets that are translated by static and twice NAT rules in hardware. Once this feature is enabled, all current rules in hardware and new rules that are configured after running this command receive policers for counting packets.

The **no ip nat translation counters** and **default ip nat translation counters** commands disable the packet counter feature for static and twice NAT connections.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip nat translation counters
no ip nat translation counters
default ip nat translation counters
```

#### Guidelines

The **ip nat translation counters** command is supported on the DCS-7150 series switches only. This command is solely intended to debug static and twice NAT translation failures in hardware. Disable this feature after completing troubleshooting. If this feature remains enabled even when the count of static connections exceed **275**, it can cause unpredictable behavior including restart of FocalPointV2 agent. The restart of FocalPointV2 agent results in traffic disruption.

#### Example

The **ip nat translation counters** command enables the packet counter feature for static and twice NAT connections. Using the **show ip nat translation hardware detail** and the **show ip nat translation twice hardware detail** commands, you can verify the packet count.

```
switch(config)# ip nat translation counters
switch(config)# show ip nat translation hardware detail
Source IP Destination IP Translated IP TGT Type Intf Proto Packets Packets Reply

192.168.10.2:0 - 20.1.10.2:0 SRC STAT V12640 - 2 1
192.168.110.2:0 - 20.1.110.2:0 SRC STAT V12640 - 2 1

switch(config)# show ip nat translation twice hardware detail
Source IP Destination IP Translated Translated Intf Group Packets Packets
 Src IP Dst IP Src IP Dst IP Proto Reply

192.16.50.2:0 10.1.50.2:0 20.1.50.2:0 10.1.60.2:0 V12922 2 - 2 1
19.16.150.2:0 10.1.150.2:0 20.1.150.2:0 10.1.160.2:0 V12922 12 - 2 1
```

### 9.3.1.4.8 ip nat translation low-mark

The **ip nat translation low-mark** command configures the minimum threshold that triggers the resumption of programming new NAT translation connections.

The **ip nat translation max-entries** command specifies the maximum number of NAT translation connections that can be stored. When this limit is reached, new connections are dropped instead of being programmed in hardware or software. At this point no new connections will be programmed until the number of stored entries drop below the configured low-mark, expressed as a percentage of the max-entries value. The default low mark value is 90%.

The **no ip nat translation low-mark** and **default ip nat translation low-mark** commands restores the default low-mark value by removing the **ip nat translation low-mark** command from **running\_config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip nat translation low-mark threshold
no ip nat translation low-mark
default ip nat translation low-mark
```

#### Parameter

**threshold** Percentage of maximum connection entries. Value ranges from 1 to 99. Default is 90.

#### Example

This command globally sets the translation low mark of **93%**.

```
switch(config)# ip nat translation low-mark 93
switch(config) #
```

---

#### 9.3.1.4.9 ip nat translation max-entries

The **ip nat translation max-entries** command specifies maximum number of NAT translation connections. After this threshold is reached, new connections are dropped until the number of programmed connections is reduced below the level specified by the **ip nat translation low-mark** command.

The **no ip nat translation max-entries** and **default ip nat translation max-entries** commands removes the maximum connection limit and resets the parameter value to zero by removing the **ip nat translation max-entries** command from **running config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip nat translation max-entries connections
no ip nat translation max-entries
default ip nat translation max-entries
```

#### Parameters

**connections** The maximum number of NAT translation connections. Value ranges from 0 to 4294967295. Default value is 0, which removes the connection limit.

#### Example

This command limits the number of NAT translation connections the switch can store to **3000**.

```
switch(config)# ip nat translation max-entries 3000
switch(config)#End
```

### 9.3.1.4.10 ip nat translation tcp-timeout

The `ip nat translation tcp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval during which the switch will attempt to reuse an existing TCP translation for devices specified by table entries.

The `no ip nat translation tcp-timeout` and `default ip nat translation tcp-timeout` commands reset the timeout to its default by removing the corresponding `ip nat translation tcp-timeout` command from *running config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip nat translation tcp-timeout period
no ip nat translation tcp-timeout
default ip nat translation tcp-timeout
```

#### Parameter

***period*** Time-out period in seconds for port translations. Value ranges from 0 to **4294967295**. Default value is **86400** (24 hours).

#### Examples

- This command sets the TCP timeout for translations to **600** seconds.

```
switch(config)# ip nat translation tcp-timeout 600
switch(config)#
```

- This command removes the TCP translation timeout.

```
switch(config)# no ip nat translation tcp-timeout
switch(config)#
```

---

#### 9.3.1.4.11 ip nat translation udp-timeout

The `ip nat translation udp-timeout` command specifies the translation timeout period for translation table entries. The timeout period specifies the interval the switch attempts to establish a UDP connection with devices specified by table entries.

The `no ip nat translation udp-timeout` and `default ip nat translation udp-timeout` commands disables NAT translation of the specified destination address by removing the corresponding `ip nat translation udp-timeout` command from *running config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip nat translation udp-timeout period
no ip nat translation udp-timeout
default ip nat translation udp-timeout
```

#### Parameter

***period*** Value ranges from 0 to 4294967295. Default value is 300 (5 minutes).

#### Examples

- This command globally sets the timeout for UDP to 800 seconds.

```
switch(config)# ip nat translation udp-timeout 800
```

- This command removes the timeout for UDP.

```
switch(config)# no ip nat translation udp-timeout
```

### 9.3.1.4.12 show ip nat access-list interface

The **show ip nat acl interface** command displays the access control lists (ACLs) that are configured as source NAT or destination NAT filters. The display indicates ACL rules that do not comply with these NAT requirements:

- Source IP address is any.
- Destination IP address may use any mask size.
- Source port matching is not allowed.
- Protocol matching is not allowed.

#### Command Mode

EXEC

#### Command Syntax

```
show ip nat access-list interface [INTF][LISTS]
```

#### Parameters

- **INTF** Filters NAT statements by interface. Options include:
  - **no parameter** Includes all statements on all interfaces.
  - **interface ethernet e\_num** Statements on specified Ethernet interface.
  - **interface loopback l\_num** Statements on specified Loopback interface.
  - **interface management m\_num** Statements on specified Management interface.
  - **interface port-channel p\_num** Statements on specified Port-Channel Interface.
  - **interface vlan v\_num** Statements on specified VLAN interface.
  - **interface VXLAN vx\_num** Statements on specified VXLAN interface.
- **LISTS** ACLs displayed by command. Options include:
  - **no parameter** All ACLs.
  - **acl\_name** Specifies individual ACL.

#### Example

These commands display the NAT command usage of the ACL1 and ACL2 access control lists.

```
switch> show ip nat acl ACL1
acl ACL1
 (0.0.0.0/0, 168.10.1.1/32)
Interfaces using this ACL for Nat:
 Vlan100

switch> show ip nat acl ACL2
acl ACL2
 (168.10.1.1/32, 0.0.0.0/0)
Interfaces using this ACL for Nat:
 Vlan201 switch>
```

---

#### 9.3.1.4.13 show ip nat pool

The `show ip nat pool` command displays the configuration of the address pool.

##### Command Mode

EXEC

##### Command Syntax

```
show ip nat pool POOL_SET
```

##### Parameters

- **pool\_name** The name of the pool.
- **POOL\_SET** Options include:
  - **no parameter** All configured port channels.
  - **pool\_name** The name of the pool.

##### Examples

- This command displays all the address pools configured on the switch.

```
switch# show ip nat pool
Pool StartIp EndIp Prefix
p1 10.15.15.15 10.15.15.25 24
p2 10.10.15.15 10.10.15.25 22
p3 10.12.15.15 10.12.15.25 12 switch#
```

- These commands display specific information for the address pools configured on the switch.

```
switch# show ip nat pool p1
Pool StartIp EndIp Prefix
p1 4.1.1.1 4.1.1.2 24
 1.1.1.1 1.1.1.2 24
 3.1.1.1 3.1.1.2 24
switch# show ip nat pool p2
Pool StartIp EndIp Prefix
p2 10.1.1.1 10.1.1.2 16 switch#
```

#### 9.3.1.4.14 show ip nat synchronization advertised-translations

The **show ip nat synchronization advertised-translations** command displays the detailed status of devices that are advertised to a peer device.

##### Command Mode

EXEC

##### Command Syntax

```
show ip nat synchronization advertised-translations
```

##### Example

This command displays details of devices that are advertised to a peer device.

```
switch# show ip nat synchronization advertised-translations
```

| Source IP       | Destination IP | Translated IP         | TGT | Type | Intf |
|-----------------|----------------|-----------------------|-----|------|------|
| 61.0.0.15:6661  | 100.0.0.2:80   | 192.170.230.171:6661  | SRC | DYN  | Et5  |
| 61.0.0.41:2245  | 100.0.0.2:80   | 192.170.230.170:2245  | SRC | DYN  | Et5  |
| 61.0.0.48:22626 | 100.0.0.2:80   | 192.170.230.169:22626 | SRC | DYN  | Et5  |
| 61.0.0.41:22601 | 100.0.0.2:80   | 192.170.230.170:22601 | SRC | DYN  | Et5  |
| 61.0.0.41:16798 | 100.0.0.2:80   | 192.170.230.170:16798 | SRC | DYN  | Et5  |
| 61.0.0.18:22605 | 100.0.0.2:80   | 192.170.230.177:22605 | SRC | DYN  | Et5  |
| 61.0.0.16:2256  | 100.0.0.2:80   | 192.170.230.166:2256  | SRC | DYN  | Et5  |

---

#### 9.3.1.4.15 show ip nat synchronization discovered-translations

The **show ip nat synchronization discovered-translations** command displays details of what has been advertised from a peer device.

##### Command Mode

EXEC

##### Command Syntax

```
show ip nat synchronization discovered-translations
```

##### Example

This command displays details of devices that are advertised to a peer device.

```
switch# show ip nat synchronization discovered-translations
```

| Source IP     | Destination IP | Translated IP     | TGT | Type | Intf |
|---------------|----------------|-------------------|-----|------|------|
| 61.0.2.229:63 | 100.0.0.2:63   | 170.24.86.180:63  | SRC | DYN  | Et5  |
| 61.0.15.51:63 | 100.0.0.2:63   | 170.24.73.90:63   | SRC | DYN  | Et5  |
| 61.0.6.68:63  | 100.0.0.2:63   | 170.24.110.128:63 | SRC | DYN  | Et5  |
| 61.0.7.163:63 | 100.0.0.2:63   | 170.24.104.35:63  | SRC | DYN  | Et5  |

### 9.3.1.4.16 show ip nat synchronization peer

The **show ip nat synchronization peer** command displays the detailed status of a peer device.

#### Command Mode

EXEC

#### Command Syntax

```
show ip nat synchronization peer
```

#### Example

This command displays details of a peer device with an IP address of **11.11.11.0** and interface **VLAN 1111** that is used to connect to the peer device.

```
switch# show ip nat synchronization peer
Description : Value
Peer : 11.11.11.0
Connection Port : 4532
Connection Source : 0.0.0.0
Kernel Interface : vlan1111
Local Interface : Vlan1111
Established Time : 1969-12-31 16:00:00
Connection Attempts : 0
Oldest Supported Version : 1
Newest Supported Version : 1
Version Compatible : True
Connection State : connected
Shutdown State : False
Status Mount State : mountMounted
Version Mount State : mountMounted
Recover Mount State : mountMounted
Reboot Mount State : mountMounted
```

### 9.3.1.4.17 show ip nat translation

The `show ip nat translation` command displays configured NAT statements in the switch hardware.

#### Command Mode

EXEC

#### Command Syntax

```
show ip nat translation [address | address-only | destination | detail | dynamic | hardware | interface | kernel | max-entries | source | static | summary | twice]
```

The command position of all parameters are interchangeable.

#### Parameters

- **no parameter** Displays all NAT connections installed in software.
- **address *ipv4\_addr*** Displays NAT connections of the specified IPv4 host address.
- **address-only *ipv4\_addr*** Displays address-only NAT connections of the specified IPv4 host address.
- **destination** Displays destination NAT connections installed in software.
- **detail** Displays detailed output of all NAT connections.
- **dynamic** Displays dynamic NAT connections.
- **hardware** Displays NAT connections installed in hardware.
- **interface** Filters NAT connections by interface. Options include:
  - **interface ethernet *e\_num*** Displays NAT connections of the specified ethernet interface.
  - **interface port-channel *p\_num*** Displays NAT connections of the specified port-channel interface.
  - **interface vlan *v\_num*** Displays NAT connections of the specified VLAN interface.
- **kernel** Displays NAT connections installed in kernel.
- **max-entries** Displays the configured NAT connection limits of a hardware.
- **source** Displays source NAT connections installed in software.
- **static** Displays static NAT connections.
- **summary** Displays summary of all NAT connections.
- **twice** Displays twice NAT connections.

#### Examples

- This command displays all configured NAT translations.

```
switch> show ip nat translation
Source IP Destination IP Translated IP TGT Type Intf

192.168.1.10:62822 172.22.22.40:53 172.17.254.161:62822 SRC DYN V13925
192.152.1.10:20342 172.22.22.40:80 172.17.254.161:22222 SRC STAT V13945 switch#
```

- This command displays NAT connections of the specified ethernet interface.

```
switch> show ip nat translation dynamic interface Ethernet 26
Source IP Destination IP Translated IP TGT Type Intf

192.168.1.2:8080 10.1.1.5:600 20.1.1.5:8080 SRC DYN Et26
```

- This command displays the configured NAT connection limits of a hardware.

```
switch> show ip nat translation max-entries
Global connection limit 100
```

| Global connection limit low mark | 90 (90%)    |          |             |
|----------------------------------|-------------|----------|-------------|
| Hosts connection limit           | 20          |          |             |
| Hosts connection limit low mark  | 18 (90%)    |          |             |
| Total number of connections      | 1           |          |             |
| Host                             | Max-Entries | Low-Mark | Connections |
| 10.1.1.1                         | 10          | 9 (90%)  | 0           |

---

## 9.3.2 Media Access Control Security

This section explains the basic concepts of Media Access Control Security (MACsec) including overview, configuration, and the different MACsec commands used.

- [MACsec Overview](#)
- [Configuring MACsec](#)
- [Displaying MACsec Information](#)
- [MACsec Key Retirement Immediate](#)
- [MACsec EAP-FAST Support](#)
- [MACsec Proxy For VXLAN](#)
- [MACsec Fallback to Unprotected Traffic](#)
- [MACsec Commands](#)

### 9.3.2.1 MACsec Overview

Media Access Control Security (MACsec) is an industry-standard encryption mechanism that protects all traffic flowing on Ethernet links. MACsec is based on IEEE 802.1X and IEEE 802.1AE standards.

The major benefits of MACsec include the following:

- MACsec supports packet authentication by providing integrity checking so that packet data cannot be altered during a packet flow.
- MACsec provides secure encryption at the Layer 2 level by ensuring complete data confidentiality.
- Integrating a high-density MACsec solution for Cloud Data Centers using the 7500R switch for the highest density and performance in a modular platform.
- Optimizing the cost and performance of the Data Center Interconnect to transport massive traffic volumes through metro or long haul networks.
- Securing data transport over distance with MACsec encryption, eliminating additional intermediate devices.

#### 9.3.2.1.1 MACsec Terminology

**MACsec Key Agreement Protocol (MKA)** - provides the key agreement protocol for discovering MACsec peers and negotiating keys between MACsec peers (IEEE 802.1X-REV).

**Connectivity Association (CA)** - allows a security relationship between MACsec-capable devices (endpoints). Endpoints in the same CA share a Connectivity Association Key (CAK). The Arista implementation supports 2 endpoints.

**Connectivity Association Key (CAK)** - contains a master key used to generate all other keys that are used for MACsec. Endpoints in the same secure Connectivity Association (CA) share a CAK. This key can either be a static pre-shared key or dynamically derived using 802.1X authentication.

**Primary Key** - contains the CAK for the MKA session in progress. The Primary key consists of a combination of the key name and the actual key. For example, when a configuration uses **0abcd1 0 1234abcd** as a primary key, **0abcd1** is the hex key name, while **1234abcd** is the actual key.

**Note:** A key name must be in hex format. The operator **0** means the entered key is unencrypted (or unhashed), versus **7** meaning the hashed version of the entered key in cases where the configuration replays on the switch.

**Fallback Key**- When the configured primary key does not establish a connection, the fallback key establishes the session to ensure no traffic loss.

**Secure Association Key (SAK)** - derived from the CAK and used by the network device ports to encrypt traffic for a given session.

**Key Server** - One of the MACsec peers in the CA becomes the Key Server. The Key Server creates and distributes SAKs and uses them for data encryption.

**Static Secure Association Key (SAK)** - a SAK configured directly on a switch and used with unidirectional links when the MKA protocol is not feasible. Static SAKs require using eXtended Packet Numbering (XPN) cipher suites.

#### 9.3.2.1.2 MACsec Limitations

The following are the limitations of MACsec:

- EOS supports MACsec only on point-to-point links unless static SAK is enabled.
- When enabling MACsec on an interface for the first time, interface flapping occurs until MACsec takes effect.
- A port configured with MACsec and without a statically configured SAK will remain blocked, preventing data forwarding until the MKA protocol successfully negotiates encryption keys.

#### 9.3.2.1.3 MACsec Licensing

MACsec encryption is an EOS-licensed feature that requires a valid MACsec license on a switch. MACsec licenses are based on a switch's serial number and the licensee. Every switch running MACsec requires a separate license.

Use one of the following methods to configure a MACsec license:

1. Use the command **license licensee\_name license\_value** in MACsec mode. The license value is an 8-digit hexadecimal number. This method of license configuration supports backward compatibility.
2. Use the command **license import license\_file\_path** in Global configuration mode. All new licenses generated on the license portal are JSON-based.

Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

#### 9.3.2.1.4 MACsec in FIPS mode

Federal Information Processing Standards (FIPS) are a set of standards defined by the United States federal government related to data processing in computer systems by non-military government agencies and government contractors. These standards define specific requirements for various purposes, such as ensuring computer security and interoperability within and across the computer networking industry.

Arista devices are compliant with FIPS 140. The FIPS 140 enforces the use of a "FIPS Crypto Module." This implementation ensures that the algorithms are correct and restricts the set of allowed algorithms to those approved by the FIPS standard. These are the FIPS-supported algorithms AES-128/256, SHA-256/512, RSA

---

with 2048 bit keys, a subset of Elliptic Curve Digital Signature Algorithm (ECDSA). MACsec has both the AES-128-GCM and AES-256-GCM algorithms certified for the data plane. The FIPS mode is enabled using the **fips restrictions** command, which, when enabled, filters out any unapproved algorithms and warns you if you try to set them.

#### 9.3.2.1.5 VLAN Tagged MACsec

Media Access Control Security (MACsec) is configured on subinterfaces using the **mac security profile** command. Since subinterfaces are logical interfaces that send and receive VLAN tagged traffic, encryption/decryption is applied per VLAN tag.

#### 9.3.2.1.6 MACsec Using Static Secure Association Key

MAC security uses the MACsec Key Agreement (MKA) protocol to negotiate between peers using keys (CAKs and CKNs) which are either pre-shared or derived from an 802.1X session and derives a Secure Association Key (SAK) based on the MKA negotiation. This SAK is then programmed in hardware and used for encrypting and decrypting data traffic. In cases where MKA negotiation is not feasible but encryption and decryption of traffic is required (such as unidirectional links), MACsec can instead be configured to use static Secure Association Keys (SAK) configured separately on transmitting and receiving peers. Each peer can have up to four receiving secure keys and one transmitting key.

### 9.3.2.2 Configuring MACsec

These sections describe basic MACsec configuration steps:

- [Enabling MACsec](#)
- [Configuring MACsec for MKA](#)
- [Configuring the FIPS mode](#)
- [Configuring the Layer 2 Protocol Processing Mode](#)
- [Configuring MACsec Profile on a Subinterface](#)
- [Configuring MACsec Using Static SAK](#)
- [Configuring MACsec Proxy For VXLAN](#)
- [Configuring MAC Security Dynamic Key Derivation](#)
- [Configuring MACsec Fallback to Unprotected Traffic](#)

#### 9.3.2.2.1 Enabling MACsec

Use the **mac security** command to enable MACsec and enter the MAC Security Configuration Mode, followed by the **profile** command to create a profile and enter the MAC Security Profile Configuration Mode.

The following commands are available for detailed configuration:

- [cipher](#)
- [key \(MACsec\)](#)
- [l2-protocol](#)
- [mka key-server](#)
- [mka session](#)
- [replay](#)
- [sci](#)
- [traffic unprotected allow](#)

## Example

These commands enable MACsec and enter MAC Security Configuration Mode, then create a profile named "MACsec\_test" and enter MAC Security Profile Configuration Mode.

```
switch(config) # mac security
switch(config-mac-security) # profile MACsec_test
switch(config-mac-security-profile-MACsec_test) #
```

### 9.3.2.2.2 Configuring MACsec for MKA

By default, MAC security (MACsec) uses the MACsec Key Agreement (MKA) protocol to negotiate and exchange encryption keys among peers. To complete a typical MACsec configuration:

1. Use the [cipher](#) command to select a valid encryption standard.
2. Use the [key \(MACsec\)](#) command to enter a Connectivity Association Key (CAK).
3. Use the **fallback** option to add a fallback CAK if the primary CAK fails.

The key server is responsible for generating and distributing encryption keys. Run the [mka key-server priority](#) command on a peer to change its priority. The peer with the lowest priority is elected as the key server. If multiple peers have the same priority, the system chooses the peer with the lowest MAC address. Priority values range from 0 to 255; the default priority is 16.

Configure the refresh period for the Secure Association Key (SAK) using the [mka session rekey-period](#) command. MACsec uses an SAK to encrypt data traffic and derives this SAK from the CAK. The rekey-period values range from **30** to **100000** seconds. The system does not enforce a session rekey period by default and does not refresh the SAK periodically.

To improve the randomness of the numbers used to generate MACsec's cryptographic keys, add a source of entropy with the [entropy source](#) command in the Management Security Configuration Mode.

## Examples

These commands configure MACsec to use the AES256-GCM-XPN cipher and add a key and a fallback key. For MKA with a pre-shared key configuration, keys of any length are allowed to work. However, for a 256-bit cipher, use keys with 64 hexadecimal digits in length.

```
switch(config-mac-security-profile-test) # cipher aes256-gcm-xpn
switch(config-mac-security-profile-test) # key 0abc12340def56780abc12340def5678 7 06070E234E4D0
A48544540585F507E
switch(config-mac-security-profile-test) # key 0def56780abc12340def56780abc1234 7 09484A0C1C031
1475E5A527D7C7C70 fallback
```

These commands give the switch a key-server priority of 10, and an MKA session rekey period of 600 seconds.

```
switch(config-mac-security-profile-test) # mka key-server priority 10
switch(config-mac-security-profile-test) # mka session rekey-period 600
```

These commands add an entropy source for more random cryptographic keys.

```
switch(config-mac-security-profile-test) # management security
switch(config-mgmt-security) # entropy source hardware
```

These commands apply the "test" profile to Ethernet interface 5/3/1.

```
switch(config-mgmt-security) # interface ethernet 5/3/1
switch(config-if-Et5/3/1) # mac security profile test
```

```
switch(config-if-Et5/3/1) #
```

### 9.3.2.2.3 Configuring the FIPS mode

To configure the FIPS mode on the MACsec protocol, use the **FIPS** command.

#### Example

This command configures the FIPS mode on the MACsec protocol.

```
switch(config)# mac security
switch(config-mac-security) fips restrictions
```

### 9.3.2.2.4 Configuring the Layer 2 Protocol Processing Mode

To configure the Layer 2 (L2) Protocol Processing mode on the MACsec protocol, use the [12-protocol](#) command.

#### Example

Use this command to configure the L2 Protocol Processing mode to bypass encryption and send traffic without protection.

```
switch(config)# mac security
switch(config-mac-security) 12-protocol ethernet-flow-control bypass
```

### 9.3.2.2.5 Configuring MACsec Profile on a Subinterface

Use the following commands to configure a MACsec profile on a subinterface.

#### Example

- The following example enables MAC security on a subinterface with a predefined MACsec profile **test-profile**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# interface ethernet1.10
switch(config-if-Et1.10)# encapsulation dot1q vlan 20
switch(config-if-Et1.10)# mac security profile test-profile
```

### 9.3.2.2.6 Configuring MACsec Using Static SAK

Static SAK is configured separately for receive (Rx) and transmit (Tx) directions. In the Rx direction, multiple SAKs can be configured. For the Tx direction, only one SAK is allowed at a time. An SAK configured for Rx on the local peer should match the SAK configured for Tx on the connected peer and vice versa. Configure the Rx direction first on all the MACsec peers, then configure the Tx direction. Use the **cipher** command to select a cipher suite. You must choose an eXtended Packet Number (XPN) cipher suite, such as AES128-GCM-XPN or AES256-GCM-XPN. Static SAK will not work with a non-XPN cipher.

#### Examples

- These commands select the AES256-GCM-XPN cipher suite for the MACsec profile ***rx\_test*** on the receiving peer (Rx).

```
switch(config)# mac security
switch(config-mac-security)# profile rx_test
switch(config-mac-security-profile-rx_test)# cipher aes128gcm-xpn
switch(config-mac-security-profile-rx_test)#{
```

- This command configures the key source as static SAK.

```
switch(config-mac-security-profile-rx_test)# key source sak static
switch(config-mac-security-profile-rx_test-sak-static)#{
```

- These commands configure a secure channel identifier (SCI) on the receiving peer. The SCI is a MAC address with six hexadecimal octets and a decimal port number.

```
switch(config-mac-security-profile-rx_test-sak-static)#{ secure channel rx
switch(config-mac-security-profile-rx_test-sak-static-rx)# identifier 01:02:03:04:05:06::1234
switch(config-mac-security-profile-rx_test-sak-static-rx)#{
```

- This command configures an SAK and assigns it an association number (AN) of **0**.

```
switch(config-mac-security-profile-rx_test-sak-static-rx)#{ an 0 key 0 1111222233334
4445555666677778888
switch(config-mac-security-profile-rx_test-sak-static-rx)#{
```

- This command configures another SAK and its association number. Up to four associations can be configured.

```
switch(config-mac-security-profile-rx_test-sak-static-rx)#{ an 1 key 0 9999aaaabbbbc
ccccdddeeeeffff0000
switch(config-mac-security-profile-rx_test-sak-static-rx)#{
```

- These commands configure the secure channel on a transmitting peer using the profile ***tx\_test***. Only one SAK can be configured per transmitting peer. This will encrypt traffic in the Tx direction, so the receiving peer must be configured with a matching SAK to decrypt this traffic.

```
switch(config-mac-security-profile-tx_test-sak-static)#{ secure channel tx
switch(config-mac-security-profile-tx_test-sak-static-tx)#{ identifier 01:02:03:04:05:07::1235
switch(config-mac-security-profile-tx_test-sak-static-tx)#{ an 0 key 0 2222333344445
5556666777788889999
switch(config-mac-security-profile-tx_test-sak-static-tx)#{
```

### 9.3.2.2.7 Configuring MACsec Proxy For VXLAN

The switch platforms that use this feature are:

- 7280SRAM-48C6
- 7280CR2M-30
- 7500R2M-36CQ-LC

The mandatory steps to configure a MACsec proxy sub-interface on an Arista switch are:

1. Configure the parent interface to be a routed port.
2. Create a L3 sub-interface on the parent interface. This is the MACsec proxy sub-interface.
3. Create a L2 sub-interface on the parent interface. This is the MACsec patch sub-interface.
4. Configure and enable the MACsec proxy port on a sub-interface.

- 
5. Configure the VXLAN tunnel.
  6. Assign the forwarding VLAN ID for the MACsec patch sub-interface and VXLAN tunnel.

#### **Example Configurations**

- a. Configure a **100g** MACsec interface as a routed port.

```
switch(config)# interface et49/1
switch(config-if-Et49/1)# no switchport
```

- b. Create a new L3 sub-interface - **et49/1.1**.

```
switch(config-if-Et49/1)# interface et49/1.1
```

- c. Create a new L2 sub-interface - **et49/1.2**.

```
switch(config-if-Et49/1)# interface et49/1.2
```

- d. Configure the MACsec proxy port, and enable MACsec on the proxy port.

```
switch(config)# interface et49/1.1
switch(config-if-Et49/1.1)# mac security proxy patch Ethernet49/1.2
switch(config-if-Et49/1.1)# mac security profile test1
switch(config-if-Et49/1.1)# ip address 2.2.2.1/24
```

- e. Configure the VXLAN tunnel. The remote VTEP is provided as the flood VTEP.

```
switch(config)# interface VXLAN 1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 4789
switch(config-if-Vx1)# VXLAN vlan 20 vni 20
switch(config-if-Vx1)# VXLAN vlan 20 flood vtep 100.100.100.2
```

- f. Configure the L2 MACsec patch interface to be in the same VLAN as VXLAN.

```
switch(config)# interface et49/1.2
switch(config-if-Et49/1.2)# vlan id 20
```

### **9.3.2.2.8 Configuring MAC Security Dynamic Key Derivation**

#### **9.3.2.2.8.1 802.1X Authenticator Configuration**

A new option is added to the 802.1X authenticator configuration to make the authenticator stronger for unreliable authentication servers. By default, when an authentication server is unreachable, the authenticator blocks all traffic on the port and keeps the port as Unauthorized until it gets replies from the authentication server. The following option changes the behavior and maintains the port in its current state if the authentication server is not reachable:

#### **Example**

```
switch(config-if-Et1)# dot1x timeout reauth-timeout-ignore always
```

### 9.3.2.2.8.2 802.1X Supplicant Configuration

The 802.1X supplicant configurations are done through MACsec profiles. The MACsec profile contains all the credentials necessary for 802.1X authentication to succeed.

Perform the following steps to configure an 802.1X supplicant profile:

1. Use **dot1x** command to enter the dot1x mode to configure a supplicant profile.

```
switch(config)# dot1x
switch(config-dot1x) #
```

2. Use **supplicant profile** command to configure a 802.1X supplicant profile.

```
switch(config)# supplicant profile <profileName>
```

3. The following mandatory commands must be configured for a supplicant profile to be operational:

- a. Configure the Extensible Authentication Protocol (EAP) method for the profile. The only method supported by Arista supplicants is EAP-FAST.

```
switch(config-dot1x-supp-profile-test)# eap-method fast
```

- b. Configure EAP Identity which is used to authenticate the supplicant with the Radius server:

```
switch(config-dot1x-supp-profile-test)# identity <user-identity>
```

- c. Configure EAP pass-phrase the password used to authenticate the supplicant with the Radius server:

```
switch(config-dot1x-supp-profile-test)# passphrase <options>
```

#### Example

This is an sample 802.1X supplicant profile:

```
switch(config-dot1x-supp-profile-test)# show active
dot1x
 supplicant profile test
 identity arista
 passphrase 7 070E334D5D1D0B04
```

Apply the supplicant profile by enabling it on the Mac Security interface:

```
switch(config-if-Et6/1)# dot1x pae supplicant test
```

#### Mac Security

Mac Security configuration remains the same as described in the configuration guide, but there is one important difference. Instead of configuring manual keys, configure the Mac security profile to use dynamic keys:

```
switch(config-mac-security-profile-test)# key source dot1x
```

### 9.3.2.2.8.3 Displaying 802.1X Supplicant Status

The **show dot1x supplicant** command displays the 802.1X supplicant status.

```
switch#show dot1x supplicant
Interface: Ethernet6/1
```

```
Identity: arastr
EAP method: fast
Status: success
Supplicant MAC: 44:4c:a8:34:bf:20
Authenticator MAC: 00:1c:73:e0:d3:76
```

### About the Output

- **Interface:** The port on which the supplicant is running.
- **Identity:** Configured supplicant identity.
- **EAP method:** Configured EAP method (Currently just EAP-FAST).
- **Status:** Supplicant Status. Can be one of the following:
  - Success Authentication has been successful.
  - Down Authentication sequence has not begun.
  - Failed Authentication has failed.
  - Connecting Authentication is in progress.
  - Unused Supplicant is uninitialized.
- **Supplicant MAC:** MAC address of the supplicant.
- **Authenticator MAC:** MAC address of the authenticator (peer).
- **Existing Mac Security:** Show commands can be used to look at Mac Security status.

#### 9.3.2.2.9 Configuring MACsec Fallback to Unprotected Traffic

EOS supports this feature on all MACsec capable cards except the 7500E-6CFPX-LC.

The MACsec Fallback to Unprotected Traffic feature is configured under MACsec profile mode using the **traffic unprotected allow** command. The **no** form of the command removes the configuration from the switch. This configuration must be present in both the peers for the unprotected traffic to flow between them successfully.

#### Example

```
switch(config-mac-security-profile-sampleProfile)# no traffic unprotected allow
```

#### 9.3.2.3 Displaying MACsec Information

The following sections provide information about MACsec on a switch.

This section contains the following topics:

- [Displaying MACsec Information](#)
- [Displaying MACsec Detailed Information](#)
- [Displaying MACsec Participants](#)
- [Displaying MACsec Participants Detailed Information](#)
- [Displaying MACsec MKA Counters](#)
- [Displaying MACsec Security Counters Detailed Information](#)
- [Displaying MACsec Security Counters](#)
- [Displaying MACsec MKA Counters Detailed Information](#)
- [Displaying MACsec FIPS Status](#)
- [Displaying Information for MACsec Using Static Secure Association Key](#)

### 9.3.2.3.1 Displaying MACsec Information

The `show mac security interface` command shows information about the MACsec on the interface.

#### Example

```
switch# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605 True 9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613 True 9d5bc0d3076ea4a08b99b9d9:1
```

### 9.3.2.3.2 Displaying MACsec Detailed Information

Use the `show mac security interface detail` command to display detailed information about MACsec.

#### Example

```
switch# show mac security interface detail
Interface: Ethernet4/1/1
 SCI: 28:99:3a:82:6f:82::605
 SSCI: 00000002
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)

Interface: Ethernet4/3/1
 SCI: 28:99:3a:82:6f:85::613
 SSCI: 00000001
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)
```

#### About the Output:

- **Interface:** Name of the interface.
- **Secure Channel Identifier (SCI):** Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- **Controlled Port:** Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- **Key In Use:** The SAK identifier currently in use. Combination of Key Servers message identifier (see below) and key number.
- **Key Server Priority:** Configured key server priority.
- **Session Rekey Period:** Configured session rekey period.
- **Latest Key:** Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA)
- **Old Key:** The last SAK negotiated by Mac Security Key Agreement Protocol (MKA)

**Note:** Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, Key In Use field is used to identify the current key.

### 9.3.2.3.3 Displaying MACsec Participants

Use the **show mac security participants** command to display information about the MACsec participants.

#### Example

```
switch# show mac security participants
Interface: Ethernet4/1/1
 CKN: abcd
 Message ID: 9d5bc0d3076ea4a08b99b9d9
 Elected self: True
 Success: True
 Principal: True
 Default: False

 CKN: dead
 Message ID: 4ef4cf009161bd551b5e7434
 Elected self: True
 Success: True
 Principal: False
 Default: True

Interface: Ethernet4/3/1
 CKN: abcd
 Message ID: c79ad8882c2dd3a8e838a691
 Elected self: False
 Success: True
 Principal: True
 Default: False

 CKN: dead
 Message ID: 3dfd4486b5f68a81014a37ec
 Elected self: False
 Success: True
 Principal: False
 Default: True
```

### 9.3.2.3.4 Displaying MACsec Participants Detailed Information

Use the **show mac security participants detail** command to display detailed information about the MACsec participants.

#### Example

```
switch# show mac security participants detail
Interface: Ethernet4/1/1
 CKN: abcd
 Message ID: 9d5bc0d3076ea4a08b99b9d9
 Elected self: True
 Success: True
 Principal: True
 Default: False
 KeyServer SCI: 28:99:3a:82:6f:82::605
 SAK transmit: True
 LLPN exhaustion: 0
 Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
 Live peer list: ['c79ad8882c2dd3a8e838a691']
 Potential peer list: []

 CKN: dead
 Message ID: 4ef4cf009161bd551b5e7434
 Elected self: True
```

```

Success: True
Principal: False
Default: True
KeyServer SCI: 28:99:3a:82:6f:82::605
SAK transmit: False
LLPN exhaustion: 0
Distributed key identifier: None
Live peer list: ['3dfd4486b5f68a81014a37ec']
Potential peer list: []

Interface: Ethernet4/3/1
CKN: abcd
Message ID: c79ad8882c2dd3a8e838a691
Elected self: False
Success: True
Principal: True
Default: False
KeyServer SCI: 28:99:3a:82:6f:82::605
SAK transmit: True
LLPN exhaustion: 0
Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
Live peer list: ['9d5bc0d3076ea4a08b99b9d9']
Potential peer list: []

CKN: dead
Message ID: 3dfd4486b5f68a81014a37ec
Elected self: False
Success: True
Principal: False
Default: True
KeyServer SCI: 28:99:3a:82:6f:82::605
SAK transmit: False
LLPN exhaustion: 0
Distributed key identifier: None
Live peer list: ['4ef4cf009161bd551b5e7434']
Potential peer list:

```

## About the Output

- **Connectivity Association Key Name (CKN)**: Configured name of the key in use.
- **Message ID**: A random 92 bit string used as an identifier for an MKA participant.
- **Elected Self**: True if this participant is the elected key server.
- **Success**: True if this participant is live and has at least one live peer.
- **Principal**: True if this participant is the principal participant elected to distribute SAKs or if participant receives SAKs from key server.
- **Default**: True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).
- **Key Server SCI**: The SCI of the key server.
- **SAK Transmit**: True if the participant is ready to use the negotiated key for transmit.
- **LLPN Exhaustion**: Increments if the number of data packets sent using the current key exceeds a certain threshold.
- **Distributed Key Identifier**: Message ID + key number of the most recently generated SAK.
- **Live Peer List**: Message IDs of all the live peers of the participant.
- **Potential Peer List**: Message IDs of all the potential peers of the participant. These are peers which have not yet established mutual liveness but have sent out at least one control packet.

### 9.3.2.3.5 Displaying MACsec MKA Counters

Use the **show mac security mka counters** command to display information about the MACsec MKA counters.

#### Example

```
switch# show mac security mka counters
Interface Rx Success Rx Failure Tx Success Tx Failure
Ethernet4/1/1 287 0 288 0
Ethernet4/3/1 288 0 287 0
```

### 9.3.2.3.6 Displaying MACsec Security Counters Detailed Information

Use the **show mac security counters detail** command to display detailed information about the MACsec security counters.

#### Example

```
switch# show mac security counters detail
Ethernet4/1/1 Counter Name Count

outPktsEncrypted 112
outOctetsEncrypted 11984
outPktsUntagged 0
outPktsTooLong 0
outPktCtrl 224
inPktsDecrypted 2
inOctetsDecrypted 214
inPktsUnchecked 0
inPktsOK 2
inPktsNotValid 0
inPktsNotUsingSA 0
inPktCtrl 223
inPktsNoTag 8
inPktsTagged 0
inPktsBadTag 0
inPktsNoSCI 0
inPktsLate 0

Ethernet4/3/1 Counter Name Count

outPktsEncrypted 2
outOctetsEncrypted 214
outPktsUntagged 0
outPktsTooLong 0
outPktCtrl 223
inPktsDecrypted 111
inOctetsDecrypted 11877
inPktsUnchecked 0
inPktsOK 111
inPktsNotValid 0
inPktsNotUsingSA 0
inPktCtrl 224
inPktsNoTag 9
inPktsTagged 0
inPktsBadTag 0
inPktsNoSCI 0
inPktsLate 0
```

### 9.3.2.3.7 Displaying MACsec Security Counters

Use the **show mac security counters** command to display information about the MACsec security counters.

### Example

```
switch# show mac security counters
Port InPktsDecrypted InOctetsDecrypted OutPktsEncrypted OutOctetsEncrypted
Et4/1/1 2 214 109 11663
Et4/3/1 109 11663 2 214
```

### 9.3.2.3.8 Displaying MACsec MKA Counters Detailed Information

Use the **show mac security mka counters detail** command to display detailed information about the MACsec MKA counters.

### Example

```
switch# show mac security mka counters detail
Interface: Ethernet4/1/1
 Tx packet success: 290
 Tx packet failure: 0
 Tx invalid: 0
 Rx packet success: 289
 Rx packet failure: 0
 Rx invalid: 0
 Rx eapol error: 0
 Rx basic parameter set error: 0
 Rx unrecognized CKN error: 0
 Rx ICV validation error: 0
 Rx live peer list error: 0
 Rx potential peer list error: 0
 Rx SAK use set error: 0
 Rx distributed SAK set error: 0
 Rx distributed CAK set error: 0
 Rx ICV Indicator error: 0
 Rx unrecognized parameter set error: 0

Interface: Ethernet4/3/1
 Tx packet success: 289
 Tx packet failure: 0
 Tx invalid: 0
 Rx packet success: 290
 Rx packet failure: 0
 Rx invalid: 0
 Rx eapol error: 0
 Rx basic parameter set error: 0
 Rx unrecognized CKN error: 0
 Rx ICV validation error: 0
 Rx live peer list error: 0
 Rx potential peer list error: 0
 Rx SAK use set error: 0
 Rx distributed SAK set error: 0
 Rx distributed CAK set error: 0
 Rx ICV Indicator error: 0
 Rx unrecognized parameter set error: 0
```

### 9.3.2.3.9 Displaying MACsec FIPS Status

Use the **show mac sec status** command to display information about the MACsec FIPS status.

### Example

```
switch(config)# mac security
switch(config-mac-security)# show mac sec status
Active Profiles: 1
FIPS Mode: Yes
Secured Interfaces: 2
```

### 9.3.2.3.10 Displaying Information for MACsec Using Static Secure Association Key

If MACsec is configured to use static SAKs, these commands will show additional information related to static SAKs:

- **show active**

In MAC Security configuration mode, the **show active** command displays the MAC security key source. If one or more static SAKs are configured, this key source will be shown as "key source sak static."

- **show mac security interface**

With a static SAK configured, the **show mac security interface** command shows the association numbers for SAKs which are programmed for Rx and Tx. **Show** commands never display actual SAK values.

If a unidirectional link is configured with a static SAK, the Rx side will show the SCI as "00:00:00:00:00::0," and only the Rx AN will be shown. On the Tx side, the configured SCI and Tx AN will be shown.

- **show mac security sak**

If one or more SAKs are configured in the switch, the **show mac security sak** command will show SAK-related details.

### 9.3.2.4 MACsec Key Retirement Immediate

The MACsec configures two keys for MKA negotiation: Primary and Fallback (as a backup). For a given MAC security profile configured on an interface, an actor is created per key and is responsible for MKA negotiation with the other peer. After configuring a new primary key, the old primary key actor is retained in the system until the MKA session succeeds with the configured new primary key. The same holds for the fallback key. Using the **key retirement immediate** command immediately removes the actor corresponding to the old key, be it primary or fallback, from the system.

#### MACsec Key Retirement Immediate Operations

- After configuring a new primary key in a MAC security profile, the old primary key actor is deleted from the system immediately.
- After configuring a new fallback key in a MAC security profile, the old fallback key actor is deleted from the system immediately.
- Removing the feature configuration from the MAC security profile will only prevent cleaning up old keys immediately when configuring new keys. It will not create old actors again.

**Note:** The **key retirement immediate** command only deletes the actor corresponding to the old key. It only cleans up the SAK programmed in the hardware after a new SAK is available to be programmed. However, as a side effect of deleting an actor, the system chooses a new principal actor (if an eligible actor is available), over which a new SAK will be distributed.

#### MACsec Key Retirement Immediate Feature Interactions

##### MACsec EAP-FAST Support

When using Dynamic MAC Security keys with **key retirement immediate**, then with every new primary key derived from 802.1X, the system deletes the old primary key actor. This action usually happens based on the reauth time interval configuration for 802.1X.

## MACsec Fallback to Unprotected Traffic Support

The **key retirement immediate** is configured with the Fallback to Unprotected Traffic feature, and the transition between unprotected and protected traffic may become more frequent. This is because with the Key Retirement Immediate feature, whenever a new key is configured, existing successful MKA sessions corresponding to the old key are not maintained, which might bring down the number of successful MKA sessions to zero, eventually moving the interface to an unprotected traffic state as per the Fallback to Unprotected Traffic feature functionality.

### 9.3.2.4.1 MACsec Key Retirement Immediate Configuration

The `show dot1x supplicant` command is configured in the **mac security profile mode**. The configuration must be present on both key server and non-key server peers. Since the key server decides the principal actor for SAK distribution, it is recommended that this configuration be present in the key server to trigger the re-election of the principal actor immediately.

If **key retirement immediate** is configured only on the key server, the non-key server will still try to negotiate MKA over the old primary key, unnecessarily utilizing some system resources and some time even when not required.

If **key retirement immediate** is configured only on the non-key server, it will take **6** seconds (MKA Lifetime) to trigger any re-election on the key server due to session failure.

```
switch(config-mac-security-profile-sampleProfile)# [no] key retirement immediate
```

## Configuration Scenarios

**Configuring both Primary Key and Fallback Key** without configuring **key retirement immediate**: When configuring a new primary, the actor corresponding to the old actor stays active until the MKA session succeeds on the new primary. With **key retirement immediate**, the system immediately deletes the actor corresponding to the old primary. Since Fallback is also configured, the key server will choose it as the new principal actor if it is eligible. After choosing a new principal actor, a new SAK is distributed, which will eventually be programmed and used for encryption and decryption.

**When only the Primary Key is configured**, the behavior is the same as described earlier, except no other actor will become principal until the new primary becomes successful. Until then, hardware will continue to use SAK generated with the old primary.

**When the Fallback is a Principal actor and configured without immediate key retirement**, when configuring a new fallback key, the old Fallback will stay in the system until the new Fallback becomes active or the primary becomes active. With **immediate key retirement**, the system deletes the fallback actor immediately. Until a new principal actor is elected, hardware will continue to use SAK generated with the old Fallback.

The `show mac security participants` command shows all the participants present in the system. When **key retirement immediate** is configured, the actor corresponding to old keys will no longer appear in the command output.

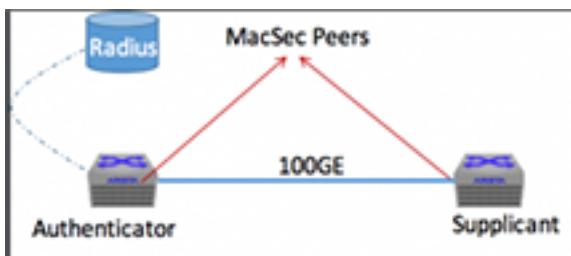

### 9.3.2.5 MACsec EAP-FAST Support

The Media Access Control Security (MACsec) with static keys feature supports dynamic Mac Security keys. Configure both peers for 802.1X authentication to derive Mac Security keys dynamically. Configure one peer as the Authenticator and the other peer as the Suplicant.

---

Upon a successful 802.1X authentication sequence between the peers, both the Authenticator and the Supplicant generate keying material. This keying material is then used to derive Mac Security keys to establish a MACsec Key Agreement (MKA) protocol session. This feature supports Arista devices acting as the Supplicant to derive Mac Security keys bidirectionally.

The following diagram illustrates a typical Mac Security over 802.1X topology:

### 9.3.2.6 MACsec Proxy For VXLAN

The MACsec Proxy for VXLAN feature enables the MACsec service over VXLAN. MACsec over VXLAN is provided by mapping a Visual Networking Index (VNI), Remote VXLAN Tunnel Endpoint (VTEP) IP to a MACsec proxy subinterface.

Any packets routed to the MACsec proxy subinterface are encrypted and tunneled to the remote VTEP. On the receiving path, the packets are decrypted, then decapsulated, and forwarded. MKA negotiates and renews the encryption keys. For this purpose, a MACsec-capable front panel port has to be dedicated and cannot be plugged in, as it will be used to recycle packets being encrypted and decrypted.

#### 9.3.2.6.1 Configuring MACsec Proxy For VXLAN

The switch platforms that use this feature are:

- 7280SRAM-48C6
- 7280CR2M-30
- 7500R2M-36CQ-LC

The mandatory steps to configure a MACsec proxy sub-interface on an Arista switch are:

1. Configure the parent interface to be a routed port.
2. Create a L3 sub-interface on the parent interface. This is the MACsec proxy sub-interface.
3. Create a L2 sub-interface on the parent interface. This is the MACsec patch sub-interface.
4. Configure and enable the MACsec proxy port on a sub-interface.
5. Configure the VXLAN tunnel.
6. Assign the forwarding VLAN ID for the MACsec patch sub-interface and VXLAN tunnel.

#### Example Configurations

- a. Configure a **100g** MACsec interface as a routed port.

```
switch(config)# interface et49/1
switch(config-if-Et49/1)# no switchport
```

- b. Create a new L3 sub-interface - **et49/1.1**.

```
switch(config-if-Et49/1)# interface et49/1.1
```

- c. Create a new L2 sub-interface - **et49/1.2**.

```
switch(config-if-Et49/1) # interface et49/1.2
```

- d. Configure the MACsec proxy port, and enable MACsec on the proxy port.

```
switch(config)# interface et49/1.1
switch(config-if-Et49/1.1) # mac security proxy patch Ethernet49/1.2
switch(config-if-Et49/1.1) # mac security profile test1
switch(config-if-Et49/1.1) # ip address 2.2.2.1/24
```

- e. Configure the VXLAN tunnel. The remote VTEP is provided as the flood VTEP.

```
switch(config)# interface VXLAN 1
switch(config-if-Vx1) # VXLAN source-interface Loopback0
switch(config-if-Vx1) # VXLAN udp-port 4789
switch(config-if-Vx1) # VXLAN vlan 20 vni 20
switch(config-if-Vx1) # VXLAN vlan 20 flood vtep 100.100.100.2
```

- f. Configure the L2 MACsec patch interface to be in the same VLAN as VXLAN.

```
switch(config)# interface et49/1.2
switch(config-if-Et49/1.2) # vlan id 20
```

### 9.3.2.6.2 Displaying MACsec Proxy For VXLAN Information

Use **show mac security interface** command to display the proxy sub-interface information.

#### Examples

- Use **show mac security mka counters** command to display the MACsec counters and detailed values.

```
switch(config)# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605 True 9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613 True 9d5bc0d3076ea4a08b99b9d9:1
```

- switch(config)# show mac security mka counters**
- | Interface     | Rx Success | Rx Failure | Tx Success | Tx Failure |
|---------------|------------|------------|------------|------------|
| Ethernet4/1/1 | 287        | 0          | 288        | 0          |
| Ethernet4/3/1 | 288        | 0          | 287        | 0          |

```
switch(config)# show mac security mka counters ethernet 49/1.1 detail
Interface: Ethernet49/1.1
 Tx packet success: 84
 Tx packet failure: 0
 Tx invalid: 0
 Rx packet success: 82
 Rx packet failure: 0
 Rx invalid: 0
 Rx eapol error: 0
 Rx basic parameter set error: 0
 Rx unrecognized CKN error: 0
 Rx ICV validation error: 0
 Rx live peer list error: 0
 Rx potential peer list error: 0
 Rx SAK use set error: 0
 Rx distributed SAK set error: 0
 Rx distributed CAK set error: 0
 Rx ICV Indicator error: 0
 Rx unrecognized parameter set error: 0
```

### 9.3.2.6.3 Limitations

The following limitations may apply when using this feature:

- An interface that switches from allowing unprotected traffic to allowing only protected traffic can experience a traffic disruption of up to **4** seconds.
- If the key server interface manages to establish an MKA session with its old credentials (CKN/CAK pair) while allowing unprotected traffic, a traffic disruption lasting up to **6** seconds may occur in addition to the duration mentioned earlier.

### 9.3.2.7 MACsec Fallback to Unprotected Traffic

When MACsec is enabled on an interface, it tries to establish MACsec Key Agreement ( MKA ) session(s) with its peer. If there are no successfully established MKA sessions, the interface can continue to protect the traffic with the last known negotiated key, and if such a key does not exist, it blocks the traffic. The MACsec Fallback to Unprotected Traffic feature introduces an optional configuration which, if provided, allows unprotected traffic whenever there is no successful MKA session with the peer in the following scenarios:

- If MACsec is enabled on an interface with this feature configured, the interface allows unprotected traffic immediately without waiting for the establishment of an MKA session.
- If a MACsec-enabled interface was blocking traffic because no MKA sessions were established, and its corresponding MACsec profile is changed to enable this feature, the interface will start allowing unprotected traffic immediately.
- If a MACsec-enabled interface previously allowed unprotected traffic and its corresponding MACsec profile is changed to disable this feature, the interface will block traffic immediately.
- While an interface is allowing unprotected traffic, it will stop doing so when a new Secure Association Key (SAK) is generated (if this interface is the key server) or when a SAK is received from the key server (if this interface is not the key server).
- If MACsec Fallback to Unprotected Traffic is configured and all MKA sessions between the peers fail, the peers will switch to unprotected traffic. If not configured, protected traffic could have continued with the last known negotiated key.

Primary MKA session-derived keys are prioritized over fallback MKA sessions to protect traffic between pairs. With this feature enabled, the priority order of traffic between peers is:

1. Protected using derived keys from primary MKA sessions.
2. Protected using derived keys from Fallback MKA sessions.
3. Unprotected traffic.

**Note:** Arista allows the configuration of a primary and a Fallback Connectivity Association Key (CAK) and Connectivity Association Key Name (CKN) pair on an interface. The interface attempts to establish an MKA session with its peer corresponding to each CAK/CKN pair.

### 9.3.2.7.1 MACsec Fallback to Unprotected Traffic Feature Interaction

This feature interacts with other related features in the following way:

- **MACsec EAP-FAST Support:** The feature configuration has no effect if using dynamic MAC Security keys (derived from 802.1X authentication).

- **MACsec Proxy Interfaces:** This feature does not work with MACsec proxy subinterfaces.
- **Key Retirement Immediate:** When configuring this feature with the **Key Retirement Immediate** feature on an interface, the transition between unprotected and protected traffic may become more frequent. This is because with the **Key Retirement Immediate** feature, the existing successful MKA session corresponding to the old key is not maintained whenever a new key is configured.

### 9.3.2.7.2 Limitations

The following limitations may apply when using this feature:

- An interface that switches from allowing unprotected traffic to allowing only protected traffic can experience a traffic disruption of up to **4** seconds.
- If the key server interface manages to establish an MKA session with its old credentials (CKN/CAK pair) while allowing unprotected traffic, a traffic disruption lasting up to **6** seconds may occur in addition to the duration mentioned earlier.

### 9.3.2.7.3 Configuring MACsec Fallback to Unprotected Traffic

EOS supports this feature on all MACsec capable cards except the 7500E-6CFPX-LC.

The MACsec Fallback to Unprotected Traffic feature is configured under MACsec profile mode using the **traffic unprotected allow** command. The **no** form of the command removes the configuration from the switch. This configuration must be present in both the peers for the unprotected traffic to flow between them successfully.

#### Example

```
switch(config-mac-security-profile-sampleProfile)# no traffic unprotected allow
```

### 9.3.2.7.4 Displaying MACsec Fallback to Unprotected Traffic Information

The **show mac security interface detail** command can be used to verify if the interface is currently allowing unprotected traffic.

```
switch# show mac security interface Ethernet 6/1/1 detail
Interface: Ethernet4/1/1
 SCI: 28:99:3a:82:6f:82::605
 SSCI: 00000002
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Unprotected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)

Interface: Ethernet4/3/1
 SCI: 28:99:3a:82:6f:85::613
 SSCI: 00000001
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)
```

---

### 9.3.2.8 MACsec Commands

#### MACsec Configuration Commands

- [an \(MACsec\)](#)
- [cipher](#)
- [entropy source hardware](#)
- [identifier \(MACsec\)](#)
- [key \(MACsec\)](#)
- [key retirement immediate](#)
- [l2-protocol](#)
- [license \(Global Mode\)](#)
- [license \(MACsec\)](#)
- [mac security](#)
- [mka key-server](#)
- [mka session](#)
- [profile \(MACsec\)](#)
- [replay](#)
- [sci](#)
- [secure channel \(MACsec\)](#)
- [traffic unprotected allow](#)

#### MACsec Profile on a Subinterface

- [mac security profile](#)

#### MACsec Show Commands

- [show mac security counters](#)
- [show mac security counters detail](#)
- [show mac security interface](#)
- [show mac security interface detail](#)
- [show mac security mka counters](#)
- [show mac security participants](#)
- [show mac security participants detail](#)
- [show mac security profile](#)
- [show mac security sak](#)
- [show mac security status](#)

#### MACsec EAP FAST Support Commands

- [dot1x](#)
- [dot1x pae supplicant](#)
- [dot1x timeout reauth-timeout-ignore always](#)
- [show dot1x supplicant](#)
- [supplicant profile](#)

### 9.3.2.8.1 an (MACsec)

The **an** command defines an Association Number (AN) and a Secure Association Key (SAK) for use in the selected channel in MACsec. Up to 4 SAKs can be configured in the Rx direction, with ANs ranging from 0 to 3. The Tx channel can only have one AN and one SAK. The **no** **an** and **default an** commands remove the specified AN and its SAK from ***running-config***.

#### Command Mode

MAC Security Profile SAK Static Secure Channel Configuration

#### Command Syntax

```
an an_number key key_type key_string
no an an_number
default an an_number
```

#### Parameters

- ***an\_number*** The Association Number. For the Rx channel, values range from 0 to 3. For the Tx channel, the only allowed value is 0. There is no default value.
- ***key\_type*** The type of string specifying the SAK. There are three valid key types:
  - **0** indicates that the key string which follows is not encrypted.
  - **7** indicates that the key string which follows is hidden or obfuscated.
  - **8a** The following key is encrypted with AES-256-GCM.
- ***key\_string*** The Secure Association Key itself, in hexadecimal octets.

#### Example

These commands add a static SAK with **AN 1** to the Rx channel for profile **test**.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel rx
switch(config-mac-security-profile-test-sak-static-rx)# an 1 key 0 11112222333344445555666677
778888
switch(config-mac-security-profile-test-sak-static-rx)#

```

---

### 9.3.2.8.2 cipher

The **cipher** command configures the cipher authentication for MAC security on the switch.

#### Command Mode

MACsec Profile

#### Command Syntax

`cipher encryption_standard`

#### Parameters

***encryption\_standard*** The cipher authentication options.

- **aes128-gcm-xpn** Advanced Encryption Standard (128-bit, Galois/Counter mode, Extended Packet Numbering).
- **aes256-gcm-xpn** Advanced Encryption Standard (256-bit, Galois/Counter mode, Extended Packet Numbering).

#### Example

The following command configures the **cipher aes128-gcm-xpn** for MAC security on the switch for the MACsec profile called test.

```
switch(config-mac-security-profile-test)# cipher aes128-gcm-xpn
switch(config-mac-security-profile-test)#{
```

### 9.3.2.8.3 dot1x pae supplicant

The **dot1x pae supplicant** command applies the supplicant profile by enabling it on the Mac Security interface.

#### Command Mode

Interface Configuration

#### Command Syntax

`dot1x pae supplicant`

#### Example

The following command applies the supplicant profile test on the **MACsec interface 6/1**.

```
switch(config-if-Et6/1)# dot1x pae supplicant test
```

---

#### 9.3.2.8.4   **dot1x timeout reauth-timeout-ignore always**

The **dot1x timeout reauth-timeout-ignore always** command retains the current port state without blocking it, irrespective of when the authentication server is unreachable or in case of supplicant timeouts.

##### **Command Mode**

Interface Configuration

##### **Command Syntax**

```
dot1x timeout reauth-timeout-ignore always
```

##### **Example**

The following command retains the port status of **interface Ethernet 6/1** when there is an authentication server timeout.

```
switch(config-if-Et6/1)# dot1x timeout reauth-timeout-ignore always
```

### 9.3.2.8.5 dot1x

The **dot1x** command places the switch in the dot1x mode. In this mode, the user is allowed to configure various MACsec configurations.

#### Command Mode

Global Configuration

#### Command Syntax

```
dot1x
```

#### Example

The following command places the switch in the **dot1x** mode.

```
switch(config)# dot1x
switch(config-dot1x) #
```

---

### **9.3.2.8.6    entropy source hardware**

The **entropy source hardware** command generates the cryptographic keys to strengthen the random number generator used by MACsec.

#### **Command Mode**

Management Configuration

#### **Command Syntax**

```
entropy source hardware
```

#### **Example**

The following command configures the entropy source hardware and generates the cryptographic keys.

```
switch(config)# management security
switch(config-mgmt-security)# entropy source hardware
```

### 9.3.2.8.7 identifier (MACsec)

The **identifier** command defines a Secure Channel Identifier (SCI) for the Rx or Tx secure channel for use with MACsec static Secure Association Keys (SAKs). The SCI is a MAC address in the format H:H:H:H:H::P, where H is a hexadecimal octet and P is a decimal integer. The **no identifier** and **default identifier** commands remove the channel's SCI from *running-config*.

#### Command Mode

MAC Security Profile SAK Static Secure Channel Configuration

#### Command Syntax

```
identifier MAC_address
no identifier
default identifier
```

#### Parameter

**MAC\_address** The MAC address identifying the secure channel.

#### Example

These commands add the SCI 01:02:03:04:05:06::1234 to the Rx channel for profile "test."

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel rx
switch(config-mac-security-profile-test-sak-static-rx)# identifier 01:02:03:04:05:06::1234
switch(config-mac-security-profile-test-sak-static-rx)#

```

### 9.3.2.8.8 key (MACsec)

The **key** command configures the primary key to activate the MACsec profile

**Note:** Optionally a fallback CAK can also be configured on a profile. This CAK is picked up by MACsec to negotiate keys if the primary CAK fails. A CAK can be configured as a backup key using the **fallback** keyword with the **key** command.

#### Command Mode

MACsec Profile Configuration

#### Command Syntax

**key <options>**

#### Parameters

- **CKN** Connectivity association key name in hex octets. Options include:
  - **0** Specifies that an UNENCRYPTED key will follow.
  - **7** Specifies that an HIDDEN key will follow.
  - **CAK** Connectivity association key in hex octets.
  - **fallback** Configure the key as a fallback.
- **retirement** Retire the key. Options include:
  - **immediate** Retire the key immediately.
- **source** List of sources to derive MAC security keys. Options include:
  - **dot1xDerive** MAC security keys from IEEE 802.1X-based port authentication
  - **group-cak** Derive MAC security keys from Group CAK Distribution.
  - **sak static** Enter

#### Examples

- The following example configures the primary key for the sample profile for MAC security on the switch.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-profile-sample_Profile)# key 0abcd1 0 1234abcd
```

- The following example configures the fallback CAK on a profile.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-profile-sample_Profile)# key 0abcd1 0 1234abcd fallback
```

### 9.3.2.8.9 key retirement immediate

The **key retirement immediate** command configures the key retirement feature on the key server and assists the key server to decide the principal actor for SAK distribution by triggering the re-election of principal actor immediately. It is recommended that the key retirement is configured on both key server and non key server peers.

The **no key retirement immediate** command disable the key retirement function by removing the key retirement immediate command from the ***running-config***.

#### Command Mode

MACsec Profile

#### Command Syntax

```
key retirement immediate
```

#### Example

The following commands configures the key retirement immediate feature on a switch for a MACsec profile called **sample**.

```
switch(config)# mac security
switch(config-mac-security)# profile sample
switch(config-mac-security-profile-sample)# key retirement immediate
```

---

### 9.3.2.8.10 license (Global Mode)

The **license** command configures EOS licenses on the switch under the global configuration mode. These licenses include the MACsec license.

**Note:** Contact your system engineer to acquire the required license codes before attempting to configure MACsec.

#### Command Mode

Global Configuration

#### Command Syntax

```
license [[import URL] | update]
```

#### Parameters

- **import** Import license from a URL.
  - **URL** The URL from which to import a license.
- **update** Trigger a check for licenses.

#### Example

The following example configures the MACsec license on the switch using a JSON file as shown.

```
switch# license import flash:EOSLic-1.json
switch#
```

### 9.3.2.8.11 license (MACsec)

The **license** command configures the MACsec license on the switch under the MAC Security configuration mode using a hex key.

The **no license** and **default license** commands delete the current license from *running-config*.

**Note:** This method of license configuration is no longer being used except for backward compatibility.

#### Command Mode

MAC Security

#### Command Syntax

```
license licensee_name license_value
```

#### Parameters

- ***licensee\_name*** Name of the licensee.
- ***license\_value*** 8 digit hexadecimal key to authorize MAC security.

#### Example

The following example configures the MACsec license on the switch using an 8 digit hexadecimal key.

```
switch(config)# mac security
switch(config-mac-security)# license Test-LICNC AABBCCDD
switch(config-mac-security) #
```

---

### 9.3.2.8.12 l2-protocol

The command **l2-protocol** configures the Layer 2 protocol processing for MACsec. The **no l2-protocol** and the **default l2-protocol** remove the command from the configuration.

#### Command Mode

MAC Security Configuration

#### Command Syntax

```
l2-protocol ethernet-flow-control [bypass | encrypt]
no l2-protocol ethernet-flow-control [bypass | encrypt]
default l2-protocol ethernet-flow-control [bypass | encrypt]
```

#### Parameters

- **ethernet-flow-control** - Configures Ethernet Flow Control frame processing for MAC security.
  - **bypass** - Transmit frames without processing them.
  - **encrypt** - Transmit and receive frames with protection.

#### Example

The following example configures MAC security with L2 protocol and Ethernet Flow Control bypassing frame protection:

```
switch(config)# mac-security
switch(config-mac-security)# l2 protocol ethernet-flow-control bypass
```

### 9.3.2.8.13 mac security

The **mac security** command enables MAC security provision on the switch.

The **no mac security** and **default mac security** commands restore the switch to its default state by removing the corresponding mac security command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac security
no mac security
default mac security
```

#### Example

The following command places the switch in MAC security mode.

```
switch(config)# mac security
switch(config-mac-security)#{
```

---

#### 9.3.2.8.14 mac security profile

The **mac security profile** command applies a MACsec profile to an interface or subinterface.

The **no mac security profile** and **default mac security profile** commands remove the MACsec profile, disabling MACsec on the configuration-mode interface.

#### Command Mode

Interface Ethernet Configuration Mode

#### Command Syntax

```
mac security profile profile-name
no mac security profile profile-name
default mac security profile profile-name
```

#### Parameter

***profile-name*** the MACsec profile name.

#### Example

The following commands enable MACsec on Ethernet subinterface **1.10** by applying the MACsec profile called **test-profile**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# interface ethernet1.10
switch(config-if-Et1.10)# encapsulation dot1q vlan 20
switch(config-if-Et1.10)# mac security profile test-profile
```

### 9.3.2.8.15 mka key-server

The **mka key-server** command configures key server among the MACsec peers.

#### Command Mode

MACsec Profile Configuration

#### Command Syntax

```
mka key-server [priority value]
```

#### Parameters

- **priority** MKA key server priority.
  - **value** Key server priority value. Value ranges from **0** to **255**.

#### Example

The following example configures the key server value of **10** among the MACsec peers.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-sample_Profile)# mka key-server priority 10
```

---

### 9.3.2.8.16 mka session

The **mka session** command configures period at which the SAK is refreshed .

#### Command Mode

MACsec Profile Configuration

#### Command Syntax

```
mka session [rekey-period value]
```

#### Parameters

- **rekey-period** Sets MKA session re-key period.
  - **value** Session re-key period in seconds. Value ranges from **30** to **100000**.

#### Example

The following example configures the mka session rekey-period time of **10** seconds at which the SAK is refreshed.

```
switch(config)# mac security
switch(config-mac-security)# profile sample_Profile
switch(config-mac-security-sample_Profile)# mka session rekey-period 10
```

### 9.3.2.8.17 profile (MACsec)

The **profile** command places the switch in MAC Security Profile configuration mode and creates a MACsec profile if a profile of the specified name does not already exist. MACsec profiles contain the configuration information needed to establish a MACsec connection, and are applied to interfaces using the **mac security profile** command.

#### Command Mode

MAC Security Configuration

#### Command Syntax

**profile** *profile-name*

#### Parameter

**profile-name** Name of the MACsec profile.

#### Commands Available in MAC Security Profile Configuration Mode

- [cipher](#)
- [key \(MACsec\)](#)
- [mka key-server](#)
- [mka session](#)
- [replay](#)
- [sci](#)
- [traffic unprotected allow](#)

#### Example

The following commands create a MACsec profile called **test** and place the switch in MAC Security Profile configuration mode for that profile.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)#

```

---

### 9.3.2.8.18 replay

The **replay** command configures the action to be taken when packets received are not in order, based on their packet numbers. The window size in replay protection specifies the window size within which out-of-order packets are allowed. This command is configured under the MACsec Profile configuration mode.

The **no** and **default** form of the command removes all the configurations related to **replay** command from the running configuration on the switch.

#### Command Mode

MACsec Profile

#### Command Syntax

```
replay protection {disabled | window window_size}
no replay protection {disabled | window window_size}
default replay protection {disabled | window window_size}
```

#### Parameters

- **protection** Specifies the action to be taken when packets received are not in order, based on their packet numbers..
- **disabled** Disables replay protection.
- **window** Specifies the allowable window within which an out-of-order packet can be received.
  - **window\_size** The allowable value ranges from **0** through **4294967295**.

#### Example

The following commands configures a MACsec profile called TEST and a replay protection with a window size of **100** is configured on the switch.

```
switch(config)# mac security
switch(config-mac-security)# profile TEST
switch(config-mac-security-profile-TEST)# replay protection window 100
```

### 9.3.2.8.19 sci

The **sci** command add a Secure Channel Identifier (SCI) in data packets for MACsec on the switch. Each MACsec device has a Secure Channel (SC) used to send traffic to other device. Each channel has an 8-byte Secure Channel Identifier (SCI). The first 6 bytes match the MAC address of the device transmitting through that channel. The remaining 2 bytes are a Port Identifier used to distinguish between multiple channels from the same device. The command is configured under the MACsec profile configuration mode.

#### Command Mode

MACsec Profile

#### Command Syntax

**sci**

#### Example

The following commands place the switch on MACsec profile configuration mode and add a SCI for the MACsec profile called **TEST**.

```
switch(config)# mac security
switch(config-mac-security)# profile TEST
switch(config-mac-security-profile-TEST)# sci
```

---

### 9.3.2.8.20 secure channel (MACsec)

The **secure channel** command enters MAC Security Profile Static SAK Secure Channel configuration mode. In this mode, you can add Association Numbers (AN) and Secure Channel Identifiers (SCI) for the specified channel. The available channels are Rx (receive) and Tx (transmit).

#### Command Mode

MAC Security Profile Static SAK Configuration Mode

#### Command Syntax

```
secure channel {Rx|Tx}
```

#### Parameters

- **Rx** Enter the configuration mode for the Rx channel.
- **Tx** Enter the configuration mode for the Tx channel.

#### Available Commands

- [an](#)
- [identifier](#)

#### Example

These commands enter MAC Security Profile Static SAK Secure Channel configuration mode for the Tx channel.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# key source sak static
switch(config-mac-security-profile-test-sak-static)# secure channel tx
switch(config-mac-security-profile-test-sak-static-sc-tx)#

```

### 9.3.2.8.21 show dot1x supplicant

The `show dot1x supplicant` command displays the 802.1X supplicant status.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x supplicant
```

#### Example

The following example displays information about 802.1X supplicant status.

```
switch# show dot1x supplicant

Interface: Ethernet6/1
 Identity: arastr
 EAP method: fast
 Status: success
 Supplicant MAC: 44:4c:a8:34:bf:20
 Authenticator MAC: 00:1c:73:e0:d3:76
```

#### About the Output

- **Interface:** The port on which the supplicant is running.
- **Identity:** Configured supplicant identity.
- **EAP method:** Configured EAP method (Currently just EAP-FAST).
- **Status:** Supplicant Status. Can be one of the following:
  - Success Authentication has been successful.
  - Down Authentication sequence has not begun.
  - Failed Authentication has failed.
  - Connecting Authentication is in progress.
  - Unused Supplicant is uninitialized.
- **Supplicant MAC:** MAC address of the supplicant.
- **Authenticator MAC:** MAC address of the authenticator (peer). Existing Mac Security show commands can be used to look at Mac Security status.

---

### 9.3.2.8.22 show mac security counters detail

The **show mac security counters detail** command displays the detail information about the MACsec security counters.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security counters detail
```

#### Example

The following example displays detail information about MACsec security counters.

```
switch# show mac security counters detail
Ethernet4/1/1 Counter Name Count

outPktsEncrypted 112
outOctetsEncrypted 11984
outPktsUntagged 0
outPktsTooLong 0
outPktCtrl 224
inPktsDecrypted 2
inOctetsDecrypted 214
inPktsUnchecked 0
inPktsOK 2
inPktsNotValid 0
inPktsNotUsingSA 0
inPktCtrl 223
inPktsNoTag 8
inPktsTagged 0
inPktsBadTag 0
inPktsNoSCI 0
inPktsLate 0

Ethernet4/3/1 Counter Name Count

outPktsEncrypted 2
outOctetsEncrypted 214
outPktsUntagged 0
outPktsTooLong 0
outPktCtrl 223
inPktsDecrypted 111
inOctetsDecrypted 11877
inPktsUnchecked 0
inPktsOK 111
inPktsNotValid 0
inPktsNotUsingSA 0
inPktCtrl 224
inPktsNoTag 9
inPktsTagged 0
inPktsBadTag 0
inPktsNoSCI 0
inPktsLate 0
```

### 9.3.2.8.23 show mac security counters

The **show mac security counters** command displays information about the MACsec security counters.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security counters
```

#### Example

The following example displays information about MACsec security counters.

```
switch# show mac security counters
Port InPktsDecrypted InOctetsDecrypted OutPktsEncrypted OutOctetsEncrypted
Et4/1/1 2 214 109 11663
Et4/3/1 109 11663 2 214
```

### 9.3.2.8.24 show mac security interface detail

The `show mac security interface detail` command displays the detail information about the MACsec on the interface.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security interface detail
```

#### Example

The following example displays detail information about MACsec on the interface.

```
switch# show mac security interface detail
Interface: Ethernet4/1/1
 SCI: 28:99:3a:82:6f:82::605
 SSCI: 00000002
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)

Interface: Ethernet4/3/1
 SCI: 28:99:3a:82:6f:85::613
 SSCI: 00000001
 Controlled port: True
 Key server priority: 16
 Session rekey period: 0
 Traffic: Protected
 Key in use: 9d5bc0d3076ea4a08b99b9d9:1
 Latest key: None
 Old key: 9d5bc0d3076ea4a08b99b9d9:1 (RT)
```

#### About the Output

- **Interface:** Name of the interface.
- **Secure Channel Identifier (SCI):** Combination of MAC address and port number. Used to uniquely identify a Mac Security port.
- **Controlled Port:** Indicates if Mac Security is enabled on the port. A value of True indicates that encryption is enabled on the port.
- **Key In Use:** The SAK identifier currently in use. Combination of Key Servers message identifier (see below) and key number.
- **Key Server priority:** Configured key server priority.
- **Session Rekey Period:** Configured session rekey period.
- **Latest Key:** Latest SAK being negotiated by Mac Security Key Agreement Protocol (MKA).
- **Old Key:** The last SAK negotiated by Mac Security Key Agreement Protocol (MKA).

**Note:** Latest and Old key are MKA protocol specific terminology and are used to refer to the last two keys in use. For all practical purposes, Key In Use field is used to identify the current key.

### 9.3.2.8.25 show mac security interface

The **show mac security interface** command shows information about MACsec on the interface.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security interface
```

#### Examples

- The following example displays information about MACsec on the interface.

```
switch# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet4/1/1 28:99:3a:82:6f:82::605 True 9d5bc0d3076ea4a08b99b9d9:1
Ethernet4/3/1 28:99:3a:82:6f:85::613 True 9d5bc0d3076ea4a08b99b9d9:1
switch#
```

- The following example displays the association numbers (ANs) of SAKs for both Rx and Tx on the interface **Ethernet9/1**. Actual SAK values are never displayed in **show** command output.

```
switch# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet9/1 01:02:03:04:05:06::1235 True static SAK: Rx AN: 0,1 Tx AN: 0
switch#
```

- The following example displays MACsec information for a unidirectional link. On the Rx side, the SCI is shown as **00:00:00:00:00::0**, and only the Rx AN is shown.

```
switch# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet9/1 00:00:00:00:00:00::0000 True static SAK: Rx AN: 0
switch#
```

- The following example displays MACsec information on the Tx side of a unidirectional link. In this case, the configured SCI is shown, along with the Tx AN.

```
switch(config)# show mac security interface
Interface SCI Controlled Port Key in Use
Ethernet9/1 01:02:03:04:05:06::1235 True static SAK: Tx AN: 0
```

---

### 9.3.2.8.26 show mac security mka counters

The **show mac security mka counters** command to display information about the MACsec MKA counters.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security mka counters
```

#### Example

The following example displays information about MACsec MKA counters.

```
switch# show mac security mka counters
Interface Rx Success Rx Failure Tx Success Tx Failure
Ethernet4/1/1 287 0 288 0
Ethernet4/3/1 288 0 287 00
```

### 9.3.2.8.27 show mac security participants detail

The **show mac security participants detail** command displays detail information about the MACsec participants.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security participants detail
```

#### Example

The following example displays information about MACsec participants details.

```
switch# show mac security participants detail
Interface: Ethernet4/1/1
CKN: abcd
 Message ID: 9d5bc0d3076ea4a08b99b9d9
 Elected self: True
 Success: True
 Principal: True
 Default: False
 KeyServer SCI: 28:99:3a:82:6f:82::605
 SAK transmit: True
 LLNP exhaustion: 0
 Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
 Live peer list: ['c79ad8882c2dd3a8e838a691']
 Potential peer list: []

CKN: dead
 Message ID: 4ef4cf009161bd551b5e7434
 Elected self: True
 Success: True
 Principal: False
 Default: True
 KeyServer SCI: 28:99:3a:82:6f:82::605
 SAK transmit: False
 LLNP exhaustion: 0
 Distributed key identifier: None
 Live peer list: ['3dfd4486b5f68a81014a37ec']
 Potential peer list: []

Interface: Ethernet4/3/1
CKN: abcd
 Message ID: c79ad8882c2dd3a8e838a691
 Elected self: False
 Success: True
 Principal: True
 Default: False
 KeyServer SCI: 28:99:3a:82:6f:82::605
 SAK transmit: True
 LLNP exhaustion: 0
 Distributed key identifier: 9d5bc0d3076ea4a08b99b9d9:1
 Live peer list: ['9d5bc0d3076ea4a08b99b9d9']
 Potential peer list: []

CKN: dead
 Message ID: 3dfd4486b5f68a81014a37ec

 LLNP exhaustion: 0
 Distributed key identifier: None
 Live peer list: ['4ef4cf009161bd551b5e7434']
 Potential peer list:
```

---

## About the Output

- **Connectivity Association Key Name (CKN):** Configured name of the key in use.
- **Message ID:** A random 92 bit string used as an identifier for an MKA participant.
- **Elected Self:** True if this participant is the elected key server.
- **Success:** True if this participant is live and has at least one live peer.
- **Principal:** True if this participant is the principal participant elected to distribute SAKs.
- **Default:** True if this participant is a fallback/backup participant (spawned when a fallback key is configured in a Mac Security profile).
- **Key Server SCI:** The SCI of the key server.
- **SAK Transmit:** True if the participant is ready to use the negotiated key for transmit.
- **LLPN Exhaustion:** Increments if the number of data packets sent using the current key exceeds a certain threshold. Because we use a 64 bit packet number cipher suite, this should never increment.
- **Distributed Key Identifier:** Message ID + key number of the most recently generated SAK.

### 9.3.2.8.28 show mac security participants

The **show mac security participants interface** command displays information about the MACsec participants.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security interface
```

#### Example

The following example displays information about MACsec participants.

```
switch# show mac security participants
Interface: Ethernet4/1/1
 CKN: abcd
 Message ID: 9d5bc0d3076ea4a08b99b9d9
 Elected self: True
 Success: True
 Principal: True
 Default: False

 CKN: dead
 Message ID: 4ef4cf009161bd551b5e7434
 Elected self: True
 Success: True
 Principal: False
 Default: True

Interface: Ethernet4/3/1
 CKN: abcd
 Message ID: c79ad8882c2dd3a8e838a691
 Elected self: False
 Success: True
 Principal: True
 Default: False

 CKN: dead
 Message ID: 3dfd4486b5f68a81014a37ec
 Elected self: False
 Success: True
 Principal: False
 Default: True
```

---

### 9.3.2.8.29 show mac security profile

The **show mac security profile** command displays information about the specified MACsec profile. If no profile is specified, information about all profiles is shown.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security profile [profile_name]
```

#### Parameters

***profile\_name*** The MACsec profile to show information about.

#### Example

The following command shows information for the MACsec profile **test**.

```
switch# show mac security profile
Profile: test
 Cipher: aes256-gcm-xpn
 Primary CKN:
 Primary CAK SHA-256 hash:
 Fallback CKN:
 Fallback CAK SHA-256 hash:
 Source: cli
 Priority: 100
 SCI Inclusion: disabled
 Key retirement policy: delayed
 Unprotected traffic policy: allow active-sak
 MKA lifetime: 6 seconds
 MKA key server priority: 16
 Session rekey period: 0
 Bypassed protocols:
 Max AN value of SAK: 3
 Configured on:
switch#
```

### 9.3.2.8.30 show mac security sak

The **show mac security sak** command displays information about MACsec static secure association key (SAK) status for the specified Ethernet interface. If no interface is specified, all interfaces are shown. The following information is shown for each Ethernet interface.

- The name of the Ethernet interface.
- The installed SAK IDs.
- The SAK profile name.
- The total number of SAKs generated.
- The number of SAKs generated due to a new live peer.
- The number of SAKs generated due to a rekey timer.
- The number of SAKs generated due to packet number exhaustion.
- The SAK installation time in seconds in each direction.
- The number of forced new Tx SAK installations.

#### Command Mode

EXEC

#### Command Syntax

```
show mac security sak [interface ethernet Ethernet_interface]
```

#### Parameters

**interface ethernet** Show SAK status information about the specified Ethernet interface. If this option is omitted, information for all Ethernet interfaces is shown.

**Ethernet\_interface** The Ethernet interface to show SAK status for.

#### Example

The following command displays the MACsec SAK status for the Ethernet interface Ethernet9/1.

```
switch(config-mac-security-profile-test)# show mac security sak
Interface: Ethernet9/1
Installed SAK ID: static SAK: Rx AN: 0,1 Tx AN: 0
Installed SAK from: static-SA
Total SAK generated: 0
SAK generated due to new live peer: 0
SAK generated due to rekey timer: 0
SAK generated due to packet number exhaustion: 0
SAK installation time(in seconds):
Direction 0-1 1-2 2-3 3+
----- -----
Rx 1 0 0 0
Tx 1 0 0 0

Maximum Rx installation time: 0.0884998080001 seconds
Maximum Tx installation time: 0.0884941590002 seconds
Forced new Tx SAK installation count: 0
```

---

### **9.3.2.8.31 show mac security status**

The **show mac security status** command displays the MACsec status information on a switch.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show mac security status
```

#### **Example**

The following command displays the MACsec status information.

```
switch# show mac security status
Active Profiles: 1
Data Delay Protection: No
FIPS Mode: No
Secured Interfaces: 2
License: Enabled
```

### 9.3.2.8.32 supplicant profile

The **supplicant profile** command configures the supplicant profile containing all the credentials necessary for 802.1X authentication to succeed.

#### Command Mode

dot1x Configuration

#### Command Syntax

`supplicant profile profile_name options`

#### Parameters

- ***profile\_name*** Name of the supplicant profile.
- The following parameters can be included after entering the profile mode:
  - **eap-method** Extensible Authentication Protocol (EAP) method. Option include:
    - **fastEAP** Flexible Authentication via Secure Tunneling (FAST).
    - **identity** Extensible Authentication Protocol (EAP) user identity. Option include:
      - **WORD** User identity name.
    - **passphrase** Extensible Authentication Protocol (EAP) password. Options include:
      - **0** Specifies that an UNENCRYPTED key will follow.
      - **7** Specifies that an HIDDEN key will follow.
      - **LINE** The UNENCRYPTED (clear-text) shared key.

#### Examples

- The following commands place the switch in the supplicant profile mode.

```
switch(config)# dot1x
switch(config-dot1x)# supplicant profile test
switch(config-dot1x-supp-profile-test)#{
```

- The following commands configures the EAP FAST method for the supplicant profile called **test profile** for MAC security on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# supplicant profile test
switch(config-dot1x-supp-profile-test)#eap-method fast
```

- The following commands configures the Identity for the supplicant profile called test profile for MAC security on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# supplicant profile test
switch(config-dot1x-supp-profile-test)# identity New_User
```

- The following commands configures the passphrase for the supplicant profile called **test profile** for MAC security on the switch.

```
switch(config)# dot1x
switch(config-dot1x)# supplicant profile test
switch(config-dot1x-supp-profile-test)# passphrase 7 070E334D5D1D0B04
```

---

### 9.3.2.8.33 traffic unprotected allow

The **traffic unprotected allow** command configures the switch to allow the unprotected traffic whenever there is no successful MKA session established with the peer.

The **no traffic unprotected allow** command disable the MACsec Fallback to Unprotected Traffic function by removing the traffic unprotected allow command from *running-config*.

#### Command Mode

MACsec Profile

#### Command Syntax

```
traffic unprotected allow
no traffic unprotected allow
```

#### Example

The following commands configures the MACsec Fallback traffic unprotected allow feature on a switch for a MACsec profile called sample.

```
Switch(config)# mac security
Switch(config-mac-security)# profile sample
Switch(config-mac-security-profile-sample)# no traffic unprotected allow
```

### 9.3.3 Internet Protocol Security (IPsec)

This section describes Arista's IPsec implementation. Topics in this section include:

- [IPsec Introduction](#)
- [IPsec Overview](#)
- [Configuring IPsec](#)
- [Configuring PKI](#)
- [IPsec Commands](#)

#### 9.3.3.1 IPsec Introduction

Internet Protocol Security (IPsec) is a protocol suite for securing Internet Protocol (IP) communications by authenticating and encrypting each IP packet of a communication session. IPsec includes protocols for establishing mutual authentication between agents periodically during the session and negotiation of cryptographic keys to be used during the session. IPsec supports network-level peer authentication, data origin authentication, data integrity, data confidentiality (encryption), and replay protection.

IPsec protects data traffic between sites, such as between an enterprise's Branch, HQ, and Data center sites.

IPsec uses the following protocols to perform various functions:

- **Authentication Headers** (AH) provide connectionless integrity and data origin authentication for IP datagrams and protect against replay attacks.
- **Encapsulating Security Payloads** (ESP) provides confidentiality, data origin authentication, connectionless integrity, and an anti-replay service (a form of partial sequence integrity).
- **Internet Key Exchange** (IKE) is a key management protocol that provides security for virtual private networks (VPNs) negotiations and network access to random hosts. It is also described as a method for exchanging keys for encryption and authentication over an unsecured medium, such as the Internet.

#### 9.3.3.2 IPsec Overview

##### 9.3.3.2.1 Security Associations

Security Associations (SA) provide the bundle of algorithms and data that provide the parameters necessary for AH and ESP operations. The Internet Security Association and Key Management Protocol (ISAKMP) provides a framework for authentication and key exchange, with actual authenticated keying material provided by manual configuration with pre-shared keys, Internet Key Exchange (IKE and IKEv2), and other mechanisms.

IPsec uses the Security Parameter Index (SPI) and the destination address in the packet header to determine the necessary protection for an outgoing packet. The SPI is an index to the security association database (SADB). The SPI uniquely identifies a security association for the packet in combination with the destination address.

The system performs a similar procedure for an incoming packet, where IPsec gathers decryption and verification keys from the security association database.

Full bidirectional communication requires at least two SAs, one for each direction. The following parameters define SA:

- Security Algorithms (AH) or Encapsulating Security Payloads (ESP) and keys.
- **Mode:** Tunnel or Transport.

- 
- **Key Management Method:** Manual or IKE.
  - **Lifetime:** Expressed in hours or minutes (minimum configurable value is 10 minutes).

### 9.3.3.2.2 Mode of Operation

IPsec on Arista switches operates in tunnel mode. In tunnel mode, the entire IP packet is encrypted and authenticated, then encapsulated into a new IP packet with a new IP header.

IPsec uses tunnel mode to create virtual private networks (VPN) for network-to-network communications, such as secure connections between routers across different sites. Tunnel mode serves as the foundation for the majority of network-to-network IPsec implementations.

### 9.3.3.2.3 Key Management

Key management on Arista switches uses the Internet Key Exchange (IKE) method. Internet Key Exchange (IKE) supports automated generation and renegotiation of SAs (includes keys) between the devices at a configured interval, making it much more scalable and secure.

IPsec needs SAs to define the algorithms and keys to protect traffic. IKE establishes the SA so IPsec can protect traffic.

There are two IKE versions, IKEv1 and IKEv2. IKEv2 builds on IKEv1, but both are still widely used today.

#### 9.3.3.2.3.1 IKEv1

IKEv1 has two phases.

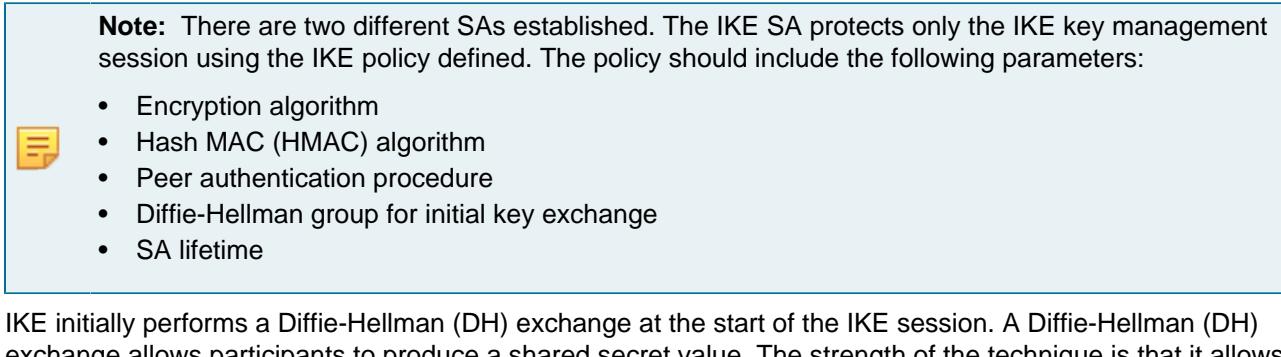

- IKEv1 Phase 1
- IKEv1 Phase 2

##### IKEv1 Phase 1

- Uses main or aggressive mode exchange
- Negotiates IKE SA
- Used for control plane
- Peer authentication

##### IKEv1 Phase 2

- Uses quick mode exchange
- Negotiates IPsec SAs

IKE initially performs a Diffie-Hellman (DH) exchange at the start of the IKE session. A Diffie-Hellman (DH) exchange allows participants to produce a shared secret value. The strength of the technique is that it allows participants to create the secret value over an unsecured medium without passing the secret value through

the wire. From that exchange, peers get shared keying material, which is then used for IKE encryption and integrity functions. The strength of that keying material is that it can be used for faster performance by choosing lower key sizes for Diffie-Hellman exchanges. Diffie-Hellman exchanges' key length (strength) can be changed using different DH groups.

When an IKE session's lifetime expires, a new Diffie-Hellman exchange is performed between peers, and the IKE SA is re-established.

The IPsec protection policy, resulting in IPsec SAs, defines network traffic protection. These IPsec SAs are usually negotiated over IKE sessions. The parameters that define the IPsec protection policy are:

- Encryption Algorithm
- Hash MAC (HMAC) Algorithm

The key material for IPsec SA (also called Child SA) is derived from keying material from IKEv1 phase 1.

There are two different modes for phase 1:

- Main Mode
- 6 packet exchange
- Full identity protection and better anti-DoS protection
- Aggressive Mode
- 3 packet faster session establishment
- Identities are exchanged in clear
- Weak DoS protection

### **Authentication**

- **Pre-Shared Keys (PSK):** As the name suggests, a shared secret is distributed out-of-band to the peers. The peers use this information and nonce parameters to create a hash to authenticate messages.
- **PKI Certificates:** Here, peers' certificates are exchanged, and hashes are calculated over these certificates to authenticate each other.

#### **9.3.3.2.3.2 IKEv2**

IKEv2 differs from IKEv1 in the following ways:

- Faster set up because of the reduced number of messages.
- More secure.
- ESP is reused for all IKEv2 messages.
- Suite-B support.
- There is no aggressive mode, so IKEv2 always provides identity protection.
- Additional authentication methods.
- Local and remote can use different authentication methods and use different pre-shared keys.
- Authentication is done unidirectionally in IKEv2.

#### **9.3.3.2.4 Route-based VPN**

A route-based VPN employs routed tunnel interfaces as the virtual network's endpoints. All traffic passing through a tunnel interface traverses the VPN. Rather than relying on an explicit policy to dictate which traffic enters the VPN, static and dynamic IP routes are formed to direct the desired traffic through the VPN tunnel interface.

---

Since route-based VPNs support dynamic routing information through VPN tunnels, EOS supports only route-based VPNs for dynamic routing support and easier configuration and management.

In route-based VPN, features like NAT, ACL, and QoS are applied to packets before they are encrypted by applying these features to the tunnel interface and can be applied to encrypted packets by applying these features on the physical interface carrying the tunnel traffic.

### **Virtual Template Interface (VTI)**

A new tunnel interface type, **vti**, represents the VPN tunnel. This tunnel interface will participate in the routing, and any packets forwarded to it will be encrypted and forwarded to the other end of the tunnel. Note that this does not add a new header to the packet.

#### **9.3.3.3 Configuring IPsec**

Complete the following steps to configure IPsec tunnels over the switch.

This configuration uses the default IKE version 2 procedure.

1. Use **ip security** command to enter IP security mode.

```
switch(config)# ip security
```

2. To use IKE version 1, complete the following before completing the default IKE version the steps below.

```
switch(config)# ip security
switch(config-ipsec)# ike policy ike-peerRtr
switch(config-ipsec-ike)# version 1
```

3. Create an IKE Policy to be used to communicate with the peer to establish IKE. You have the option of configuring multiple IKE policies.

The default IKE Policy values are:

- **Encryption:** AES256 / AES128
- **Integrity:** SHA256 / SHA128
- **DH group:** Group 14
- **IKE lifetime:** 8 hours

```
switch(config-ipsec)# ike policy ike-router
switch(config-ipsec-ike)# encryption aes256
switch(config-ipsec-ike)# integrity sha256
switch(config-ipsec-ike)# dh-group 24
switch(config-ipsec-ike)# version 2
```

4. If the router is behind a NAT, configure the local-id with the local public IP address. The public IP corresponds to the underlying interface over which the IKE communications are done with the peer.

```
switch(config-ipsec-ike)# local-id <public ip address>
```

5. Create an IPsec Security Association policy to be used in the data path for encryption and integrity. Use the option of enabling Perfect Forward Secrecy by configuring a DH group to the SA. In this example, **AES256** is used for encryption, **SHA 256** is used for integrity, and Perfect Forward Secrecy is enabled (the DH group is 14).

```
switch(config-ipsec)# sa policy sa-vrouter
switch(config-ipsec-sa)# esp encryption aes256
switch(config-ipsec-sa)# esp integrity sha256
switch(config-ipsec-sa)# pfs dh-group 14
switch(config-ipsec-sa)# sa lifetime 2
switch(config-ipsec-sa)# exit
```

6. Bind or associate the IKE and SA policies together using an IPsec profile. Provide a shared-key, which must be common on both peers. The default profile assigns default values for all parameters that are not explicitly configured in the other profiles. In this example, the IKE Policy **ike-peerRtr** and SA Policy **sa-peerRtr** are applied to profile **peer-Rtr**. Dead Peer Detection is enabled and configured to delete the connection when the peer is down for more than **50** seconds. The peer **peer-Rtr** is set to be the responder.

```
switch(config-ipsec)# profile default
switch(config-ipsec-profile)# ike-policy ikedefault
switch(config-ipsec-profile)# sa-policy sadefault
switch(config-ipsec-profile)# shared-key arista
switch(config-ipsec-profile)# connection start
switch(config-ipsec)# profile vrouter
switch(config-ipsec-profile)# ike-policy ike-vrouter
switch(config-ipsec-profile)# sa-policy sa-vrouter
switch(config-ipsec-profile)# dpd 10 50 clear
switch(config-ipsec-profile)# connection add
```

7. Configure the WAN interface to be the underlying interface for the tunnel. You must specify an L3 address for the tunnel. If you do not, the switch cannot route packets using the tunnel.

```
switch(config)# interface E1
switch(config-if-E1)# no switchport
switch(config-if-E1)# ip address 1.0.0.1/24
switch(config-if-E1)# mtu 1500
```

8. Apply the IPsec profile to a new tunnel interface. You create the new tunnel interface as part of this step and configure the tunnel as a VTI IPsec tunnel. In this example, the new tunnel interface is **Tunnel0**. The new tunnel interface is configured to use IPsec. The other end of the tunnel also needs to be configured as a GRE-over-IPsec tunnel.

```
switch(config)# interface tunnel0
switch(config-if-Tu0)# ip address 1.0.3.1/24
switch(config-if-Tu0)# mtu 1394
switch(config-if-Tu0)# tunnel source 1.0.0.1
switch(config-if-Tu0)# tunnel destination 1.0.0.2
switch(config-if-Tu0)# tunnel ipsec profile vrouter
```

### Example Configuration

```
ip security
ike policy ikebranch1
integrity sha256
dh-group 15
!
sa policy sabranch1
sa lifetime 2
pfs dh-group 14
!
profile hq
mode tunnel
ike-policy ikebranch1
sa-policy sabranch1
connection add
shared-key keyAristaHq
dpd 10 50 clear
!
interface Tunnel1
mtu 1404
ip address 1.0.3.1/24
tunnel source 1.0.0.1
tunnel destination 1.0.0.2
tunnel ipsec profile hq
!
interface Ethernet1
no switchport
ip address 1.0.0.1/24
!
```

### 9.3.3.3.1 Displaying IPsec Information

- Use the `show ip security policy` command to display the IPsec policy information.

```
switch# show ip security policy
Policy Name Authentication Encryption Integrity Lifetime Rekey DH Group
ike-policy Pre-shared 256-bit AES 256bit Hash 8 hours False 3072 bit
```

- Use the `show ip security profile` command to display the IP security profile information.

```
switch# show ip security profile
Profile name IKE Policy Name SA
ipsec-profile ike-policy sa-policy
```

### 9.3.3.4 Configuring PKI

Configure PKI as a certificate-based authentication for the IPsec protocol.

#### Enabling PKI for an IKE Policy

Configure the authentication mode as PKI for the IKE policy. The IPsec refers to this policy when using PKI authentication.

Use the following commands to enable PKI authentication for the IKE policy, MyPKI:

```
switch(config)#ip security
switch(config-ipsec)#ike policy MyPolicy
switch(config-ipsec)#authentication pki
switch(config-ipsec)#exit
switch(config-ipsec)#show active
 ip security
 ike policy MyPolicy
 authentication pki
```

#### Configuring the PKI Profile

Configure the PKI profile used by an IPsec profile. This profile refers to the SSL profile for authentication.

```
switch(config)#ip security
switch(config-ipsec)#profile MyProfile
switch(config-ipsec)#pki-profile pki-abc
switch(config-ipsec)#ike-profile MyPKI
switch(config-ipsec)#exit
switch(config-ipsec)#show active
 profile MyProfile
 ...
 ike-policy MyPKI
 pki-profile pki-abc
 ...
!
```

When configuring IPsec, consider the following information:

- For PKI, each rekey performs reauthentication.
- DPS paths always use the VTEP-IP as the ID when configuring a local ID for each IKE policy.
- If the IKE policy does not have a local ID, the ID comes from the certificate subject name (SN).

- If the IKE policy has a local ID, the certificate used in the corresponding PKI profile should contain this ID in the Subject Alternative Names (SAN) field. If the local ID contains the FQDN, it must be present in the DNS or email field in the SAN depending on if the FQDN contains a domain address or email-ID.
  - Multiple connections on one device can use the same certificate by specifying all of the IDs for each connection in the certificate SAN.
- For tunnels sharing a common endpoint, use different certificates for each tunnel or configure a unique local ID for each tunnel. This avoids duplicate connections.

### Displaying PKI IPsec Information

Use the **show ip security policy** to display the authentication mode for security policies:

| Policy Name | Authentication |       |            | Crypto Suite | Encryption         |
|-------------|----------------|-------|------------|--------------|--------------------|
| Integrity   | Lifetime       | Rekey | DH Group   |              |                    |
| a           |                |       | Pre-shared | -            | 128-bit AES 256bit |
| Hash        | 8 hours        | False | 3072 bit   |              |                    |
| MyPKI       |                |       | PKI        | -            | 128-bit AES 256bit |
| Hash        | 8 hours        | False | 3072 bit   |              |                    |

Use the **show ip security profile** to display information about PKI profile configured for an IPsec profile.

| Profile name | IKE Policy Name | SA     |
|--------------|-----------------|--------|
| PKI Profile  |                 |        |
| MyPKI        | ike-xyz         | sa-xyz |
| pki-xyz      |                 |        |

#### 9.3.3.5 IPsec Commands

- [ike policy](#)
- [interface tunnel \(IPsec\)](#)
- [ip security](#)
- [profile \(IPsec\)](#)
- [sa policy](#)
- [show ip security applied-profile](#)
- [show ip security connection](#)
- [show ip security policy](#)
- [show ip security profile](#)
- [show ip security security-association](#)

---

### 9.3.3.5.1 ike policy

The **ike policy** command configures the Internet Security Association and Key Management Protocol on the switch and related policies. Configure the IKE policy in IP security configuration mode.

The **no ike policy** command deletes the IKE policy configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

#### Command Mode

IP Security Configuration

#### Command Syntax

```
ike policy policy-name
no ike policy policy-name
```

#### Parameters

- ***policy-name*** - Specify the IKE policy name.

The ***policy-name*** uses the following parameters to configure the policy after placing the in IKE policy configuration mode:

- **authentication** - Specify the authentication type.
- **crypto** - Specify a crypto algorithm suite type.
- **dh-group** - Specify the Diffie-Hellman Group value.
- **encryption** - Specify the encryption type.
- **ike-lifetime** - Sets the IkeLifetime for an ISAKMP security association. Specify a value in hours or minutes with a minimum of 10 minutes.
- **integrity** - Specify the Integrity algorithm.
- **local-id** - Specify the local IKE identification.
- **remote-id** - Specify the remote peer IKE identification.
- **version** - Specify the IKE version.

#### Example

This command configures the IKE policy MyIKEPolicy for IP security configuration.

```
switch(config)# ip security
switch(config-ipsec)# ike policy MyIKEPolicy
```

### 9.3.3.5.2 interface tunnel (IPsec)

The **interface tunnel** command places the switch in the Interface Tunnel Configuration Mode.

Interface tunnel configuration mode does not provide a group change mode. The **running-config** changes immediately after executing the commands.

The **no interface tunnel** command deletes the interface tunnel configuration.

The **exit** command returns the switch to the global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

**interface tunnel value**

**no interface tunnel value**

#### Parameter

**value** - Specify the tunnel interface number. The value ranges from **0** to **255**.

#### Example

This command places the switch in Interface Tunnel Configuration Mode with a tunnel value of **10**.

```
switch(config)# interface tunnel 10
switch(config-if-Tu10)#[/pre]
```

---

### 9.3.3.5.3 ip security

The **ip security** command places the switch in the IP Security Configuration Mode.

IP security configuration mode is not a group change mode. The **running-config** changes immediately after executing the commands.

The **no ip security** command deletes the IP security configuration.

The **exit** command returns the switch to the global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip security
no ip security
```

#### Example

This command places the switch in IP security configuration mode.

```
switch(config)# ip security
switch(config-ipsec)# ike policy IKE1
switch(config-ipsec-IKE1)# exit
switch(config-ipsec)# sa policy SA1
switch(config-SA1) #
```

#### 9.3.3.5.4 profile (IPsec)

The **profile** command configures the IP security profile on the switch. Configure the profile in IP security configuration mode.

The **no profile** command deletes the IP security profile configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

##### Command Mode

IP Security Configuration

##### Command Syntax

**profile profile-name**

**no profile profile-name**

##### Parameters

- **profile-name** Specifies the IP security profile name.

The following parameters can be configured in SA policy configuration mode:

- **connection** - Specify the type of IPsec Connection (Initiator/Responder/Dynamic).
- **dpd** - Specify the Dead Peer Detection in an interval between 2 and 3600 seconds.
- **flow** - Specify to set the flow in parallel.
- **ike-policy** - Specify the ISAKMP policy.
- **mode** - Specify the IP security mode type.
- **sa-policy** - Specify the name of the security association.
- **shared-key** - Specify a shared key value.

##### Example

This command configures the IP security profile test for IP security configuration.

```
switch(config)# ip security
switch(config-ipsec)# profile test
switch(config-ipsec-profile)#{
```

---

### 9.3.3.5.5 sa policy

The **sa policy** command specifies a Security Association (SA) policy used for IPsec configuration, and enters IP security SA policy configuration mode to configure the named policy.

The **no sa policy** command deletes the specified SA policy configuration from the switch.

The **exit** command returns the switch to the global configuration mode.

#### Command Mode

IP Security Configuration

#### Command Syntax

```
sa policy policy_name
no sa policy policy_name
```

#### Parameters

- ***policy\_name*** - Specifies the SA policy name.

Configure the following parameters in IP security SA policy configuration mode:

- **anti-replay** - Specify the IPsec duplicate IP datagram detection mode.
- **esp** - Specify the type of Encapsulation Security Payload.
- **pfs** - Add Perfect Forward Secrecy.
- **sa lifetime** - Specify a lifetime for the Security Association. Configure the lifetime in hours or minutes.

#### Example

This command applies the SA policy called **test** and adds a lifetime of 30 minutes for IP security and enters IP security SA policy configuration mode for the test policy.

```
switch(config)# sa policy test
switch(config-ipsec-sa)# sa lifetime 30 minutes
```

### 9.3.3.5.6 show ip security applied-profile

The **show ip security applied-profile** command displays the IP security profile names and the corresponding interfaces with the profile.

#### Command Mode

EXEC

#### Command Syntax

```
show ip security applied-profile
```

#### Example

This command displays the IP security **profile-1** and the corresponding interfaces with the profile.

```
switch# show ip sec applied-profile
Profile Name Interface
ipsec-profile-1 Tunnel1,
 Tunnel2,
 Tunnel3,
 Tunnel4,
 Tunnel5,
 Tunnel6,
 Tunnel7,
 Tunnel8,
 Tunnel9,
 Tunnel10,
 Tunnel11,
 Tunnel12,
 Tunnel13,
 Tunnel14,
 Tunnel15,
 Tunnel16,
 Tunnel17,
 Tunnel18,
 Tunnel19,
 Tunnel20,
 Tunnel21,
 Tunnel22,
 Tunnel23,
 Tunnel24,
 Tunnel25,
 Tunnel26,
```

### 9.3.3.5.7 show ip security connection

The **show ip security connection** command displays the IP security connection status information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip security connection
```

#### Example

These commands display the IP security connection status information.

```
switch# show ip sec conn tunnel 1
Tunnel Source Dest Status Uptime Input Output Rekey Time
Tunnell1 11.1.1.1 11.2.1.1 Established 19 hours 0 bytes 0 bytes 4 hours
 0 pkts 62937679 pkts

switch# show ip sec conn tunnel 1 detail
Tunnell1:
 source address 11.1.1.1, dest address 11.2.1.1
 state: Established
 uptime: 19 hours, 7 minutes, 23 seconds
 Inbound SPI 0xca5560f4:
 request id 193, mode tunnel replay-window 16384, seq 0x0
 stats errors:
 replay-window 0, replay 0, integrity_failed 0
 lifetime config:
 softlimit 4534352933249 bytes, hardlimit 6442450944000 bytes
 softlimit 2077499095 pkts, hardlimit 4000000000 pkts
 expire add soft 85619 secs, hard 86400 secs
 lifetime current:
 0 bytes, 0 pkts
 add time Mon May 13 17:33:54 2019, use time Mon May 13 17:33:54 2019
 Outbound SPI 0xc60da749:
 request id 193, mode tunnel replay-window 16384, seq 0x0
 stats errors:
 replay-window 0, replay 0, integrity_failed 0
 lifetime config:
 softlimit 3286021368749 bytes, hardlimit 6442450944000 bytes
 softlimit 2480571031 pkts, hardlimit 4000000000 pkts
 expire add soft 85418 secs, hard 86400 secs
 lifetime current:
 0 bytes, 62937679 pkts
 add time Mon May 13 17:33:54 2019, use time Mon May 13 18:06:42 2019
```

### 9.3.3.5.8 show ip security policy

The **show ip security policy** command displays the IP security policy information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip security policy
```

#### Example

This command displays IP security policy configuration information.

```
switch# show ip security policy
Policy Name Authentication Encryption Integrity Lifetime Rekey DH Group
ike-policy Pre-shared 256-bit AES 256bit Hash 8 hours False 3072 bit
```

---

### **9.3.3.5.9 show ip security profile**

The **show ip security profile** command displays the IP security profile information.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show ip security profile
```

#### **Example**

This command displays IP security profile configuration information.

```
switch# show ip security profile
Profile name IKE Policy Name SA
ipsec-profile ike-policy sa-policy
```

### 9.3.3.5.10 show ip security security-association

The **show ip security security-association** command displays the IP security SA information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip security security-association
```

#### Example

This command displays the IP security SA information.

```
switch# show ip sec security-association
SA Name ESP Encryption ESP Integrity Lifetime PFS Group
sa-policy-1 256-bit AES 256bit Hash 24 hours 2k bit
```

---

## 9.3.4 Macro-Segmentation Service (CVX)

Arista Macro-Segmentation Service (MSS) is a CloudVision-based service that supports the integration of vendor firewalls with the Arista network fabric.

Topics in this section include:

- [Overview](#)
- [How MSS Works](#)
- [Configuration](#)
- [MSS Integration with Check Point](#)
- [MSS for Layer 3 Firewall Enhancements](#)
- [MSS Commands](#)

### 9.3.4.1 Overview

The advent of contemporary networking features such as mobile applications and the Internet of Things (IoT) brings additional security challenges that are unprotected by legacy infrastructure. These security breaches cannot be handled by installing a firewall at the Internet edge. Arista Macro-Segmentation Service (MSS) addresses the security breach issue by securing access, protecting critical data, and ensuring end-user privacy.

Arista MSS is a CloudVision-based service that provides the point of integration between individual vendor firewalls or a firewall manager and the Arista network fabric. MSS supports flexibility on where to place the service devices and workloads: Physical-to-Physical (P-to-P) and Physical-to-Virtual (P-to-V).

MSS components include:

- Arista leaf-spine switch fabric.
- Arista CloudVision.
- Vendor firewall attached to a spine or service leaf switches. Different vendor firewalls can be attached to different switches to enhance scalability.

The component topology supports consistency in application deployment, scale, manageability, and scalability of the network and service layers. For details, see:

- [Benefits](#)
- [Terminology](#)
- [Usage Scenarios](#)

#### 9.3.4.1.1 Benefits

The key benefits include:

- MSS provides enhanced security between physical and virtual workloads in the data center.
- MSS's automatic and seamless service insertion ability eliminates manual traffic steering for workloads or tenants.
- MSS applies the security policies to the host and application throughout the network.
- MSS is flexible as there are no proprietary frame formats, tagging, or encapsulation.

### 9.3.4.1.2 Terminology

Familiarize with the following MSS terminology:

- **Intercept Switch/VTEP:** The TOR switch and VXLAN tunnel endpoint connected to the host, from which traffic gets intercepted. In the topology diagram, Intercept-1 and Intercept-2 are intercept switches.
- **Service Switch/VTEP:** The TOR switch and VXLAN tunnel endpoint connected to a firewall. In the topology diagram, Service-1 is the service switch.
- **VXLAN:** Virtual eXtensible LAN - a standards-based method of encapsulating Layer 2 traffic across a Layer 3 fabric.
- **CVX:** Arista CloudVision eXchange (CVX) is part of CloudVision and is a virtualized instance of the same Extensible Operating System (EOS) that runs on physical switches. It functions as a point of integration between customer firewalls or firewall policy managers and the Arista network to steer traffic to the firewall.

### 9.3.4.1.3 Usage Scenarios

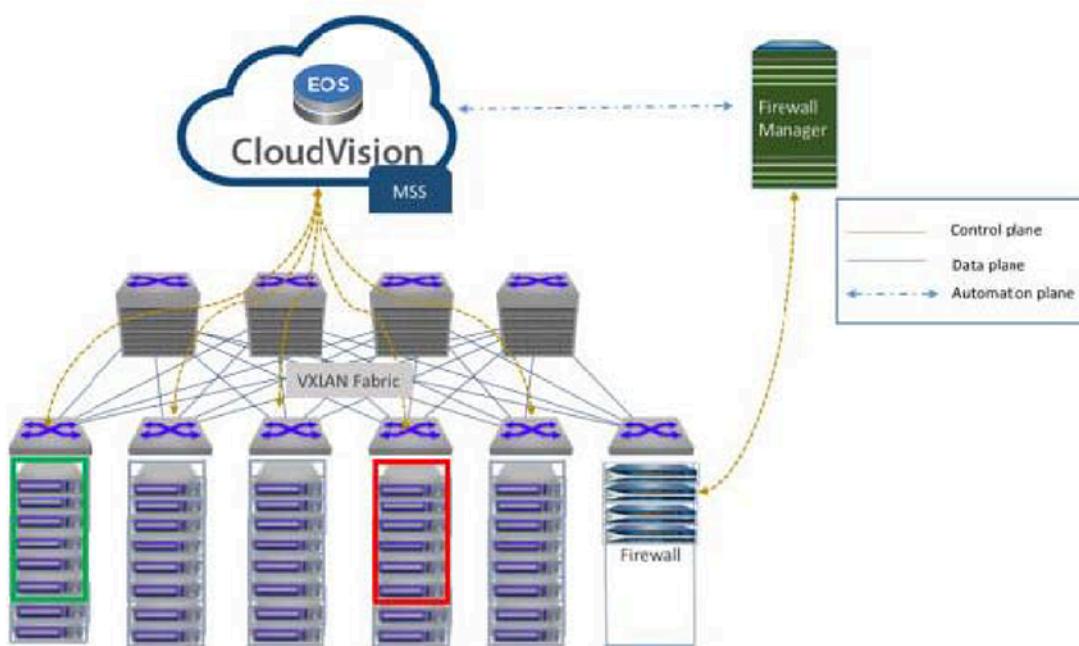

The following usage scenarios describe a few major security challenges in today's data center that are successfully handled by MSS.

#### 1. Securing server-to-server traffic.

This scenario provides information about the role of MSS in securing network traffic between physical-to-physical (P-to-P) and physical to virtual (P-to-V) servers. Prior to MSS, network infrastructure devices followed the firewall sandwich setup where firewalls were placed in line between the security zones. This setup would impact scalability and performance of the servers.

Using MSS, this restriction on firewall placement is reduced. Firewalls are now attached to a service leaf switch in the network fabric and they still protect hosts without concern about their physical location. The following topology demonstrates the usage scenario.

**Figure 9-11: Securing server-server traffic**

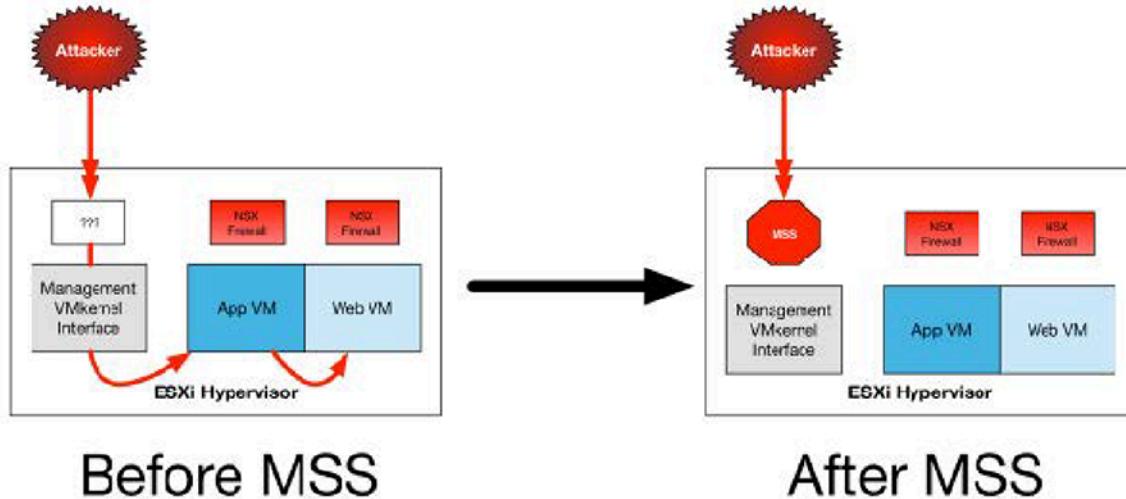

---

## 2. Monitoring and securing management traffic.

This usage scenario demonstrates how MSS successfully monitors and secures management interfaces in the data center.

The modern data center caters to managing the application, storage, virtualization, network, analytics and other layers. With virtualization, the hypervisor management also needs to be secured to prevent unwanted access to a hypervisor management interface. In the event of a rogue access, Arista's MSS protects management interfaces. The explicitly allowed hosts can gain access through a jump host or administrator end-user computing instances. The following topology diagram illustrates the role of MSS in a data center.

**Figure 9-12: Monitoring and Securing management traffic**

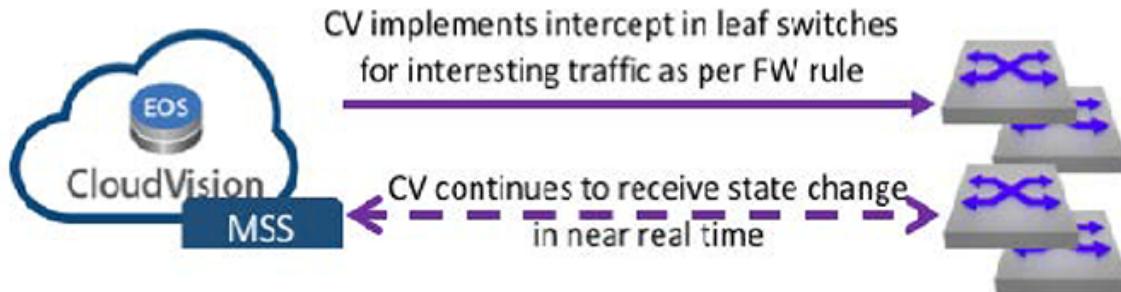

### 9.3.4.2 How MSS Works

The following steps provide information about how MSS works as a service in the data center.

1. MSS is enabled on the CloudVision eXchange (CVX) and the Arista switches are configured to stream their active state to CVX. This allows CVX to build a database of hosts and firewalls attached to the network and also to identify physical ports and IP addresses. CVX is also configured to communicate and synchronize policies from a vendor's firewall.
2. CVX sends a request to the firewall or firewall manager to provide information about the security policies which are tagged for MSS usage.

3. The MSS service on CVX determines the flow based forwarding rules to be pushed to the switches in the network.

**Figure 9-13: CVX intercept**

4. The leaf switch starts sending intercepted traffic to the service leaf when the intercept has been applied to the leaf switch.

**Figure 9-14: Leaf switches intercept**

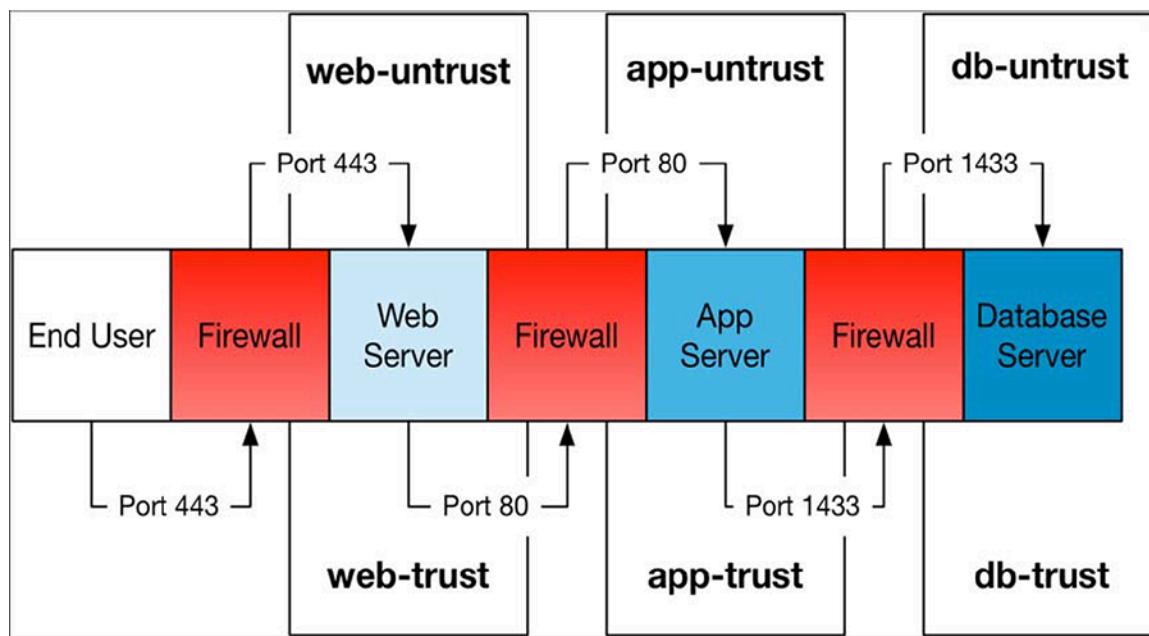

5. Traffic is forwarded completely unmodified to the firewall after it enters the service leaf where the firewall is attached. Based on the configuration policy, the firewall applies the required actions such as inspection, log, allow, or deny.
6. The service leaf switch sends the inspected traffic to its final destination or to the destination based on the firewall policy.

#### 9.3.4.3 Configuration

The following sections provide detailed information about MSS configuration, system requirements, recommendations, and limitations.

The traffic flow below is an example of a typical MSS deployment with a 3-tiered application. The goal of this design is to limit access between hosts in the following zones: web-untrust, app-untrust, db-untrust, web-trust, app-trust, and db-trust.

**Figure 9-15: Traffic flow in an MSS deployment**

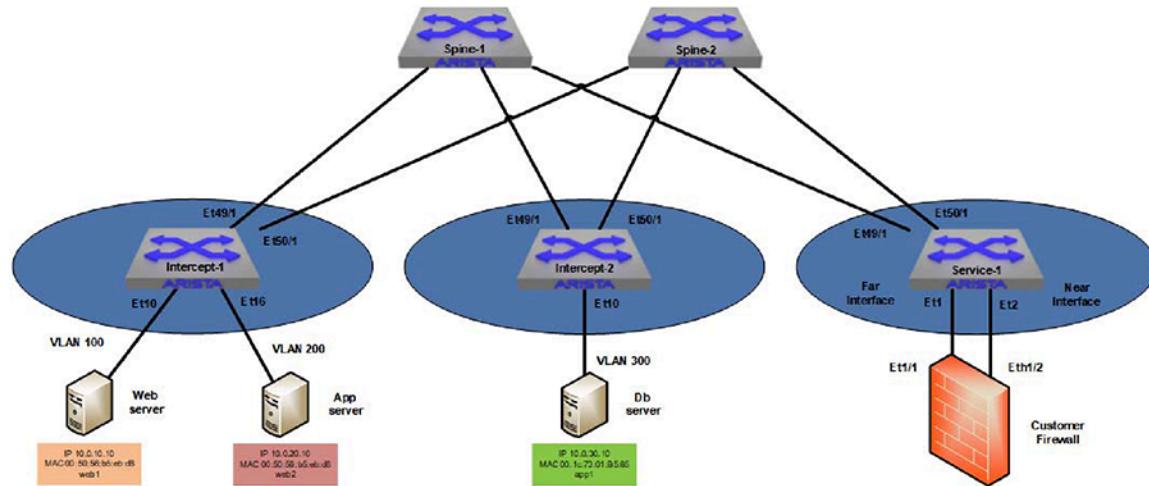

End users in the untrust zone access the web server through the TCP/443 port. Traffic flows through the active firewall to the web server interface in the web-untrust security zone. The web server interface in the web-trust security zone accesses the application server interface in the app-untrust security zone through port TCP/80 after traversing the firewall. From there, the application server interface in the app-trust security zone accesses the database through TCP/1433 in the db-untrust zone.

The following physical topology indicates the MSS setup.

The hosts are attached to a pair of intercept leaf switches. A firewall is connected to a service leaf switch using a pair of physical interfaces with a subinterface per zone or vWire.

**Figure 9-16: Physical Topology of the MSS**

- System Requirements
- Recommendations and Limitations

- [Configuring MSS](#)

#### **9.3.4.3.1 System Requirements**

The system requirements to effectively run MSS are listed below.

- Arista CloudVision eXchange (CVX).
- Arista 7280SR, 7280TR, 7280CR, 7020SR, 7020TR series switches; 7050X, 7050X2, 7060X, and 7060X2 series top of rack (TOR) switches.
- Connected to the hosts to intercept traffic from the firewall devices.
- The network must be a VXLAN-enabled fabric with CVX running the VXLAN Control Service (VCS) or EVPN.

#### **9.3.4.3.2 Recommendations and Limitations**

##### **Firewall**

The firewall policy name must not have any whitespace character in the name. As an example, ***PCI policy*** is an unacceptable policy name. An acceptable name would be ***PCI\_policy***.

#### **9.3.4.3.3 Configuring MSS**

These sections describe steps to configure MSS.

- [Deploying CVX](#)
- [Enabling the VXLAN Control Service on CVX](#)
- [Configuring the Access Switches and the Service Switch Ports](#)
- [Enabling DirectFlow on Access Switches and Service Switches](#)
- [Enabling VXLAN routing on the TOR switches](#)
- [Configuring MSS on CVX](#)
- [Configuring the Firewall](#)

##### **9.3.4.3.3.1 Deploying CVX**

Deploy CloudVision and configure the Arista TOR switches to connect to it. A CVX cluster of three instances with host names of ***cvx01***, ***cvx02***, and ***cvx03*** are configured as an example.

**Note:** As a best practice, always deploy the CV in a HA cluster with a minimum of three instances.

##### **9.3.4.3.3.2 Enabling the VXLAN Control Service on CVX**

Enable the VXLAN Control Service (VCS) on every CVX instance after the three Arista CVX instances have been deployed and the TOR switches are configured to be managed by them.

VCS allows hardware VXLAN Tunnel End Points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane.

##### **Example**

## CVX instance cvx01

```
cvx01 (config-cvx) # service VXLAN
cvx01 (config-cvx-VXLAN) # no shutdown
```

Similarly, VCS is enabled on the **cvx02** and **cvx03** devices.

### 9.3.4.3.3.3 Configuring the Access Switches and the Service Switch Ports

Configure the switch ports that are connected to the hosts, whose traffic should be steered to the firewalls and the service switch ports which are connected to the firewalls.

#### Access Switch Configuration

The switch ports connected to the hosts, whose traffic needs to be intercepted, need to be configured as 802.1q trunks with the VLAN that is mapped to the VNI requiring interception. Unique VLAN IDs are configured for each tier of the application.

#### Access Switch (Intercept-1)

```
intercept-1# configure
intercept-1(config)# interface et10
intercept-1(config-if-Et10)# description web server
intercept-1(config-if-Et10)# switchport mode trunk
intercept-1(config-if-Et10)# switchport trunk allowed vlan 100

intercept-1(config)# interface et16
intercept-1(config-if-Et16)# description app server
intercept-1(config-if-Et16)# switchport mode trunk
intercept-1(config-if-Et16)# switchport trunk allowed vlan 200
```

#### Access Switch (Intercept-2)

```
intercept-2# configure
intercept-2(config)# interface et10
intercept-2(config-if-Et10)# description db server
intercept-2(config-if-Et10)# switchport mode trunk
intercept-2(config-if-Et10)# switchport trunk allowed vlan 300
```

**Note:** For untagged traffic, configure a native VLAN on the port using the **switchport trunk native vlan** command.

#### Service Switch (Service-1)

```
service-1# configure
service-1(config)# interface port-channel 10
service-1(config-if-Po10)# description Far Interface
service-1(config-if-Po10)# switchport mode trunk
service-1(config-if-Po10)# switchport trunk allowed vlan none
service-1(config-if-Po10)# spanning-tree bpdufilter enable

service-1(config)# interface port-channel 20
service-1(config-if-Po20)# description Near Interface
service-1(config-if-Po20)# switchport mode trunk
service-1(config-if-Po20)# switchport trunk allowed vlan none
service-1(config-if-Po20)# spanning-tree bpdufilter enable
```

**Note:** Dynamically mapped VLANs are not shown in the switch port configuration. You can view them by running the **show vlan** command on the switch once a policy is applied.

#### 9.3.4.3.3.4 Enabling DirectFlow on Access Switches and Service Switches

Arista MSS uses DirectFlow to intercept traffic while the VXLAN is used to carry tunnel traffic from the intercepted host to the firewall and back. DirectFlow should be enabled on every intercept switch as well as the service switches.

##### Switch Service-1

```
service-1# configure
service-1(config)# directflow
service-1(config-directflow)# no shutdown
```

##### Switch Intercept-1

```
intercept-1# configure
intercept-1(config)# directflow
intercept-1(config-directflow)# no shutdown
```

##### Switch Intercept-2

```
intercept-2# configure
intercept-2(config)# directflow
intercept-2(config-directflow)# no shutdown
```

#### 9.3.4.3.3.5 Enabling VXLAN routing on the TOR switches

CVX uses Address Resolution Protocol (ARP) to determine where intercept hosts are physically located in the network. VXLAN routing should be configured on every TOR switch that will be intercepting traffic to ensure that CVX is aware of every host ARP entry.

The following configuration shows the routing configuration for each tier of the application, but not the entire VXLAN configuration. For more information on how to configure VXLAN and VXLAN routing, refer to the VXLAN section of the *Arista EOS Configuration Guide*.

##### Switch Intercept-1

```
intercept-1# configure
intercept-1(config)# ip routing
intercept-1(config)# interface vlan100
intercept-1(config-if-V1100)# ip address virtual 10.0.10.254/24
intercept-1(config)# interface vlan200
intercept-1(config-if-V1200)# ip address virtual 10.0.20.254/24
intercept-1(config)# interface vlan300
intercept-1(config-if-V1300)# ip address virtual 10.0.30.254/24
```

##### Switch Intercept-2

```
intercept-2# configure
intercept-2(config)# ip routing
intercept-2(config)# interface vlan100
intercept-2(config-if-V1100)# ip address virtual 10.0.10.254/24
intercept-2(config)# interface vlan200
intercept-2(config-if-V1200)# ip address virtual 10.0.20.254/24
intercept-2(config)# interface vlan300
intercept-2(config-if-V1300)# ip address virtual 10.0.30.254/24
```

##### Switch Service-1

```
service-1# configure
service-1(config)# ip routing
service-1(config)# interface vlan100
service-1(config-if-V1100)# ip address virtual 10.0.10.254/24
```

```
service-1(config)# interface vlan200
service-1(config-if-Vl200)# ip address virtual 10.0.20.254/24
service-1(config)# interface vlan300
service-1(config-if-Vl300)# ip address virtual 10.0.30.254/24
```

#### 9.3.4.3.3.6 Configuring MSS on CVX

This step enables configuring Arista MSS on CVX. The topology diagram depicts three CVX instances in a cluster and the configuration is the same for every instance. The active and standby vendor firewalls are configured. If Panorama is used, only Panorama should be configured.

##### Example

In the example, the primary vendor firewall has a DNS name of **fw-ha-node-1**. The standby firewall has a DNS name of **fw-ha-node-2**. The username and password are set as **admin**.

##### CVX instance cvx01

```
cvx01# configure
cvx01(config)# cvx
cvx01(config-cvx)# no shutdown
cvx01(config-cvx)# service mss
cvx01(config-cvx-mss)# no shutdown
cvx01(config-cvx-mss)# vni range 20000-30000
cvx01(config-cvx-mss)# dynamic device-set panfw1
cvx01(config-cvx-mss-panfw1)# tag Arista_MSS
cvx01(config-cvx-mss-panfw1)# type palo-alto firewall
cvx01(config-cvx-mss-panfw1)# state active
cvx01(config-cvx-mss-panfw1)# device fw-ha-node-1
cvx01(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0 admin
```

##### CVX instance cvx02

```
cvx02# configure
cvx02(config)# cvx
cvx02(config-cvx)# no shutdown
cvx02(config-cvx)# service mss
cvx02(config-cvx-mss)# no shutdown
cvx02(config-cvx-mss)# vni range 20000-30000
cvx02(config-cvx-mss)# dynamic device-set panfw1
cvx02(config-cvx-mss-panfw1)# tag Arista_MSS
cvx02(config-cvx-mss-panfw1)# type palo-alto firewall
cvx02(config-cvx-mss-panfw1)# state active
cvx02(config-cvx-mss-panfw1)# device fw-ha-node-1
cvx02(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0 admin
```

##### CVX instance cvx03

```
cvx03# configure
cvx03(config)# cvx
cvx03(config-cvx)# no shutdown
cvx03(config-cvx)# service mss
cvx03(config-cvx-mss)# no shutdown
cvx03(config-cvx-mss)# vni range 20000-30000
cvx03(config-cvx-mss)# dynamic device-set panfw1
cvx03(config-cvx-mss-panfw1)# tag Arista_MSS
cvx03(config-cvx-mss-panfw1)# type palo-alto firewall
cvx03(config-cvx-mss-panfw1)# state active
cvx03(config-cvx-mss-panfw1)# device fw-ha-node-1
cvx03(config-cvx-mss-panfw1-fw-ha-node-1)# username admin password 0 admin
```

### 9.3.4.3.3.7 Configuring the Firewall

Three policies are created in addition to the default implicit deny policy for inter-zone traffic. The implicit deny ensures that the inter-zone traffic is not allowed unless a policy explicitly allows for it.

The first policy **untrust\_to\_web1** is from the **untrust** zone to the **web1** zone, that allows HTTPS traffic from anywhere to the web server web.

The third policy **web2\_to\_app1** is from the **web2** zone to the **app1** zone that allows HTTP traffic between the web server web and the application server app.

The fifth policy **app2\_to\_db1** is from the **app2** zone to the **db1** zone that allows database traffic on port **TCP/1433** between the application server app and the database server db.

The second, fourth, and sixth policies prevent the firewall to drop a session for which does not see the initial connection to the protected resource. This could happen if the protected resource has not sent any traffic previous to this point.

Refer to the following images for more clarity about the above policies and interface configuration.

**Figure 9-17: Firewall Policy Configuration**

| Name                | Tags    | Type      | Source  |              |             | Destination  |           |                     | Rule Usage          |     |                     | Application | Service | Action |
|---------------------|---------|-----------|---------|--------------|-------------|--------------|-----------|---------------------|---------------------|-----|---------------------|-------------|---------|--------|
|                     |         |           | Zone    | Address      | Zone        | Address      | Hit Count | Last Hit            | First Hit           |     |                     |             |         |        |

| ethernet1/7       | Tap             |                    | up         | none         | none           |          | none                | none          |          |                         |
| ethernet1/8       | Layer2          |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/9       | Layer2          |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/10      | Aggregate (ae7) |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/11      | Aggregate (ae8) |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/12      | Aggregate (ae7) |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/13      | Aggregate (ae8) |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/14      | Tap             |                    | up         | none         | none           |          | none                | none          |          |                         |
| ethernet1/15      | Virtual Wire    |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/16      | Virtual Wire    |                    | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/17      | Layer3          | allow ping         | up         | none         | none           | Untagged | none                | none          |          |                         |
| ethernet1/17.1200 | Layer3          | allow ping         | up         | 199.2.0.2/21 | default        | 1200     | none                | vl 1200       |          |                         |
| ethernet1/17.1201 | Layer3          | allow ping         | up         | 199.2.8.2/21 | default        | 1201     | none                | vl 1201       |          |                         |

Create a rule that Arista MSS will use to intercept and redirect traffic and add a firewall policy with the default Arista\_MSS tag as shown in the example above. MSS intercepts all traffic from endpoints identified in policies that match the tag values configured in CVX. The firewall will apply all rules (tagged or untagged) to all traffic.

**Note:** LLDP should always be enabled on the firewall interfaces attached to the service switches. To minimize reconvergence time on the network changes, reduce the LLDP transmit interval and hold time multiples on the firewall, while keeping the LLDP hold time above the LLDP timer configured on the connected Arista switches.

Alternatively, the **device interface map** command can be used on CVX to manually map a device to Arista switch interfaces. To map multiple devices, add a mapping entry for each device.

```
dynamic device-set fw1
device dc-firewall-1
map device-interface ethernet1/1 switch 00:1c:73:7e:21:bb interface Ethernet1
map device-interface ethernet1/2 switch 00:1c:73:7e:21:bb interface Ethernet9
```

The first policy **untrust\_to\_web1** is from the untrust zone to the web1 zone, that allows HTTPS traffic from anywhere to the web server web.

The third policy **web2\_to\_app1** is from the web2 zone to the app1 zone that allows HTTP traffic between the web server web and the application server app.

The fifth policy **app2\_to\_db1** is from the app2 zone to the db1 zone that allows database traffic on port TCP/1433 between the application server app and the database server db.

The second, fourth, and sixth policies prevent the firewall to drop a session for which does not see the initial connection to the protected resource. This could happen if the protected resource has not sent any traffic previous to this point.

Refer to the following images for more clarity about the above policies and interface configuration.

**Figure 9-19: Firewall Policy Configuration**

| Name                | Tags    | Type      | Source       |              | Destination  |              | Rule Usage |                     |                     | Application | Service             | Action |

| aaa ethernet1/16      | Virtual Wire    |                    | online     | none         | none           | Untagged | none                | none          |          |                         |
| aaa ethernet1/17      | Layer3          | allow ping         | online     | none         | none           | Untagged | none                | none          |          |                         |
| aaa ethernet1/17.1200 | Layer3          | allow ping         | online     | 199.2.0.2/21 | default        | 1200     | none                | vl 1200       |          |                         |
| aaa ethernet1/17.1201 | Layer3          | allow ping         | online     | 199.2.8.2/21 | default        | 1201     | none                | vl 1201       |          |                         |

Create a rule that Arista MSS will use to intercept and redirect traffic and add a firewall policy with the default **Arista\_MSS** tag as shown in the example above. MSS intercepts all traffic from endpoints identified in policies that match the tag values configured in CVX. The firewall will apply all rules (tagged or untagged) to all traffic.

**Note:** LLDP should always be enabled on the firewall interfaces attached to the service switches. To minimize reconvergence time on the network changes, reduce the LLDP transmit interval and hold time multiples on the firewall, while keeping the LLDP hold time above the LLDP timer configured on the connected Arista switches.

Alternatively, the **device interface map** command can be used on CVX to manually map a device to Arista switch interfaces. To map multiple devices, add a mapping entry for each device.

```
dynamic device-set fwl
device dc-firewall-1
map device-interface ethernet1/1 switch 00:1c:73:7e:21:bb interface Ethernet1
map device-interface ethernet1/2 switch 00:1c:73:7e:21:bb interface Ethernet9
```

#### 9.3.4.4 MSS Integration with Check Point

Macro Segmentation Service (MSS) is configurable for Check Point Software Technologies (Check Point) Firewalls. The configuration and deployment requires the use of Check Point Management Server (Gaia), a security management platform which allows central management of Check Point gateway security devices.

##### Requirements

The following requirements apply to the deployment.

- **MSS version R80.30 version 1.5** and above and a special URL access on the Management Server using a Gateway API provided by Check Point.
- **Gateway version R80.30** with API version 1.2 and above.
- **Check Point Management Server release R31** and above.

---

## Configuration and Deployment

The following components of the solution require configuration:

- Check Point Gateway firewalls
- Check Point Management Server
- Arista leaf switches
- CVX

### Check Point Firewalls (Gateways)

#### Interface Configuration

Configure IPv4 addresses on the routed L3 interfaces on the firewall interfaces connected to the Arista TORs.

#### IPv4 Static Routes Configuration

Configure IPv4 static routes to include routes to all subnets of the hosts which MSS will be intercepting either using a WebUI or CLI as shown below. The nexthop gateway addresses are the gateway of the subnet to which the firewall interfaces. The static route information is used by MSS to identify which firewall interface is connected to the subnet to which the intercepted traffic needs to be forwarded.

```
set static-route 192.0.2.0/24 nexthop gateway address 192.0.2.155 on
```

The following displays the configuration.

```
gateway1> show route static
Codes: C - Connect ed, S - Static, R - RIP, B - BGP (D - Default),
 O - OSPF IntraArea (IA - InterArea, E - External, N - NSSA),
 A - Aggregate, K - Kernel Remnant, H - Hidden, P - Suppressed,
 U - Unreachable, i - Inactive

S 0.0.0.0/0 via 172.2.18.12, Mgmt, cost 0, age 3134690
S 10.6.10.0/24 via 10.6.100.2, eth1, cost 0, age 3134690
S 10.6.20.0/24 via 10.6.200.2, eth2, cost 0, age 3134690
```

### Check Point Management Server Configuration

The Check Point firewall devices intended to be used with Arista MSS must be registered and fully manageable via a Check Point Management Server.

- Identify or define a new security policy network layer to be considered by MSS where 'TestPolicy' is the security policy network layer that is referenced in the CVX configuration.
- Create firewall access rules (to be used by Arista MSS).
- In the access rule, the supported source and destination object types are Host, Network, and Security Zone.
- In the "Services & Applications," the following services are supported: 1: ICMP, IGMP, IPv4, TCP, EGP, UDP, IPv6, RSVP, GRE, OSPFIGP, SCTP.
- Add tags in the policy comments/description field in this format: "tags( <tag1>, <tag2>, ... )", e.g. "tags( Arista\_MSS1, Arista\_MSS2 )"
  - Arista MSS inspects management server access rules that have an embedded "tags( )" string in the comments field. Individual tags are extracted from within the enclosing parentheses and compared with the tags configured in the Arista MSS device-set on CVX.

### 1-to-1 HA Cluster Configuration

The following figure shows the 1-to-1 HA cluster. The HA interface pairs connected to the Arista switches should have Virtual IP addresses where the intercepted traffic will be forwarded. The active firewall sends out a GARP with its own MAC to indicate where traffic sent to the VIP should be forwarded.

## Arista Leaf Switches Configuration

The following configures the switch interfaces connected to the firewall.

```
switchport trunk native vlan <interface vlan>
switchport mode trunk
spanning-tree portfast
spanning-tree bpdufilter enable

interface Vlan<interface vlan>
 ip address virtual <interface IPv4 address>/<mask>
```

## CVX Configuration

The following displays the CVX configuration with Standalone Check Point firewall.

```
!! Standalone firewall
cvx
 no shutdown
 service mss
 no shutdown
 !
 dynamic device-set chkpt
 device <management-server-ip-or-dnsName>
 username admin password 7 PKigsm//o3IcnW5rgoZXWO==
 protocol https 4434 (or the configured https port like 443)
 group <management-server-network-layer>
 !
 device member <checkpoint-device-name>
 map device-interface eth1 switch 00:1c:73:7e:28:11 interface Ethernet39
 map device-interface eth2 switch 00:1c:73:7e:28:11 interface Ethernet40
 type check-point management-server
 policy tag offload Arista_MSS_offload
 policy tag redirect Arista_MSS
 state active
```

The checkpoint-device-name used in the **device member** command is the name used in the Management Server to identify that firewall. A sample CVX configuration with Check Point firewalls in 1-to-1 High Availability cluster configuration will include more than one device member as follows:

```
!! HA Active/Passive firewall pair
cvx
 no shutdown
 service mss
 no shutdown
 !
 dynamic device-set chkpt
 device <management-server-ip-or-dnsName>
 username admin password 7 PKigsm//o3IcnW5rgoZXWO==
 protocol https 4434 (or the configured https port like 443)
 group <management-server-network-layer>
 !
 device member <checkpoint-device1-name>
 map device-interface eth1 switch 00:1c:73:7e:28:11 interface Ethernet39
 map device-interface eth2 switch 00:1c:73:7e:28:11 interface Ethernet40
 device member <checkpoint-device2-name>
 map device-interface eth1 switch 00:1c:73:7e:28:11 interface Ethernet41
 map device-interface eth2 switch 00:1c:73:7e:28:11 interface Ethernet42
 type check-point management-server
 policy tag offload Arista_MSS_offload
 policy tag redirect Arista_MSS
 state active
```

### 9.3.4.5 MSS for Layer 3 Firewall Enhancements

The **verbatim** qualifier enhances the Macro Segmentation Service (MSS) with two policy actions: **redirect** and **offload**. For firewall policies tagged with the **redirect** tag, MSS extracts IP addresses from the policy and forwards all traffic destined to or generated from that set of IP addresses to the firewall. The additional **verbatim** tag, redirecting bidirectional traffic is restricted to the subset that matches the additional qualifiers of a firewall policy to a firewall (such as the source, destination IP addresses or subnets, protocol, L4 ports).

The **verbatim** tag can also be paired with the **offload** tag for a policy which installs necessary DirectFlow rules at the TORs to drop or allow the traffic matching the exact qualifiers in the policy definition. If the **verbatim** tag is not used with the offload tag, the behavior is to offload enforcement for all traffic matching the specific policy rule, while redirecting the remainder of the (non-matching) traffic to the firewall to ensure the security policy for the protected host remains in compliance. The addition of the **verbatim** tag removes this implicit redirection

#### Configuring for Verbatim Use

##### Firewall Configuration

The verbatim is a modifier of the original policy enforcement scheme and works with multiple firewalls such as those from Palo Alto Networks and Fortinet.

##### Policy Semantics

IP address extraction for **redirect** or **redirect** tag:

- If IP addresses are specified in source or destination field, Mss extracts those for redirection.
- If no IP addresses are specified, then Mss extracts the subnets corresponding to the source and destination zone for redirection.
- If no zones are specified, then Mss extracts all subnets in the **default** virtual-router for redirection.

Constraints on **offload** tag policies:

- Must have IP address specified in source or destination field if the corresponding zone is an **external** zone (zone towards default route).

Constraints on **redirect verbatim** tag policies:

- Must have IP address specified in source or destination field if the corresponding zone is an **external** zone (zone towards default route).
- Must have either zone or IP specified in both source and destination field. ‘Any’, ‘All’, or similar constructs are not supported for source or destination fields.

Policies with broadcast or multicast destination:

Only **offload** and **offloadverbatim** tags are supported for policies with IPv4 broadcast or IPv4 multicast destination.

##### CVX Configuration

The following configuration commands set 'tag-list' as the verbatim modifier on a per device basis for the **redirect** and **offload** tags.

```
CVX
 service mss
 dynamic device-set <device-set-name>
 device <device-name>
 [no | default] policy tag redirect <tag-list>
 [no | default] policy tag offload <tag-list>
 [no | default] policy tag modifier verbatim <tag-list>
```

## TCAM Profile Configuration

The following depicts a recommended TCAM profile to be used with MSS.

**Note:** This is an example for some of the devices that are currently supported.

```

hardware tcam

The following displays the profile. The platform does not support any arbitrarily created PMF profile. If the PMF profile cannot be programmed, the show command will print '**ERROR**' in the status column.

| switch# show hardware tcam profile |                         |                         |
|------------------------------------|-------------------------|-------------------------|
|                                    | Configuration           | Status                  |
| FixedSystem                        | direct-flow-mss13-VXLAN | direct-flow-mss13-VXLAN |

## Limitations

- DirectFlow needs to be enabled at the TOR so that the policies enforced by MSS are correctly programmed.
- *Group* option is available only for some switches.

- Deployments with a mix of switches require special considerations. The following table summarizes supported configurations in different deployment models.

**Table 9: Configuration Summary**

|                                                                                                                                                              |                 |                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| Both compute and service TORs:<br>DCS-7050X, DCS-7050X2, DCS-7050X3,<br>DCS-7060X, DCS-7060X2                                                                | group, verbatim | <ul style="list-style-type: none"> <li>redirect</li> <li>offload</li> <li>redirect, verbatim</li> <li>offload, verbatim</li> </ul> |
| Both compute and service TORs:<br>DCS-7020R, DCS-7280R, DCS-7280R2,<br>DCS-7500R, DCS-7500R2                                                                 | verbatim        | <ul style="list-style-type: none"> <li>redirect, verbatim</li> <li>offload, verbatim</li> </ul>                                    |
| Both compute and service TORs:<br>DCS-7050X, DCS-7050X2, DCS-7050X3,<br>DCS-7060X, DCS-7060X2, DCS-7020R,<br>DCS-7280R, DCS-7280R2, DCS-7500R,<br>DCS-7500R2 | verbatim        | <ul style="list-style-type: none"> <li>redirect, verbatim</li> <li>offload, verbatim</li> </ul>                                    |
| DCS-7050X, DCS-7050X2, DCS-7050X3,<br>DCS-7060X, DCS-7060X2 as compute<br>TOR and other series as service TOR (with<br>no intercepted hosts connected).      | group, verbatim | <ul style="list-style-type: none"> <li>redirect</li> <li>offload</li> <li>redirect, verbatim</li> <li>offload, verbatim</li> </ul> |

## Backward Compatibility and Other Considerations

For existing deployments, (where any of DCS-7020R, DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2 switch platforms are used in the service rack), in order to upgrade hitlessly, upgrade the CVX cluster first and execute the following command prior to upgrading EOS on any switch:

```
CVX
 service mss
 policy enforcement rules group verbatim
```

The command `[no|default] policy enforcement rules {group verbatim | verbatim}` disables / enables policy enforcement.

## Displaying CVX Status

The following displays the status of the mss policy.

```
switch# show service mss policy
<--snip-->
 Macro-Segmentation L3 Policy Table

### 9.3.4.6 MSS Commands

#### Configuration Commands

- [dynamic device-set](#)
- [exception device](#)
- [group](#)

- name-resolution interval (CVX-OpenStack)
- service mss
- state
- tag
- type palo-alto

### CVX Show Commands

- show service mss dynamic device-set
- show service mss policy
- show service mss status
- show service mss zone

### 9.3.4.6.1 dynamic device-set

The **dynamic device-set** command configures a device such as a firewall to communicate with the MSS in the MSS configuration mode.

The **no dynamic device-set** command removes a previously configured device from the MSS configuration and returns to the CVX mode.

#### Command Mode

MSS Configuration

#### Command Syntax

```
dynamic device-set device-set_name
no dynamic device-set device-set_name
```

#### Parameter

***device-set\_name*** a unique name for the device set.

#### Example

This example creates a set of firewalls with the name ***panfw1***.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
cvx(config-cvx-mss)# vni range 30000-40000
cvx(config-cvx-mss)# dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)#
cvx#
```

**Note:** The **vni range** command configures a range of VXLAN Network Identifiers (VNI) that MSS uses to tunnel traffic to the firewall. If VNI range is not configured, the default VNIs in the range of **1** to **16777214** are used.

### 9.3.4.6.2 exception device

The **exception device** command bypasses or continues redirecting traffic to service device such as a firewall if the service device control-plane API is unreachable after initial policies have been processed.

The no exception device command.

#### Command Mode

MSS Configuration

#### Command Syntax

```
exception device unreachable [bypass | redirect]
no exception device unreachable [bypass | redirect]
default exception device unreachable bypass
```

#### Parameters

- **bypass**: bypass the service device.
- **redirect**: continue redirecting traffic to the service device.

#### Example

This example redirects traffic to the service device.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
cvx(config-cvx-mss)# vni range 30000-40000
cvx(config-cvx-mss)# dynamic device-set fw
cvx(config-cvx-mss-fw)# device firewall-dc7
cvx(config-cvx-mss-fw)# username admin password 7 PKigsmo3IcnW5rqoZXWQ
cvx(config-cvx-mss-fw)# state active
cvx(config-cvx-mss-fw)# type palo-alto firewall
cvx(config-cvx-mss-fw)# exception device unreachable redirect
```

---

### 9.3.4.6.3 group

The **group** command configures the Panorama device group name to be used with MSS.

The no group command removes the group from the MSS configuration when the Panorama firewall manager is used.

See the type Palo-Alto command for more information about the firewall manager.

#### Command Mode

Device-set mode

#### Command Syntax

group *group\_name*

no group *group\_name*

#### Parameters

*group\_name* the name of the group.

#### Example

This command configures the group name as **mssDevices**.

```
cvx(config)# cvx
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# dynamic device-set pano2
cvx(config-cvx-mss-pano2)# type palo-alto panorama
cvx(config-cvx-mss-pano2)# device myPanorama
cvx(config-cvx-mss-pano2-myPanorama)# group mssDevices
```

#### 9.3.4.6.4 name-resolution interval (CVX-OpenStack)

The **name-resolution interval** command specifies the period between consecutive requests that the OpenStack controller sends to the Keystone service for VM and tenant name updates. Keystone is OpenStack's authentication and authorization service.

The default period is **21600** seconds (6 hours).

The name-resolution force (CVX-OpenStack) command performs an immediate update, as opposed to waiting for the periodic update.

##### Command Mode

CVX-OpenStack Configuration

##### Command Syntax

```
name-resolution interval period
```

##### Parameters

**period:** Keystone identity service polling interval (seconds).

##### Comment

**service openstack** places the switch in **CVX-OpenStack** configuration mode.

##### Example

These commands set the name resolution interval period at five hours.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# name-resolution interval 18000
switch(config-cvx-openstack)#

```

---

#### 9.3.4.6.5 service mss

The **service mss** command enters the MSS configuration sub-mode.

The **no service mss** command exits the MSS configuration mode and returns to the CVX mode.

#### Command Mode

CVX Configuration

#### Command Syntax

```
service mss
no service mss
default service mss
```

#### Example

This example enables MSS on CVX and enters the MSS config mode.

**Note:** The **no shutdown** command enables MSS on the CloudVision eXchange (CVX).

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
```

### 9.3.4.6.6 show service mss dynamic device-set

The **show service mss dynamic device-set** command displays detailed information about a specific service device set. Information such as device group members, high availability, network, resource details are displayed.

**Note:** Interfaces from multiple switches can be placed in the same zone by the device.

#### Command Mode

EXEC

CVX Configuration

#### Command Syntax

```
show service mss dynamic device-set device_set_name [device device_name [group-members | high-availability | neighbors | network | policies | resources]]
```

#### Parameters

- ***device\_set\_name*** defines the device set name.
- **device *device name*** defines the service device properties such as the DNS hostname or IP address of the service device.
- **group members** lists device-group members for an aggregation manager.
- **high-availability** displays service device high availability information.
- **neighbors** displays the service devices ethernet interface neighbor information.
- **network** displays the service devices network interface information.
- **policies** displays the list of policies read from service device that have the MSS tag.
- **resources** displays the service devices system resource information.

#### Related Commands

- [show service mss status](#)
- [show service mss policy](#)

#### Examples

- This command displays information about interfaces that are placed in a zone by the ***device1***.

```
switch# show service mss zone
Source: static

Device: device1
```

- This command displays information about interfaces that are placed in a zone by the ***device1***.

```
switch# show service mss zone
Source: static

Device: device1
Zone: zone1
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet1/1
Allowed VLAN: 1000-1010
Port-Channel2/1:
Allowed VLAN: 1000-2000
Switch: 00:00:00:00:00:02
Hostname: switch2.arista.com
```

---

```
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Zone: zone2
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Ethernet 20/1
Allowed VLAN: 1000-2000
```

### 9.3.4.6.7 show service mss policy

The **show service mss policy** command displays generic information about the configuration and operational state of the macro-segmentation service (MSS) policies on a device.

#### Command Mode

EXEC

CVX Configuration

#### Command Syntax

```
show service mss policy [[device device_name][name policy-name][source (static | plugin_name)]]
```

#### Parameters

- **device *device name*** defines the service device name.
- **name *policy-name*** the filter policy name.
- **source** the source of the policy.
- **static** the policy configured using the command line interface.
- ***plugin\_name*** the service device type.

#### Related Commands

- [show service mss status](#)
- [show service mss zone](#)

#### Example

This command displays information about the MSS policy **policy1** enabled on the device.

| Source | Device   | Policy | Config  | Status              |
|--------|----------|--------|---------|---------------------|
| vendor | Firewall | pan100 | policy1 | Enabled Initialized |

The **Config** column indicates the configuration state of a policy. The different states are: **Enabled**, **dry run**, and **disabled** states.

The **Status** column indicates the operational state of a policy. The different status types are **initialized**, **pending**, **initializing**, **active**, **reinitializing**, **dry-run Complete**, and **deactivating**.

---

### 9.3.4.6.8 show service mss status

The **show service mss status** command displays the status of a macro-segmentation service (MSS) on the device.

#### Command Mode

EXEC

CVX Configuration

#### Command Syntax

```
show service mss status
```

#### Related Commands

- [show service mss policy](#)
- [show service mss zone](#)

#### Examples

- This command displays the MSS status on the device as Enabled.

```
switch# show service mss status
State: Enabled
Service VNIs: 1500-1600,1800,1900-2000
```

- This command displays the MSS status on the device as Disabled.

```
switch# show service mss status
State: Disabled
Service VNIs: 1-16777214
```

### 9.3.4.6.9 show service mss zone

The **show service mss zone** command displays information about the interfaces that are placed in a single zone by the service device. Along with the **show service mss policy** command, we can use this command to identify issues with the policy configuration.

Interfaces from multiple switches can be placed in the same zone by the device.

#### Command Mode

EXEC

CVX Configuration

#### Command Syntax

```
show service mss zone [[device device_name][[name zone_name]][[source (static | dynamic_source)]]]
```

#### Parameters

- **device *device name*** defines the service device properties.
- **name *policy-name*** the filter zone name.
- **source** the source of the zone.
- **static** the zone configured using the command line interface.
- **dynamic\_source** the service device type.

#### Related Commands

- [show service mss status](#)
- [show service mss policy](#)

#### Example

This command displays information about interfaces that are placed in a zone by the **device1**.

```
switch# show service mss zone
Source: static

Device: device1
Zone: zone1
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet1/1
Allowed VLAN: 1000-1010
Port-Channel2/1:
Allowed VLAN: 1000-2000
Switch: 00:00:00:00:00:02
Hostname: switch2.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Zone: zone2
Switch: 00:00:00:00:00:01
Hostname: switch1.arista.com
Interfaces:
Ethernet10/1
Allowed VLAN: 1000-1010
Ethernet 20/1
Allowed VLAN: 1000-2000
```

---

#### 9.3.4.6.10 state

The **state** command configures device set as active or disabled or suspended state.

The no state command disables the previously configured state of the device set.

#### Command Mode

MSS Configuration

#### Command Syntax

```
state [active | shutdown | suspend]
```

```
no state
```

#### Parameters

- **active**: the active state of the device set. Policy monitoring and network traffic redirection are enabled.
- **shutdown**: the disabled state of the device set. Policy monitoring and network traffic redirection is stopped.
- **suspend**: the suspended state of the device set. Policy monitoring is suspended but there is no change in the existing traffic redirection.

#### Example

This output example configures the device set state as active.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
cvx(config-cvx-mss)# vni range 30000-40000
cvx(config-cvx-mss)# dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)# tag Arista_MSS
cvx(config-cvx-mss-panfw1)# type palo-alto firewall
cvx(config-cvx-mss-panfw1)# state active
```

### 9.3.4.6.11 tag

The **tag** command specifies the tag or tags that MSS searches when it is reading the security policy from the firewall or firewall manager in the **dynamic device-set** configuration mode. You can specify more than one tag as well.

The no tag command removes the tag from the MSS configuration.

**Note:** The tag specified should always match with the firewall policy tags in the vendor firewall policy for the MSS to read the policy and set up the intercept.

#### Command Mode

MSS Configuration

#### Command Syntax

tag *tag\_name*

no tag

default tag

#### Parameter

**tag\_name:** a unique name for the tag.

#### Examples

- This command specifies the tag with the name **Arista\_MSS**.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
cvx(config-cvx-mss)# vni range 30000-40000
cvx(config-cvx-mss)# dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)# tag Arista_MSS
```

- This command specifies multiple tags with names **mss1**, **mss2**, and **mss3**.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# no shutdown
cvx(config-cvx-mss)# vni range 30000-40000
cvx(config-cvx-mss)# dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)# tag mss1 mss2 mss3
```

### 9.3.4.6.12 type palo-alto

The **type palo-alto** command configures the firewall type to be used in the MSS configuration.

The **no type palo-alto** command disables the firewall type from the MSS configuration.

#### Command Mode

MSS Configuration

#### Command Syntax

```
type palo-alto [firewall | panorama]
no type palo-alto
```

#### Parameters

- **firewall**: the Palo Alto Networks firewall.
- **panorama**: the Palo Alto Networks Panorama firewall manager.

#### Example

This command configures the Palo Alto Networks firewall type.

```
cvx# configure
cvx(config)# cvx
cvx(config-cvx)# service mss
cvx(config-cvx-mss)# dynamic device-set panfw1
cvx(config-cvx-mss-panfw1)# type palo-alto firewall
```

## Quality of Service and Traffic Management

---

This chapter describes Arista's Quality of Service (QoS) implementation and Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Quality of Service](#)
- [Traffic Management](#)

### 10.1 Quality of Service

This chapter describes the EOS Quality of Service (QoS) implementation, including configuration instructions and command descriptions. Topics covered by this chapter include the following:

- [Quality of Service Conceptual Overview](#)
- [QoS Configuration: Platform-Independent Features](#)
- [QoS Configuration: Arad Platform Switches](#)
- [QoS Configuration: Jericho Platform Switches](#)
- [QoS Configuration: FM6000 Platform Switches](#)
- [QoS Configuration: Petra Platform Switches](#)
- [QoS Configuration: Trident and Tomahawk Platform Switches](#)
- [QoS Configuration: Trident II and Helix Platform Switches](#)
- [Support for Configuring Color Extended Communities](#)
- [ACL based QoS Configuration](#)
- [Configuring IPv6 Flow Label Matches for QoS](#)
- [Differentiated MMU Discard Counters](#)
- [txQueue Percentage-based Shaping](#)
- [Configuring Round Robin Scheduling on Shaped Subinterfaces](#)
- [Explicit Congestion Notification \(ECN\)](#)
- [Latency-based Explicit Congestion Notification](#)
- [Configuring a Low Latency Transmit Queue Scheduler Profile](#)
- [Quality of Service Configuration Commands](#)
- [Chipset Mapping for QoS](#)

#### 10.1.1 Quality of Service Conceptual Overview

QoS processes apply to traffic that flows through Ethernet ports and control planes. These processes can modify data fields (CoS or DSCP) or assign data streams to traffic classes for prioritized handling. Transmission queues are configurable for individual Ethernet ports to shape traffic based on its traffic class. Many switches also support traffic policies that apply to data that is filtered by access control lists.

The following sections describe QoS features:

- [Identifying the Switch Platform](#)
- [QoS Data Fields and Traffic Classes](#)

- 
- Transmit Queues and Port Shaping
  - Explicit Congestion Notification (ECN)
  - ACL Policing
  - Quality of Service (QoS) Profiles

#### 10.1.1.1 Identifying the Switch Platform

QoS configuration varies significantly by switch platform. A list of Arista switch model numbers and their corresponding switch platforms (chipsets) can be found in the [Chipset Mapping for QoS](#).

On some switches, the platform can also be determined by entering `platform ?` in the CLI.

##### Example

This command shows that the example switch is running on the Trident platform.

```
switch(config)# platform ?
 trident Trident chip
switch(config) #
```

#### 10.1.1.2 QoS Data Fields and Traffic Classes

Quality of Service (QoS) defines a method of differentiating data streams to provide varying levels of service to the different streams.

Criteria determining a packet's priority level include packet field contents and the port where data packets are received. QoS settings are translated into traffic classes, which are then used by switches to manage all traffic flows. Traffic flow management varies with each switch platform.

##### 10.1.1.2.1 QoS Data Fields

Quality of service decisions are based on the contents of the following packet fields:

- CoS (three bits): Class of service (CoS) is a 3-bit field in Ethernet frame headers using VLAN tagging. The field specifies a priority value between zero and seven. Class of service operates at Layer 2.
- DSCP (six bits): Differentiated Service Code Point (DSCP) is a 6-bit field in the Type Of Service (TOS) field of IP packet headers.

##### 10.1.1.2.2 Port Settings – Trust Mode and Traffic Class

Ethernet and port channel interfaces support three QoS trust modes:

- **CoS Trust:** Ports use inbound packet CoS field contents to derive the traffic class.
- **DSCP Trust:** Ports use inbound packets DSCP field contents to derive the traffic class.
- **Untrusted:** Ports use their default values to derive the traffic class, ignoring packet contents.

The default mode setting is **CoS trust** for switched ports and **DSCP trust** for routed ports.

Ports are associated with default CoS, DSCP, and traffic class settings; defaults vary by platform.

These sections describe procedures for configuring port settings:

- [CoS and DSCP Port Settings – Arad Platform Switches](#)

- CoS and DSCP Port Settings – FM6000 Platform Switches
- CoS and DSCP Port Settings – Petra Platform Switches
- CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches
- CoS and DSCP Port Settings – Trident II and Helix Platform Switches

#### 10.1.1.2.3 Rewriting CoS and DSCP

##### **CoS Rewrite**

Switches can rewrite the CoS field for outbound tagged packets. The new CoS value is configurable, and is derived from a data stream's traffic class as specified by the traffic class-to-CoS rewrite map. CoS rewrite is disabled on all the traffic received on CoS trusted ports.

On Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, CoS rewrite can be enabled or disabled on DSCP trusted ports and untrusted ports.

- CoS rewrite is globally enabled by default for packets received on untrusted ports and DSCP trusted ports if at least one port is explicitly configured in **DSCP trust** or **untrusted** mode.
- CoS rewrite is globally disabled by default for packets received on untrusted ports and DSCP trusted ports if there are no ports explicitly configured in **DSCP trust** or **untrusted** mode.

On Petra platform switches, CoS rewrite is always enabled on DSCP trusted ports and untrusted ports.

##### **DSCP Rewrite**

Switches can rewrite the DSCP field for outbound IP packets. On FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, DSCP rewrite is disabled by default on all ports and always disabled for traffic received on DSCP trusted ports. On Petra, Arad, and Jericho platform switches, DSCP rewrite is always disabled.

FM6000, Trident and Tomahawk, Trident II, and Helix platform switches provide a command that enables or disables DSCP rewrite for packets received on CoS trusted ports and untrusted ports. The new DSCP value is configurable, based on the data stream's traffic class, as specified by the traffic class-to-DSCP rewrite map.

These sections describe procedures for rewriting CoS and DSCP fields:

- [CoS Rewrite – Arad Platform Switches](#)
- [CoS and DSCP Rewrite – FM6000 Platform Switches](#)
- [CoS Rewrite – Petra Platform Switches](#)
- [CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches](#)
- [CoS and DSCP Rewrite – Trident II and Helix Platform Switches](#)

#### 10.1.1.2.4 Traffic Classes

Data stream distribution is based on their traffic classes. Data stream management varies by switch platform. Traffic classes are derived from these data stream, inbound port, and switch attributes:

- CoS field contents.
- DSCP field contents.
- Inbound port trust setting.
- CoS default setting (Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches).
- DSCP default setting (Arad, Jericho, FM6000, Trident and Tomahawk, and Trident II platform switches).
- Traffic class default setting (Petra platform switches).

---

When a port is configured to derive a data stream's traffic class from the CoS or DSCP value associated with the stream, the traffic class is determined from a conversion map.

- A CoS-to-traffic class map derives a traffic class from a CoS value.
- A DSCP-to-traffic class map derives a traffic class from a DSCP value.

Map entries are configurable through CLI commands. Default maps determine the traffic class value when CLI map entry commands are not configured. Default maps vary by switch platform.

These sections describe traffic class configuration procedures:

- [Traffic Class Derivations – Arad Platform Switches](#)
- [Traffic Class Derivations – Jericho Platform Switches](#)
- [Traffic Class Derivations – FM6000 Platform Switches](#)
- [Traffic Class Derivations – Petra Platform Switches](#)
- [Traffic Class Derivations – Trident and Tomahawk Platform Switches](#)
- [Traffic Class Derivations – Trident II and Helix Platform Switches](#)

#### 10.1.1.3 Transmit Queues and Port Shaping

Transmit queues are logical partitions of an Ethernet port's egress bandwidth. Data streams are assigned to queues based on their traffic class, then sent as scheduled by port and transmit settings. Support varies by switch platform. A queue's label determines its priority: queues with the suffix **0** have the lowest priority.

Parameters that determine transmission schedules include:

- **Traffic class-to-transmit queue** mapping determines the transmit queue for transmitting data streams based on traffic class. The set of available transmit maps vary by switch platforms:
  - **Arad, Jericho, FM6000, Trident II, and Helix platforms:** one map for all unicast and multicast traffic.
  - **Trident and Tomahawk platform:** one map for unicast traffic and one map for multicast traffic.
  - **Petra platform:** one map for unicast traffic. Queue shaping is not available for multicast traffic.
- **Port shaping** specifies a port's maximum egress bandwidth.
- **Queue shaping** specifies a transmit queue's maximum egress bandwidth, and implementation varies by platform.
  - **Trident and Tomahawk platform:** queue shaping is configurable separately for unicast and multicast queues.
  - **Trident II platform:** queue shaping is configurable for transmit queues. Port shaping and queue shaping are supported only in store-and-forward switching mode.
  - **Petra platform:** queue shaping is not available for multicast traffic.
  - **Helix platform:** queue shaping is configurable for transmit queues.
  - **FM6000 platform:** switches do not support simultaneous port shaping and queue shaping. Enabling port shaping on an FM6000 switch disables queue shaping, regardless of the previous configuration.
- **Guaranteed bandwidth** guarantees the allocation of a specified bandwidth for a transmit queue. Guaranteed bandwidth is supported only on Trident II platforms.
- **Queue priority** specifies the priority at which a transmit queue is serviced. The switch defines two queue priority types:
  - **Strict priority queues** are serviced in the order of their priority rank - subject to each queue's configured maximum bandwidth. Data is not handled for a queue until all queues with higher priority are emptied or their transmission limit is reached. These queues typically carry low latency real time traffic and require highest available priority.

- **Round robin queues** are serviced simultaneously subject to assigned bandwidth percentage and configured maximum bandwidth. All round robin queues have lower priority than strict priority queues. Round robin queues can be starved by strict priority queues.
- **Queue scheduling** determines how packets from different transmit queues are serviced to be sent out on the port.
- **Queue bandwidth allocation** specifies the time slice (percentage) assigned to a round robin queue, relative to all other round robin queues.

These sections describe transmit queue and port shaping configuration procedures:

- [Transmit Queues and Port Shaping – Arad Platform Switches](#)
- [Transmit Queues and Port Shaping – Jericho Platform Switches](#)
- [Transmit Queues and Port Shaping – FM6000 Platform Switches](#)
- [Transmit Queues and Port Shaping – Petra Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident and Tomahawk Platform](#)
- [Transmit Queues and Port Shaping – Trident II and Helix Platform Switches](#)

#### 10.1.1.4 Explicit Congestion Notification (ECN)

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

##### 10.1.1.4.1 ECN Conceptual Overview

The ECN field in the IP header (bits 6 and 7 in the IPv4 TOS or IPv6 traffic class octet) advertises ECN capabilities:

- **00:** Router does not support ECN.
- **10:** Router supports ECN.
- **01:** Router supports ECN.
- **11:** Congestion encountered.

Networks typically signal congestion by dropping packets. After an ECN-capable host negotiates ECN, it signals impending congestion by marking the IP header of packets encountering the congestion instead of dropping the packets. The recipient echoes the congestion indication back to the sender, which reduces its transmission rate as if it had detected a dropped packet.

Switches support ECN for unicast queues through Weighted Random Early Detection (WRED), an Active Queue Management (AQM) algorithm that extends Random Early Detection (RED) to define multiple thresholds for an individual queue. WRED determines congestion by comparing average queue size with queue thresholds. Average queue size depends on the previous average and current queue size:

- average queue size =  $(\text{old\_avg} * (1-2^{(-\text{weight})})) + (\text{current\_queue\_size} * 2^{(-\text{weight})})$
- where weight is the exponential weight factor used for averaging the queue size.
- Packets are marked based on WRED as follows:

- 
- If average queue size is below the minimum threshold, packets are queued as in normal operation without ECN.
  - If average queue size is greater than the maximum threshold, packets are marked for congestion.
  - If average queue size is between minimum and maximum queue threshold, packets are either queued or marked. The proportion of packets that are marked increases linearly from 0% at the minimum threshold to 100% at the maximum threshold.

Treatment of packets marked as not ECN capable varies by platform.

These sections describe ECN configuration procedures:

- [ECN Configuration – Arad Platform Switches](#)
- [ECN Configuration – Trident and Tomahawk Platform Switches](#)

#### 10.1.1.5 ACL Policing

ACL policing monitors the ingress data rates for a particular class of traffic and performs the action configured when the traffic exceeds the user configured value. Therefore, it allows the user to control ingress bandwidth based on packet classification. The incoming traffic is metered and marked by the policing, and based on the metering results the actions are performed.

ACL policing uses a token bucket shaping algorithm for packet transmission. Packets are eligible for transmission when token count is positive, and when token count is negative the next packet will have to wait until the token count turns positive again. The tokens are renewed at 96ns time interval (Tc). The tokens are collected in the policer bucket up to a max burst size of 16KB, and any traffic beyond this shape rate and burst size is buffered in the shared memory. The packets are dropped if there is a memory overflow.

**Note:** The policer bucket is refilled at a sweeper period of 0.333 millisecond. This is applicable for all the platforms.

For example, let us assume that shaping is not enabled, and the link is at 10 Gbps, that is 1.25 bytes/nsec. In such case each refill cycle will add tokens worth 120 bytes. For a shape rate of 500 Mbps, each refill cycle will add 6 bytes. And for 64 byte worth of tokens we need around 11 refill cycles = 1us. A 64 byte packet coming immediately after a jumbo frame will have to wait longer compared to a jumbo frame coming after 64 byte packet.

Token size depends on the interface speed, following the last example:

- For 10 Gbps, each refill cycle will add tokens worth 120 bytes.
- For 1 Gbps, each refill cycle will add tokens worth 12 bytes.

At lower shaping rates (less than 10 Mbps), granularity and rounding errors may alter the actual shaping rate by 20% from the specified rate, and the rounding errors are much less at higher speeds. For example, At 100 Mbps you will see 98.9 Mbps configured in hardware. User can use the `show qos interfaces` command to verify the interface speed.

The policing uses three types of traffic metering and coloring mechanisms.

- **Single Rate Two Color Marker**
- **Single Rate Three Color Marker**
- **Two Rate Three Color Marker**

##### **Single Rate Two Color Marker**

It meters the packet stream and marks packets based on committed burst size (bc) and excess burst size (be).

### Single Rate Three Color Marker

It meters the packet stream and marks packets based on single rate committed information rate (cir), and committed burst size (bc) and excess burst size (be). The packets are marked in green if it does not exceed the set burst size, and marked in yellow if it does exceed the burst size but not the excess burst size, and marked red otherwise. The packets are marked in two color modes.

- **Color-blind Mode:** In color-blind mode the incoming packet color is ignored.
- **Color-aware Mode:** In color-aware mode it is assumed that incoming packet is colored by preceding entity. And, in color-aware mode, a packet never get better than it was. If the input color of the packet is green, it can be marked as green, yellow, or red. But if the input color is yellow, then it can be marked only yellow or red.

### Two Rate Three Color Marker

It meters the packet stream and marks its packets based on two rates, peak information rate (pir) and committed information rate (cir), and associated burst sizes (bc and be). The packet is marked red if rate exceeds 'pir', and yellow if it exceeds 'cir' but not 'pir' and marked green if rate is lower than 'cir'. The two rate mode is configured by setting four parameters pir, cir, bc, and be.

The ACL policing is supported on platforms specified in the table below.

**Table 10: ACL Policing Support Matrix**

| Platform Supported | ACL Policing | ACL Policing on LAG Interface |
|--------------------|--------------|-------------------------------|
| Trident            | Yes          | Yes                           |
| Trident II         | Yes          | Yes                           |
| Trident+           | Yes          | Yes                           |
| FM6000             | Yes          | Yes                           |
| Arad               | Yes          | Only Per-Port                 |
| Jericho            | Yes          | Yes                           |
| Helix              | Yes          | Yes                           |
| XP                 | Yes          | Yes                           |
| Trident 3          | Yes          | Yes                           |
| Tomahawk           | Yes          | Yes                           |
| Tomahawk 2         | Yes          | Yes                           |
| Tofino             | No           | No                            |

#### 10.1.1.5.1 Configuring ACL Policing

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policers. The following is the default behavior on conditions and available policing actions:

- Police command creates a per-interface policer. If you attach per-interface policers to multiple ingress ports, each one polices the matched traffic on each ingress port separately. Per interface statistics gathered for conformed/allowed traffic and exceeded/dropped traffic.

- When there is no policer configured within a class, all traffic is transmitted without any policing. If there are any actions configured, the configured actions are applied.
  - conform-action (green): transmit (default).
  - exceed-action (yellow): drop (default).
  - violate-action (red): drop (default).
- The policer bucket is refilled at a sweeper period of 0.333 milliseconds, and the tokens in the policer bucket are renewed at 96ns time interval (Tc). This is applicable for all the platforms.

## Steps to Configure ACL Policing

These commands set the CIR, burst size, and creates a class and applies the policing to the policy map:

1. Create a policy map.
2. Create a class-map.
3. Apply the policer to the policy map created.

## Examples

- These commands configure the ACL policing for a policy map.

```
switch# configure terminal
switch(config)# policy-map [type qos] policy-name
switch(config-pmap)# class { class-name }
switch(config-pmap-c)# [no] police cir cir [{bps|kbps|mbps}] bc
committed-burst-size [{bytes|kbytes|mbytes}]
```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit

switch(config)# policy-map type quality-of-service policy1
switch(config-pmap)# class class1
switch(config-pmap-c)# police cir 512000 bc 96000
switch(config-pmap-c)# exit
switch(config-pmap)#
```

## Displaying ACL Policing Information

## Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy p

Class-map: c (match-any)
 Match: ip access-group name a
 police rate 1000 mbps burst-size 100 bytes
 Class-map: class-default (match-any)
Service-policy p
 Class-map: c (match-any)
 Match: ip access-group name a
 police rate 1000 mbps burst-size 100 bytes
 Class-map: class-default (match-any)
```

- This command shows the interface-specific police counters for ***interface Ethernet 1***.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
```

```

Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

```

- This command shows the counters associated with the policy map called **p1**.

```

switch(config)# show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

```

- This command shows the QoS policy map for **interface Ethernet 1**.

```

switch(config)# show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

```

#### 10.1.1.6 Quality of Service (QoS) Profiles

QoS profiles are sets of QoS configuration instructions defined and applied at the interface level. A QoS profile serves the traffic better by reducing disorder in the running configuration. QoS profiles can modify all interface-level QoS configurations, and are supported on fabric, Ethernet, and port-channel interfaces. Control-plane policies cannot be applied using QoS profiles. Because configuration can be applied through QoS profiles or directly at the interface level, multiple configurations can be applied to the same interface. In such cases, QoS configurations with non-default values, whether configured through the CLI at the interface level or through a QoS profile, are given priority. In the case of multiple non-default values being configured, the interface-level CLI configuration is given priority.

Policy maps incorporating traffic resolution commands can also be applied by a QoS profile. If two policy maps are applied to the same interface (one through a QoS profile and another directly to the CLI).

Policy maps cannot be used on fabric interfaces. If a QoS profile which includes a policy map is applied to a fabric interface, a warning message will be displayed and the policy map will not be applied to the interface, but any additional supported configurations in the QoS profile will be applied. On SVIs and subinterfaces, QoS profiles are not supported, so policy maps must be applied directly through the CLI for these interfaces.

**Note:** For tx-queue configuration, conflicts between QoS profiles and configuration entered via the CLI are resolved at the tx-queue level and not at the tx-queue attribute level. If any non-default configuration has been entered for the tx-queue through the CLI, all tx-queue configuration included in the QoS profile is ignored.

### 10.1.1.6.1 IPv6 Flow Label Matches for QoS

Certain packets may include a flow label in their IPv6 headers when the source requests special handling by routers, such as for a media stream or other “real-time” service, among others. A flow consists of packets which share a single flow label, which is preserved throughout their passage from source to destination.

QoS policy map rules can match IPv6 traffic based on their flow labels. This requires a special TCAM profile (qos-match-ipv6-flow-label). These rules require either an exact match, using the “eq” operator, or both a label and a mask.

## 10.1.2 QoS Configuration: Platform-Independent Features

### 10.1.2.1 Creating QoS Profiles

QoS profiles are created by using the `qos profile` command. This also places the switch in QoS profile configuration mode, where the QoS parameters applied to interfaces are configured. To delete a QoS profile from the running configuration, use the no form of the command.

#### Example

This command creates a QoS profile named **Test-Profile** and places the switch in QoS profile configuration mode for the profile.

```
switch(config) # qos profile Test-Profile
switch(config-qos-profile-Test-Profile) #
```

### 10.1.2.2 Configuring QoS Profiles

The parameters that a QoS profile applies to interfaces are configured in QoS profile configuration mode by issuing the same QoS configuration commands that are available in interface configuration mode. **QoS profile** configuration mode is a group change mode, and changes made in the mode are not saved until the mode is exited. To abandon all changes made while in the mode, use the `abort` command.

#### Example

These commands enter QoS profile configuration mode for a QoS profile named **Test Profile**, configure the CoS value and transmit queue, and save the changes to the profile.

```
switch(config) # qos profile Test-Profile
switch(config-qos-profile-Test-Profile) # qos cos 3
switch(config-qos-profile-Test-Profile) # priority-flow-control on
switch(config-qos-profile-Test-Profile) # exit
switch(config) #
```

These commands enter QoS profile configuration mode for a QoS profile named **Latency**, configure the maximum latency value for VOQ tail-drop threshold, and save the changes to the profile. The latency value can be specified to a maximum of **50** ms. Both milliseconds and microseconds may be used.

```
switch(config) # qos profile Latency
switch(config-qos-profile-Latency) # tx-queue 3
switch(config-qos-profile-Latency) # latency maximum <1-50000> microseconds
switch(config-qos-profile-Latency) # latency maximum <1-50> milliseconds
switch(config-qos-profile-Latency) # exit
switch(config) #
```

### 10.1.2.3 Attaching Policy-Map to a QoS Profile

The **qos profile** command places the switch in QoS profile configuration mode. The profile applies the QoS configurations to Ethernet and Port-Channel, and even to the Fabric interfaces, if it exists. A profile specifies the policy-map and other QoS supported configurations. The policy-map is then attached to the QoS profile using **service-policy** command.

Profiles are created in QoS-profile configuration mode, then applied to an interface in interface configuration mode.

#### Examples

- This command places the switch in QoS profile configuration mode, the policy-map is then attached to the profile using **service-policy** command in this mode.

```
switch(config)# qos profile TP
switch(config-qos-profile-TP) #
```

- This command applies the policy-map to the QoS profile.

```
switch(config-qos-profile-TP) # service-policy type qos input PM-1
```

### 10.1.2.4 Applying a QoS profile on an Interface

The **service-profile** command applies a QoS profile to the configuration mode interface.

#### Example

This command applies the QoS profile TP to **interface ethernet 13**.

```
switch(config)# interface ethernet 13
switch(config-if-Et13) # service-profile TP
```

### 10.1.2.5 Displaying the QoS Profile Information

The **show qos profile** command displays information about the QoS profiles configured and their parameters. To display the attribute of a specific profile, add the name of the profile. To display a list of configured QoS profiles and the interfaces on which they are configured, add the **summary** keyword.

#### Examples

- This command displays the configured profiles and their configuration.

```
switch# show qos profile
qos profile p
 qos cos 1
 no priority-flow-control pause watchdog
 priority-flow-control priority 1 no-drop
 priority-flow-control priority 2 no-drop
 qos profile p2
 qos cos 3
 priority-flow-control priority 0 no-drop
```

- This command displays the contents of a specific profile.

```
switch# show qos profile p2
qos profile p2
 qos cos 3
```

```
priority-flow-control priority 0 no-drop
```

- This command displays the interfaces on which each profile is applied.

```
switch# show qos profile summary
Qos Profile: p
Configured on: Et13,7
Fabric
Po12
Qos Profile: p2
Configured on: Et56
```

### 10.1.3 QoS Configuration: Arad Platform Switches

Implementing QoS on an Arad platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Arad Platform Switches](#)
- [Traffic Class Derivations – Arad Platform Switches](#)
- [CoS Rewrite – Arad Platform Switches](#)
- [Transmit Queues and Port Shaping – Arad Platform Switches](#)
- [ECN Configuration – Arad Platform Switches](#)
- [ACL Policing – Arad Platform Switches](#)

**Note:** QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

#### 10.1.3.1 CoS and DSCP Port Settings – Arad Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

##### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port's port-trust mode.
- `qos trust dscp` specifies **DSCP** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

##### Example

These commands configure and display the following trust modes:

- **Ethernet 3/5/1: dscp**
- **Ethernet 3/5/2: untrusted**
- **Ethernet 3/5/3: cos**
- **Ethernet 3/5/4: default** as a switched port
- **Ethernet 3/6/1: default** as a routed port

```
switch(config)# interface ethernet 3/5/1
```

## Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default CoS and DSCP values.

- **qos cos** configures a port's default CoS value.
  - **qos dscp** configures a port's default DSCP value.

## Example

These commands configure default CoS (4) and DSCP (44) values on **Ethernet interface 3/6/2**.

```
switch(config)# interface ethernet 3/6/2
switch(config-if-Et3/6/2)# qos cos 4
switch(config-if-Et3/6/2)# qos dscp 44
switch(config-if-Et3/6/2)# show active
interface Ethernet3/6/2
 qos cos 4
 qos dscp 44
switch(config-if-Et3/6/2)# show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
 Trust Mode: COS
 Default COS: 4
 Default DSCP: 44

switch(config-if-Et3/6/2)#

```

### 10.1.3.2 Traffic Class Derivations – Arad Platform Switches

Traffic Classes describes traffic classes.

## Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 11: Traffic Class Derivation Source: Arad Platform Switches**

|                 | Untrusted          | CoS Trusted        | DSCP Trusted        |
|-----------------|--------------------|--------------------|---------------------|
| Untagged Non-IP | Default CoS (port) | Default CoS (port) | Default DSCP (port) |
| Untagged IP     | Default CoS (port) | Default CoS (port) | DSCP (packet)       |
| Tagged Non-IP   | Default CoS (port) | CoS (packet)       | Default DSCP (port) |
| Tagged IP       | Default CoS (port) | CoS (packet)       | DSCP (packet)       |

[CoS and DSCP Port Settings – Arad Platform Switches](#) describes the default CoS and DSCP settings for each port.

### Mapping CoS to Traffic Class

The [qos map cos](#) command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

#### Example

This command assigns the traffic class of **5** to the classes of service **1, 3, 5, and 7**.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 5 2 5 4 5 6 5

switch(config) #
```

The following table displays the default CoS to Traffic Class map on Arad platform switches.

**Table 12: Default CoS to Traffic Class Map: Arad Platform Switches**

|               |                                     |   |   |   |   |   |   |   |   |
|---------------|-------------------------------------|---|---|---|---|---|---|---|---|
| Inbound CoS   | Untagged                            | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class | Derived: use default CoS as inbound | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Mapping DSCP to Traffic Class

The [qos map dscp](#) command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the traffic class of **0** to DSCP values of **12, 24, 41, and 44-47**.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

 0 : 1 1 1 1 1 1 1 1 0 0
```

```

1 : 0 0 0 0 0 0 2 2 2 2
2 : 2 2 2 2 0 3 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4 4
4 : 5 0 5 5 0 0 0 0 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7
switch(config)#

```

The following table displays the default DSCP to traffic class map on Arad platform switches.

**Table 13: Default DSCP to Traffic Class Map: Arad Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

#### 10.1.3.3 CoS Rewrite – Arad Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS rewrite functions.

##### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

##### Example

This command assigns the CoS of two to traffic classes **1**, **3**, and **5**.

```

switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
 tc: 0 1 2 3 4 5 6 7

 cos: 1 2 2 2 4 2 6 7

switch(config)#

```

The following table displays the default Traffic Class to CoS rewrite value map on Arad platform switches.

**Table 14: Default Traffic Class to CoS Rewrite Value Map: Arad Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

##### Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Arad platform switches.

#### 10.1.3.4 Transmit Queues and Port Shaping – Arad Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

---

Arad platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The [show qos maps](#) command displays the traffic class-transmit queue map.

The following table displays the default traffic class to transmit queue map on Arad platform switches.

**Table 15: Default Traffic Class to Transmit Queue Map: Arad Platform Switches**

| Traffic Class  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------------|---|---|---|---|---|---|---|---|
| Transmit Queue | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from [interface-ethernet](#) configuration mode.

### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class **7** and transmit queue **7** are always mapped to each other. This association is not editable.

### Example

These commands assign traffic classes of **1**, **3**, and **5** to **transmit queue 1**, traffic classes **2**, **4**, and **6** to transmit queue **2**, and traffic class **0** to transmit queue **0**, then display the resultant map.

```
switch(config) # qos map traffic-class 1 3 5 to tx-queue 1
switch(config) # qos map traffic-class 2 4 6 to tx-queue 2
switch(config) # qos map traffic-class 0 to tx-queue 0
switch(config) # show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 1 2 1 2 7

switch(config) #
```

### Entering Tx-Queue Configuration Mode

The [tx-queue \(Arad/Jericho\)](#) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **interface Ethernet 3/3/3**.

```
switch(config) # interface ethernet 3/3/3
switch(config-if-Et3/3/3) # tx-queue 4
switch(config-if-Et3/3/3-txq-4) #
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter [shape rate \(Interface – Arad/Jericho\)](#) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Arad/Jericho\)](#) from the queue's tx-queue configuration mode.

### Examples

- This command configures a port shape rate of **5 Gbps** on **interface Ethernet 3/5/1**.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

 Port shaping rate: 5000012 / 5000000 kbps

 Tx Bandwidth Shape Rate Priority ECN
 Queue (percent) (units)
 -----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
switch(config-if-Et3/5/1) #
```

- These commands configure a shape rate of **1 Gbps** on transmit queues **3** and **4** of **interface Ethernet 3/4/1**.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet 3/4/1
Ethernet3/4/1:

 Port shaping rate: disabled

 Tx Bandwidth Shape Rate Priority ECN
 Queue (percent) (units)
 -----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - 999 / 1000 (Mbps) SP / SP D
 3 - / - 999 / 1000 (Mbps) SP / SP D
 2 - / - - / - (-) SP / SP D
 1 - / - - / - (-) SP / SP D
 0 - / - - / - (-) SP / SP D
switch(config-if-Et3/4/1-txq-3) #
```

## Configuring Queue Priority

The [priority \(Arad/Jericho\)](#) command configures a transmit queue's priority type:

- The [priority strict](#) command configures the queue as a strict priority queue.
- The [no priority](#) command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The [bandwidth percent \(Arad/Jericho\)](#) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the

cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

## Examples

- These commands configure queues **0** through **3** (**interface Ethernet 3/5/1**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

The **no priority** statement for queue 3 also configures queues **0**, **1**, and **2** as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units) () / ()
-----+-----+-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - - / - (-) SP / SP D
 3 10 / 10 - / - (-) RR / RR D
 2 30 / 30 - / - (-) RR / SP D
 1 30 / 30 - / - (-) RR / SP D
 0 30 / 30 - / - (-) RR / SP D

switch(config-if-Et3/5/1-txq-0) #
```

- Changing the bandwidth percentage for queue **3** to **30** changes the operational bandwidth of each queue to its configured bandwidth divided by **120%** (10%+20%+30%+60%).

```
switch(config-if-Et3/5/1-txq-0)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

Port shaping rate: disabled

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units) () / ()
-----+-----+-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - - / - (-) SP / SP D
 3 24 / 30 - / - (-) RR / RR D
 2 24 / 30 - / - (-) RR / SP D
 1 24 / 30 - / - (-) RR / SP D
 0 24 / 30 - / - (-) RR / SP D

Note: Values are displayed as Operational/Configured
switch(config-if-Et3/5/1-txq-3) #
```

### 10.1.3.5 ECN Configuration – Arad Platform Switches

Explicit Congestion Notification (ECN) describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. Average queue length is tracked for transmit queues. When it reaches maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues that can simultaneously implement ECN.

The **random-detect ecn (Arad/Jericho)** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

### Example

These commands enable ECN marking of unicast packets from ***unicast transmit queue 4 of interface Ethernet 3/5/1***, setting thresholds at **128** kbytes and **1280** kbytes.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 4
switch(config-if-Et3/5/1-txq-4)# random-detect ecn minimum-threshold 128 kbytes maximum-threshold
 1280 kbyte
switch(config-if-Et3/5/1-txq-4)# show active
interface Ethernet3/5/1
 tx-queue 4
 random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#

```

### 10.1.3.6 ACL Policing – Arad Platform Switches

[ACL Policing](#) describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings.
- class-name.
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users.
- burst size the maximum burst size in bytes the network commits to moving under normal conditions.

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default).
  - Violate-action (red): drop (default).

### Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-policy1)# class class1
switch(config-policy1-class1)# police cir 512000 bc 96000
```

```
switch(config-policy1-class1)# exit
switch(config-policy1)# exit
switch(config)#

```

## Displaying ACL Policing Information

### Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#

```

- This command shows the interface-specific police counters for **interface Ethernet 1**.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#

```

- This command shows the counters associated with the policy map called **p1**.

```
switch(config)# show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

switch(config)#

```

- This command shows the QoS policy map for **interface Ethernet 1**.

```
switch(config)# show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#

```

## 10.1.4 QoS Configuration: Jericho Platform Switches

Implementing QoS on an Jericho platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Jericho Platform Switches](#)
- [Traffic Class Derivations – Jericho Platform Switches](#)
- [CoS Rewrite – Jericho Platform Switches](#)
- [Transmit Queues and Port Shaping – Jericho Platform Switches](#)
- [ACL Policing – Jericho Platform Switches](#)

**Note:** QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

### 10.1.4.1 CoS and DSCP Port Settings – Jericho Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port's port-trust mode.
- `qos trust dscp` specifies **DSCP** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

These commands configure and display the following trust modes:

- **Ethernet 3/5/2: untrusted.**
- **Ethernet 3/5/3: cos.**
- **Ethernet 3/5/4: default** as a switched port.
- **Ethernet 3/6/1: default** as a routed port.

| Port          | Operational | Configured |
|---------------|-------------|------------|
| Ethernet3/5/1 | DSCP        | DSCP       |
| Ethernet3/5/2 | UNTRUSTED   | UNTRUSTED  |
| Ethernet3/5/3 | COS         | COS        |
| Ethernet3/5/4 | COS         | DEFAULT    |

---

```

Ethernet3/6/1 DSCP DEFAULT
switch(config-if-Et3/6/1)#

```

## Configuring Default Port Settings

Default **CoS** and **DSCP** values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default **CoS** and **DSCP** values.

- **qos cos** configures a port's default CoS value.
- **qos dscp** configures a port's default DSCP value.

### Example

These commands configure default **CoS (4)** and **DSCP (44)** values on **interface Ethernet 3/6/2**.

```

switch(config)# interface ethernet 3/6/2
switch(config-if-Et3/6/2)# qos cos 4
switch(config-if-Et3/6/2)# qos dscp 44
switch(config-if-Et3/6/2)# show active
interface Ethernet3/6/2
 qos cos 4
 qos dscp 44
switch(config-if-Et3/6/2)# show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
 Trust Mode: COS
 Default COS: 4
 Default DSCP: 44

switch(config-if-Et3/6/2)#

```

### 10.1.4.2 Traffic Class Derivations – Jericho Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class on Jericho platform switches.

**Table 16: Traffic Class Derivation Source: Jericho Platform Switches**

|                 | Untrusted          | CoS Trusted        | DSCP Trusted        |
|-----------------|--------------------|--------------------|---------------------|
| Untagged Non-IP | Default CoS (port) | Default CoS (port) | Default DSCP (port) |
| Untagged IP     | Default CoS (port) | Default CoS (port) | DSCP (packet)       |
| Tagged Non-IP   | Default CoS (port) | CoS (packet)       | Default DSCP (port) |
| Tagged IP       | Default CoS (port) | CoS (packet)       | DSCP (packet)       |

[CoS and DSCP Port Settings – Arad Platform Switches](#) describes the default CoS and DSCP settings for each port.

#### Mapping CoS to Traffic Class

The **qos map cos** command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

### Example

This command assigns the traffic class of **5** to the classes of service **1, 3, 5, and 7**.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
Number of Traffic Classes supported: 8

Cos-tc map:
cos: 0 1 2 3 4 5 6 7

tc: 1 5 2 5 4 5 6 5

switch(config) #
```

The following table displays the default CoS to Traffic Class map on Jericho platform switches.

**Table 17: Default CoS to Traffic Class Map: Jericho Platform Switches**

| Inbound CoS   | Untagged                            | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---------------|-------------------------------------|---|---|---|---|---|---|---|---|
| Traffic Class | Derived: use default CoS as inbound | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Mapping DSCP to Traffic Class

The [qos map dscp](#) command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

### Example

This command assigns the traffic class of 0 to DSCP values of **12, 24, 41, and 44-47**.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8

Dscp-tc map:
d1 : d2 0 1 2 3 4 5 6 7 8 9

0 : 1 1 1 1 1 1 1 1 0 0
1 : 0 0 0 0 0 0 2 2 2 2
2 : 2 2 2 2 0 3 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4 4
4 : 5 0 5 5 0 0 0 0 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7

switch(config) #
```

The following table displays the default DSCP to traffic class map on Jericho platform switches.

**Table 18: Default DSCP to Traffic Class Map: Jericho Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

#### 10.1.4.3 CoS Rewrite – Jericho Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS rewrite functions.

##### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class–CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

##### Example

This command assigns the CoS of two to traffic classes **1**, **3**, and **5**.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc-cos map:
 tc: 0 1 2 3 4 5 6 7

 cos: 1 2 2 2 4 2 6 7

switch(config) #
```

The following table displays the default Traffic Class to CoS rewrite value map on Jericho platform switches.

**Table 19: Default Traffic Class to CoS Rewrite Value Map: Jericho Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

##### Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Jericho platform switches.

#### 10.1.4.4 Transmit Queues and Port Shaping – Jericho Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Jericho platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The [show qos maps](#) command displays the traffic class–transmit queue map.

The following table displays the default traffic class to transmit queue map on Jericho platform switches.

**Table 20: Default Traffic Class to Transmit Queue Map: Jericho Platform Switches**

| Traffic Class  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------------|---|---|---|---|---|---|---|---|
| Transmit Queue | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

#### Example

These commands assign traffic classes of **1**, **3**, and **5** to **transmit queue 1**, traffic classes **2**, **4**, and **6** to **transmit queue 2**, and **traffic class 0** to **transmit queue 0**, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 1 2 1 2 7

switch(config) #
```

### Entering Tx-Queue Configuration Mode

The [tx-queue \(Arad/Jericho\)](#) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. **Tx-queue 7** is not configurable. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **interface ethernet 3/3/3**.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4) #
```

### Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter [shape rate \(Interface – Arad/Jericho\)](#) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Arad/Jericho\)](#) from the queue's tx-queue configuration mode.

#### Examples

- This command configures a port shape rate of **5 Gbps** on **interface ethernet 3/5/1**.

```

switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

 Port shaping rate: 5000012 / 5000000 kbps

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units)
-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
switch(config-if-Et3/5/1)#

```

- These commands configure a shape rate of **1 Gbps** on transmit queues **3** and **4** on **interface ethernet 3/4/1**.

```

switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet 3/4/1
Ethernet3/4/1:

 Port shaping rate: disabled

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units)
-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - 999 / 1000 (Mbps) SP / SP D
 3 - / - 999 / 1000 (Mbps) SP / SP D
 2 - / - - / - (-) SP / SP D
 1 - / - - / - (-) SP / SP D
 0 - / - - / - (-) SP / SP D
switch(config-if-Et3/4/1-txq-3)#

```

## Configuring Queue Priority

The [priority \(Arad/Jericho\)](#) command configures a transmit queue's priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The [bandwidth percent \(Arad/Jericho\)](#) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

## Examples

- These commands configure queues **0** through **3** (**interface ethernet 3/5/1**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

The **no priority** statement for queue **3** also configures queues **0**, **1**, and **2** as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```

switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units) (units)
-----+-----+-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - - / - (-) SP / SP D
 3 10 / 10 - / - (-) RR / RR D
 2 30 / 30 - / - (-) RR / SP D
 1 30 / 30 - / - (-) RR / SP D
 0 30 / 30 - / - (-) RR / SP D

switch(config-if-Et3/5/1-txq-0)#

```

- Changing the bandwidth percentage for queue **3** to **30** changes the operational bandwidth of each queue to its configured bandwidth divided by **120%** ( $10\% + 20\% + 30\% + 60\%$ ).

```

switch(config-if-Et3/5/1-txq-0)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

Port shaping rate: disabled

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units) (units)
-----+-----+-----+-----+-----+-----+-----+
 7 - / - - / - (-) SP / SP D
 6 - / - - / - (-) SP / SP D
 5 - / - - / - (-) SP / SP D
 4 - / - - / - (-) SP / SP D
 3 24 / 30 - / - (-) RR / RR D
 2 24 / 30 - / - (-) RR / SP D
 1 24 / 30 - / - (-) RR / SP D
 0 24 / 30 - / - (-) RR / SP D

Note: Values are displayed as Operational/Configured
switch(config-if-Et3/5/1-txq-3)#

```

#### 10.1.4.5 ACL Policing – Jericho Platform Switches

[ACL Policing](#) describes ACL policing.

Implementing ACL policing consists of configuring the following:

- **policy-map settings**.
- **class-name**.
- **committed information rate (CIR)** – the data speed committed to any given circuit regardless of the number of users.

- **burst size** the maximum burst size in bytes the network commits to moving under normal conditions.

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default).
  - Violate-action (red): drop (default).

## Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-class1)# match ip access-group acl1
switch(config-cmap-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-policy1)# class class1
switch(config-policy1-class1)# police cir 512000 bc 96000
switch(config-policy1-class1)# exit
switch(config-policy1)# exit
switch(config) #
```

## Displaying ACL Policing Information

### Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config) #
```

- This command shows the interface-specific police counters for **interface ethernet 1**.

```
switch(config)# show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386 bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0
switch(config) #
```

- This command shows the counters associated with the policy map called **p1**.

```
switch(config)# show policy-map type qos p1 input counters
```

```

Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

switch(config)#

```

- This command shows the QoS policy map for **interface ethernet 1**.

```

switch(config)# show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#

```

## 10.1.5 QoS Configuration: FM6000 Platform Switches

Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – FM6000 Platform Switches](#)
- [Traffic Class Derivations – FM6000 Platform Switches](#)
- [CoS and DSCP Rewrite – FM6000 Platform Switches](#)
- [Transmit Queues and Port Shaping – FM6000 Platform Switches](#)

### 10.1.5.1 CoS and DSCP Port Settings – FM6000 Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The **qos trust** command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- **qos trust cos** specifies **cos** as the port's port-trust mode.
- **qos trust dscp** specifies **dscp** as the port's port-trust mode.
- **no qos trust** specifies untrusted as the port's port-trust mode.

The **show qos interfaces trust** command displays the trust mode of specified interfaces.

#### Example

These commands configure and display the following trust modes:

- **Ethernet 15: dscp**.
- **Ethernet 16: untrusted**.

- **Ethernet 17: cos.**
- **Ethernet 18: default** as a switched port.
- **Ethernet 19: default** as a routed port.

```

switch(config)# interface ethernet 15
switch(config-if-Et15)# qos trust dscp
switch(config-if-Et15)# interface ethernet 16
switch(config-if-Et16)# no qos trust
switch(config-if-Et16)# interface ethernet 17
switch(config-if-Et17)# qos trust cos
switch(config-if-Et17)# interface ethernet 18
switch(config-if-Et18)# switchport
switch(config-if-Et18)# default qos trust
switch(config-if-Et19)# interface ethernet 19
switch(config-if-Et19)# no switchport
switch(config-if-Et19)# default qos trust
switch(config-if-Et19)# show qos interface ethernet 15 - 19 trust
Port Trust Mode
 Operational Configured

Ethernet15 DSCP DSCP
Ethernet16 UNTRUSTED UNTRUSTED
Ethernet17 COS COS
Ethernet18 COS DEFAULT
Ethernet19 DSCP DEFAULT

switch(config-if-Et19)#

```

## Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- [qos cos](#) configures a port's default CoS value.
- [qos dscp](#) configures a port's default DSCP value.

### Example

These commands configure default CoS (4) and DSCP (44) settings on [\*\*interface ethernet 19\*\*](#).

```

switch(config)# interface ethernet 19
switch(config-if-Et19)# qos cos 4
switch(config-if-Et19)# qos dscp 44
switch(config-if-Et19)# show active
interface Ethernet19
 qos cos 4
 qos dscp 44
switch(config-if-Et19)# show qos interfaces ethernet 19
Ethernet19:
 Trust Mode: COS
 Default COS: 4
 Default DSCP: 44

switch(config-if-Et19)#

```

## 10.1.5.2 Traffic Class Derivations – FM6000 Platform Switches

[Traffic Classes](#) describes traffic classes.

### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 21: Traffic Class Derivation Source: FM6000 Platform Switches**

|                        | <b>Untrusted</b>   | <b>CoS Trusted</b> | <b>DSCP Trusted</b> |
|------------------------|--------------------|--------------------|---------------------|
| <b>Untagged Non-IP</b> | Default CoS (port) | Default CoS (port) | Default DSCP (port) |
| <b>Untagged IP</b>     | Default CoS (port) | Default CoS (port) | DSCP (packet)       |
| <b>Tagged Non-IP</b>   | Default CoS (port) | CoS (packet)       | Default DSCP (port) |
| <b>Tagged IP</b>       | Default CoS (port) | CoS (packet)       | DSCP (packet)       |

[CoS and DSCP Port Settings – FM6000 Platform Switches](#) describes the default CoS and DSCP settings for each port.

### Mapping CoS to Traffic Class

The [qos map cos](#) command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

#### Example

This command assigns the traffic class of **5** to the classes of service **1, 3, 5, and 7**.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 5 2 5 4 5 6 5

switch(config) #
```

The following table displays the default CoS to Traffic Class map on FM6000 platform switches.

**Table 22: Default CoS to Traffic Class Map: FM6000 Platform Switches**

|                      |                                         |          |          |          |          |          |          |          |          |
|----------------------|-----------------------------------------|----------|----------|----------|----------|----------|----------|----------|----------|
| <b>Inbound CoS</b>   | <b>Untagged</b>                         | <b>0</b> | <b>1</b> | <b>2</b> | <b>3</b> | <b>4</b> | <b>5</b> | <b>6</b> | <b>7</b> |
| <b>Traffic Class</b> | Derived: use default CoS as inbound CoS | 1        | 0        | 2        | 3        | 4        | 5        | 6        | 7        |

### Mapping DSCP to Traffic Class

The [qos map dscp](#) command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the traffic class of three to the DSCP values of **12, 13, 25, and 37**.

```
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

```

```

0 : 1 1 1 1 1 1 1 1 0 0
1 : 0 0 3 3 0 0 2 2 2 2
2 : 2 2 2 2 3 3 3 3 3 3
3 : 3 3 4 4 4 4 4 3 4 4
4 : 5 5 5 5 5 5 5 5 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7
switch(config)#

```

The following displays the default DSCP to Traffic Class map on FM6000 platform switches.

**Table 23: Default DSCP to Traffic Class Map: FM6000 Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

#### 10.1.5.3 CoS and DSCP Rewrite – FM6000 Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS and DSCP rewrite functions.

##### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

##### Example

This command assigns the CoS rewrite value of two to traffic classes **1**, **3**, and **5**.

```

switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 3 4 5 6 7

switch(config)#

```

The following table displays the default traffic class–CoS rewrite map on FM6000 platform switches.

**Table 24: Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

##### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The [qos map traffic-class to dscp](#) command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–DSCP rewrite map.

##### Example

This command assigns the DSCP rewrite value of **37** to traffic classes **2, 4, and 6**.

```
switch(config)# qos map traffic-class 2 4 6 to dscp 37
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc-dscp map:
 tc: 0 1 2 3 4 5 6 7

 dscp: 8 0 37 24 37 40 37 56

switch(config)#

```

The following table displays the default traffic class–DSCP rewrite map on on FM6000 platform switches.

**Table 25: Default Traffic Class to DSCP Rewrite Map: FM6000 Platform Switches**

| Traffic Class      | 0 | 1 | 2  | 3  | 4  | 5  | 6  | 7  |
|--------------------|---|---|----|----|----|----|----|----|
| DSCP Rewrite Value | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |

#### 10.1.5.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The [show qos maps](#) command displays the traffic class to transmit queue map.

The following table displays the default traffic class to transmit queue map on FM6000 platform switches.

**Table 26: Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches**

| Traffic Class  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------------|---|---|---|---|---|---|---|---|
| Transmit Queue | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

#### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

#### Example

These commands assign traffic classes of **1, 3, and 5** to **transmit queue 1**, traffic classes **2, 4, and 6** to **transmit queue 2**, and **traffic class 0** to **transmit queue 0**, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 1 2 1 2 7

switch(config)#

```

## Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The [tx-queue \(FM6000\)](#) command places the switch in tx-queue configuration mode. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

### Example

This command enters tx-queue configuration mode for **transmit queue 3 of interface Ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3) #
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

**Note:** Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in **running-config**.

- To configure a port's shape rate, enter [shape rate \(Interface – FM6000\)](#) from the port's **interface** configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – FM6000\)](#) from the queue's **tx-queue** configuration mode.

### Example

These commands configure a shape rate of **5 Gbs** on **interface Ethernet 3**, then configure the shape rate for the following transmit queues:

- transmit queues **0, 1, and 2: 500 Mbps**.
- transmit queues **3, 4, and 5: 400 Mbps**.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# shape rate 5000000
switch(config-if-Et3)# tx-queue 0
switch(config-if-Et3-txq-0)# shape rate 500000
switch(config-if-Et3-txq-0)# tx-queue 1
switch(config-if-Et3-txq-1)# shape rate 500000
switch(config-if-Et3-txq-1)# tx-queue 3
switch(config-if-Et3-txq-3)# shape rate 400000
switch(config-if-Et3-txq-3)# tx-queue 4
switch(config-if-Et3-txq-4)# shape rate 400000
switch(config-if-Et3-txq-4)# tx-queue 5
switch(config-if-Et3-txq-5)# shape rate 400000
switch(config-if-Et3-txq-5)# exit
switch(config-if-Et3)# show qos interface ethernet 3
Ethernet3:
 Port shaping rate: 5000000Kbps
 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A 400000 strict
 4 N/A 400000 strict
 3 N/A 400000 strict
 2 N/A disabled strict
 1 N/A 500000 strict
 0 N/A 500000 strict
```

```
switch(config-if-Et3) #
```

## Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The [priority \(FM6000\)](#) command configures a transmit queue's priority type:

- **priority strict** configures the queue as a strict priority queue.
- **no priority** configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The [bandwidth percent \(FM6000\)](#) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

## Examples

- These commands configure **transmit queue 3** (on **interface Ethernet 19**) as a round robin queue, then allocates **10%**, **20%**, **30%**, and **40%** bandwidth to queues **0** through **3**.  
The **no priority** statement for **queue 3** also configures queues **0**, **1**, and **2** as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# tx-queue 3
switch(config-if-Et19-txq-3)# no priority
switch(config-if-Et19-txq-3)# bandwidth percent 40
switch(config-if-Et19-txq-3)# tx-queue 2
switch(config-if-Et19-txq-2)# bandwidth percent 30
switch(config-if-Et19-txq-2)# tx-queue 1
switch(config-if-Et19-txq-1)# bandwidth percent 20
switch(config-if-Et19-txq-1)# tx-queue 0
switch(config-if-Et19-txq-0)# bandwidth percent 10
switch(config-if-Et19-txq-0)# show qos interface ethernet 19
Ethernet19:
 Port shaping rate: disabled

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 40 disabled round-robin
 2 30 disabled round-robin
 1 20 disabled round-robin
 0 10 disabled round-robin

switch(config-if-Et19-txq-0) #
```

- Changing the bandwidth percentage for queue **3** to **60** changes the operational bandwidth of each queue to its configured bandwidth divided by **120%** (10%+20%+30%+60%).

```
switch(config-if-Et19-txq-0) #tx-queue 3
switch(config-if-Et19-txq-3)# bandwidth percent 60
switch(config-if-Et19-txq-3)# show qos interface ethernet 19
Ethernet19:
 Port shaping rate: disabled

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

```

```

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 49 disabled round-robin
 2 24 disabled round-robin
 1 16 disabled round-robin
 0 8 disabled round-robin

switch(config-if-Et19-txq-3)#

```

## 10.1.6 QoS Configuration: Petra Platform Switches

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Petra Platform Switches](#)
- [Traffic Class Derivations – Petra Platform Switches](#)
- [CoS Rewrite – Petra Platform Switches](#)
- [Transmit Queues and Port Shaping – Petra Platform Switches](#)

### 10.1.6.1 CoS and DSCP Port Settings – Petra Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port's port-trust mode.
- `qos trust dscp` specifies `dscp` as the port's port-trust mode.
- `no qos trust` specifies untrusted as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

These commands configure and display the following trust modes:

- **Ethernet 3/25: dscp.**
- **Ethernet 3/26: untrusted.**
- **Ethernet 3/27: cos.**
- **Ethernet 3/28: default** as a switched port.
- **Ethernet 3/29: default** as a routed port.

```

switch(config)# interface ethernet 3/25
switch(config-if-Et3/25)# qos trust dscp
switch(config-if-Et3/25)# interface ethernet 3/26
switch(config-if-Et3/26)# no qos trust
switch(config-if-Et3/26)# interface ethernet 3/27
switch(config-if-Et3/27)# qos trust cos
switch(config-if-Et3/27)# interface ethernet 3/28
switch(config-if-Et3/28)# switchport
switch(config-if-Et3/28)# default qos trust
switch(config-if-Et3/28)# interface ethernet 3/29
switch(config-if-Et3/29)# no switchport
switch(config-if-Et3/29)# default qos trust
switch(config-if-Et3/29)# show qos interface ethernet 3/25 - 3/29 trust

```

| Port         | Trust Mode  |            |
|--------------|-------------|------------|
|              | Operational | Configured |
| Ethernet3/25 | DSCP        | DSCP       |
| Ethernet3/26 | UNTRUSTED   | UNTRUSTED  |
| Ethernet3/27 | COS         | COS        |
| Ethernet3/28 | COS         | DEFAULT    |
| Ethernet3/29 | DSCP        | DEFAULT    |

```
switch(config-if-Et3/29) #
```

## Configuring Default Port Settings

Port channel and Ethernet interfaces are not assigned default CoS or DSCP settings.

### 10.1.6.2 Traffic Class Derivations – Petra Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's default traffic class.

**Table 27: Traffic Class Derivation Source: Petra Platform Switches**

|                 | Untrusted         | CoS Trusted       | DSCP Trusted      |
|-----------------|-------------------|-------------------|-------------------|
| Untagged Non-IP | Default TC (chip) | Default TC (chip) | Default TC (chip) |
| Untagged IP     | Default TC (chip) | Default TC (chip) | DSCP (packet)     |
| Tagged Non-I    | Default TC (chip) | CoS (packet)      | Default TC (chip) |
| Tagged IP       | Default TC (chip) | CoS (packet)      | DSCP (packet)     |

## Configuring Default Traffic Class

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The [platform petraA traffic-class](#) command specifies the default traffic class used by all ports controlled by a specified chip. The [show platform petraA traffic-class](#) command displays traffic class assignments.

#### Examples

- This command configures the default traffic class to five for the ports **32-39** on *linecard 3* (7500 Series).

```
switch(config)# platform petraA petra3/4 traffic-class 5
switch(config)# show platform petraA module 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch(config) #
```

- This command configures the default traffic class to three for all ports on *linecard 6* (7500 Series).

```
switch(config)# platform petraA module 6 traffic-class 6
switch(config)# show platform petraA module 6 traffic-class
Petra6/0 traffic-class: 6
Petra6/1 traffic-class: 6
Petra6/2 traffic-class: 6
```

```

Petra6/3 traffic-class: 6
Petra6/4 traffic-class: 6
Petra6/5 traffic-class: 6
switch(config)#

```

## Mapping CoS to Traffic Class

The **qos map cos** command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS–traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

### Example

This command assigns **traffic class 4** to the classes of service **1, 3, 5, and 7**.

```

switch(config)# qos map cos 1 3 5 7 to traffic-class 4
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 4 2 4 4 4 6 4

switch(config)#

```

The following table displays the default CoS to traffic class map on Petra platform switches.

**Table 28: Default CoS to Traffic Class Map: Petra Platform Switches**

| Inbound CoS   | untagged                                | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---------------|-----------------------------------------|---|---|---|---|---|---|---|---|
| Traffic Class | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

## Mapping DSCP to Traffic Class

The **qos map dscp** command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s DSCP field or the chip upon which it is received.

### Example

This command assigns **traffic class 3** to the DSCP values of **12, 13, 25, and 37**.

```

switch(config)# qos map dscp 12 13 14 25 48 to traffic-class 3
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

 0 : 1 1 1 1 1 1 1 1 0 0
 1 : 0 0 3 3 3 0 2 2 2 2
 2 : 2 2 2 2 3 3 3 3 3 3
 3 : 3 3 4 4 4 4 4 4 4 4
 4 : 5 5 5 5 5 5 5 5 3 6
 5 : 6 6 6 6 6 6 7 7 7 7
 6 : 7 7 7 7

switch(config)#

```

The following table displays the default DSCP to Traffic Class map on Petra platform switches.

**Table 29: Default DSCP to Traffic Class Map: Petra Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

**10.1.6.3 CoS Rewrite – Petra Platform Switches**

[Rewriting CoS and DSCP](#) describes the CoS rewrite function.

**Traffic Class to CoS Rewrite Map**

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

**Example**

This command assigns the CoS of two to traffic classes **1**, **3**, and **5**.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc-cos map:
 tc: 0 1 2 3 4 5 6 7

 cos: 1 2 2 2 4 2 6 7

switch(config)#

```

The following table displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

**Table 30: Default Traffic Class to CoS Rewrite Value Map: Petra Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

**Traffic Class to DSCP Rewrite Map**

DSCP rewrite is always disabled on Petra platform switches.

**10.1.6.4 Transmit Queues and Port Shaping – Petra Platform Switches**

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in the table below. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among physical egress queues.

---

**Table 31: Traffic Distribution to Egress Port Queues**

|                   | High Priority Queue   | Low Priority Queue    |
|-------------------|-----------------------|-----------------------|
| Unicast Traffic   | Transmit Queues 5 – 7 | Transmit Queues 0 – 4 |
| Multicast Traffic | Traffic Classes 5 – 7 | Traffic Classes 0 – 4 |

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

[Unicast Transmit Queues and Port Shaping](#) describes unicast transmit queues and shaping. [Multicast Egress Scheduling](#) describes multicast priority and traffic classes.

#### 10.1.6.4.1 Unicast Transmit Queues and Port Shaping

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The [show qos maps](#) command displays the traffic class–transmit queue map. The following table displays the default traffic class to transmit queue map on Petra platform switches.

**Table 32: Default Traffic Class to Transmit Queue Map: Petra Platform Switches**

| Traffic Class  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------------|---|---|---|---|---|---|---|---|
| Transmit Queue | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

Transmit queue parameters are configured in tx-queue configuration command mode.

#### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class **7** and transmit queue **7** are always mapped to each other. This association is not editable.

#### Example

These commands assign traffic classes of **1**, **3**, and **5** to **transmit queue 1**, traffic classes **2**, **4**, and **6** to **transmit queue 2**, and **traffic class 0** to **transmit queue 0**, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8

Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 1 2 1 2 7

switch(config) #
```

## Entering Tx-Queue Configuration Mode

The [tx-queue \(Petra\)](#) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. **Tx-queue 7** not configurable. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

### Example

This command enters tx-queue configuration mode for **transmit queue 3 of interface ethernet 3/28**.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3) #
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter [shape rate \(Interface – Petra\)](#) from the port's **interface** configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Petra\)](#) from the queue's **tx-queue** configuration mode.

### Example

These commands configure a shape rate of **5 Gbs** on **interface Ethernet 3**, then configure the shape rate for the following transmit queues:

- transmit queues **0, 1, and 2: 500 Mbps**.
- transmit queues **3, 4, and 5: 400 Mbps**.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# shape rate 5000000
switch(config-if-Et3/28)# tx-queue 0
switch(config-if-Et3/28-txq-0)# shape rate 500000
switch(config-if-Et3/28-txq-0)# tx-queue 1
switch(config-if-Et3/28-txq-1)# shape rate 500000
switch(config-if-Et3/28-txq-1)# tx-queue 2
switch(config-if-Et3/28-txq-2)# shape rate 500000
switch(config-if-Et3/28-txq-2)# tx-queue 3
switch(config-if-Et3/28-txq-3)# shape rate 400000
switch(config-if-Et3/28-txq-3)# tx-queue 4
switch(config-if-Et3/28-txq-4)# shape rate 400000
switch(config-if-Et3/28-txq-4)# tx-queue 5
switch(config-if-Et3/28-txq-5)# shape rate 400000
switch(config-if-Et3/28-txq-5)# show qos interface ethernet 3/28
Ethernet3/28:

 Port shaping rate: 5000000Kbps

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A 400000 strict
 4 N/A 400000 strict
 3 N/A 400000 strict
 2 N/A 500000 strict
 1 N/A 500000 strict
 0 N/A 500000 strict

switch(config-if-Et3/28-txq-5) #
```

## Configuring Queue Priority

The [priority \(Petra\)](#) command configures a transmit queue's priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The [bandwidth percent \(Petra\)](#) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

## Examples

- These commands configure **transmit queue 3** (on **interface Ethernet 3/28**) as a round robin queue, then allocates **10%**, **20%**, **30%**, and **40%** bandwidth to queues **0** through **3**.

The **no priority** statement for **queue 3** also configures queues **0**, **1**, and **2** as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config-if-Et3/28) # tx-queue 3
switch(config-if-Et3/28-txq-3) # no priority
switch(config-if-Et3/28-txq-3) # bandwidth percent 40
switch(config-if-Et3/28-txq-3) # tx-queue 2
switch(config-if-Et3/28-txq-2) # bandwidth percent 30
switch(config-if-Et3/28-txq-2) # tx-queue 1
switch(config-if-Et3/28-txq-1) # bandwidth percent 20
switch(config-if-Et3/28-txq-1) # tx-queue 0
switch(config-if-Et3/28-txq-0) # bandwidth percent 10
switch(config-if-Et3/28-txq-0) # show qos interface ethernet 3/28
Ethernet3/28:
```

Port shaping rate: 5000000Kbps

| Tx-Queue | Bandwidth<br>(percent) | Shape Rate<br>(Kbps) | Priority    |
|----------|------------------------|----------------------|-------------|
| 7        | N/A                    | disabled             | strict      |
| 6        | N/A                    | disabled             | strict      |
| 5        | N/A                    | 400000               | strict      |
| 4        | N/A                    | 400000               | strict      |
| 3        | 40                     | 400000               | round-robin |
| 2        | 30                     | 500000               | round-robin |
| 1        | 20                     | 500000               | round-robin |
| 0        | 10                     | 500000               | round-robin |

```
switch(config-if-Et3/28-txq-0) #
```

- Changing the bandwidth percentage for queue **3** to **60** changes the operational bandwidth of each queue to its configured bandwidth divided by **120%** (**10%+20%+30%+60%**).

```
switch(config-if-Et3/28-txq-0) # tx-queue 3
switch(config-if-Et3/28-txq-3) # bandwidth percent 60
switch(config-if-Et3/28-txq-3) # show qos interface ethernet 3/28
Ethernet3/28:
```

Port shaping rate: 5000000Kbps

| Tx-Queue | Bandwidth<br>(percent) | Shape Rate<br>(Kbps) | Priority    |
|----------|------------------------|----------------------|-------------|
| 7        | N/A                    | disabled             | strict      |
| 6        | N/A                    | disabled             | strict      |
| 5        | N/A                    | 400000               | strict      |
| 4        | N/A                    | 400000               | strict      |
| 3        | 49                     | 400000               | round-robin |

```

 2 24 500000 round-robin
 1 16 500000 round-robin
 0 8 500000 round-robin
switch(config-if-Et3/28-txq-3)#

```

#### 10.1.6.4.2 Multicast Egress Scheduling

Multicast traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.

### 10.1.7 QoS Configuration: Trident and Tomahawk Platform Switches

Implementing QoS on a Trident and Tomahawk platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches](#)
- [Traffic Class Derivations – Trident and Tomahawk Platform Switches](#)
- [CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches](#)
- [ECN Configuration – Trident and Tomahawk Platform Switches](#)

#### 10.1.7.1 CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches

##### Configuring Port Trust Settings

The [qos trust](#) command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- [qos trust cos](#) specifies **CoS** as the port's trust mode.
- [qos trust dscp](#) specifies **DSCP** as the port's trust mode.
- [no qos trust](#) specifies **untrusted** as the port's trust mode.

The [show qos interfaces trust](#) command displays the trust mode of specified interfaces.

##### Example

- These commands configure and display the following trust modes:
  - **Ethernet 15: dscp**
  - **Ethernet 16: untrusted**
  - **Ethernet 17: cos**
  - **Ethernet 18: default** as a switched port
  - **interface ethernet 19: default** as a routed port

```

switch(config)# interface ethernet 15
switch(config-if-Et15)# qos trust dscp
switch(config-if-Et15)# interface ethernet 16
switch(config-if-Et16)# no qos trust
switch(config-if-Et16)# interface ethernet 17
switch(config-if-Et17)# qos trust cos
switch(config-if-Et17)# interface ethernet 18
switch(config-if-Et18)# switchport
switch(config-if-Et18)# default qos trust

```

```

switch(config-if-Et18)# interface ethernet 19
switch(config-if-Et19)# no switchport
switch(config-if-Et19)# default qos trust
switch(config-if-Et19)# show qos interface ethernet 15 - 19 trust
Port Trust Mode
 Operational Configured

Ethernet15 DSCP
Ethernet16 UNTRUSTED
Ethernet17 COS
Ethernet18 COS
Ethernet19 DSCP
 DSCP
 UNTRUSTED
 COS
 DEFAULT
 DEFAULT

switch(config-if-Et19)#

```

## Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- [qos cos](#) configures a port's default CoS value.
- [qos dscp](#) configures a port's default DSCP value.

### Example

These commands configure default CoS (4) and DSCP (44) values on [\*\*interface ethernet 7\*\*](#).

```

switch(config)# interface ethernet 7
switch(config-if-Et7)# qos cos 4
switch(config-if-Et7)# qos dscp 44
switch(config-if-Et7)# show active
interface Ethernet7
 qos cos 4
 qos dscp 44
switch(config-if-Et7)# show qos interfaces ethernet 7
Ethernet7:
 Trust Mode: COS
 Default COS: 4
 Default DSCP: 44

switch(config-if-Et7)#

```

### 10.1.7.2 Traffic Class Derivations – Trident and Tomahawk Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 33: Traffic Class Derivation Source: Trident and Tomahawk Platform Switches**

|                 | Untrusted          | CoS Trusted        | DSCP Trusted        |
|-----------------|--------------------|--------------------|---------------------|
| Untagged Non-IP | Default CoS (port) | Default CoS (port) | Default DSCP (port) |
| Untagged IP     | Default CoS (port) | Default CoS (port) | DSCP (packet)       |
| Tagged Non-IP   | Default CoS (port) | CoS (packet)       | Default DSCP (port) |
| Tagged IP       | Default CoS (port) | CoS (packet)       | DSCP (packet)       |

[CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches](#) describes the default CoS and DSCP settings for each port.

### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

#### Example

This command assigns the **traffic class 5** to the classes of service **1, 3, 5, and 7**.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 5 2 5 4 5 6 5

switch(config)#

```

The following table displays the default CoS–traffic class map on Trident and Tomahawk platform switches.

**Table 34: Default CoS to Traffic Class Map: Trident II Platform Switches**

| Inbound CoS   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---------------|---|---|---|---|---|---|---|---|
| Traffic Class | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the **traffic class 0** to DSCP values of **12, 24, 41, and 44-47**.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

 0 : 1 1 1 1 1 1 1 1 0 0
 1 : 0 0 0 0 0 0 2 2 2 2
 2 : 2 2 2 0 3 3 3 3 3 3
 3 : 3 3 4 4 4 4 4 4 4 4
 4 : 5 0 5 5 0 0 0 0 6 6
 5 : 6 6 6 6 6 6 7 7 7 7
 6 : 7 7 7 7 7 7 7 7 7 7

switch(config)#

```

The following table displays the default DSCP–traffic class map on Trident and Tomahawk platform switches.

---

**Table 35: Default DSCP to Traffic Class Map: Trident and Tomahawk Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

### 10.1.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

Rewriting CoS and DSCP describes the CoS and DSCP rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

#### Example

This command assigns the **CoS 2** to traffic classes **1**, **3**, and **5**.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc-cos map:
 tc: 0 1 2 3 4 5 6 7

 cos: 1 2 2 2 4 2 6 7

switch(config)#

```

The following table displays the default Traffic Class to CoS rewrite value map on Trident and Tomahawk platform switches.

**Table 36: Default Traffic Class to CoS Rewrite Value Map: Trident and Tomahawk Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

#### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The [qos map traffic-class to dscp](#) command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–DSCP rewrite map.

#### Example

This command assigns the DSCP value of **29** to traffic classes **2**, **4**, and **6**.

```
switch(config)# qos map traffic-class 2 4 6 to dscp 29
switch(config)# show qos map
 Number of Traffic Classes supported: 8

 Tc-dscp map:
 tc: 0 1 2 3 4 5 6 7

 dscp: 8 0 29 24 29 40 29 56

switch(config)#

```

The following displays the default traffic class to DSCP rewrite map on Trident and Tomahawk platform switches.

**Table 37: Traffic Class to DSCP Rewrite Value Map: Trident and Tomahawk Platform Switches**

| Traffic Class | 0 | 1 | 2  | 3  | 4  | 5  | 6  | 7  |
|---------------|---|---|----|----|----|----|----|----|
| DSCP          | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |

#### 10.1.7.4 Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Trident and Tomahawk platform switches define **12** transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC03). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The [show qos maps](#) command displays the traffic class–transmit queue maps.

The following table displays the default traffic class–transmit queue maps.

**Table 38: Default Traffic Class to Transmit Queue Map: Trident and Tomahawk Platform Switches**

| Traffic Class            | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|--------------------------|---|---|---|---|---|---|---|---|
| Unicast Transmit Queue   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Multicast Transmit Queue | 0 | 0 | 1 | 1 | 2 | 2 | 3 | 3 |

#### Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- [qos map traffic-class to uc-tx-queue](#) associates a unicast queue to a traffic class set.
- [qos map traffic-class to mc-tx-queue](#) associates a multicast queue to a traffic class set.

Multiple commands create the complete maps.

#### Example

These commands assign the following on **interface ethernet 7**:

- traffic classes **1, 3, and 5** to **unicast queue 1**
- traffic classes **2, 4, and 6** to **unicast queue 5**
- traffic classes **1, 2, and 3** to **multicast queue 1**
- traffic classes **4, 5, and 6** to **multicast queue 3**
- **traffic class 0** to **unicast queue 0** and **multicast queue 0**

```

switch(config)# default interface ethernet 7
switch(config)# qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)# qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)# qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)# qos map traffic-class 0 to uc-tx-queue 0
switch(config)# qos map traffic-class 0 to mc-tx-queue 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 12
Tc - uc-tx-queue map:

```

```

tc: 0 1 2 3 4 5 6 7

uc-tx-queue: 0 1 5 1 5 1 5 7

Tc - mc-tx-queue map:
tc: 0 1 2 3 4 5 6 7

mc-tx-queue: 0 1 1 1 3 3 3 3

switch(config)#

```

## Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- **uc-tx-queue** places the switch in ***uc-tx-queue*** mode to configure a unicast transmit queue.
- **mc-tx-queue** places the switch in ***mc-tx-queue*** mode to configure a multicast transmit queue.

The **show qos interfaces** displays the transmit queue configuration for a specified port.

### Examples

- This command enters the mode that configures ***unicast transmit queue 3 of interface ethernet 5***.

```

switch(config)# interface ethernet 5
switch(config-if-Et5)# uc-tx-queue 3
switch(config-if-Et5-uc-txq-3)#

```

- This command enters the mode to configure ***multicast transmit queue 3 of interface ethernet 5***.

```

switch(config-if-Et5)# mc-tx-queue 2
switch(config-if-Et5-mc-txq-2)#

```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter **shape rate (Interface – Trident and Tomahawk)** from the port's ***interface*** configuration mode.
- To configure a transmit queue's shape rate, enter **shape rate (Tx-queue – Trident and Tomahawk)** from the queue's ***tx-queue*** configuration mode.

### Example

These commands configure a shape rate of **5 Gbs** on ***interface Ethernet 7***, then configure the shape rate for the following transmit queues:

- unicast transmit queues **0 and 1: 500 Mbps**.
- unicast transmit queues **3 and 4: 400 Mbps**.
- multicast transmit queues **0 and 2: 300 Mbps**.

```

switch(config)# interface ethernet 7
switch(config-if-Et7)# shape rate 5000000
switch(config-if-Et7)# uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)# shape rate 500000
switch(config-if-Et7-uc-txq-0)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# shape rate 500000
switch(config-if-Et7-uc-txq-1)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# shape rate 400000

```

```

switch(config-if-Et7-uc-txq-3) # uc-tx-queue 5
switch(config-if-Et7-uc-txq-5) # shape rate 400000
switch(config-if-Et7-uc-txq-5) # mc-tx-queue 0
switch(config-if-Et7-mc-txq-0) # shape rate 300000
switch(config-if-Et7-mc-txq-0) # mc-tx-queue 2
switch(config-if-Et7-mc-txq-2) # shape rate 300000
switch(config-if-Et7-mc-txq-2) # exit
switch(config-if-Et7) # show qos interface ethernet 7
Ethernet7:

 Port shaping rate: 5000000Kbps

 Tx-Queue Bandwidth Shape Rate Priority Priority Group
 (percent) (Kbps)

 UC7 N/A disabled strict 1
 UC6 N/A disabled strict 1
 MC3 N/A disabled strict 1
 UC5 N/A 400000 strict 0
 UC4 N/A disabled strict 0
 MC2 N/A 300000 strict 0
 UC3 N/A 400000 strict 0
 UC2 N/A disabled strict 0
 MC1 N/A disabled strict 0
 UC1 N/A 500000 strict 0
 UC0 N/A 500000 strict 0
 MC0 N/A 300000 strict 0

switch(config-if-Et7) #

```

## Configuring Queue Priority

Trident and Tomahawk platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The [priority \(Trident and Tomahawk\)](#) command configures a transmit queue's priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The [bandwidth percent \(Trident and Tomahawk\)](#) command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The **bandwidth percent** command is not available for these queues.

## Examples

- These commands configure **unicast transmit queue 3** as a round robin queue, then allocates **5%, 15%, 25%, 35%, 8%,** and **12%** bandwidth to unicast transmit queues **0** through **3** and multicast transmit queues **0** and **1**, respectively.

The **no priority** statement for **queue 3** also configures priority for all lower priority queues. Removing the statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)# interface ethernet 7
```

```

switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# no priority
switch(config-if-Et7-uc-txq-3)# bandwidth percent 5
switch(config-if-Et7-uc-txq-3)# uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)# bandwidth percent 15
switch(config-if-Et7-uc-txq-2)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# bandwidth percent 25
switch(config-if-Et7-uc-txq-1)# uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)# bandwidth percent 35
switch(config-if-Et7-uc-txq-0)# mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)# bandwidth percent 12
switch(config-if-Et7-mc-txq-1)# mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)# bandwidth percent 8
switch(config-if-Et7-mc-txq-0)# show qos interface ethernet 7
Ethernet7:

Port shaping rate: disabled

 UC1 20 disabled round-robin 0
 UC0 28 disabled round-robin 0
 MC0 6 disabled round-robin 0

switch(config-if-Et7-uc-txq-3)#

```

### 10.1.7.5 ECN Configuration – Trident and Tomahawk Platform Switches

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The [qos random-detect ecn global-buffer \(Trident and Tomahawk\)](#) command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

### Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at **20** and **500** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-threshold 20 segments
maximum-threshold 500 segments
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config)#
```

The [random-detect ecn \(Trident and Tomahawk\)](#) command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

- These commands enable ECN marking of unicast packets from **transmit queue 4 of interface Ethernet 15**, setting thresholds at **10** and **100** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)# random-detect ecn minimum-threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
 uc-tx-queue 4
 random-detect ecn minimum-threshold 10 segments maximum-threshold 100
 segments
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15) #
```

- This command disables ECN marking of unicast packets from **transmit queue 4 of interface Ethernet 15**.

```
switch(config-if-Et15-uc-txq-4)# no random-detect ecn
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15) #
```

## 10.1.8 QoS Configuration: Trident II and Helix Platform Switches

Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Trident II and Helix Platform Switches](#)
- [Traffic Class Derivations – Trident II and Helix Platform Switches](#)
- [CoS and DSCP Rewrite – Trident II and Helix Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident II and Helix Platform Switches](#)
- [Ingress Policing on LAG](#)
- [Fabric QoS -- Trident II Platform Switches](#)

## 10.1.8.1 CoS and DSCP Port Settings – Trident II and Helix Platform Switches

### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is `cos`. The port-trust default for routed ports is `dscp`.

- `qos trust cos` specifies `cos` as the port's port-trust mode.
- `qos trust dscp` specifies `dscp` as the port's port-trust mode.
- `no qos trust` specifies `untrusted` as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

### Example

These commands configure and display the following trust modes:

- **Ethernet 7/1: dscp.**
- **Ethernet 7/2: untrusted.**
- **Ethernet 7/3: cos.**
- **Ethernet 7/4: default** as a switched port.
- **Ethernet 8/1: default** as a routed port.

```
switch(config)# interface ethernet 7/1
switch(config-if-Et7/1)# qos trust dscp
switch(config-if-Et7/1)# interface ethernet 7/2
switch(config-if-Et7/2)# no qos trust
switch(config-if-Et7/2)# interface ethernet 7/3
switch(config-if-Et7/3)# qos trust cos
switch(config-if-Et7/3)# interface ethernet 7/4
switch(config-if-Et7/4)# switchport
switch(config-if-Et7/4)# default qos trust
switch(config-if-Et7/4)# interface ethernet 8/1
switch(config-if-Et8/1)# no switchport
switch(config-if-Et8/1)# default qos trust
switch(config-if-Et8/1)# show qos interface ethernet 7/1 - 8/1 trust

 Port Trust Mode
 Operational Configured
-----+-----+-----+
Ethernet7/1 DSCP DSCP
Ethernet7/2 UNTRUSTED UNTRUSTED
Ethernet7/3 COS COS
Ethernet7/4 COS DEFAULT
Ethernet8/1 DSCP DEFAULT

switch(config-if-Et8/1)#

```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

These commands configure default **CoS 4** and **DSCP 44** values on **interface ethernet 7/3**.

```
switch(config)# interface ethernet 7/3
```

```

switch(config-if-Et7/3) # qos cos 4
switch(config-if-Et7/3) # qos dscp 44
switch(config-if-Et7/3) # show active

interface Ethernet7/3
 qos cos 4
 qos dscp 44

switch(config-if-Et7/3) # show qos interfaces ethernet 7/3

Ethernet7/3:
 Trust Mode: COS
 Default COS: 4
 Default DSCP: 44

switch(config-if-Et7/3) #

```

### 10.1.8.2 Traffic Class Derivations – Trident II and Helix Platform Switches

[Traffic Classes](#) describes traffic classes.

**Note:** QoS traffic policy is supported on Trident II platform switches.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 39: Traffic Class Derivation Source: Trident II Platform Switches**

|                 | Untrusted          | CoS Trusted        | DSCP Trusted        |
|-----------------|--------------------|--------------------|---------------------|
| Untagged Non-IP | Default CoS (port) | Default CoS (port) | Default DSCP (port) |
| Untagged IP     | Default CoS (port) | Default CoS (port) | DSCP (packet)       |
| Tagged Non-IP   | Default CoS (port) | CoS (packet)       | Default DSCP (port) |
| Tagged IP       | Default CoS (port) | CoS (packet)       | DSCP (packet)       |

[CoS and DSCP Port Settings – Trident II and Helix Platform Switches](#) describes the default CoS and DSCP settings for each port.

#### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

#### Example

This command assigns the **traffic class 5** to the classes of service **1, 3, 5, and 7**.

```

switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 5 2 5 4 5 6 5

switch(config)#

```

The following table displays the default CoS–traffic class map on Trident II platform switches.

**Table 40: Default CoS to Traffic Class Map: Trident II Platform Switches**

| Inbound CoS   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---------------|---|---|---|---|---|---|---|---|
| Traffic Class | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Mapping DSCP to Traffic Class

The [qos map dscp](#) command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the *traffic class 0* to DSCP values of **12, 24, 41, and 44-47**.

```
switch(config)# qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8

Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

 0 : 1 1 1 1 1 1 1 1 0 0
 1 : 0 0 0 0 0 0 0 2 2 2
 2 : 2 2 2 2 0 3 3 3 3 3
 3 : 3 3 4 4 4 4 4 4 4 4
 4 : 5 0 5 5 0 0 0 0 6 6
 5 : 6 6 6 6 6 6 7 7 7 7
 6 : 7 7 7 7

switch(config) #
```

The following table displays the default DSCP–traffic class map on Trident II platform switches.

**Table 41: Default DSCP to Traffic Class Map: Trident II Platform Switches**

| Inbound DSCP  | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|---------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

### 10.1.8.3 CoS and DSCP Rewrite – Trident II and Helix Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS and DSCP rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class–CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

#### Example

This command assigns the CoS of two to traffic classes **1, 3, and 5**.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
```

```

Number of Traffic Classes supported: 8

Tc-cos map:
tc: 0 1 2 3 4 5 6 7

cos: 1 2 2 2 4 2 6 7

switch(config)#

```

The following table displays the default Traffic Class to CoS rewrite value map on Trident II platform switches.

**Table 42: Default Traffic Class to CoS Rewrite Value Map: Trident II Platform Switches**

| Traffic Class     | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The [qos map traffic-class to dscp](#) command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

#### Example

This command assigns the DSCP value of **29** to traffic classes **2**, **4**, and **6**.

```

switch(config)# qos map traffic-class 2 4 6 to dscp 29
switch(config)# show qos map

Number of Traffic Classes supported: 8

Tc-dscp map:
tc: 0 1 2 3 4 5 6 7

dscp: 8 0 29 24 29 40 29 56

switch(config)#

```

The following table displays the default traffic class to DSCP rewrite map on Trident II platform switches.

**Table 43: Traffic Class to DSCP Rewrite Value Map: Trident II Platform Switches**

| Traffic Class | 0 | 1 | 2  | 3  | 4  | 5  | 6  | 7  |
|---------------|---|---|----|----|----|----|----|----|
| DSCP          | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |

### 10.1.8.4 Transmit Queues and Port Shaping – Trident II and Helix Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The [show qos maps](#) command displays the traffic class to transmit queue map.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The following table displays the default traffic class to transmit queue maps.

**Table 44: Default Traffic Class to Transmit Queue Map: Trident II Platform Switches**

| Traffic Class        | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------------------|---|---|---|---|---|---|---|---|
| Transmit Queue Group | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

#### Example

These commands assign traffic classes of **1**, **3**, and **5** to **transmit queue 1**, traffic classes **2**, **4**, and **6** to **transmit queue 2**, and **traffic class 0** to **transmit queue 0**, then display the resultant map.

```
switch(config)# qos map traffic-class 1 3 5 to tx-queue 1
switch(config)# qos map traffic-class 2 4 6 to tx-queue 2
switch(config)# qos map traffic-class 0 to tx-queue 0
switch(config)# show qos maps
 Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 1 2 1 2 7

switch(config) #
```

### Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The [tx-queue \(Trident II\)](#) command places the switch in tx-queue configuration mode. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

#### Example

This command enters tx-queue configuration mode for **transmit queue 3** of **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3) #
```

### Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter [shape rate \(Interface – Trident II\)](#) from the port's **interface** configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Trident II\)](#) from the queue's **tx-queue** configuration mode.

#### Example

These commands configure a shape rate of **5 Gbs** on **interface Ethernet 3**, then configure the shape rate for the following transmit queues:

- transmit queues **0, 1, and 2: 500 Mbps**
- transmit queues **3, 4, and 5: 400 Mbps**

```

switch(config) # interface ethernet 17/3
switch(config-if-Et17/3) # shape rate 5000000
switch(config-if-Et17/3) # tx-queue 0
switch(config-if-Et17/3-txq-0) # shape rate 500000
switch(config-if-Et17/3-txq-0) # tx-queue 1
switch(config-if-Et17/3-txq-1) # shape rate 500000
switch(config-if-Et17/3-txq-1) # tx-queue 3
switch(config-if-Et17/3-txq-3) # shape rate 400000
switch(config-if-Et17/3-txq-3) # tx-queue 4
switch(config-if-Et17/3-txq-4) # shape rate 400000
switch(config-if-Et17/3-txq-4) # tx-queue 5
switch(config-if-Et17/3-txq-5) # shape rate 400000
switch(config-if-Et17/3-txq-5) # exit
switch(config-if-Et17/3) # show qos interface ethernet 17/3
Ethernet17/3:

Tx Bandwidth Shape Rate Priority
Queue Guaranteed (units) (units) SP / SP
-----+-----+-----+-----+-----+-----+-----+
 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP
 5 - / - (-) 400 / 400 (Mbps) SP / SP
 4 - / - (-) 400 / 400 (Mbps) SP / SP
 3 - / - (-) 400 / 400 (Mbps) SP / SP
 2 - / - (-) - / - (-) SP / SP
 1 - / - (-) 500 / 500 (Mbps) SP / SP
 0 - / - (-) 500 / 500 (Mbps) SP / SP

switch(config-if-Et17/3) #

```

## Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident II supports strict priority queues; round robin queues are not supported.

The **bandwidth guaranteed (Trident II)** command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.

### Example

These commands configure a minimum egress bandwidth of **1 Mbps** for **transmit queue 4** on **interface ethernet 17/3**.

```

switch(config-if-Et17/3) # tx-queue 4
switch(config-if-Et17/3-txq-4) # show qos interface ethernet 17/3

Tx Bandwidth Shape Rate Priority
Queue Guaranteed (units) (units) SP / SP
-----+-----+-----+-----+-----+-----+-----+
 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP
 5 - / - (-) 400 / 400 (Mbps) SP / SP
 4 1 / 1 (Mbps) 400 / 400 (Mbps) SP / SP
 3 - / - (-) 400 / 400 (Mbps) SP / SP
 2 - / - (-) - / - (-) SP / SP
 1 - / - (-) 500 / 500 (Mbps) SP / SP
 0 - / - (-) 500 / 500 (Mbps) SP / SP

switch(config-if-Et17/3-txq-4) #

```

### 10.1.8.5 Ingress Policing on LAG

Ingress policing on a port-channel polices the matched traffic from all member interfaces combined, i.e. it provides aggregate policing and statistics (DCS-7050X, DCS-7010T, DCS-7250X, and DCS-7300X series). When a per-interface policer is attached to a port-channel, one set of TCAM entries is created for all member interfaces. The associated interface bitmap is updated, and aggregate policing is performed on all member interfaces.

#### Examples

- These commands configure a service-policy (with policer action) on LAG by creating the service-policy and applying the service-policy on a port-channel.

```
switch(config)# policy-map policy-1
switch(config-pmap-qos-policy-1)# class class-1
switch(config-pmap-c-qos-policy-1-class-1)# police cir 512000 bps bc 96000
switch(config-pmap-c-qos-policy-1-class-1)# exit
switch(config-pmap-qos-policy-1)# exit
switch(config)# interface Et 4 / 5 / 4
switch(config-if-Et4/5/4)# channel-group 2 mode active
switch(config-if-Et4/5/4)# exit
switch(config)# interface po2
switch(config-if-Po2)# service-policy type qos input policy-1
switch(config-if-Po2)# exit
switch(config)#

```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
switch(config-cmap-qos-class1)# exit
switch(config)# policy-map type quality-of-service policy1
switch(config-pmap-qos-policy1)# class class1
switch(config-pmap-c-qos-policy1-class1)# police cir 512000 bc 96000
switch(config-pmap-c-qos-policy1-class1)# exit
switch(config-pmap-qos-policy1)# exit
switch(config)# show policy-map
Service-policy policy1

Class-map: class1 (match-any)
 Match: ip access-group name acl1
 police rate 512000 bps burst-size 96000 bytes

 Class-map: class-default (match-any)

switch(config)#

```

### 10.1.8.6 Fabric QoS -- Trident II Platform Switches

EOS is optimized to support QoS configuration on the Fabric interfaces on 7250x and 7300 series switches. Configuring QoS on the Fabric interfaces in addition to front panel ports allows user to have end-to-end control and helps to manage traffic better over these switches. By default, tx queues are configured as strict priority on 7250X and 7300X series.

The following QoS configuration options are supported on Fabric interfaces on 7250x and 7300 series switches.

- Guaranteed Bandwidth:** In order to prevent queue starvation on fabric ports EOS supports minimum bandwidth configuration on per queue basis across all fabric ports.
- Explicit Congestion Notification (ECN):** EOS supports enabling ECN on a per queue basis across all fabric ports.

- **Priority Flow Control (PFC):** Queue back-pressure propagates across the backplane such that flow control messages can be generated to the upstream devices. This is done by enabling PFC for the desired backplane traffic-classes.
- **Weight Round Robin (WRR):** EOS supports configuring Weighted Round Robin (WRR) on a per queue basis across all fabric ports.

#### 10.1.8.6.1 Configuring Fabric QoS on 7250X and 7300X Series

Fabric QoS is configured using a QoS profiles which is then applied on fabric interfaces on 7250x and 7300x series. Following are the steps to configure Fabric QoS.

1. Use `qos profile` command to create a QoS profile.
2. Use `tx-queue (Trident II)` command to configure a transmit queue on the configuration mode interface.
3. Use `bandwidth guaranteed (Trident II)` command to specify the minimum bandwidth for outbound traffic on the transmit queue.
4. Use `random-detect ecn (Trident)` command to enable the ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.
5. Use `priority-flow-control priority` command to configure the packet resolution setting on the configuration mode interface.
6. Use `interface fabric` command to configure Fabric interface.
7. Use `service-profile` command to apply the QoS profile to the Fabric interface.

#### Examples

- These commands create a QoS profile named `fabricProfile` with tx queue, bandwidth, ECN, PFC and DLB values defined in it and then the profile is attached to Fabric interface of the switch.

**Note:** To support PFC on a particular priority, DLB is disabled for that priority.

```
switch(config)# qos profile fabricProfile
switch(config-qos-profile-fabricProfile)# tx-queue 0
switch(config-qos-profile-fabricProfile-txq-0)# bandwidth guaranteed 10000 kbps
switch(config-qos-profile-fabricProfile-txq-0)# random-detect ecn
minimum-threshold 10 mbytes maximum-threshold 10 mbytes
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 1
no-drop
switch(config-qos-profile-fabricProfile)# priority-flow-control priority 6
no-drop dlb
```

- Applying the QoS profile on `interface fabric` of the switch.

```
switch# configure terminal
switch(config)# interface fabric
switch(config-if-fabric)# service-profile fabricProfile
```

#### 10.1.8.6.2 Displaying Fabric QoS Information

These show commands display the configured Fabric QoS information on the switch.

- `show qos profile [profile Name]`: Displays the list of QoS profiles configured on the switch.

- 
- **show qos interfaces fabric**: Displays the profile applied on the fabric interface on the switch.

### Examples

- This command displays the **fabricProfile** profile information.

```
switch# show qos profile fabricProfile
 qos profile fabricProfile
 priority-flow-control priority 1 no-drop
 priority-flow-control priority 6 no-drop dlb
 tx-queue 0
 bandwidth guaranteed 10000 kbps
 random-detect ecn minimum-threshold 10 mbytes maximum-threshold 10 mbytes
```

- This command displays the profile applied on the fabric interface.

```
switch# show qos interfaces fabric
 qos profile fabricProfile
```

## 10.1.9 Support for Configuring Color Extended Communities

EOS Release 4.23.1F introduces the ability to configure the color extended community in route-map set clauses and in an extcommunity-list for inbound and outbound policy application.

Use the color extended community for per-destination steering into Segment-Routing-Traffic-Engineered (SR-TE) policies. If the next-hop and color of a BGP route match a particular policy (composed of an endpoint and color), any traffic bound to the destination can be steered according to the policy instead of forwarded via an IGP path or tunnel.

This section describes support for configuring color extended communities, including configuration instructions and command descriptions. Topics covered by this section include:

- [Platform Compatibility](#)
- [Configuration](#)
- [Limitations](#)

### 10.1.9.1 Platform Compatibility

Configuring color extended communities is supported on all platforms.

### 10.1.9.2 Configuration

Use the following command for color extended community expressions:

```
color COLOR-VALUE [color-only (exact-match | (endpoint-match (any | null)))]
```

Use this command in route-maps and extcommunity-lists to apply inbound and outbound policy.

| Configuring Color Extended Community in route-map mode |                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command(config-route-map mode)                         | [no   default] set extcommunity COLOR-EXPRESSION [additive   delete]                                                                                                                                                                                                                                                                                                                   |
| Action                                                 | Adds a color extended community to be applied to routes affected by the route-map. Multiple set clauses can be applied to a single route-map to configure multiple colors for routes. <b>Additive</b> adds the extended communities to those received, while <b>delete</b> deletes any matching extended color communities. Negating the command removes the entry from the route-map. |
| Default                                                | None                                                                                                                                                                                                                                                                                                                                                                                   |
| Example                                                | <pre>switch(config)# route-map foo switch(config-route-map foo)# set extcommunity color 1 switch(config-route-map foo)# set extcommunity color 2 color-only exact-match switch(config-route-map foo)# set extcommunity color 3 color-only endpoint-match null switch(config-route-map foo)# set extcommunity color 4 color-only endpoint-match any</pre>                               |

| Configuring Color Extended Community in extcommunity-list |                                                                                                                                                                                                               |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command(config mode)                                      | [ (no default) ] ip extcommunity-list WORD {permit deny}{COLOR-EXPRESSION}                                                                                                                                    |
| Action                                                    | Adds a color extended community to an extcommunity-list. Multiple color extended communities can be added to the list. Negating the command removes the corresponding color extended community from the list. |
| Default                                                   | None                                                                                                                                                                                                          |
| Example                                                   | <pre>switch(config)# ip extcommunity-list foo permit color 1 color 2 switch(config)# ip extcommunity-list bar permit color 3 color-only endpoint-match null color 4 color-only endpoint-match any</pre>       |

### 10.1.9.3 Limitations

The color extended community is only supported in multi-agent mode. Enable Multi-agent mode via the following command:

```
service routing protocols mode multi-agent
```

## 10.1.10 ACL based QoS Configuration

### 10.1.10.1 ACL Based QoS (DCS-7160)

The IPv4 ACL based QoS is enabled on switches through policy-map configuration. The ACL based QoS can be configured on front panel ports, port-channel interfaces on **DCS-7160** series switches.

#### 10.1.10.1.1 ACL based QoS on SVIs

The ACL based QoS policy applied on SVIs modify the QoS parameters for SVI traffic (L3 VLAN) based on ACL classification. The ACL based QoS on Switched Virtual Interface (SVI) ports is supported on DCS-7500E, DCS-7280E, DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X, DCS-7020TR.

### 10.1.10.1.2 ACL Sharing on QoS

The ACLs applied on QoS shares the hardware resources (TCAM) when potentially large QoS policy-maps are applied to multiple SVIs. For ACL based QoS on SVIs in sharing mode we share TCAM for class-maps without policer action and replicate entries for policer class-maps. The ACL Sharing on QoS is supported only on selected platforms.

The QoS actions is applicable only to the routed traffic flowing through the members of the corresponding VLAN.

The steps to configure ACL based QoS is as follows:

1. Create a access list using `ip access-list` command.
2. Create a class map and attach it to the access list using `class-map` command.
3. Create a policy and attach the class map to the policy created, using the `policy-map` command.
4. Apply the policy to the interface using the `service-policy input` command.

#### Examples

- These command configure the access list **acl1**.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit ip 10.1.1.1/24 any
switch(config-acl-acl1)# exit
```

- These commands configure the class map **class1**.

```
switch(config)# class-map match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
switch(config-cmap-qos-class1)# exit
```

- These commands configure the policy map **policy1**.

```
switch(config)# policy-map policy1
switch(config-pmap-qos-policy1)# class class1
switch(config-pmap-c-qos-policy1-class1)# set dscp 20
switch(config-pmap-c-qos-policy1-class1)# set traffic-class 2
switch(config-pmap-c-qos-policy1-class1)# exit
switch(config-pmap-c-qos-policy1)# exit
```

- These commands apply the **policy1** to the **interface ethernet 1/1**.

```
switch(config)# interface Et1/1
switch(config-if-Et1/1)# service-policy input policy1
switch(config-if-Et1/1)# exit
```

- These commands configure a ACL based QoS on the SVI interface **VLAN10**.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# service-policy [type qos] input policy1
```

- This command enables the resource (hardware) sharing when a ACL based QoS is attached to VLAN interface. The no form of the command disables it.

```
switch(config)# hardware access-list qos resource sharing vlan in
```

- This command allows inbound broadcast IP packets with source IP address as one of the permitted hosts and denies the rest of the directed broadcast traffic.

```

switch(config)# ip directed-broadcast
switch(config-ip-directed-broadcast)# field-set ipv4 prefix ALLOWED1
switch(config-ipdb-field-set-ipv4-prefix-ALLOWED1)# 10.1.1.1/32 20.1.1.1/32 30.1.1.1/32
switch(config-ipdb-field-set-ipv4-prefix-ALLOWED1)# commit

switch(config-ip-directed-broadcast)# field-set ipv4 prefix ALLOWED2
switch(config-ipdb-field-set-ipv4-prefix-ALLOWED2)# 10.2.1.1/32 20.2.1.1/32 30.2.1.1/32
switch(config-ipdb-field-set-ipv4-prefix-ALLOWED2)# commit

```

## Show Commands

The following show commands display the status of policy-maps programmed on the interface, for more information on these commands refer [Quality of Service Commands](#).

- **show policy-map [policy-name]**: Displays the policy-map programming status.
- **show policy-map interface interface id**: Displays the policy-map that is currently programmed on the interface.
- **show policy-map [policy-name] counters**: Displays the policy-map traffic hits.
- **show platform xp qos tcam [hits]**: Displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.
- **show run | grep sharing**: Displays if whether the ACL based QoS is enabled or disabled.
- **show platform trident tcam shared vlan interface-class-id**: Displays what SVIs are currently sharing the QoS policy-map.
- **show platform trident tcam directed-broadcast**: Displays the permitted hosts via field-set.
- **show platform trident tcam qos detail**: Displays the list of all the SVIs that are sharing the TCAM entries.

### 10.1.10.1.3 Limitations

- Maximum number of TCAM entries that can be programmed in hardware for all QoS policy-maps on the box is **1024**.
- Layer 4 port ranges are not supported for ACL based QoS. The ranges will be expanded into multiple TCAM rules and programmed in the hardware.
- Configured policer rate should be above 1mbps and recommended burst value is **2000** bytes.
- Policer action cannot be associated with policy-maps applied to Port-Channels.

The following are the limitations specific to DCS-7500E, DCS-7280E and DCS-7020TR:

The user cannot apply more than 31 QoS service policies per chip on L3 interfaces.

- When different QoS service policies are applied to the SVI and its member interfaces, the behavior is indeterministic.
- When QoS service policies are applied on SVIs with partial failures due to limited hardware resources, any event that triggers a forwarding agent restart will lead to indeterministic behavior.
- When QoS service policies are applied on 2 SVIs, any event that triggers the VLAN membership change of a member interface may result in a policy-map programming failure. To change the VLAN membership, remove the interface from the first VLAN and then add it to the other.

- 
- Outgoing COS rewrite is not supported.
  - QoS policy-map counters are not supported.

The following are the limitations specific to DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X:

- TCAM resources will not be shared for the same policy-map applied to multiple SVIs.
- Policy-map applied to a SVI will result in TCAM allocation on all chips irrespective of whether the SVI members are present or not.

When QoS service policies are applied to both SVI and its member interfaces and packets hit both policies, the behavior is indeterministic.

### 10.1.11 Configuring IPv6 Flow Label Matches for QoS

In addition to criteria like COS and DSCP, QoS decisions can be based on the IPv6 flow labels of packets. To use IPv6 flow labels as a criterion for QoS decisions, use the `permit` command to create ACL rules to select packets based on their IPv6 flow labels using an exact match and an optional mask, and then apply the access list to a class map in a QoS policy map, which can then be applied to individual interfaces. This requires a TCAM profile which must be installed explicitly.

#### Install the QoS Flow Label TCAM Profile

Open the QoS flow label TCAM profile Web page at <https://www.arista.com/en/support/toi/tcam-profile?pn=qos-match-ipv6-flow-label>. Copy the entire contents of the file which starts with the following commands:

```
hardware tcam
system profile qos-match-ipv6-flow-label
```

There are approximately 130 lines.

Paste this into the CLI of the switch. Each command in the file will be executed in turn when you paste the file contents. When the paste completes, if the cursor is at the end of the last command, type **enter** to execute it.

#### Confirm the QoS Flow Label TCAM Profile Installation

Configure the TCAM with the `hardware tcam` command, and use the `system profile` command to confirm that the “qos-match-ipv6-flow-label” profile has been installed. If the profile is installed, the `?` operator will show “qos-match-ipv6-flow-label” as an available profile.

#### Example

The following commands confirm whether the “qos-match-ipv6-flow-label” profile is installed and available to be applied.

```
switch(config)# hardware tcam
switch(config-tcam)# system profile qos-match?
WORD qos-match-ipv6-flow-label
switch(config-tcam)# exit
switch(config) #
```

#### Apply the QoS Flow Label TCAM Profile

If the profile “qos-match-ipv6-flow-label” is listed, use the `system profile` command to apply it. Confirm that the profile has been successfully applied with the `show hardware tcam profile` command.

#### Example

The following commands apply the profile “qos-match-ipv6-flow-label” to the TCAM configuration, then confirm that the profile has been applied. The warning is normal, as the restart of forwarding agents is part of the procedure.

```
switch(config)# hardware tcam
switch(config-tcam)# system profile qos-match-ipv6-flow-label
!
WARNING!
Changing TCAM profile will cause forwarding agent(s) to exit and restart.
All traffic through the forwarding chip managed by the restarting
forwarding agent will be dropped.

Proceed [y/n] y
switch(config-tcam)# exit
switch(config)# show hardware tcam profile
 Configuration Status
FixedSystem qos-match-ipv6-flow-label qos-match-ipv6-flow-label
switch(config)#

```

## Create IPv6 ACL Rules

Configure an access list with the **ipv6 access-list** command. Then create rules with the **permit ipv6** command.

### Example

The following commands create an IPv6 ACL rule which matches the flow label **23** in the access list **L1**.

```
switch(config)# ipv6 access-list L1
switch(config-ipv6-acl-L1)# permit ipv6 any any flow-label eq 23
switch(config-ipv6-acl-L1)# exit
switch(config)#

```

## Add Access List to QoS Class Map

Configure a QoS class map with the **class-map** command. Then add an access list to the class map with the **match** command.

### Example

The following commands create a QoS class map called **C1**, and then add the access list **L1**.

```
switch(config)# class-map type qos match-any C1
switch(config-cmap-qos-C1)# match ipv6 access-group L1
switch(config-cmap-qos-C1)# exit
switch(config)#

```

## Add Class Map to Policy Map

Configure a QoS policy map, creating it if necessary, with the **policy-map** command. Then add a class map to the policy map and define the traffic class.

### Example

The following commands configure the QoS policy map **P1** and add the class map **C1**, and then assign the class to traffic class **4**.

```
switch(config)# policy-map type quality-of-service P1
switch(config-pmap-quality-of-service-P1)# class C1
switch(config-pmap-c-quality-of-service-P1-C1)# set traffic-class 4
switch(config-pmap-c-quality-of-service-P1-C1)# exit
switch(config-pmap-quality-of-service-P1)# exit
switch(config)#

```

## Configure An Interface with QoS Policy

Configure an interface with the `interface` command. Apply the QoS policy to the interface with the `service-policy` command.

### Example

The following commands configure the Ethernet interface **1/1**, and apply the QoS policy **P1** to the interface.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# service-policy type qos input P1
switch(config-if-Et1/1)# exit
switch(config)#+
```

### Example

The following commands confirm that the policy map **P1** has been programmed successfully.

```
switch(config)# show policy-map P1
Service-policy input: P1
 Hardware programming status: Successful

 Class-map: C1 (match-any)
 Match: ipv6 access-group name L1
 set traffic-class 4

 Class-map: class-default (match-any)

switch(config)# show ipv6 access-lists L1
IPV6 Access List L1
 10 permit ipv6 any any flow-label eq 23
switch(config)#+
```

## 10.1.12 Differentiated MMU Discard Counters

To count discarded packets through tagging, assign drop-precedence for a certain class of packets on platforms that support such tagging.

### Configuring Differentiated MMU Discard Counters

The following steps configure the Differentiated MMU Discard Counters.

1. Configure an IP access-lists to match traffic

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit 41 any any !!41 = 0x29 = IPv6
```

2. Add the access-list to a class-map

```
switch(config)# class-map type qos match-any class1
switch(config-cmap-qos-class1)# match ip access-group acl1
```

3. Add the class-map to a policy-map

```
switch(config)# policy-map type quality-of-service policy1
switch(config-pmap-quality-of-service-policy1)# class class1
```

4. Add drop-precedence action to the policy-map

```
switch(config-pmap-c-quality-of-service-policy1-class1)# set drop-precedence 2
```

5. Create qos profile with the policy map assigned

```
switch(config)# qos profile qos1
switch(config-qos-profile-qos1)# service-policy input policy1
```

6. Apply the policy-map to the interface

```
switch(config)# int et3/1
switch(config-if-Et3/1)# service-profile qos1
```

Repeat step 6 on all interfaces that receive traffic to be counted. Packets are tagged on ingress. If the same packet gets dropped on egress as an MMU discard, the corresponding counter gets incremented.

### Displaying Differentiated MMU Discard Counters

The **show interface counters queue drop-precedence** command displays the drop-precedence counters. Based on the above configuration, drop-precedence 2 counts IPv6 packets.

```
switch# show interface counters queue drop-precedence
intf 0 1 2
Et1/1 100 0 200
Et1/2 200 0 300
...
...
```

## 10.1.13 txQueue Percentage-based Shaping

When you enable this feature using the **qos tx-queue shape rate percent percentage adaptive** command, QoS calculates the txQueue shape rate based the available bandwidth and not the link speed. For instance, if the interface has a link speed of 100Gbps, and the subinterface configured to 50%, then the subinterface has a link speed of 50Gbps.

### Configuring txQueue Percentage-based Shaping

Use the following command to configure traffic for a 50Gps interface for adaptive shaping on interfaces.

```
switch(config)# qos tx-queue shape rate percentage adaptive
! Change will take effect only after switch reboot.
```

Reboot the switch.

### Displaying txQueue Adaptive Information

Use the **show qos tx-queue** to display the status of the configuration. One of the following messages displays after entering the command:

#### No Configuration

```
switch# show qos tx-queue
Shape rate percent : Non-Adaptive
```

#### Configuration Successful After Switch Reboot

```
switch# show qos tx-queue
Shape rate percent : Adaptive
```

---

## Configuration Successful but No Switch Reboot

```
switch# show qos tx-queue
Shape rate percent : Non-Adaptive (reboot required for Adaptive)
```

### 10.1.14 Configuring Round Robin Scheduling on Shaped Subinterfaces

To enable subinterface Round Robin scheduling on the switch, use the following command:

```
switch(config)# qos subinterface scheduling parent round-robin
! Change will only take effect after switch reboot.
```

To disable subinterface Round Robin scheduling on the switch, use the following command:

```
switch(config)# no qos subinterface scheduling parent round-robin
! Change will only take effect after switch reboot.
```

### Displaying Round Robin Scheduling Information

When enabled, the command **show platform sand subinterface capabilities** displays the Round Robin scheduling information on the switch:

```
switch# show platform sand subinterface capabilities
SubInterface:

Supported:

Minimum port shape rate(kbps) : 1000
Maximum port shape rate(kbps) : 400000000
Number of voqs per subinterface when shaping is applied : 4
Traffic class to Voq mapping
 TC0-1 : Voq0
 TC2-3 : Voq1
 TC4-5 : Voq2
 TC6-7 : Voq3
Traffic class to scheduling mode
 TC0-1 : WRR(weight 1)
 TC2-3 : WRR(weight 2)
 TC4-5 : WRR(weight 3)
 TC6-7 : SP
 (Higher weight implies more credits)
Voq tail-drop threshold(MegaByte) : 12.500000
Voq tail-drop threshold(Buffer Descriptor) : 12500
Maximum number of subinterfaces with voq supported on the system: 512
Maximum number of subinterfaces with voq supported per core
 System Core 0 : 512
 System Core 1 : 512
Scheduling between parent and shaped subinterfaces: : Round Robin
```

### 10.1.15 Explicit Congestion Notification (ECN)

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

### 10.1.15.1 Configuring Latency-based ECN

Latency-based ECN can be configured on a per transmit queue basis. Use the following commands to configure a transmit queue on interface *Ethernet 1/1* with a delay threshold of 33 milliseconds:

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# random-detect ecn delay threshold 33 milliseconds
```

Configure a **delay threshold** as a value between 1 to 4294967 microseconds or a value between 1 to 4294 milliseconds.

### Displaying the ECN Configuration

Use the following command to display information about the ECN configuration:

```
switch(config)# show qos interfaces Ethernet 1/1 ecn
Ethernet1/1:
 ECN ECN ECN
 Minimum Maximum Delay ECN ECN
Tx-Queue Threshold Unit Threshold Threshold Threshold Mark-Prob Weight
----- ----- ----- ----- -----
7 - - - - - / -
6 - - - - - / -
5 - - - - - / -
4 - - - - - / -
3 - - - 33000.000 / 33000.000 (L) - / -
2 - - - - - / -
1 - - - - - / -
0 - - - - - / -
Delay Threshold Type: G -> Global L -> Local
Note: Values are displayed as Configured/Operational
```

### 10.1.16 Latency-based Explicit Congestion Notification

Explicit Congestion Notification (ECN) provides a mechanism of notifying about network traffic congestion without dropping packets. Notification occurs in two ways:

- Queue Length ECN - Marks the ECN-capable Transport (ECT) packets when the average Virtual Output Queue (VOQ) length exceeds the configured ECN threshold value.
- Latency-based ECN - Notifies the congestion by marking the ECT packets if the packets take longer than the configured threshold to dequeue from the VOQ.

Both types of notification result in the egress marking of the packet when experiencing the congestion beyond the configured threshold.

Configure ECN on a transmit queue of an interface, and only switches with front panel ports and port-channels support ECN.

#### Supported Platforms

- DCS-7280R3 series
- DCS-7500R3 series
- DCS-7800R3 series
- DCS-7130

---

## 10.1.17 Configuring a Low Latency Transmit Queue Scheduler Profile

Configuring a low latency transmit queue scheduler profile provides an alternative operating mode for queues with reduced latency. By default, the switch has a balanced profile focused on maintaining sustained throughput and avoiding excessive latency. In certain scenarios, this profile may not provide an optimal configuration for latency-sensitive scenarios with critical flow completion time. In this case, configure a responsive low latency scheduler profile validated against the hardware capabilities.

The responsive profile provides maximum benefits in scenarios with low fan-in and bursty flows and reduces the maximum latency from 40 microseconds to 8 microseconds when a flow starts or stops.

### Compatible Platforms

The following platforms support the responsive profile feature:

- DCS-7280R3
- DCS-7500R3
- DCS-7800R3

### Configuring the Responsive Profile

Enable unified credit rates to allow the scheduler profile to provide credits to the low latency queues at rates optimized for hardware. Use the following command to enable unified credit rates:

```
switch(config)# platform fap voq credit rates unified
```

Then configure the responsive profile on a transmit queue with the following command:

```
switch(config)# qos tx-queue 0-7 scheduler profile responsive
```

Configure up to eight (8) responsive profiles.

---

## 10.1.18 Quality of Service Commands

### QoS Data Field and Traffic Class Configuration Commands

- [color](#)
- [hardware access-list qos resource sharing vlan in](#)

### **Transmit Queue and Port Shaping Commands – Trident II Platform**

- 
- bandwidth guaranteed (Trident II)
- shape rate (Tx-queue – Trident II)
- shape rate (Interface – Trident II)
- tx-queue (Trident II)
- interface fabric (Trident II)

### 10.1.18.1 bandwidth guaranteed (Helix)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth guaranteed DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

#### Parameters

**DATA\_MIN** Minimum bandwidth. Value range varies with data unit:

- **8 to 40000000 kbytes per second.**
- **8 to 40000000 kbps** **8 to 40000000** kbytes per second.
- **1 to 60000000 pps** **1 to 60000000** packets per second.

#### Related Command

[tx-queue \(Helix\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands configure a minimum egress bandwidth of **1 Mbps** for **transmit queue 4 of interface ethernet 17/3**.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# tx-queue 4
switch(config-if-Et17-txq-4)# bandwidth guaranteed 1000 kbps
switch(config-if-Et17-txq-4)# show qos interfaces ethernet 17

Ethernet17/3:
 Trust Mode: COS
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: disabled

 Tx Bandwidth Shape Rate Priority
 Queue Guaranteed (units) (units)

 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP
 5 - / - (-) - / - (-) SP / SP
 4 1 / 1 (Mbps) - / - (-) SP / SP
 3 - / - (-) - / - (-) SP / SP
 2 - / - (-) - / - (-) SP / SP

 0 - / - (-) - / - (-) SP / SP
```

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et17-txq-4)#

```

### 10.1.18.2 bandwidth guaranteed (Trident II)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth guaranteed rate DATA_MIN
no bandwidth guaranteed
default bandwidth guaranteed
```

#### Parameters

**DATA\_MIN** minimum bandwidth. Value range varies with data unit:

- **8 to 40000000** kbytes per second.
- **8 to 40000000 kbps** kbytes per second.
- **1 to 60000000pps** packets per second.

#### Related Command

[tx-queue \(Trident II\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands configure a minimum egress bandwidth of **1 Mbps** for **transmit queue 4 of interface ethernet 17/3**.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# bandwidth guaranteed 1000 kbps
switch(config-if-Et17/3-txq-4)# show qos interfaces ethernet 17/3

Ethernet17/3:
 Trust Mode: COS
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: disabled

 Tx Bandwidth Shape Rate Priority
 Queue Guaranteed (units) (units)

 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP
 5 - / - (-) - / - (-) SP / SP
 4 1 / 1 (Mbps) - / - (-) SP / SP
 3 - / - (-) - / - (-) SP / SP
 2 - / - (-) - / - (-) SP / SP
 1 - / - (-) - / - (-) SP / SP
 0 - / - (-) - / - (-) SP / SP
```

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et17/3-txq-4) #
```

### 10.1.18.3 bandwidth percent (Arad/Jericho)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command from **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

`bandwidth percent proportion`

`no bandwidth percent`

`default bandwidth percent`

#### Parameter

**proportion** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**interface ethernet 3/5/1**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# no priority
switch(config-if-Et3/5/1-txq-3)# bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)# show qos interfaces ethernet 3/5/1
```

Ethernet3/5/1:

| Tx Queue | Bandwidth (percent) | Shape Rate (units) | Priority | ECN |
|----------|---------------------|--------------------|----------|-----|
| 7        | - / -               | - / - ( - )        | SP / SP  | D   |
| 6        | - / -               | - / - ( - )        | SP / SP  | D   |
| 5        | - / -               | - / - ( - )        | SP / SP  | D   |
| 4        | - / -               | - / - ( - )        | SP / SP  | D   |
| 3        | 10 / 10             | - / - ( - )        | RR / RR  | D   |

| 0        | 30 / 30             | - / - ( - )        | RR / SP  | D   |

```
switch(config-if-Et3/5/1-txq-0) #
```

- These commands re-configure the bandwidth share of the fourth queue at **30%**.

- These commands configure the bandwidth share of the fourth queue at **2%**.

#### 10.1.18.4 bandwidth percent (FM6000)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

`bandwidth percent proportion`

`no bandwidth percent`

`default bandwidth percent`

#### Parameter

**proportion** Configured bandwidth percentage. Value ranges from **1** to **100**. Default value is **0**.

#### Related Command

[tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**interface Ethernet 19**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```

switch(config)# interface Ethernet 19
switch(config-if-Et19)# tx-queue 3
switch(config-if-Et19-txq-3)# no priority
switch(config-if-Et19-txq-3)# bandwidth percent 10
switch(config-if-Et19-txq-3)# tx-queue 2
switch(config-if-Et19-txq-2)# bandwidth percent 30
switch(config-if-Et19-txq-2)# tx-queue 1
switch(config-if-Et19-txq-1)# bandwidth percent 30
switch(config-if-Et19-txq-1)# tx-queue 0
switch(config-if-Et19-txq-0)# bandwidth percent 30
switch(config-if-Et19-txq-0)# show qos interface ethernet 19

### 10.1.18.5 bandwidth percent (Petra)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth percent proportion
```

```
no bandwidth percent
```

```
default bandwidth percent
```

#### Parameter

**proportion** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Command

[tx-queue \(Petra\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**interface ethernet 3/28**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3)# no priority
switch(config-if-Et3/28-txq-3)# bandwidth percent 10
switch(config-if-Et3/28-txq-3)# tx-queue 2
switch(config-if-Et3/28-txq-2)# bandwidth percent 30
switch(config-if-Et3/28-txq-2)# tx-queue 1
switch(config-if-Et3/28-txq-1)# bandwidth percent 30
switch(config-if-Et3/28-txq-1)# tx-queue 0
switch(config-if-Et3/28-txq-0)# bandwidth percent 30
switch(config-if-Et3/28-txq-0)# show qos interface ethernet 3/28
```

Ethernet3/28:

| Tx-Queue | Bandwidth<br>(percent) | Shape Rate<br>(Kbps) | Priority    |
|----------|------------------------|----------------------|-------------|

### 10.1.18.6 bandwidth percent (Trident and Tomahawk)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command **running-config**.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

`bandwidth percent proportion`

`no bandwidth percent`

`default bandwidth percent`

#### Parameter

***proportion*** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Commands

- [mc-tx-queue](#) places the switch in mc-tx-queue configuration mode.
- [uc-tx-queue](#) places the switch in uc-tx-queue configuration mode.

#### Examples

- These commands configure **unicast transmit queue 3** (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues **1**, **2**, and **3** at **30%** and **multicast transmit queue 1** at **10%**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# no priority
switch(config-if-Et7-uc-txq-3)# bandwidth percent 30
switch(config-if-Et7-uc-txq-3)# uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)# bandwidth percent 30
switch(config-if-Et7-uc-txq-2)# uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)# bandwidth percent 30
switch(config-if-Et7-uc-txq-1)# mc-tx-queue 1

### 10.1.18.7 color

Use the **color** command for the ability to configure the color extended community in route-map set clauses and in an extcommunity-list for inbound and outbound policy application.

#### Command Mode

Route-maps and extcommunity-lists

#### Command Syntax

```
color COLOR-VALUE [color-only | exact-match | endpoint-match [any | null]]]
```

#### Parameters

- **COLOR-VALUE** A single policy color value, range **0** to **4294967295**.
- **color-only** Allows configuration of color-only bits.
- **exact-match** Explicitly sets the color-only bits of the extended community to **00** (optional).
- **endpoint-match any** Sets the color-only bits of the extended community to **10**.
- **endpoint-match null** Sets the color-only bits of the extended community to **01**.

#### Example

```
switch(config)# route-map foo
switch(config(route-map-foo))# set community color 2 color-only endpoint-match any
```

### 10.1.18.8 dscp to traffic-class (DSCP map)

The **dscp to traffic-class** command configures the specified QoS map to map one or more DSCP classes to a traffic class. Only one traffic class may be specified per command. The command can be repeated to configure additional traffic classes. The configuration is modified immediately. Each **dscp to traffic-class** command overwrites the existing entries in the map.

The **default dscp to traffic-class** and **no dscp to traffic-class** commands restore the global map values for the given DSCP classes.

#### Command Mode

DSCP Map Configuration

#### Command Syntax

```
dscp dscp_classes to traffic-class traffic_class
default dscp dscp_classes to traffic-class
no dscp dscp_classes to traffic-class
```

#### Parameters

- ***dscp\_classes*** The DSCP class or classes to map to a new traffic-class value. These can be provided as a single value, a range given with a hyphen (such as 20-25), a comma separated list (such as 1,4,9), or a combination (such as 20-25, 35). The range for each value is 0-63.
- ***traffic\_class*** The traffic class to map the specified DSCP class or classes to.

#### Example

These commands configure the DSCP-to-traffic-class map **map1** to map DSCP class **35** to traffic class **7**, and DSCP classes **20-25** to traffic class **6**.

```
switch(config)# qos map dscp to traffic-class name map1
switch(config-dscp-map-map1)# dscp 35 to traffic-class 7
switch(config-dscp-map-map1)# dscp 20-25 to traffic-class 6
```

---

### **10.1.18.9 hardware access-list qos resource sharing vlan in**

The **hardware access-list qos resource sharing vlan in** command enables the ACL based QoS resources sharing on a VLAN interface.

The **no hardware access-list qos resource sharing vlan in** disables the ACL based QoS resources sharing on a VLAN interface. By default this function is disabled.

#### **Command Mode**

Global Configuration

#### **Command Syntax**

```
hardware access-list qos resource sharing vlan in
no hardware access-list qos resource sharing vlan in
```

#### **Example**

This commands enables the ACL based QoS resources sharing on a VLAN interface.

```
switch(config)# hardware access-list qos resource sharing vlan in
```

### 10.1.18.10 interface fabric (Trident II)

The **interface fabric** command places the switch in Fabric-interface configuration mode and allows the user to attach the QoS profile to the fabric interface of the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface fabric
```

#### Example

This command places the switch in Fabric-interface configuration mode.

```
switch(config)# interface fabric
switch(config-if-fabric)#
```

---

## 10.1.18.11 ip extcommunity-list

The **ip extcommunity-list** command adds a color extended community to an extcommunity-list. Multiple color extended communities can be added to the list. Negating the command removes the corresponding color extended community from the list.

### Command Mode

Configuration mode

### Command Syntax

```
ip extcommunity-list WORD [permit | deny][COLOR-EXPRESSION]
no ip extcommunity-list WORD [permit | deny] COLOR-EXPRESSION
default ip extcommunity-list WORD [permit | deny][COLOR-EXPRESSION]
```

### Parameters

- **WORD** Community list name.
- **permit** Specifies community to accept.
- **deny** Specifies community to reject.
- **COLOR-EXPRESSION** Color extended community.

### Example

```
switch(config)# ip extcommunity-list foo permit color 1 color 2
switch(config)# ip extcommunity-list bar permit color 3 color-only endpoint-match null color 4
color-only endpoint-match any
```

### 10.1.18.12 mc-tx-queue

The **mc-tx-queue** command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident and Tomahawk switches have four multicast queues (**MC0 – MC03**) and eight unicast queues (**UC0 – UC7**), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- **Priority Group 1:** **UC7, UC6, MC3**
- **Priority Group 0:** **UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0**

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no mc-tx-queue** and **default mc-tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **mc-tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**mc-tx-queue queue\_level**

#### Parameter

**queue\_level** The multicast transmit queue number. Values range from **0** to **3**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Trident and Tomahawk\)](#)
- [priority \(Trident and Tomahawk\)](#)
- [shape rate \(Tx-queue – Trident and Tomahawk\)](#)

#### Related Command

[\*\*uc-tx-queue\*\*](#) Configures unicast transmit queues on Trident and Tomahawk platform switches.

#### Example

This command enters mc-tx-queue configuration mode for **multicast transmit queue 3** of **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# mc-tx-queue 3
switch(config-if-Et5-mc-txq-3) #
```

---

### 10.1.18.13 platform petraA traffic-class

The `platform petraA traffic-class` command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace `qos cos` and `qos dscp` commands. Traffic class values range from **0** to **7**. The default traffic class is **1**.

When `platform ?` returns **Petra**:

- **CoS trusted ports:** inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- **DSCP trusted ports:** inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- **Untrusted ports:** all inbound packets are assigned to the default traffic class.

The `no platform petraA traffic-class` and `default platform petraA traffic-class` commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding `platform petraA traffic-class` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform petraA [CHIP_NAME] traffic-class tc_value
no platform petraA [CHIP_NAME] traffic-class
default platform petraA [CHIP_NAME] traffic-class
```

#### Parameters

**CHIP\_NAME** Trust mode assigned to the specified ports. Port designation options include:

- **no parameter** All ports on the switch.
- **module cardX** All ports on specified linecard (7500 Series).
- **petra cardX / chipY** All ports on PetraA chip **chipY** on linecard **cardX** (7500 Series).
- **petra -chipZ** All ports on PetraA chip chipZ (7048 Series)

#### 7500 Series

Switches can contain up to eight linecards. **CardX** varies from **3** to **10**.

Each linecard contains six PetraA chips. Each chip controls eight ports. **ChipY** varies from **0** to **5**:

- **0** controls ports **1** through **8**:
  - **1** controls ports **9** through **16**.
  - **2** controls ports **17** through **24**.
  - **3** controls ports **25** through **32**.
  - **4** controls ports **33** through **40**.
  - **5** controls ports **41** through **48**.

#### 7048 Series

Each switch contains two PetraA chips. **ChipZ** varies from **0** to **1**:

- **0** controls ports **1** through **32**.
  - **1** controls ports **33** through **52**.
- **tc\_value** Traffic class value. Values range from **0** to **7**. Default value is **1**.

## Related Command

[show platform petraA traffic-class](#) displays the traffic class assignment on all specified Petra chips.

## Example

This command configures the default **traffic class 6** for ports **25-32** on linecard **5**.

```
switch(config)# platform petraA petra5/3 traffic-class 6
switch(config)#{
```

### 10.1.18.14 priority (Arad/Jericho)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

**Tx-queue 7** is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
no priority
default priority
```

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands perform the following on **interface ethernet 3/4/1**:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# show qos interfaces ethernet 3/4/1
```

Ethernet3/4/1:

| Tx Queue | Bandwidth (percent) | Shape Rate (units)  | Priority | ECN |
|----------|---------------------|---------------------|----------|-----|
| 7        | - / -               | - / - ( - )         | SP / SP  | D   |
| 6        | - / -               | - / - ( - )         | SP / SP  | D   |
| 5        | - / -               | - / - ( - )         | SP / SP  | D   |
| 4        | - / -               | 999 / 1000 ( Mbps ) | SP / SP  | D   |
| 3        | - / -               | 999 / 1000 ( Mbps ) | SP / SP  | D   |
| 2        | - / -               | - / - ( - )         | SP / SP  | D   |
| 1        | - / -               | - / - ( - )         | SP / SP  | D   |
| 0        | - / -               | - / - ( - )         | SP / SP  | D   |

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/4/1)# tx-queue 3
```

```
switch(config-if-Et3/4/1-txq-3)# no priority
switch(config-if-Et3/4/1-txq-3)# show qos interfaces ethernet 3/4/1

Ethernet3/4/1:

Tx Bandwidth Shape Rate Priority ECN
Queue (percent) (units)

7 - / - - / - (-) SP / SP D
6 - / - - / - (-) SP / SP D
5 - / - - / - (-) SP / SP D
4 - / - 999 / 1000 (Mbps) SP / SP D
3 25 / - 999 / 1000 (Mbps) RR / RR D
2 25 / - - / - (-) RR / SP D
1 25 / - - / - (-) RR / SP D
0 25 / - - / - (-) RR / SP D
```

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/4/1-txq-3)#

```

### 10.1.18.15 priority (FM6000)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
no priority
default priority
```

#### Related Command

[tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands perform the following on **interface ethernet 19**:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# show qos interface ethernet 19

Ethernet19:
 Trust Mode: COS

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 N/A disabled strict
 2 N/A disabled strict
 1 N/A disabled strict
 0 N/A disabled strict

switch(config-if-Et19)# tx-queue 3
switch(config-if-Et19-txq-3)# no priority
switch(config-if-Et19-txq-3)# show qos interface ethernet 19

Ethernet19:
```

```
Trust Mode: COS

Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 25 disabled round-robin
 2 25 disabled round-robin
 1 25 disabled round-robin
 0 25 disabled round-robin

switch(config-if-Et19-txq-3) #
```

### 10.1.18.16 priority (Petra)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

**Tx-queue 7** is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
no priority
default priority
```

#### Related Command

[tx-queue \(Petra\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands perform the following on **Ethernet interface 3/28**:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# show qos interface ethernet 3/28

Ethernet3/28:
 Trust Mode: COS

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 N/A disabled strict
 2 N/A disabled strict
 1 N/A disabled strict
 0 N/A disabled strict

switch(config-if-Et3/28)# tx-queue 3
switch(config-if-Et3/28-txq-3)# no priority
```

```
switch(config-if-Et3/28-txq-3)# show qos interface ethernet 3/28
Ethernet3/28:
 Trust Mode: COS

 Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A disabled strict
 3 25 disabled round-robin
 2 25 disabled round-robin
 1 25 disabled round-robin
 0 25 disabled round-robin

switch(config-if-Et3/28-txq-3)#

```

### 10.1.18.17 priority (Trident and Tomahawk)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority**: contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority**: contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident and Tomahawk switches have eight unicast queues (**UC0 – UC7**) and four multicast queues (**MC0 – MC03**), categorized into two priority groups. **Priority group 1** queues have priority over **priority 0** queues. The following lists display the priority group queues in order from higher priority to lower priority.

- **Priority Group 1: UC7, UC6, MC3**
- **Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0**

**Priority group 1** queues are strict priority queues and are not configurable as round robin. **Priority 0** queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

```
priority strict
no priority
default priority
```

#### Related Commands

- [mc-tx-queue](#) places the switch in mc-tx-queue configuration mode.
- [uc-tx-queue](#) places the switch in uc-tx-queue configuration mode.

#### Example

These commands perform the following on **interface ethernet 7**:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config) #interface ethernet 7
switch(config-if-Et7)# show qos interface ethernet 7

Ethernet7:
 Trust Mode: COS

 Tx-Queue Bandwidth Shape Rate Priority Priority Group
 (percent) (Kbps)
```

| UC7 | N/A | disabled | strict | 1 |  |
|-----|-----|----------|--------|---|--|
| UC6 | N/A | disabled | strict | 1 |  |
| MC3 | N/A | disabled | strict | 1 |  |
| UC5 | N/A | disabled | strict | 0 |  |
| UC4 | N/A | disabled | strict | 0 |  |
| MC2 | N/A | disabled | strict | 0 |  |

 UC0 16 disabled round-robin 0
 MC0 16 disabled round-robin 0

```

switch(config-if-Et7-uc-txq-3)#

### 10.1.18.18 qos cos

The **qos cos** command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from **0** to **7**. Default value is **0**.

**Arad, Jericho, fm6000, Trident, Tomahawk, and Trident II** platform switches:

- CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

**Petra** platform switches:

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by [platform petraA traffic-class](#). Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The **no qos cos** and **default qos cos** commands restore the port's default CoS value to zero by deleting the corresponding **qos cos** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
qos cos cos_value
no qos cos
default qos cos
```

#### Parameter

**cos\_value**CoS value assigned to port. Value ranges from **0** to **7**. Default value is **0**.

#### Example

This command configures the default **CoS 4** on **interface ethernet 8**.

```
switch(config-if-Et8)# qos cos 4
switch(config-if-Et8)#[/pre]
```

### 10.1.18.19 qos dscp

The **qos dscp** command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, Trident, Tomahawk, and Trident II** platform switches:
  - non-IP packets: default DSCP value specified by **qos dscp** determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.
- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by [platform petraA traffic-class](#).
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The **no qos dscp** and **default qos dscp** commands restore the port's default DSCP value to zero by deleting the corresponding **qos dscp** command from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**qos dscp *dscp\_value***

**no qos dscp**

**default qos dscp**

#### Parameter

***dscp\_value*** DSCP value assigned to the port. Value ranges from **0** to **63**. Default value is **0**.

#### Example

This command sets the default DSCP of **44** on ***interfacee thernet 7***.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# qos dscp 44
switch(config-if-Et7)
```

## 10.1.18.20 qos map cos

The `qos map cos` command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

The `no qos map cos` and `default qos map cos` commands restore the specified CoS values to their default traffic class setting by deleting the corresponding `qos map cos` statements from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
qos map cos cos_value_1 [cos_value_2 ... cos_value_n] to traffic-class tc_value
```

```
no qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

```
default qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

### Parameters

- **cos\_value\_x** Class of Service (CoS) value. Value ranges from **0** to **7**.
- **tc\_value** Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform ([Table 45: Default CoS to Traffic Class Map](#)).

### Default Inbound CoS to Traffic Class Map

[Table 45: Default CoS to Traffic Class Map](#) displays the default CoS to traffic class map for each platform.

**Table 45: Default CoS to Traffic Class Map**

| Inbound CoS                          | untagged                                | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|--------------------------------------|-----------------------------------------|---|---|---|---|---|---|---|---|
| Traffic Class (Arad /Jericho)        | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class (FM6000)               | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class (Helix)                | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class (Petra)                | Assigned default traffic class          | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class (Trident and Tomahawk) | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| Traffic Class (Trident II)           | Derived: use default CoS as inbound CoS | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

### Related Commands

- [qos cos](#) specifies the default CoS.
- [platform petraA traffic-class](#) specifies the default traffic class.

### Example

This command assigns the **traffic class 5** to the classes of service **1, 3, 5**, and **7**.

```
switch(config)# qos map cos 1 3 5 7 to traffic-class 5
switch(config) #
```

## 10.1.18.21 qos map dscp

The `qos map dscp` command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

This command configures the global DSCP to traffic-class map. To create additional named maps that can be attached to specific VRFs, use the `qos map dscp to traffic-class` command with the `name` option.

The `no qos map dscp` and `default qos map dscp` commands restore the specified DSCP values to their default traffic class settings by deleting corresponding `qos map dscp` statements from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
qos map dscp dscpv_1 [dscpv_2...dscpv_n] to traffic-class tc_value
```

```
no qos map dscp dscpv_1 [dscpv_2...dscpv_n]
```

```
default qos map dscp dscpv_1 [dscpv_2...dscpv_n]
```

### Parameters

- **dscpv\_x**      Differentiated Services Code Point (DSCP) value. Value ranges from **0** to **63**.
- **tc\_value**      Traffic class value. Value range varies by platform.

Default map varies by platform ([Table 46: Default DSCP to Traffic Class Map](#)).

### Default Inbound DSCP to Traffic Class Map

[Table 46: Default DSCP to Traffic Class Map](#) displays the default DSCP to traffic class map for each platform.

**Table 46: Default DSCP to Traffic Class Map**

| Inbound DSCP                         | 0-7 | 8-15 | 16-23 | 24-31 | 32-39 | 40-47 | 48-55 | 56-63 |
|--------------------------------------|-----|------|-------|-------|-------|-------|-------|-------|
| Traffic Class (Arad /Jericho)        | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |
| Traffic Class (FM6000)               | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |
| Traffic Class (Helix)                | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |
| Traffic Class (Petra)                | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |
| Traffic Class (Trident and Tomahawk) | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |
| Traffic Class (Trident II)           | 1   | 0    | 2     | 3     | 4     | 5     | 6     | 7     |

### Example

This command assigns the **traffic class 3** to the DSCP values of **12**, **13**, **25**, and **37**.

```
switch(config)# qos map dscp 12 13 25 37 to traffic-class 3
switch(config)#
```

### 10.1.18.22 qos map dscp to traffic-class

The `qos map dscp to traffic-class` command puts the switch in DSCP Map Configuration mode for the specified QoS map. If the map does not already exist, it is created as a copy of the global DSCP-to-traffic-class map. In DSCP Map Configuration mode, the `dscp to traffic-class` command is available to make changes to the map.

The `no` and `default` forms of the command remove the specified custom map.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map dscp to traffic-class name map_name
no qos map dscp to traffic-class name map_name
default qos map dscp to traffic-class name map_name
```

#### Parameters

- ***map\_name*** The name of the map to configure. If the map does not exist, it is created as a copy of the global DSCP-to-traffic-class map.

#### Example

This command creates the map ***map1*** and places the switch in DSCP Map Configuration mode.

```
switch(config)#qos map dscp to traffic-class name map1
switch(config-dscp-map-map1) #
```

---

### 10.1.18.23 qos map dscp to traffic-class (MPLS tunnel termination VRF)

The **qos map dscp to traffic-class** command assigns a DSCP-to-traffic-class map to a VRF, replacing the global map or previous custom map. The switch uses this map to assign a traffic class to data packets routed to this VRF on the basis of the DSCP fields of these packets.

The **no qos map dscp to traffic-class** and **default qos map dscp to traffic-map** commands remove the assignment of a custom map from the VRF, restoring the global map. default traffic class settings by deleting corresponding **qos map dscp** statements from *running-config*.

#### Command Mode

MPLS Tunnel Termination VRF Configuration

#### Command Syntax

```
qos map dscp to traffic-class map_name
no qos map dscp to traffic-class map_name
default qos map dscp to traffic-class map_name
```

#### Parameter

- ***map\_name*** DSCP to traffic-class map name.

#### Example

These commands assign the **map1** QoS DSCP-to-traffic-class map to the **newVRF1** and **newVRF2** VRFs.

```
switch(config)# mpls tunnel termination
switch(config-mpls-tunnel-termination)# vrf newVRF1
switch(config-tunnel-termination-vrf-newVRF1)# qos map dscp to traffic-class map1
switch(config-tunnel-termination-vrf-newVRF1)# exit
switch(config-mpls-tunnel-termination)# vrf newVRF2
switch(config-tunnel-termination-vrf-newVRF2)# qos map dscp to traffic-class map1
switch(config-tunnel-termination-vrf-newVRF2)# exit
switch(config-tunnel-termination)#

```

### 10.1.18.24 qos map traffic-class to cos

The `qos map traffic-class to cos` command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The `show qos maps` command displays the CoS to traffic class map.

The `no qos traffic-class to cos` and `default qos traffic-class to cos` commands restore the specified traffic class values to their default CoS settings by removing the corresponding `qos map traffic-class to cos` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos cos_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
```

#### Parameters

- **`tc_num_x`** Traffic class value. Value range varies by switch platform.
- **`cos_value`** Class of Service (CoS) value. Value ranges from **0** to **7**.

#### Default Inbound Traffic Class to CoS Map

[Table 47: Default Traffic Class to CoS Rewrite Value Map](#) displays the default traffic class to CoS map for each platform.

**Table 47: Default Traffic Class to CoS Rewrite Value Map**

| Traffic Class                            | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|------------------------------------------|---|---|---|---|---|---|---|---|
| CoS Rewrite Value (Arad and / Jericho)   | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| CoS Rewrite Value (FM6000)               | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| CoS Rewrite Value (Helix)                | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| CoS Rewrite Value (Petra)                | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| CoS Rewrite Value (Trident and Tomahawk) | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |
| CoS Rewrite Value (Trident II)           | 1 | 0 | 2 | 3 | 4 | 5 | 6 | 7 |

#### Example

This command assigns the **CoS 2** to traffic classes **1**, **3**, and **5**.

```
switch(config)# qos map traffic-class 1 3 5 to cos 2
switch(config)#
```

### 10.1.18.25 qos map traffic-class to dscp

The `qos map traffic-class to dscp` command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The `show qos maps` command displays the traffic class to DSCP map.

The `no qos traffic-class to dscp` and `default qos traffic-class to dscp` commands restore the specified traffic class values to their default DSCP settings by removing the corresponding `qos map traffic-class to dscp` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp dscp_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value range varies by switch platform.
- ***dscp\_value*** Differentiated Services Code Point (DSCP) value. Value ranges from **0** to **63**.

#### Default Inbound Traffic Class to DSCP Map

Table 48: Default Traffic Class to DSCP Rewrite Value Map displays the default traffic class to DSCP map for each platform.

**Table 48: Default Traffic Class to DSCP Rewrite Value Map**

| Traffic Class                             | 0 | 1 | 2  | 3  | 4  | 5  | 6  | 7  |
|-------------------------------------------|---|---|----|----|----|----|----|----|
| DSCP Rewrite Value (FM6000)               | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |
| DSCP Rewrite Value (Helix)                | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |
| DSCP Rewrite Value (Trident and Tomahawk) | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |
| DSCP Rewrite Value (Trident II)           | 8 | 0 | 16 | 24 | 32 | 40 | 48 | 56 |

#### Example

This command assigns the DSCP value of **17** to traffic classes **1**, **2**, and **4**.

```
switch(config)# qos map traffic-class 1 2 4 to dscp 17
switch(config)#
```

### 10.1.18.26 qos map traffic-class to mc-tx-queue

The `qos map traffic-class to mc-tx-queue` command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to multicast transmit queue map.

The `no qos traffic-class to mc-tx-queue` and `default qos traffic-class to mc-tx-queue` commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to mc-tx-queue` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue mtq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value ranges from **0** to **7**.
- ***mtq\_value*** Multicast transmit queue number. Value ranges from **0** to **3**.

#### Default Inbound Traffic Class to Multicast Transmit Queue Map

[Table 49: Default Traffic Class to Multicast Transmit Queue Map](#) displays the default traffic class to multicast transmit queue map for Trident and Tomahawk platform switches.

**Table 49: Default Traffic Class to Multicast Transmit Queue Map**

| Traffic Class                                   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-------------------------------------------------|---|---|---|---|---|---|---|---|
| Multicast Transmit Queue (Trident and Tomahawk) | 0 | 0 | 1 | 1 | 2 | 2 | 3 | 3 |

#### Related Commands

- [qos map traffic-class to uc-tx-queue](#) (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.
- [qos map traffic-class to tx-queue](#) (all other platforms) associates traffic classes to a transmit queue.

#### Example

This command maps traffic classes **0**, **4**, and **5** to **mc-tx-queue 2**.

```
switch(config)# qos map traffic-class 0 4 5 to mc-tx-queue 2
switch(config)#
```

---

### 10.1.18.27 qos map traffic-class to tx-queue

The `qos map traffic-class to tx-queue` command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the transmit queue to traffic class map.

The `no qos traffic-class to tx-queue` and `default qos traffic-class to tx-queue` commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding `qos map traffic-class to tx-queue` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue txq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

#### Parameters

- **tc\_num\_x** Traffic class value. Value range varies by platform.
- **txq\_value** Transmit queue value. Value range varies by platform.

#### Restrictions

FM6000: When Priority Flow Control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing `qos map traffic-class to tx-queue` statements.

Arad, Jericho, and Petra: **Traffic class 7** always maps to **transmit queue 7**. This association is not editable.

#### Default Inbound Traffic Class to Transmit Queue Map

[Table 50: Default Traffic Class to Transmit Queue Map](#) displays the transmit queue to traffic class map.

**Table 50: Default Traffic Class to Transmit Queue Map**

| Traffic Class                  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|--------------------------------|---|---|---|---|---|---|---|---|
| Transmit Queue (Arad /Jericho) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Transmit Queue (FM6000)        | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Transmit Queue (Helix)         | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Transmit Queue (Petra)         | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Transmit Queue (Trident II)    | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

#### Related Commands

- [qos map traffic-class to mc-tx-queue](#) (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- [qos map traffic-class to uc-tx-queue](#) (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.

#### Example

This command maps traffic classes **0, 4, and 5** to **tx-queue 4**.

```
switch(config)# qos map traffic-class 0 4 5 to tx-queue 4
switch(config) #
```

### 10.1.18.28 qos map traffic-class to uc-tx-queue

The `qos map traffic-class to uc-tx-queue` command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to unicast transmit queue map.

The `no qos traffic-class to uc-tx-queue` and `default qos traffic-class to uc-tx-queue` commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to uc-tx-queue` command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue utq_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

#### Parameters

- **tc\_num\_x** Traffic class value. Value ranges from **0** to **7**.
- **utq\_value** Unicast transmit queue number. Value ranges from **0** to **7**.

#### Default Inbound Traffic Class to Unicast Transmit Queue Map

Table 51: Default Traffic Class to Unicast Transmit Queue Map displays the default traffic class to Unicast transmit queue map for Trident and Tomahawk platform switches.

**Table 51: Default Traffic Class to Unicast Transmit Queue Map**

| Traffic Class                                 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-----------------------------------------------|---|---|---|---|---|---|---|---|
| Unicast Transmit Queue (Trident and Tomahawk) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

#### Related Commands

- `qos map traffic-class to mc-tx-queue` (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

#### Example

This command maps traffic classes **0**, **4**, and **5** to **unicast transmit queue 4**.

```
switch(config)# qos map traffic-class 0 4 5 to uc-tx-queue 4
switch(config)#
```

### 10.1.18.29 qos profile

The **qos profile** command places the switch in QoS profile configuration mode and for the specified profile and creates the profile if it does not already exist. QoS profiles are used to apply the same QoS configuration to multiple interfaces.

The **no qos profile** and **default qos profile** command deletes the QoS profile from the running configuration.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

`qos profile profile_name`

`no qos profile profile_name`

`default qos profile profile_name`

#### Parameter

***profile\_name*** QoS profile name.

**Note:** Commands use a subset of the listed fields. Available subset depends on the specified parameter. Use CLI syntax assistance to view options for specific parameter when creating a QoS profile.

#### Example

This command places the switch in QoS profile configuration mode for policy map **policy map TP** and creates the policy map if it does not already exist.

```
switch(config)# qos profile TP
switch(config-qos-profile-TP)#{
```

---

### 10.1.18.30 qos random-detect ecn allow non-ect chip-based (Tomahawk and Trident)

The **qos random-detect ecn allow non-ect chip-based** enables per color queue thresholds using color based queue thresholds and drop-precedence values along with drop of non-ect traffic by allowing non-ect and set drop-precedence 1 in a policy map simultaneously.

The **no qos random-detect ecn allow non-ect chip-based** and **default qos random-detect ecn allow non-ect chip-based** commands disables the use of non-ect and set drop-precedence 1 simultaneously in a policy map in the **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos random-detect ecn allow non-ect chip-based
no qos random-detect ecn allow non-ect chip-based
default qos random-detect ecn allow non-ect chip-based
```

#### Example

The following command enables the use of non-ect and **set drop-precedence 1** simultaneously in a policy map.

```
switch(config)# qos random-detect ecn allow non-ect chip-based
```

### 10.1.18.31 qos random-detect ecn global-buffer (Helix)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **1 to 19456 segments** 208-byte segments units.
  - **1 to 4 mbytes** Megabyte units.
  - **1 to 4046 kbytes** Kilobyte units.
  - **1 to 4046848 bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - **1 to 19456 segments** 208-byte segments units.
  - **1 to 4 mbytes** Megabyte units.
  - **1 to 4046 kbytes** Kilobyte units.
  - **1 to 4046848 bytes** Byte units.

---

## Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

## Related Command

[random-detect ecn \(Helix\)](#) enables ECN marking for a unicast transmit queue.

## Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at **20** and **500** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-threshold 20 segments
maximum-threshold 500 segments
switch(config) #
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config) #
```

### 10.1.18.32 qos random-detect ecn global-buffer (Trident and Tomahawk)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked `congestion encountered`.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked `congestion encountered`. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked `Non ECN Capable`, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

#### Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **1 to 46080 segments** 208-byte segments units.
  - **1 to 9 mbytes** Megabyte units.
  - **1 to 9584 kbytes** Kilobyte units.
  - **1 to 9584640 bytes** Byte units.

- 
- **MAX** Maximum threshold. Options include:
    - 1 to **46080 segments** 208-byte segments units.
    - 1 to **9 mbytes** Megabyte units.
    - 1 to **9584 kbytes** Kilobyte units.
    - 1 to **9584640 bytes** Byte units.

### Related Command

[random-detect ecn \(Trident and Tomahawk\)](#) enables ECN marking for a unicast transmit queue.

### Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at **20** and **500** segments.

```
switch(config)# qos random-detect ecn global-buffer minimum-threshold 20 segments maximum-threshold 500 segments
switch(config)#{/pre>
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)# no qos random-detect ecn global-buffer
switch(config)#{/pre>
```

### 10.1.18.33 qos rewrite cos

The **qos rewrite cos** command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream's traffic class. CoS rewriting is active by default.

The **no qos rewrite cos** command disables CoS rewriting on the switch. The default **qos rewrite cos** command restores the default setting of enabling CoS rewriting by removing the **no qos rewrite cos** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos rewrite cos
no qos rewrite cos
default qos rewrite cos
```

#### Related Command

[qos map traffic-class to cos](#) configures the traffic class to CoS rewrite map.

#### Example

This command enables CoS rewrite.

```
switch(config)# qos rewrite cos
switch(config)#End
```

---

### 10.1.18.34 qos rewrite dscp

The `qos rewrite dscp` command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream's traffic class. DSCP rewriting is disabled by default.

The `no qos rewrite dscp` and `default qos rewrite dscp` commands disable DSCP rewriting on the switch by removing the `qos rewrite dscp` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos rewrite dscp
no qos rewrite dscp
default qos rewrite dscp
```

#### Related Command

[qos map traffic-class to dscp](#) configures the traffic class to DSCP rewrite map.

#### Example

This command enables DSCP rewrite.

```
switch(config)# qos rewrite dscp
switch(config) #
```

### 10.1.18.35 qos trust

The **qos trust** command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic's CoS or DSCP value. Port trust mode default setting is **cos** for switched interfaces and **dscp** for routed interfaces.

The **default qos trust** command restores the default trust mode on the configuration mode interface by removing the corresponding **qos trust** or **no qos trust** statement from ***running-config***.

The **no qos trust** command performs the following:

- **no qos trust** places the port in **untrusted** mode.
- **no qos trust cos** removes the corresponding **qos trust cos** statement.
- **no qos trust dscp** removes the corresponding **qos trust dscp** statement.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
qos trust [MODE]
no qos trust [MODE]
default qos trust
```

#### Parameters

- **MODE** Trust mode assigned to the port. Options include:
  - **cos** Enables cos trust mode.
  - **dscp** Enables dscp trust mode.

#### Examples

- This command configures trust mode of dscp for **interface ethernet 7**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# qos trust dscp
switch(config-if-Et7)# show active
interface Ethernet7
 qos trust dscp
switch(config-if-Et7) #
```

- This command configures trust mode of untrusted for **Port Channel interface 23**.

```
switch(config)# interface port-channel 23
switch(config-if-Po23)# no qos trust
switch(config-if-Po23)# show active
interface Port-Channel23
 no qos trust
switch(config-if-Po23) #
```

---

### 10.1.18.36 random-detect ecn (Arad/Jericho)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The **no random-detect ecn** and **default qos random-detect ecn** commands disables ECN marking for the shared buffer by removing the **qos random-detect ecn** command from **running-config**.

#### Command Mode

Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold [MIN | MAX] maximum-threshold [MIN | MAX]
no random-detect ecn
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - 1 to **256 mbytes** Megabyte units.
  - 1 to **256000 kbytes** Kilobyte units.
  - 1 to **25600000 bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - 1 to **256 mbytes** Megabyte units.
  - 1 to **256000 kbytes** Kilobyte units.
  - 1 to **25600000 bytes** Byte units.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

### Example

These commands enable ECN marking of unicast packets from **unicast transmit queue 4 of interface Ethernet 3/5/1**, setting thresholds at **128** kbytes and **1280** kbytes.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 4
switch(config-if-Et3/5/1-txq-4)# random-detect ecn minimum-threshold 128 kbytes
maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)# show active
interface Ethernet3/5/1
 tx-queue 4
 random-detect ecn minimum-threshold 128 kbytes maximum-threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#

```

---

### 10.1.18.37 random-detect ecn (Helix)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - **0%** are marked when average queue size is less than or equal to minimum threshold.
  - **100%** are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked Non ECN Capable, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The **no random-detect ecn** and **default random-detect ecn** commands disable ECN marking on the configuration mode queue, deleting the corresponding **random-detect ecn** command from **running-config**.

#### Command Mode

Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold [MIN | MAX] maximum-threshold [MIN | MAX]
no random-detect ecn
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **1 to 46080 segments** 208-byte segments units.
  - **1 to 9 mbytes** Megabyte units.
  - **1 to 9584 kbytes** Kilobyte units.
  - **1 to 9584640 bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - **1 to 46080 segments** 208-byte segments units.

- **1 to 9 mbytes** Megabyte units.
- **1 to 9584 kbytes** Kilobyte units.
- **1 to 9584640 bytes** Byte units.

## Related Commands

- [tx-queue \(Helix\)](#) places the switch in tx-queue configuration mode.
- [qos random-detect ecn global-buffer \(Helix\)](#) enables ECN marking for globally shared packet memory.

## Examples

- These commands enable ECN marking of unicast packets from **transmit queue 4 of interface ethernet 15**, setting thresholds at **10** and **100** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-txq-4)# random-detect ecn minimum-threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-txq-4)# show active
interface Ethernet15
 tx-queue 4
 random-detect ecn minimum-threshold 10 segments maximum-threshold 100
 segments
switch(config-if-Et15-txq-4)# exit
switch(config-if-Et15)
```

- This command disables ECN marking of unicast packets from **transmit queue 4 of interface ethernet 15**.

```
switch(config-if-Et15-txq-4)# no random-detect ecn
switch(config-if-Et15-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-txq-4)# exit
switch(config-if-Et15) #
```

---

### 10.1.18.38 random-detect ecn (Trident and Tomahawk)

The **random-detect ecn** command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - **0%** are marked when average queue size is less than or equal to minimum threshold.
  - **100%** are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The **no random-detect ecn** and **default random-detect ecn** commands disable ECN marking on the configuration mode queue, deleting the corresponding **random-detect ecn** command from **running-config**.

#### Command Mode

Uc-Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold [MIN | MAX] maximum-threshold [MIN | MAX]
```

```
no random-detect ecn
```

```
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **1 to 46080 segments** 208-byte segments units.
  - **1 to 9 mbytes** Megabyte units.
  - **1 to 9584 kbytes** Kilobyte units.
  - **1 to 9584640 bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - **1 to 46080 segments** 208-byte segments units.

- 1 to **9 mbytes** Megabyte units.
- 1 to **9584 kbytes** Kilobyte units.
- 1 to **9584640 bytes** Byte units.

## Related Commands

- [uc-tx-queue](#) places the switch in the ***uc-tx-queue*** configuration mode.
- [qos random-detectecn global-buffer \(Trident and Tomahawk\)](#) enables ECN marking for globally shared packet memory.

## Examples

- These commands enable ECN marking of unicast packets from ***unicast transmit queue 4 of interface ethernet 15***, setting thresholds at **10** and **100** segments.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)# random-detect ecn minimum-threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
 uc-tx-queue 4
 random-detect ecn minimum-threshold 10 segments maximum-threshold 100
 segments
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15) #
```

- This command disables ECN marking of unicast packets from ***unicast transmit queue 4 of interface ethernet 15***.

```
switch(config-if-Et15-uc-txq-4)# no random-detect ecn
switch(config-if-Et15-uc-txq-4)# show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)# exit
switch(config-if-Et15) #
```

---

### 10.1.18.39 random-detect ecn delay threshold

The **random-detect ecn delay threshold** command configures latency-based ECN on a per transmit queue basis.

The [**no|default**] version of the command disables the configuration and deletes the **random-detect ecn delay threshold** from the **running-config**.

#### Command Mode

Interface Configuration

#### Command Syntax

```
random-detect ecn delay threshold [microseconds | milliseconds]
```

#### Parameters

- **random-detect** - Set WRED-based congestion control parameters.
- **ecn** - Set ECN parameters.
- **delay** - Set the delay parameter.
- **threshold** - Configure the threshold to trigger latency-based ECN.
  - ***microseconds*** - Configure a value from 1 to 4294967 microseconds.
  - ***milliseconds*** - Configure a value from 1 to 4294 milliseconds.

#### Example

Use the following commands to configure transmit queue 1 on Ethernet 1/1 for latency-based ECN:

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# random-detect ecn delay threshold 33 milliseconds
```

#### 10.1.18.40 service-policy type qos input

The **service-policy type qos input** command applies the specified policy map to a QoS profile. The profile is then applied to an interface in interface configuration mode using the **service-profile** command.

The **no service-policy type qos** and **default service-policy type qos** command deletes the policy map from the profile.

The **exit** command returns the switch to global configuration mode.

##### Command Mode

QoS Profile Configuration

##### Command Syntax

```
service-policy type qos input policy_map_name
no service-policy type qos input policy_map_name
default service-policy type qos input policy_map_name
```

##### Parameter

***policy\_map\_name*** QoS policy map name.

##### Example

This command applies the policy map **PM-1** to the QoS profile **TP**.

```
switch(config-qos-profile-TP)# service-policy type qos input PM-1
switch(config-qos-profile-TP) #
```

---

#### 10.1.18.41 service-profile

The command applies the QoS profile to the configuration mode interface.

The **no service-profile** and the **default service-profile** command removes the QoS profile from the interface.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
service-profile profile_name
no service-profile profile_name
default service-profile profile_name
```

#### Parameter

***profile\_name*** QoS profile name.

#### Example

This commands applies the QoS profile **TP** to **interface ethernet 13**.

```
switch(config)# interface ethernet 13
switch(config-if-Et13)# service-profile TP
```

### 10.1.18.42 set extcommunity

The **set extcommunity** command adds a color extended community to be applied to routes affected by the route-map. Multiple set clauses can be applied to a single route-map to configure multiple colors for routes. Negating the command removes the entry from the route-map.

#### Command Mode

Config-route-map mode

#### Command Syntax

```
set extcommunity COLOR-EXPRESSION [additive | delete]
no set extcommunity COLOR-EXPRESSION [additive | delete]
default set extcommunity COLOR-EXPRESSION [additive | delete]
```

#### Parameters

- **COLOR-EXPRESSION** The color extended community to be applied to routes affected by the route-map.
- **additive** Adds the extended communities to those received.
- **delete** Deletes any matching extended color communities.

#### Example

```
switch(config)# route-map foo
switch(config-route-map foo)# set extcommunity color 1
switch(config-route-map foo)# set extcommunity color 2 color-only exact-match
switch(config-route-map foo)# set extcommunity color 3 color-only endpoint-match null
switch(config-route-map foo)# set extcommunity color 4 color-only endpoint-match any
```

### 10.1.18.43 shape rate (Interface – Arad/Jericho)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Arad/Jericho\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **162** to **100000000**.

#### Example

This command configures a port shape rate of **5 Gbps** on **interface ethernet 3/5/1**.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# shape rate 5000000
switch(config-if-Et3/5/1)# show qos interfaces ethernet 3/5/1

Ethernet3/5/1:

 Port shaping rate: 5000012 / 5000000 kbps

 Tx Bandwidth Shape Rate Priority ECN
 Queue (percent) (units) SP / SP D

 7 - / - - / - (-)
 6 - / - - / - (-)
 5 - / - - / - (-)
 4 - / - - / - (-)
 3 - / - - / - (-)
 2 - / - - / - (-)
 1 - / - - / - (-)
 0 - / - - / - (-)

switch(config-if-Et3/5/1) #
```

### 10.1.18.44 shape rate (Interface – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – FM6000\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**shape rate *byte\_limit* [kbps]**

**no shape rate**

**default shape rate**

#### Parameter

***byte\_limit*** Shape rate applied to interface (Kbps). Value ranges from **7000** to **10000000**.

#### Guidelines

Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in ***running-config***.

#### Example

This command configures a port shape rate of **5 Gbps** on ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# shape rate 5000000
switch(config-if-Et5)#

```

### 10.1.18.45 shape rate (Interface – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Interface – Helix\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - **8 to 40000000 8 to 40000000** kbytes per second.
  - **8 to 40000000kbps 8 to 40000000** kbytes per second.
  - **8 to 60000000pps 8 to 60000000** packets per second.

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than **1** Mbps, granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

#### Example

This command configures a port shape rate of **5 Gbps** on **interface ethernet 17**.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# shape rate 5000000 kbps
switch(config-if-Et17)# show qos interface ethernet 17/3

Ethernet17:
 Trust Mode: COS
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: 5000000 / 5000000 kbps

 Tx Bandwidth Shape Rate Priority
 Queue Guaranteed (units) (units) -----
 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP

switch(config-if-Et17)#

```

### 10.1.18.46 shape rate (Interface – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Petra\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**shape rate *data\_limit* [kbps]**

**no shape rate**

**default shape rate**

#### Parameters

***data\_limit*** Shape rate applied to interface (Kbps). Value ranges from **100** to **10000000**.

#### Guidelines

The following port shaping rates are supported:

- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

#### Example

This command configures a port shape rate of **5 Gbps** on **interface ethernet 3/3**.

```
switch(config)# interface ethernet 3/3
switch(config-if-Et3/3)# shape rate 5000000
switch(config-if-Et3/3)# show active
interface Ethernet3/3
 shape rate 5000000
switch(config-if-Et3/3)#

```

---

#### 10.1.18.47 shape rate (Interface – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Trident and Tomahawk\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**shape rate DATA\_LIMIT**

**no shape rate**

**default shape rate**

#### Parameters

- **DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - **8 to 40000000 8 to 40000000 kbytes per second.**
  - **8 to 40000000 kbps 8 to 40000000 kbytes per second.**
  - **8 to 60000000 pps 8 to 60000000 packets per second.**

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than **1** Mbps, granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

#### Example

This command configures a port shape rate of **5** Gbps on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# shape rate 5000000
switch(config-if-Et5)#{
```

### 10.1.18.48 shape rate (Interface – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Trident II)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**shape rate DATA\_LIMIT**

**no shape rate**

**default shape rate**

#### Parameters

**DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:

- • **8 to 40000000 kbps**   **8 to 40000000 kbytes per second.**
- **8 to 40000000 kbps**   **8 to 40000000 kbytes per second.**
- **8 to 60000000 pps**   **8 to 60000000 packets per second.**

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

#### Example

This command configures a port shape rate of **5 Gbps** on **interface ethernet 17/3**.

```

switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# shape rate 5000000 kbps
switch(config-if-Et17/3)# show qos interface ethernet 17/3

Ethernet17/3:
 Trust Mode: COS
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: 5000000 / 5000000 kbps

 Tx Bandwidth Shape Rate Priority
 Queue Guaranteed (units) (units)

 7 - / - (-) - / - (-) SP / SP
 6 - / - (-) - / - (-) SP / SP

switch(config-if-Et17/3)#

```

### 10.1.18.49 shape rate (Tx-queue – Arad/Jericho)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Arad/Jericho\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Shaping rates greater than **50000** kbps are supported. At lower shaping rates (less than **10** Mbps), granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **50000** to **100000000**.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Related Information

[shape rate \(Interface – Arad/Jericho\)](#)

#### Example

These commands configure a shape rate of **1** Gbps on transmit queues **3** and **4** of *interface ethernet 3/4/1*.

```
switch(config)# interface ethernet 3/4/1
switch(config-if-Et3/4/1)# tx-queue 4
switch(config-if-Et3/4/1-txq-4)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)# tx-queue 3
switch(config-if-Et3/4/1-txq-3)# shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)# show qos interface ethernet 3/4/1

Ethernet3/4/1:
 Port shaping rate: disabled

switch(config-if-Et3/4/1-txq-3) #
```

### 10.1.18.50 shape rate (Tx-queue – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – FM6000\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping on an FM6000 port is supported only when port shaping is not enabled on the interface. Enabling port shaping on a port disables queue shaping internally. Disabling port shaping restores queue shaping as specified by *running-config*.

Shaping rates greater than **460** kbps are supported. At lower shaping rates (less than **10** Mbps), granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the transmit queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
no shape rate
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **464** to **10000000**.

#### Related Commands

- [tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.
- [shape rate \(Interface – FM6000\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of **1** Gbps (**1,000,000** Kbps) on transmit queues **3** and **4** of *interface ethernet 19*.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# tx-queue 4
switch(config-if-Et19-txq-4)# shape rate 1000000
switch(config-if-Et19-txq-4)# tx-queue 3
switch(config-if-Et19-txq-3)# shape rate 1000000
switch(config-if-Et19-txq-3)# show qos interface ethernet 19

Ethernet19:

### 10.1.18.51 shape rate (Tx-queue – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Helix\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:

- 8 to 40000000    8 to 40,000,000 kbytes per second.
- 8 to 40000000 kbps    8 to 40000000 kbytes per second.
- 8 to 60000000 pps    8 to 60000000 packets per second.

#### Restrictions

Queue shaping is not supported in cut-through mode.

#### Related Commands

- [tx-queue \(Helix\)](#) places the switch in **tx-queue** configuration mode.
- [shape rate \(Interface – Helix\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of **1 Gbps (1,000,000 Kbps)** on transmit queues **3** and **4** of **interface Ethernet 17/3**.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)# tx-queue 3
switch(config-if-Et17/3-txq-3)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)# show qos interface ethernet 17/3
```

Ethernet17/3:

| Tx Queue | Bandwidth<br>Guaranteed<br>(units) | Shape Rate<br>(units) | Priority |
|----------|------------------------------------|-----------------------|----------|
| 7        | - / - ( - )                        | - / - ( - )           | SP / SP  |

| 3        | - / - ( - )                        | 1 / 1 ( Gbps )        | SP / SP  |
| 2        | - / - ( - )                        | - / - ( - )           | SP / SP  |
| 1        | - / - ( - )                        | - / - ( - )           | SP / SP  |
| 0        | - / - ( - )                        | - / - ( - )           | SP / SP  |

```
switch(config-if-Et1/3-txq-3) #
```

### 10.1.18.52 shape rate (Tx-queue – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Petra\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
no shape rate
default shape rate
```

#### Parameters

**DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:

- **8 to 40000000 kbps** Range is from **8** to **40000000** kbytes per second.
- **8to 60000000pps** Range is from **8** to **60000000** packets per second.

Shaping rates greater than **460** kbps are supported. At lower shaping rates (less than **10** Mbps), granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

#### Related Commands

- [tx-queue \(Petra\)](#) places the switch in **tx-queue** configuration mode.
- [shape rate \(Interface – Petra\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of **1 Gbps (1,000,000 Kbps)** on transmit queues **3** and **4** of **interface ethernet 3/28**.

```
switch(config)# interface ethernet 3/28
switch(config-if-Et3/28)# tx-queue 4
switch(config-if-Et3/28-txq-4)# shape rate 1000000
switch(config-if-Et3/28-txq-4)# tx-queue 3
switch(config-if-Et3/28-txq-3)# shape rate 1000000
switch(config-if-Et3/28-txq-3)# show qos interface ethernet 3/28

Ethernet3/28:

Tx-Queue Bandwidth Shape Rate Priority
 (percent) (Kbps)

 7 N/A disabled strict
 6 N/A disabled strict
 5 N/A disabled strict
 4 N/A 1000000 strict
 3 25 1000000 round-robin

 0 25 disabled round-robin

switch(config-if-Et3/28-txq-3) #
```

### 10.1.18.53 shape rate (Tx-queue – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Trident and Tomahawk\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:

- **8 to 40000000 kbps** Range is from **8** to **40000000** kbytes per second.
- **8 to 60000000 pps** Range is from **8** to **60000000** packets per second.

#### Related Commands

- [mc-tx-queue](#) places the switch in **mc-tx-queue** configuration mode.
- [uc-tx-queue](#) places the switch in **uc-tx-queue** configuration mode.
- [shape rate \(Interface – Trident and Tomahawk\)](#) configures the shape rate for a configuration mode interface.

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than **1** Mbps, granularity and rounding errors may skew the actual shaping rate by **20%** from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.

#### Example

These commands configure a shape rate of **1 Gbps** (**1,000,000 Kbps**) on **unicast transmit queues 3** and **multicast transmit 4** of **interface ethernet 7**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)# shape rate 1000000
switch(config-if-Et7-uc-txq-3)# mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)# shape rate 1000000
switch(config-if-Et7-mc-txq-2)# show qos interface ethernet 7
```

| Ethernet7: |                        |                      |          |                |  |
|------------|------------------------|----------------------|----------|----------------|--|
| Tx-Queue   | Bandwidth<br>(percent) | Shape Rate<br>(Kbps) | Priority | Priority Group |  |
| UC7        | N/A                    | disabled             | strict   | 1              |  |
| UC6        | N/A                    | disabled             | strict   | 1              |  |

|     |     |          |             |   |
|-----|-----|----------|-------------|---|
| MC3 | N/A | disabled | strict      | 1 |
| UC5 | N/A | disabled | strict      | 0 |
| UC4 | N/A | disabled | strict      | 0 |
| MC2 | N/A | 1000000  | strict      | 0 |
| UC3 | 20  | 1000000  | round-robin | 0 |
| UC2 | 16  | disabled | round-robin | 0 |
| MC1 | 16  | disabled | round-robin | 0 |
| UC1 | 16  | disabled | round-robin | 0 |
| UC0 | 16  | disabled | round-robin | 0 |
| MC0 | 16  | disabled | round-robin | 0 |

```
switch(config-if-Et7-mc-txq-2) #
```

### 10.1.18.54 shape rate (Tx-queue – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Trident II\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:

- **8 to 40000000 kbps** Range is from **8** to **40000000** kbytes per second.
- **8 to 60000000 pps** Range is from **8** to **60000000** packets per second.

#### Restrictions

Queue shaping is not supported in cut-through mode

#### Related Commands

- [tx-queue \(Trident II\)](#) places the switch in **tx-queue** configuration mode.
- [shape rate \(Interface – Trident II\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of **1 Gbps (1,000,000 Kbps)** on transmit queues **3** and **4** of **interface ethernet 17/3**.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)# tx-queue 3
switch(config-if-Et17/3-txq-3)# shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)# show qos interface ethernet 17/3
```

Ethernet17/3:

| Tx Queue | Bandwidth<br>Guaranteed<br>(units) | Shape Rate<br>(units) | Priority |
|----------|------------------------------------|-----------------------|----------|
| 7        | - / - ( - )                        | - / - ( - )           | SP / SP  |
| 6        | - / - ( - )                        | - / - ( - )           | SP / SP  |

| 2        | - / - ( - )                        | - / - ( - )           | SP / SP  |
| 1        | - / - ( - )                        | - / - ( - )           | SP / SP  |
| 0        | - / - ( - )                        | - / - ( - )           | SP / SP  |

```
switch(config-if-Et17/3-txq-3) #
```

---

### **10.1.18.55 show interface counters queue drop-precedence**

The **show interface counters queue drop-precedence** command displays the drop-precedence counters.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show interface counters queue drop-precedence
```

#### **Example**

This command displays the drop precedence counts on two interfaces.

```
switch# show interface counters queue drop-precedence
intf 0 1 2
Et1/1 100 0 200
Et1/2 200 0 300 switch#
```

### 10.1.18.56 show platform petraA traffic-class

The **show platform petraA traffic-class** command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the [platform petraA traffic-class](#) command.

Valid command options include:

- **show platform petraA traffic-class**      Traffic class of all chips on all linecard.
- **show platform petraA CHIP\_NAME traffic-class**      Traffic class of specified chip.
- **show platform petraA MODULE\_NAME traffic-class**      Traffic class of all chips on specified linecard.

#### Command Mode

EXEC

#### Command Syntax

```
show platform petraA traffic-class
show platform petraA CHIP_NAME traffic-class
show platform petraA MODULE_NAME traffic-class
```

#### Parameters

- **CHIP\_NAME** Name of Petra chip on linecard that control Ethernet ports. Options include:
  - **petra cardX / chipY**    All ports on PetraA chip **chipY** on linecard **cardX** (7500 Series).
  - **petra chipZ**    All ports on PetraA chip **chipZ** (7048 Series).

#### 7500 Series

Switches can contain up to eight linecards. **cardX** varies from **3** to **10**.

Each linecard contains six PetraA chips. Each chip controls eight ports. **chipY** varies from **0** to **5**:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

#### 7048 Series

Each switch contains two PetraA chips. **chipZ** varies from **0** to **1**:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52

- **MODULE\_NAME** Name and number of linecard (7500 Series). Options include:
  - **module linecard mod\_num**    Linecard number (**3** to **10**).
  - **module mod\_num**    Linecard number (**3** to **10**).

#### Related Command

[platform petraA traffic-class](#) configures the default traffic class used by all ports on a specified chip.

---

## Example

This command displays the traffic class of all chips on ***linecard 3***.

```
switch# show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1 switch#
```

### 10.1.18.57 show platform trident tcam qos detail

The `show platform trident tcam qos detail` command displays the list of all the SVIs that are sharing the TCAM entries.

#### Command Mode

EXEC

#### Command Syntax

```
show platform trident tcam qos detail
```

#### Example

This command displays the list of all the SVIs that are sharing the TCAM entries.

```
switch(config)# show platform trident tcam qos detail
==== Policy-map p01 type qos on switch Linecard0/0 ====
Interfaces : Vlan2 Vlan1
==== Interface BitMap ====
0x000000000000000000000001FFFFFE
```

---

### **10.1.18.58 show platform trident tcam shared vlan interface-class-id**

The **show platform trident tcam shared vlan interface-class-id** command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show platform trident tcam shared vlan interface-class-id
```

#### **Example**

This command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

```
switch(config)# show platform trident tcam shared vlan interface-class-id
==== Shared RACL Data on switch Linecard0/0 ====
==== Shared QoS Policy-map Data on switch Linecard0/0 ====
Interface Class Id VLANs
1 1 2
```

### **10.1.18.59 show platform xp qos tcam hit**

The **show platform xp qos tcam hit** command displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.

## Command Mode

EXEC

## Command Syntax

```
show platform xp qos tcam hit
```

## Example

This command displays the QoS TCAM hits on ***interface ethernet 10/1***.

---

## 10.1.18.60 show policy-map interface

The **show policy-map interface** command displays contents of the policy map applied to specified the interface.

### Command Mode

EXEC

### Command Syntax

```
show policy-map interface interface_name
```

### Parameters

***interface\_name*** Interface for which command returns data. Options include:

- **no parameter** Returns data for all interfaces.
- **ethernet *e\_range*** Ethernet interfaces specified by ***e\_range***.
- **port-channel *p\_range*** Port channel interfaces specified by ***p\_range***.

### Example

This command displays the name and contents of the policy map applied to ***interface Ethernet 1***.

```
switch# show policy-map interface ethernet 1
Service-policy input: p1
 Hardware programming status: Successful

 Class-map: c2001 (match-any)
 Match: vlan 2001 0xffff
 set dscp 4

 Class-map: c2002 (match-any)
 Match: vlan 2002 0xffff
 set dscp 8

 Class-map: c2003 (match-any)
 Match: vlan 2003 0xffff
 set dscp 12
```

### 10.1.18.61 show policy-map

The **show policy-map** command displays the policy map information for the configured policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map policy_map_name [counters][interface | summary]
```

#### Parameters

- ***policy\_map\_name*** QoS policy map name.
- **counters** Specifies the policy map traffic match count (This parameter is applicable only on DCS-7010, DCS-7050X, DCS7250X, DCS-7300X and DCS-7280(E/R), DCS-7500(E/R) series switches.)
- **interface** Specifies the service policy on an interface.
- **summary** Policy map summary.

#### Examples

- The **show policy-map** command displays the information for the policy map **policy1**.

```
switch# show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The **show policy-map counters** command displays the policy map traffic match count for the policy map configured.

```
switch# show policy-map policy1 counters
Service-policy input: policy1
Hardware programming status: Successful
Class-map: class1 (match-any)
Match: vlan 20-40,1000-1250
 police rate 100 mbps burst-size 100 kbytes
 Interface: Ethernet16/1
 Conformed 28621 packets, 7098008 bytes ----- packet match count
Class-map: class-default (match-any)
 Matched Packets: 19 ----- packet match count
```

## 10.1.18.62 show qos interfaces random-detect ecn

The **show qos interfaces random-detect ecn** command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

### Command Mode

EXEC

### Command Syntax

```
show qos interfaces [INTERFACE_NAME] random-detect ecn
```

### Parameters

**INTERFACE\_NAME** Interface for which command returns data. Options include:

- **no parameter** Returns data for all interfaces.
- **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
- **port-channel p\_range** Port-Channel Interfaces specified by **p\_range**.

### Example

This command configures ECN parameters for transmit queues **0** through **3** on **interface ethernet 3/5/1**, then displays that configuration.

```
switch(config)# interface ethernet 3/5/1
switch(config-if-Et3/5/1)# tx-queue 0
switch(config-if-Et3/5/1-txq-0)# random-detect ecn minimum-threshold 2560 kbytes
maximum-threshold 256000 kbytes
switch(config-if-Et3/5/1-txq-0)# tx-queue 1
switch(config-if-Et3/5/1-txq-1)# random-detect ecn minimum-threshold 25600 kbytes
maximum-threshold 128000 kbytes
switch(config-if-Et3/5/1-txq-1)# tx-queue 2
switch(config-if-Et3/5/1-txq-2)# random-detect ecn minimum-threshold 25600 bytes
maximum-threshold 128000 bytes
switch(config-if-Et3/5/1-txq-2)# tx-queue 3
switch(config-if-Et3/5/1-txq-3)# random-detect ecn minimum-threshold 25 mbytes
maximum-threshold 128 mbytes
switch(config-if-Et3/5/1-txq-3)# show qos interfaces ethernet 3/5/1 random-detect
ecn

Ethernet3/5/1:

Tx-Queue Mininimum Threshold Maximum Threshold Threshold Unit

7 - - -
6 - - -
5 - - -
4 - - -
3 25 128 mbytes
2 25600 128000 bytes
1 25600 128000 kbytes
0 2560 256000 kbytes

switch(config-if-Et3/5/1-txq-3)#

```

### 10.1.18.63 show qos interfaces trust

The `show qos interfaces trust` command displays the configured and operational QoS trust mode of all specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show qos interfaces [INTERFACE_NAME] trust
```

#### Parameters

**INTERFACE\_NAME** Interface for which command returns data. Options include:

- **no parameter** Returns data for all interfaces.
- **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
- **port-channel p\_range** Port-Channel Interfaces specified by **p\_range**.

#### Example

These commands configure a variety of QoS trust settings on a set of interfaces, then displays the QoS trust mode on these interfaces.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# qos trust cos
switch(config-if-Et1/1)# interface ethernet 1/2
switch(config-if-Et1/2)# qos trust dscp
switch(config-if-Et1/2)# interface ethernet 1/3
switch(config-if-Et1/3)# no qos trust
switch(config-if-Et1/3)# interface ethernet 1/4
switch(config-if-Et1/4)# default qos trust
switch(config-if-Et1/4)# interface ethernet 2/1
switch(config-if-Et2/1)# no switchport
switch(config-if-Et2/1)# default qos trust
switch(config-if-Et2/1)# show qos interface ethernet 1/1 - 2/4 trust
```

| Port        | Trust Mode  |            |
|-------------|-------------|------------|
|             | Operational | Configured |
| Ethernet1/1 | COS         | COS        |
| Ethernet1/2 | DSCP        | DSCP       |

switch(config-if-Et2/1) #
```

---

## 10.1.18.64 show qos interfaces

The **show qos interfaces** command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

### Command Mode

EXEC

### Command Syntax

```
show qos interfaces INTERFACE_NAME
```

### Parameters

**INTERFACE\_NAME** Interface For which command returns data. Options include:

- **no parameter** Returns data for all interfaces.
- **ethernet e\_num** Ethernet interface specified by **e\_num**.
- **port-channel p\_num** Port-Channel Interface specified by **p\_num**.

### Example

This command lists the QoS configuration for **interface ethernet 4**.

```
switch> show qos interfaces ethernet 4

Ethernet4:
 Trust Mode: COS
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: 5000000Kbps

 Tx-Queue Bandwidth ShapeRate Priority
 (percent) (Kbps)

 0 50 disabled round-robin
 1 50 disabled round-robin
 2 N/A disabled strict
 3 N/A 1000000 strict
 4 N/A 1000000 strict
 5 N/A 1500000 strict
 6 N/A 2000000 strict
switch>
```

### 10.1.18.65 show qos interfaces latency maximum

The **show qos interfaces latency maximum** command displays the maximum latency tail-drop threshold active on each Tx queue for a specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show qos interfaces INTERFACE_NAME latency maximum
```

#### Parameters

***INTERFACE\_NAME***: Name of the interface.

#### Example

This command lists the maximum latency for VOQ tail drop on **interface ethernet 23/1**.

```
switch# show qos interfaces ethernet 23/1 latency maximum

Ethernet23/1:
Tx Queue Maximum Latency
----- -----
 7 -
 6 -
 5 -
 4 -
 3 10 ms
 2 -
 1 -
 0 -
```

```
switch# show qos profile
qos profile latency
 tx-queue 3
 latency maximum 4000 microseconds
 Tx-queue 4
 latency maximum 30 milliseconds
```

---

### 10.1.18.66 show qos maps

The **show qos maps** command lists the number of traffic classes that the switch supports and displays the CoS-Traffic Class, DSCP-Traffic Class, Traffic Class-CoS, and Traffic Class-Transmit Queue maps.

#### Command Mode

EXEC

#### Command Syntax

```
show qos maps
```

#### Example

This command displays the QoS maps that are configured on the switch.

```
switch> show qos maps
Number of Traffic Classes supported: 8
 Number of Transmit Queues supported: 8
 Cos Rewrite: Disabled
 Dscp Rewrite: Disabled

 Cos-tc map:
 cos: 0 1 2 3 4 5 6 7

 tc: 1 0 2 3 4 5 6 7

 Dscp-tc map:
 d1 : d2 0 1 2 3 4 5 6 7 8 9

 0 : 1 1 1 1 1 1 1 1 0 0
 1 : 0 0 0 0 0 0 2 2 2 2
 2 : 2 2 2 2 3 3 3 3 3 3
 3 : 3 3 4 4 4 4 4 4 4 4
 4 : 5 5 5 5 5 5 5 5 6 6
 5 : 6 6 6 6 6 6 7 7 7 7
 6 : 7 7 7 7

 Tc-cos map:
 tc: 0 1 2 3 4 5 6 7

 cos: 1 0 2 3 4 5 6 7

 Tc-dscp map:
 tc: 0 1 2 3 4 5 6 7

 dscp: 8 0 16 24 32 40 48 56

 Tc - tx-queue map:
 tc: 0 1 2 3 4 5 6 7

 tx-queue: 0 1 2 3 4 5 6 7
switch>
```

### 10.1.18.67 show qos map dscp to traffic-class

The `show qos map dscp to traffic-class` command shows all DSCP to traffic-class maps, or one specified DSCP to TC map.

#### Command Mode

Privileged EXEC mode

#### Command Syntax

```
show qos map dscp to traffic-class [map_name]
```

#### Parameters

- ***map\_name*** The name of the DSCP to traffic-class map. If this is not specified, all DSCP to TC maps are shown.

#### Example

This command shows the DSCP to TC map named ***map1***.

```
switch#show qos map dscp to traffic-class map1
DSCP to TC map: map1
d1 : d2 0 1 2 3 4 5 6 7 8 9

0 : 1 1 1 1 1 1 1 1 0 0
1 : 0 0 0 0 0 0 2 2 2 2
2 : 6 6 6 6 6 6 3 3 3 3
3 : 3 3 4 4 4 7 4 4 4 4
4 : 5 5 5 5 5 5 5 5 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7 switch#
```

---

### **10.1.18.68 show qos profile summary**

The **show qos profile summary** command displays the QoS profile summary of those which are part of the running configuration.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show qos profile summary
```

#### **Example**

This command shows a summary of all QoS profiles configured on the switch.

```
switch(config)# show qos profile summary
Qos Profile: p
Configured on: Et13,7
Fabric
Po12
Qos Profile: p2
Configured on: Et56
```

### 10.1.18.69 show qos profile

The **show qos profile** command displays the contents of the specified QoS profile or of all QoS profiles in the running configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show qos profile profile_name
```

#### Parameter

***profile\_name*** QoS profile name.

#### Examples

- This command displays the contents of all QoS profiles configured on the switch.

```
switch(config)# show qos profile
qos profile p
qos cos 1
no priority-flow-control pause watchdog
priority-flow-control priority 1 no-drop
priority-flow-control priority 2 no-drop
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

- This command displays the configuration attached and information specific to **QoS profile p2**.

```
switch# show qos profile p2
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

---

### **10.1.18.70 show qos random-detect ecn**

The command displays the global Explicit Congestion Notification (ECN) configuration.

#### **Command Mode**

EXEC

#### **Command Syntax**

```
show qos random-detect ecn
```

#### **Example**

These commands configure global ECN parameters, then displays that configuration.

```
switch(config)# qos random-detect ecn global-buffer minimum-threshold 2 mbytes
maximum-threshold 5 mbytes
switch(config)# show qos random-detect ecn

 Minimum Threshold: 2
 Maximum Threshold: 5
 Threshold Unit: mbytes

switch(config) #
```

### 10.1.18.71 show run|grep sharing

The **show run|grep sharing** command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

#### Command Mode

EXEC

#### Command Syntax

```
show run|grep sharing
```

#### Example

This command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

```
switch# show run|grep sharing
hardware access-list qos resource sharing vlan in ----
```

If this message is displayed then QoS policy-map sharing on SVIs is enabled.

## 10.1.18.72 tx-queue (Arad/Jericho)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Arad and Jericho platform switches have eight queues, **0** through **7**, and all queues are exposed through the CLI. However, **queue 7** is not user-configurable. **Queue 7** is always mapped to **traffic class 7**, which is reserved for control traffic.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting all corresponding **tx-queue** mode statements from **running-config**.

### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

### Command Syntax

**tx-queue queue\_level**

### Parameters

*queue\_level* The transmit queue. Values range from **0** to **7**.

### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Arad/Jericho\)](#)
- [priority \(Arad/Jericho\)](#)
- [shape rate \(Tx-queue – Arad/Jericho\)](#)

### Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **interface ethernet 3/3/3**.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# tx-queue 4
switch(config-if-Et3/3/3-txq-4) #
```

### 10.1.18.73 tx-queue (FM6000)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

FM6000 platform switches have eight queues, **0** through **7**. All queues are exposed through the CLI and are user configurable.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**tx-queue *queue\_level***

#### Parameter

***queue\_level*** The transmit queue. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(FM6000\)](#)
- [priority \(FM6000\)](#)
- [shape rate \(Tx-queue – FM6000\)](#)

#### Guidelines

FM6000 platform switch queues handle unicast and multicast traffic.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 3** of **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# tx-queue 3
switch(config-if-Et5-txq-3)#

```

---

## 10.1.18.74 tx-queue (Helix)

The **tx-queue** command places the switch in **tx-queue** configuration mode to configure a transmit queue on the configuration mode interface. The **tx-queue** configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Helix platform switches have eight unicast (**UC0 – UC7**) and eight multicast (**MC0 – MC7**) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

### Command Syntax

**tx-queue queue\_level**

### Parameter

**queue\_level** Transmit queue group number. Values range from **0** to **7**.

### Commands Available in tx-queue Configuration Mode

- [bandwidth guaranteed \(Helix\)](#)
- [shape rate \(Tx-queue – Helix\)](#)

### Guidelines

Helix platform switch queues handle unicast and multicast traffic.

### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **interface ethernet 17/3**.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4)#

```

### 10.1.18.75 tx-queue (Petra)

The **tx-queue** command places the switch in **tx-queue** configuration mode to configure a transmit queue on the configuration mode interface. The **tx-queue** configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Petra platform switches have eight queues, **0** through **7**, and all queues are exposed through the CLI. However, **queue 7** is not user-configurable. **Queue 7** is always mapped to **traffic class 7**, which is reserved for control traffic.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**tx-queue queue\_level**

#### Parameter

**queue\_level** The transmit queue. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Petra\)](#)
- [priority \(Petra\)](#)
- [shape rate \(Tx-queue – Petra\)](#)

#### Guidelines

Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

#### Example

This command enters the **tx-queue** configuration mode for **transmit queue 3** of **interface ethernet 3/3**.

```
switch(config)# interface ethernet 3/3
switch(config-if-Et3/3)# tx-queue 3
switch(config-if-Et3/3-txq-3)#

```

---

## 10.1.18.76 tx-queue (Trident II)

The **tx-queue** command places the switch in **tx-queue** configuration mode to configure a transmit queue on the configuration mode interface. The **tx-queue** configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident II platform switches have eight unicast (**UC0 – UC7**) and eight multicast (**MC0 – MC7**) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

### Command Syntax

**tx-queue queue\_level**

### Parameter

**queue\_level** Transmit queue group number. Values range from **0** to **7**.

### Commands Available in tx-queue Configuration Mode

- [bandwidth guaranteed \(Trident II\)](#)
- [shape rate \(Tx-queue – Trident II\)](#)

Trident II platform switch queues handle unicast and multicast traffic.

### Example

This command enters the **tx-queue** configuration mode for **transmit queue 4** of **interface ethernet 17/3**.

```
switch(config)# interface ethernet 17/3
switch(config-if-Et17/3)# tx-queue 4
switch(config-if-Et17/3-txq-4) #
```

### 10.1.18.77 uc-tx-queue

The **uc-tx-queue** command places the switch in the ***uc-tx-queue*** configuration mode to configure a unicast transmit queue on the configuration mode interface. The ***uc-tx-queue*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident and Tomahawk switches have eight unicast queues (***UC0 – UC7***) and four multicast queues (***MC0 – MC03***), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- **Priority Group 1:** ***UC7, UC6, MC3***
- **Priority Group 0:** ***UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0***

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no uc-tx-queue** and **default uc-tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **uc-tx-queue** mode commands from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**uc-tx-queue *queue\_level***

#### Parameter

***queue\_level*** The multicast transmit queue number. Values range from ***0*** to ***7***.

#### Commands Available in ***uc-tx-queue*** Configuration Mode

- **bandwidth percent** (Trident and Tomahawk)
- **priority** (Trident and Tomahawk)
- **shape rate** (Tx-queue – Trident and Tomahawk)

#### Related Command

[\*\*mc-tx-queue\*\*](#): Configures multicast transmit queues on Trident and Tomahawk platform switches.

#### Example

This command enters the ***mc-tx-queue*** configuration mode for ***multicast transmit queue 4*** of ***interface ethernet 5***.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# uc-tx-queue 4
switch(config-if-Et5-mc-txq-4) #
```

### 10.1.19 Chipset Mapping for QoS

**Table 52: Chipset Names by Model Number**

| Model Number      | Chipset Name |
|-------------------|--------------|
| 7010T-48          | Helix4       |
| 7010T-48-DC       | Helix4       |
| 7020SR-24C2       | QumranAX     |

## 10.2 Traffic Management

This chapter describes Traffic Management on Arista switches, including configuration instructions and command descriptions. Topics discussed by this chapter include:

- [Traffic Management Conceptual Overview](#)
- [Traffic Management Configuration Trident Platform Switches](#)
- [Traffic Management Configuration Trident II Platform Switches](#)
- [Traffic Management Configuration Commands](#)

### 10.2.1 Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines four types of policies:

- [Control Plane Policies](#): Control plane policy maps are applied to the control plane.
- [QoS Policies](#): QoS policy maps are applied to Ethernet and port channel interfaces.
- [Segment Routing Traffic Engineering Policy \(SR-TE\)](#).
- [PBR Policies](#): PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, or PBR and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.

#### 10.2.1.1 Control Plane Policies

The switch defines one control plane policy map named ***copp-system-policy***. The ***copp-system-policy*** policy map always applies to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. **Copp-system-policy** consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from ***copp-system-policy***.

The switch provides static class maps and you cannot modify or delete them. The switch uses a naming convention of static class maps as ***copp-system- name***, where *name* differentiates the class maps. Static class maps have pre-defined internal conditions, not based on ACLs, and only listed in ***running-config*** as components of ***copp-system-policy***. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

***Copp-system-policy*** can be modified through the following steps:

1. Add classes consisting of an eponymous dynamic class map and traffic resolution commands.

---

Create, edit, or delete dynamic class maps, and filter traffic with a single IPv4 ACL, and list in ***running-config***.

## 2. Change traffic resolution commands for a preconfigured class.

The following section describes control plane traffic policy configuration procedures:

- [Configuring Control Plane Traffic Policies Trident Platform Switches](#)

### 10.2.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in ***running-config***.

QoS traffic resolution commands perform one of the following:

- Set the Layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is ***class-default***, which is composed as follows:

- The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, ***class-default*** class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- [Configuring QoS Traffic Policies Arad Platform Switches](#)
- [Configuring QoS Traffic Policies FM6000 Platform Switches](#)
- [Configuring QoS Traffic Policies Petra Platform Switches](#)
- [Configuring QoS Traffic Policies Trident Platform Switches](#)

### 10.2.1.3 Segment Routing Traffic Engineering Policy (SR-TE)

Segment Routing Traffic Engineering Policy (SR-TE) policy uses Segment Routing (SR) to enable a headend to steer traffic along any path without maintaining per flow state in every node based on the policy. Configuring SR policy for the MPLS dataplane (SR-MPLS) for Type-1 SR policy segments with BGP and locally configured policies as sources of SR policy is available on DCS-7500 and DCS-7280 family of switches.

#### **SR Policy Overview**

#### **SR Policy Identification**

The following identifies an SR policy.

- **Endpoint** - An IPv4 or IPv6 address which refers to the destination of the policy. EOS allows 0/0 and 0:: and calls these IP addresses *null endpoints*.
- **Color** - An unsigned 32-bit opaque numerical quantity. Define the semantic of a color as you prefer. It can refer to, for instance, an application or a type of traffic, such as low latency, or a geographical location.

## SR Policy Constituents

The SR policy consists of *candidate paths*. Each candidate path has the following.

- **SID-lists (SLs)** - An ordered list of Segment Identifiers. Each SID provides a MPLS label in the MPLS instantiation of SR). An SL encodes one path from the headend to the destination. Each SL has an optional weight attached to it for the purpose of Unequal Cost Multipath (UCMP) traffic distribution. The default value for SL weight is **1**.
- **Preference** - An optional, unsigned 32-bit integer used in the candidate path selection algorithm to select the *active* candidate path. The default value for preference is **100**.
- **Binding SID (BSID)** - an optional SID.

**Note:** In EOS, a BSID is mandatory for each candidate path.

## SR Policy Sources

A headend learns SR policies using the following methods:

- **BGP**
  - Single agent routing model (Ribd)
  - Multi-agent routing model
- **Local configuration using CLI**
  - Single agent routing model (Ribd)
  - Multi-agent routing model
  - Openconfig YANG models
- **PCEP**

**Note:** EOS does not support PCEP.

## Identity of a Candidate Path

A candidate path within an SR policy is identified by a 3-tuple of {Protocol-Origin, Originator, Discriminator}. In EOS, for locally configured policies:

- The ASN in the Originator set to 0.
- The node address in the Originator set to **0.0.0.0**.
- The discriminator set to the Preference configured.

**Note:** EOS CLI allows configuring only one candidate path at a given preference and does not allow configuring the discriminator for a candidate path.

## State of an SID List (SL)

The following describes the state of an SL:

- **Valid** - The top label of the SL resolves within the LFIB to the outgoing next hop(s), interface(s) and a label action.
- **Invalid** - The top label of the SL unresolvable to the outgoing next hop(s), interface(s) and a label action. An SL is also marked as invalid when the SL is resolvable, but the resolved labeled stack exceeds the

---

platform's maximum SID depth (SID), that is, exceeds the maximum number of labels the platform can push in to the outgoing packet.

**Note:** The state is either valid or invalid.

## State of a Candidate Path

The following describes the states of a candidate path.

- **Invalid** - Not eligible to participate in the best/active candidate path selection algorithm because of one of the reasons below.
  - Invalid constituent SLs in the candidate path.
  - No Binding SID present in the candidate path.
  - Binding SID present but outside SRLB range for the candidate path.
- **Valid** - At least one valid SL has lost out to some other candidate path in the best / active candidate path selection algorithm.
- **Active**: - A valid candidate path exists and wins the best / active candidate path selection algorithm. The active candidate path installs in the switch hardware and forwards traffic.

## State of an SR Policy

EOS considers an SR policy as *valid* when at least one of its candidate paths is valid. Otherwise, the SR policy is *invalid*.

## Resolution of an SL

An SL resolves if the top label (first SID) can be resolved in the system Labeled FIB (LFIB) to yield a nexthop and outgoing interface(s). The other labels in the SID-List do not play a part in resolution.

## Best Candidate Path (Active Candidate Path) Selection Algorithm

EOS overrides selection based on discriminator by retaining the current active candidate path even when current active path has a lower discriminator value. This reduces the active path flap when a new path appears with the same significance. The following lists a summary of valid candidate paths ordering for a given policy.

1. The candidate path with higher preference selected.
2. Locally configured candidate path selected over a BGP learned path
3. Lower originator selected in the following instances:
  - a. Lower AS number of Originator field selected.
  - b. Lower Node address of Originator field selected.
4. Current active candidate path selected in the following instances:

The following displays the reason for not selecting a path as an active path for a specified policy.

```
switch#show traffic-engineering segment-routing policy endpoint <endpoint>
 color <color>
```

## Binding SID

The following describes the use cases for the Binding SID:

- Stitch together multiple domains.
- Stitch together different traffic tunnels .
- Overcome label stack imposition limitation in hardware.

## BSID Conflict Handling

### Examples

1. **Between Policies** - If the policy (E1, C1) becomes eligible to be active first, then it installs in the LFIB and the policy (E2,C2) whose best path(CP1) conflicts with the Policy (E1, C1) and does not become active.
  - Policy(E1, C1): CP1: Binding-SID 965536 (wins best path)
  - Policy(E2, C2): CP1: Binding-SID 965536 (wins best path)
  - CP2: Binding-SID 965537
2. **with another Application:** The SR-TE policies have the lowest preference when a conflict exists with any other application in EOS using the SRLB range. The candidate paths with the same binding-SID as that of an LFIB entry by another application, for example, static adjacency segment, remains invalid.

In both the cases, when the conflict no longer exists, the candidate paths re-evaluate and may become active.

### BGP as a Source of Policies

SR Policies from a BGP peer (a controller, route reflector) received for installation at the headend by EOS. It does not propagate the received policies to BGP peers nor does it originate SR Policies for transmission to BGP peers.

The following supports IPv4 or IPv6 peers which can be single hop or multi-hop iBGP or eBGP peers.

1. **SAFI 73 for AFI 1 and AFI 2:** IPv4 and IPv6 policy endpoints, with the encoding defined in section 2.1 of *Advertising Segment Routing Policies in BGP*.

**Note:** The nexthop address-family must match the AFI of the NLRI.

2. **Sub-TLVs of Tunnel Encapsulation TLV of type 15 (SR-TE Policy Type) of the Tunnel Encapsulation Path Attribute**

- a. Preference (Sub-TLV Type 12)
- b. Binding SID (Sub-TLV Type 13) of length **2** or **6** bytes
- c. Segment List (Sub-TLV Type 128). The following Segment List sub-TLVs are supported:
  1. Type 1 Segment (Sub-TLV type 1)
  2. Weight (Sub-TLV type 9)
- d. Explicit NULL Label Policy (Sub-TLV Type 14)
- e. SR Prefix SID (sub TLV 3 of TLV 149, TLV 150)
- f. SR Range - Contents of TLV 149, TLV 150 (multi-topology)

**Note:** EOS ignores all other sub-TLVs of the Tunnel Encapsulation TLV and Segment List sub-TLVs.

### Route-Target and NO\_ADVERTISE Community in SR-TE SAFI Updates

EOS implements the Acceptance and Usability checks as defined in sections 4.2.1 and 4.2.2 of the IETF draft [Advertising Segment Routing Policies in BGP](#). However EOS skips matching the Route-Target with the router-ID of the headend if the SR-TE NLRI is tagged with **NO\_ADVERTISE** community.

### ECMP does not support SR-TE SAFI Paths

EOS does not support ECMP for BGP SR-TE SAFI. The BGP path selects only one best candidate path and publishes it to SR-TE Policy Agent for candidate path selection.

**Note:** EOS supports ECMP of BGP next hops where each next hop resolves to an SR-TE policy.

### Path Selection within BGP

The IETF draft [Advertising Segment Routing Policies in BGP](#) supports passing multiple candidate paths from a single protocol source for an SR-TE policy path selection. Therefore, it includes a field distinguisher

---

in the NLRI which can be unique for each controller to make BGP pass through the policies. However when multiple sources use the same distinguisher, BGP performs a path selection for the tuple: Endpoint, Color and Distinguisher. The best path for that tuple publishes to the SR-TE Policy Agent for selecting an Active path. The best **bgp-best-path** selection applies to SR-TE SAFI as well.

#### Error Handling / Edge Cases

- **Weight 0:** The IETF draft does not limit the range of SL weight to exclude weight 0. A SID-List with weight 0 is not used for forwarding so BGP module in EOS does not pass on SID-Lists with weight 0 to the SR-TE policy agent. Such SID-Lists will be visible in `show bgp sr-te` commands but not in `show traffic-engineering segment-routing policy` commands.
- **Empty SLs:** Given the TLV encoding used to propagate SR Policies in BGP, it is possible to receive SID-Lists without SIDs. The BGP module in EOS does not pass empty SID-Lists to SR-TE policy agent. Such SID-Lists are visible in `show bgp sr-te` commands but not in `show traffic-engineering segment-routing policy` commands.
- **Non Type 1 segments:** EOS supports only Type-1 segments. When receiving a BGP update with a SID-List that has non Type-1 segments, EOS ignores the entire SID-List and sends a `BGP-4-SRTE_IGNORED_SEGMENT_LIST_UNSUPPORTED_SEGMENTS` syslog. Such SID-Lists are not stored locally, and `show bgp sr-te` command does not display them.

**Note:** The SID-Lists made up of all Type-1 segments pass to the SR-TE policy agent.

## Steering Traffic into a Policy

### Incoming label as BSID - Labelled Steering

At the headend when receiving a packet with a label stack with a BSID of an active CP of a valid SR Policy as the top label, the headend pops the label, and imposes the resolved label stack on the outgoing packet.

#### Example

For instance, an SR Policy with an active candidate path with BSID **965536** and SL with label stack [**965540, 900001, 900002**]. Assume that **965540** is an IS-IS SR Adjacency SID. An incoming packet has a label stack [**965536, 100000**] then the outgoing label stack consists of [**900001, 900002, 100000**].

### Steering BGP learnt IP(v6) prefixes - IP Steering

#### Incoming label is BSID - Labelled Steering

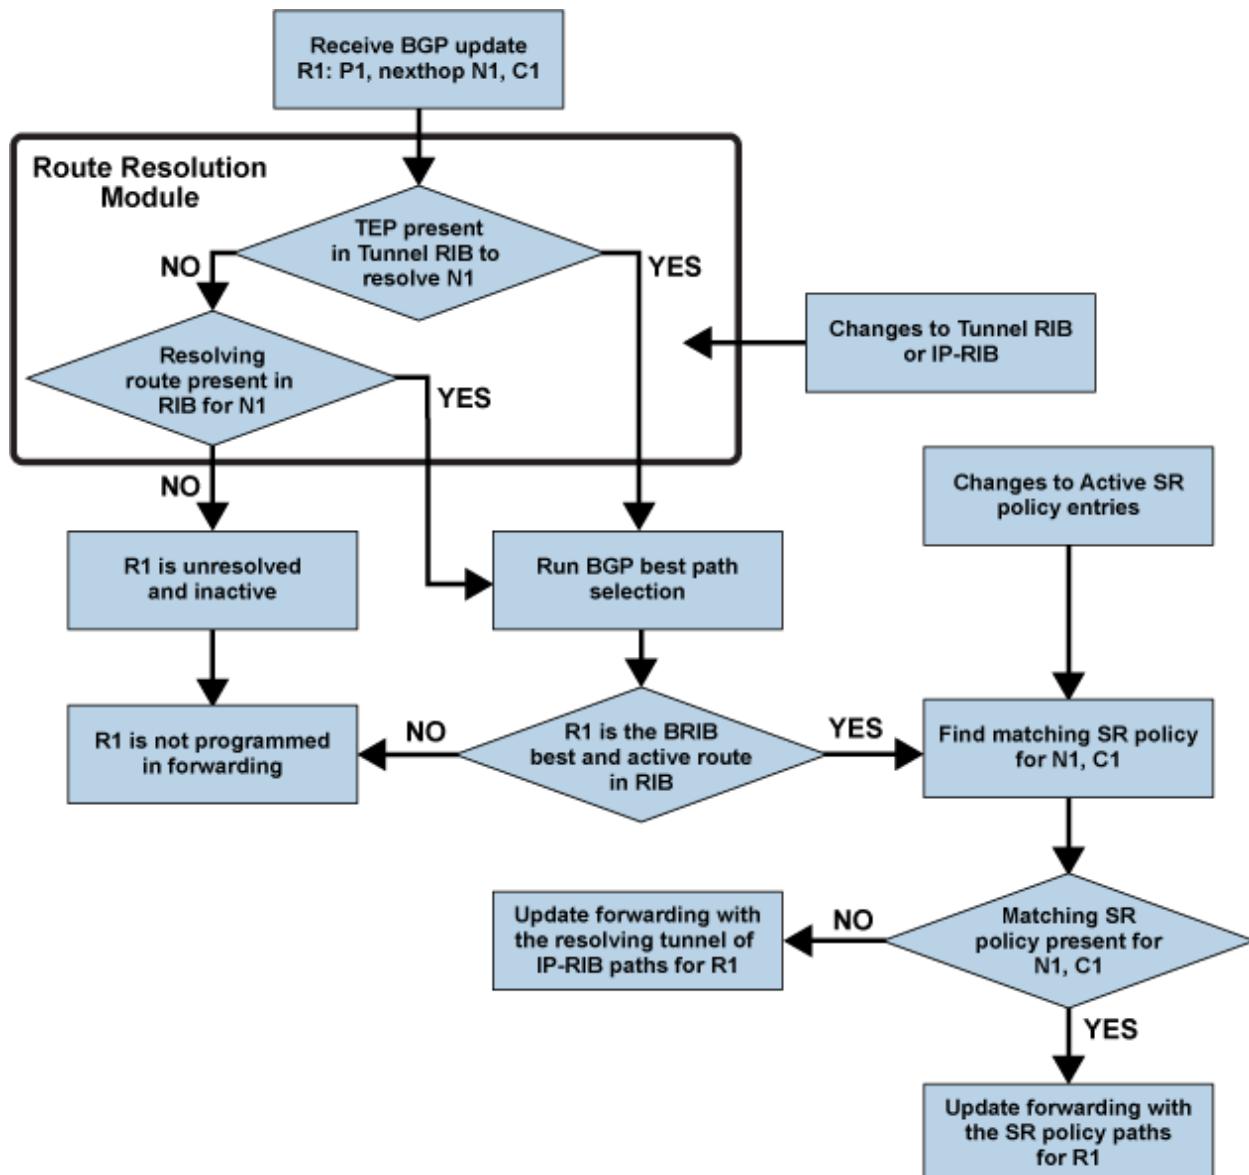

At the headend, BGP IPv4 and IPv6 routes receive one or more extended color communities and recursively resolves them through any active SR Policy that matches the BGP routes' nexthop and color. When receiving an IPv4 or IPv6 packet forwarded using this policy, the SL's resolved label stack imposes on the outgoing packet.

For BGP routes received with color community to be steered via an SR policy, the route's nexthop must already be resolvable through IGP. If no resolving route exists in IGP, the route is considered unresolvable and does not program in hardware even if a matching SR policy exists for the corresponding nexthop and color.

If no matching SR policy exists for the received BGP nexthop and color, the route resolves through the IGP route in IP RIB. If an active SR policy that matches the BGP nexthop and color gets instantiated at a later time, the BGP route changes from resolving through IGP to the new active SR policy.

**Note:** The recursion through SR policy is only applicable for active BGP routes in RIB.

### Color only IP steering using CO bits

It is possible to relax the requirement of an exact match of the BGP route's nexthop with the endpoint of the SR Policy using the "CO" (Color Only) bits in the color extended community. The "CO" bits are 2 reserved bits repurposed for color only steering as defined in section 3 of [Advertising Segment Routing Policies in BGP](#). The exact match of the nexthop is done with the CO bits set to 00 or 11.

**CO = 01 Steering:** relaxes the nexthop to match the null endpoint of a policy. For a BGP route with nexthop N and color C, the following order is used for resolution. If there is no IGP route resolving the BGP nexthop, the route is not programmed in hardware.

1. Active SR policy with endpoint N and color C
2. Active SR policy with null endpoint (from the same AFI as the BGP route) and color C
3. Active SR policy with null endpoint from any AFI and color C
4. IGP route

**CO = 10 Steering:** in addition to the steps in CO = 01 steering, CO = 10 additionally relaxes the nexthop to match *any* endpoint. The following order is used for resolving a BGP route with nexthop N and color C. The behavior described is in accordance with section 8.8.1 of the IETF draft [Segment Routing Policy for Traffic Engineering](#).

1. Active SR policy with endpoint N and color C
2. Active SR policy with null endpoint (from the same AFI as the BGP route) and color C
3. Active SR policy with null endpoint from any AFI and color C
4. Active SR policy for any endpoint from the same AFI as the BGP route and color C
5. Active SR policy for any endpoint from any AFI and color C
6. IGP route

#### **ECMP of IPv4/IPv6 Prefixes that Resolve over SR-TE Policies**

When multiple BGP paths of BGP unicast prefixes resolve through active SR policies form ECMP, the resulting FIB entry for the BGP route has an ECMP of segment list paths which is a union of all the segments-list entries present in each of the resolving SR policies for the BGP paths.

#### **Example**

The following table displays four paths for prefix **192.1.0.0/31**, and each of the four paths resolves via SR-TE policies.

**Table 53: List of Paths Resolved via SR-TE Policies**

| Path | Nexthop | Color       | Policy EP | Policy Color | Segment Lists                                  | Per SL Traffic Distribution |
|------|---------|-------------|-----------|--------------|------------------------------------------------|-----------------------------|
| 1    | 1.0.0.2 | CO(00):1000 | 1.0.0.2   | 1000         | [2500 500], Weight: 1<br>[2501 500], Weight: 2 | 8.33%<br>16.66%             |
| 2    | 1.0.2.2 | CO(00):2000 | 1.0.2.2   | 2000         | [2502 500], Weight: 1<br>[2503 500], Weight: 1 | 12.5%<br>12.5%              |
| 3    | 1.0.4.2 | CO(00):3000 | 1.0.4.2   | 3000         | [2504 500], Weight: 1<br>[2505 500], Weight: 1 | 12.5%<br>12.5%              |
| 4    | 1.0.6.2 | CO(00):4000 | 1.0.6.2   | 4000         | [2506 500], Weight: 1<br>[2507 500], Weight: 1 | 12.5%<br>12.5%              |

```
B I 192.1.0.0/31 [200/0] via SR-TE Policy 1.0.4.2, color 3000
 via SR-TE tunnel index 6, weight 1
 via 1.0.4.2, Ethernet1, label 2505 500
 via SR-TE tunnel index 5, weight 1
 via 1.0.4.2, Ethernet1, label 2504 500
 via SR-TE Policy 1.0.0.2, color 1000
 via SR-TE tunnel index 2, weight 1
 via 1.0.0.2, Ethernet2, label 2501 500
 via SR-TE tunnel index 1, weight 1
 via 1.0.0.2, Ethernet2, label 2500 500
 via SR-TE Policy 1.0.2.2, color 2000
 via SR-TE tunnel index 4, weight 1
 via 1.0.2.2, Ethernet3, label 2503 500
 via SR-TE tunnel index 3, weight 1
```

```

 via 1.0.2.2, Ethernet3, label 2502 500
via SR-TE Policy 1.0.6.2, color 4000
 via SR-TE tunnel index 8, weight 1
 via 1.0.6.2, Ethernet6, label 2507 500
 via SR-TE tunnel index 7, weight 1
 via 1.0.6.2, Ethernet6, label 2506 500

```

The traffic distribution honors the weights of the SID-Lists. In the example, each of the four SR Policies will get **25%** of the total traffic meant for prefix **192.1.0.0/31**. Within each policy, the distribution is based on the weights of the SID-Lists.

### **ECMP Group when some BGP unicast paths resolve over SR Policies and some via non SR Policy IGP paths**

If some BGP paths resolve via SR Policy paths and some BGP paths resolve via non SR Policy IGP, then the ECMP group formed programmed as the active route in FIB, only considers the SR Policy paths. ECMP in the FIB is not formed between paths that resolve over SR Policy and paths that resolve via non SR Policy IGP routes. In the example above, if SR Policy with endpoint **1.0.6.2** and color **4000** becomes inactive or is removed, the FIB path for **192.1.0.0/31** resolves via 3 SR Policies as shown below.

```

B I 192.1.0.0/31 [200/0] via SR-TE Policy 1.0.4.2, color 3000
 via SR-TE tunnel index 6, weight 1
 via 1.0.4.2, Ethernet1, label 2505 500
 via SR-TE tunnel index 5, weight 1
 via 1.0.4.2, Ethernet1, label 2504 500
via SR-TE Policy 1.0.0.2, color 1000
 via SR-TE tunnel index 2, weight 1
 via 1.0.0.2, Ethernet2, label 2501 500
 via SR-TE tunnel index 1, weight 1
 via 1.0.0.2, Ethernet2, label 2500 500
via SR-TE Policy 1.0.2.2, color 2000
 via SR-TE tunnel index 4, weight 1
 via 1.0.2.2, Ethernet3, label 2503 500
 via SR-TE tunnel index 3, weight 1
 via 1.0.2.2, Ethernet3, label 2502 500

```

**Note:** `show ip bgp` still shows a 4-way ECMP. The FIB paths switch to resolving via the (non SR Policy) IGP paths when there are no BGP paths in the ECMP group that resolve via an SR Policy.

### **UCMP of IPv4/IPv6 prefixes using LinkBandwidth (LBW) Extended Community that resolve over SR-TE policies not supported**

When multiple BGP paths of BGP unicast prefixes resolve through active SR policies form ECMP, and the unicast paths also contain the LBW extended community, EOS does not form UCMP amongst the unicast paths. Only ECMP is formed at the unicast prefix level. The LBW is ignored the behavior is identical to the behavior explained in the previous section.

### **Resolution of BGP unicast prefixes that resolve over other BGP unicast prefixes resolved via SR Policies**

A BGP unicast prefix P1, that is recursively resolved via another BGP prefix P2, such that P2 resolves via an SR Policy, then in the FIB, P1 is programmed with the resolved nexthop pointing to the non SR Policy resolution of P2. P1 does not use P2's SR Policy for forwarding.

#### **Explicit Null Label Imposition**

When the address family of the BGP unicast prefix is not the same as the address family of the endpoint of the SR Policy that the unicast prefixes resolves via, an explicit null label is automatically imposed in the outgoing label stack.

#### **Example**

If an IPv4 unicast prefix **P1** resolves over a policy whose endpoint **EP1** is an IPv6 address (this can happen due to color only CO=01/10 steering with **P1** having an IPv4 nexthop) and the SR Policy had a SID-List whose resolved label stack is [1001, 1002, 1003], the outgoing packet is imposed with [1001, 1002, 1003, 2] where **0** is the IPv4 explicit null label.

If an IPv6 prefix **P2**, resolves over a policy whose endpoint **EP2** is an IPv4 address (this can happen with color only CO=01/10 steering with **P2** having a IPv6 nexthop) and the SR Policy had a SID-List whose resolved label stack is [1001, 1002, 1003], the outgoing packet is imposed with [1001, 1002, 1003, 2] where **2** is the IPv6 explicit null label.

The following table lists the configurations which result in having explicit-null label in the resolved label stack.

**Table 54: Configurations resulting in Explicit-Null Label in Resolved Label Stack**

| ENLP configuration for the resolving SR Policy                                 | IPv4 Prefixes                                                                                           | IPv6 Prefixes                                                                                           |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| None                                                                           | -                                                                                                       | -                                                                                                       |
| IPv4                                                                           | IPv4 explicit null appended to the end of label stack                                                   | -                                                                                                       |
| IPv6                                                                           | -                                                                                                       | IPv6 explicit null appended to the end of label stack                                                   |
| Both                                                                           | IPv4 explicit null appended to the end of label stack                                                   | IPv6 explicit null appended to the end of label stack                                                   |
| No/Default config (incase of BGP learnt policies ENLP Sub-TLV is not received) | Resolving SR Policy has IPv4 Endpoint address:<br>No explicit-null                                      | Resolving SR Policy has IPv4 Endpoint address:<br>IPv6 explicit null appended to the end of label stack |
|                                                                                | Resolving SR Policy has IPv6 Endpoint address:<br>IPv4 explicit null appended to the end of label stack | Resolving SR Policy has IPv6 Endpoint address:<br>No explicit-null                                      |

## Traffic Accounting

All egress tunnel counters (MPLS/GRE/MPLSoGRE using SR-TE/Nexthop-group/BGP-LU tunnel types) share the same hardware resource.

- **7280E/7500E systems:** Up to **16k** tunnels
- **7280R/7500R systems:** Up to **8k** tunnels

Tunnel counters are allocated on a first-come, first-served basis. Configurations using GRE/MPLSoGRE, GRE, and MPLS further limit a maximum of 4k countable egress MPLS tunnels on 7280R/7500R.

## FEC Optimizations

The hardware FEC usage could be reduced as the underlying FEC is shared among different routes.

- Programming of the active candidate path of an SR-TE policy in hardware is shared between the BSID route and IP steering route.
- If all of the following conditions are met, ISIS-SR MPLS routes and tunnel entries directly point to the next hop FEC generated by the routing agent (IGP FEC).
  - All the next hops of the MPLS route either point to pop or forward (i.e. swapping to the same label) label action.
  - The switch is either a 7280 or a 7500 platform.

- The corresponding SR-TE policy BSID routes (and corresponding Segment List tunnels) that resolve over ISIS-SR MPLS routes, will directly point to the IGP FEC.

## Configuring SR-TE

The following commands start the **SrTePolicy** agent and enter the switch into the Traffic Engineering configuration sub-mode.

```
switch(config) # router traffic-engineering
switch(config-te) # segment-routing
```

**Note:** The agent must be running even if the only source of policies is BGP.

### Static Policy Configuration

The following commands set the policy using endpoint and color value, and define the BSID for the policy.

```
switch(config-te-sr) # policy endpoint v4Address|v6Address color color-value
switch(config-te-sr-policy) # binding-sid mpls-label
switch(config-te-sr-policy) # path-group preference value
```

The following commands enter the policy path configuration sub mode, and adds a segment list to the candidate path.

```
switch(config-te-sr-policy) # path-group preference value
switch(config-te-sr-policy-path) # segment-list label-stack label1 label2 ... weight value
```

**Note:** The default weight value is **1**. Adding weight is optional. Repeat the configuration statement for multiple segment lists per candidate path.

The following commands configures a null label policy.

```
switch(config-te-sr-policy-path) # explicit-null [none|ipv4|ipv6|both]
```

**Note:** The null label policy configuration is optional.

### BGP configuration for SR-TE SAFI

The following commands configures a BGP router to activate a neighbor to negotiate and accept SR-TE address-family with this peer.

```
switch(config) # router bgp <as>
switch(config-router-bgp) # address-family ipv4|ipv6 sr-te
switch(config-router-bgp-af-srte) # neighbor neighbor activate
```

The following command configures an inbound route-map to filter or modify attributes on incoming SR-TE prefixes from the peer.

```
switch(config-router-bgp-af-srte) # neighbor neighbor route-map routeMapName in
```

## Configuring Egress SR-TE Traffic Accounting

The following command enables egress traffic accounting for SR policies (also known as MPLS tunnels).

```
switch(config)# hardware counter feature mpls tunnel
```

The following command displays current status of the MPLS counters.

```
switch# show hardware counter feature
Feature Direction Counter Resource (Engine)

ACL-IPv4 out Jericho: 2, 3
ACL in Jericho: 4, 5, 6, 7
MPLS tunnel out Jericho: 8, 9
```

The following command disables egress traffic accounting for SR policies.

```
switch(config)# no hardware counter feature mpls tunnel
```

The following command displays a summary information of SR-TE SAFI.

```
switch# show bgp sr-te summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
 Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
 100.1.1.1 4 100 407 413 0 0 00:18:57 Estab 1 1
 1000::1 4 100 407 413 0 0 00:18:57 Estab 1 1
```

The following command displays a summary information of candidate paths received from neighbors which have negotiated AFI=1 for SR-TE SAFI.

```
switch# show bgp sr-te ipv4 summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
 Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
 100.1.1.1 4 100 407 413 0 0 00:18:57 Estab 0 0
```

The following command displays a summary information of candidate paths received from neighbors which have negotiated AFI=2 for SR-TE SAFI.

```
switch# show bgp sr-te ipv6 summary
BGP summary information for VRF default
Router identifier 100.1.1.2, local AS number 100
Neighbor Status Codes: m - Under maintenance
 Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
 1000::1 4 100 407 413 0 0 00:18:57 Estab 0 0
```

The following command displays all the SR-TE candidate paths.

```
switch# show bgp sr-te
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
Policy status codes: * - valid, > - active, E - ECMP head, e - ECMP
 c - Contributing to ECMP
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

 Endpoint Color Distinguisher Next Hop Metric LocPref Weight Path
*> 133.1.1.1 0 1 130.1.1.3 0 100 0 ?
*> 133.1.1.1 0 2 130.1.1.3 0 100 0 ?
*> 1330::1 0 1 1300::3 0 100 0 ?
*> 1330::1 0 2 1300::3 0 100 0 ?
```

The following command displays all the SR-TE candidate paths with IPv4 endpoints.

```
switch# show bgp sr-te ipv4
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
Policy status codes: * - valid, > - active, E - ECMP head, e - ECMP
 c - Contributing to ECMP
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

 Endpoint Color Distinguisher Next Hop Metric LocPref Weight Path
*> 133.1.1.1 0 1 130.1.1.3 0 100 0 ?
*> 133.1.1.1 0 2 130.1.1.3 0 100 0 ?
```

The following command displays all the SR-TE candidate paths with IPv6 endpoints.

```
switch# show bgp sr-te ipv6
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
Policy status codes: * - valid, > - active, E - ECMP head, e - ECMP
 c - Contributing to ECMP
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

 Endpoint Color Distinguisher Next Hop Metric LocPref Weight Path
*> 1330::1 0 1 1300::3 0 100 0 ?
*> 1330::1 0 2 1300::3 0 100 0 ?
```

The following command displays information about a specific candidate path.

```
switch# show bgp sr-te endpoint 133.1.1.1 color 0 distinguisher 1
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
BGP routing table entry for Endpoint: 133.1.1.1 Color: 0 Distinguisher: 1
Paths: 1 available
 Local
 130.1.1.3 from 100.1.1.2 (100.1.1.2)
 Origin INCOMPLETE, metric 0, localpref 100, IGP metric 0, weight 0,
 received 00:01:29 ago, valid, internal, best
 Community: no-advertise
 Rx SAFI: SR TE Policy
```

The following command displays information about a specific candidate path including the contents of the Tunnel encapsulation path attribute TLV of type SR policy.

```
switch# show bgp sr-te endpoint 133.1.1.1 color 0 distinguisher 1 detail
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
BGP routing table entry for Endpoint: 133.1.1.1 Color: 0 Distinguisher: 1
Paths: 1 available
 Local
 130.1.1.3 from 100.1.1.2 (100.1.1.2)
 Origin INCOMPLETE, metric 0, localpref 100, IGP metric 0, weight 0,
 received 00:01:29 ago, valid, internal, best
 Community: no-advertise
 Rx SAFI: SR TE Policy
 Tunnel encapsulation attribute: SR Policy
 Preference: 200
 Binding SID: 965536
 Explicit null label policy: IPv4
 Segment-List: Label Stack: [16004 16003], Weight: 10
 Segment-List: Label Stack: [2000 3000]
```

The following command displays information about SR candidate paths received from the specified neighbor. The “policies” keyword displays only the candidate paths that are accepted. “received-policies” additionally also displays the rejected candidate paths.

```
switch# show bgp neighbors 100.1.1.2 ipv4 sr-te policies
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
```

---

```

Policy status codes: * - valid, > - active
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

 Endpoint Color Distinguisher Next Hop Metric LocPref Weight Path
*> 133.1.1.1 0 1 133.1.1.3 0 100 0 ?
*> 133.1.1.1 0 2 133.1.1.3 0 100 0 ?

```

The following command displays information about SR candidate paths received from the specified neighbor along with the contents of the Tunnel Encapsulation path attribute's TLV of type SR Policy. The **policies** keyword displays only the candidate paths that are accepted. **received-policies** additionally also displays the rejected candidate paths..

```

switch# show bgp neighbors 100.1.1.2 ipv4 sr-te policies detail
BGP routing table information for VRF default
Router identifier 100.1.1.1, local AS number 100
BGP routing table entry for Endpoint: 133.1.1.1 Color: 0 Distinguisher: 2
Paths: 1 available
 Local
 130.1.1.3 from 100.1.1.2 (100.1.1.2)

 Segment-List: Label Stack: [2000 3000]

```

#### 10.2.1.4 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in **running-config**.

These sections describe PBR policy configuration procedures:

- [Configuring PBR Policies Arad Platform Switches](#)
- [Configuring PBR Policies FM6000 Platform Switches](#)
- [Configuring PBR Policies Petra Platform Switches](#)
- [Configuring PBR Policies Trident Platform Switches](#)

#### 10.2.2 Traffic Management Configuration Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

[Traffic Management Conceptual Overview](#) describes traffic policies.

### 10.2.2.1 Configuring Control Plane Traffic Policies Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [class \(policy-map \(control-plane\) Arad\)](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

Policy maps are modified in policy-map configuration mode. The [policy-map type copp](#) command enters policy-map configuration mode.

#### Examples

This command enters policy-map configuration mode for editing copp-system-policy.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

The [class \(policy-map \(control-plane\) Arad\)](#) command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

#### Example

This command enters policy-map-class configuration mode for the copp-system-lacp static class.

```
switch(config-pmap-copp-system-policy) # class copp-system-lacp
switch(config-pmap-c-copp-system-policy-copp-system-lacp) #
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- [bandwidth \(policy-map-class \(control-plane\) Arad\)](#) specifies the minimum bandwidth.
- [shape \(policy-map-class \(control-plane\) Arad\)](#) specifies the maximum bandwidth.

#### Example

These commands configure a bandwidth range of **2000** to **4000** kilobits per seconds (kbps) for traffic filtered by the copp-system-lacp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp) # bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lacp) # shape kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lacp) #
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

#### Example

---

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
 class copp-system-bpdu
 class copp-system-lldp
 class copp-system-lacp
 shape kbps 4000
 bandwidth kbps 2000
 class copp-system-l3ttl1
 class copp-system-l3slowpath

switch(config-pmap-copp-system-policy)# exit
switch(config)#[/pre>
```

### Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

### Displaying Policy Maps

The [show policy-map interface type qos](#) command displays the configured values of the policy maps classes and the number of packets filtered and dropped as a result of the class maps.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
 Hardware programming status: InProgress

 Class-map: copp-system-mlag (match-any)
 shape : 10000001 kbps
 bandwidth : 10000001 kbps
 Out Packets : 0
 Drop Packets : 0

 Class-map: copp-system-bpdu (match-any)
 shape : 2604 kbps
 bandwidth : 1302 kbps
 Out Packets : 0
 Drop Packets : 0

 Class-map: copp-system-lacp (match-any)
 shape : 4230 kbps
 bandwidth : 2115 kbps
 Out Packets : 0
 Drop Packets : 0

switch(config)#
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
```

## 10.2.2.2 Configuring QoS Traffic Policies Arad Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

## Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

### Example

This command enters class-map configuration mode to create QoS class map named **Q-CMap\_1**.

```
switch(config)# class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1) #
```

A class map contains one IPv4 access control list (ACL). The `match ip access-group` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

### Example

This command adds the IPv4 ACL named **ACL\_1** to the class map.

```
switch(config-cmap-Q-CMap_1) # match ip access-group ACL_1
switch(config-cmap-Q-CMap_1) #
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

### Example

The `show active` command indicates that the configuration mode class map is not stored in **running-config**. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1) # show active
switch(config-cmap-Q-CMap_1) # show pending
class-map type qos match-any Q-CMap_1
 match ip access-group ACL_1

switch(config-cmap-Q-CMap_1) #
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

### Example

This command exits class-map configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-CP-CMAP_1) # exit
switch(config)# show class-map type control-plane CP-CMAP_1
 Class-map: CP-CMAP_1 (match-any)
 Match: ip access-group name ACLv4_1
switch(config) #
```

## Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

### Example

---

This command places the switch in policy-map configuration mode and creates a QoS policy map named **Q-PMAP\_1**.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1) #
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in **policy-map-class** configuration mode. The **below** command adds a class to the configuration mode policy map and places the switch in **policy-map-class** configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the **Q-CMap\_1** class to the **Q-PMAP\_1** policy map and places the switch in **policy-map-class** configuration mode.

```
switch(config-pmap-Q-PMAP_1) # class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) #
```

The **set cos** commands configure traffic resolution methods for data that passes the class map:

- **set cos** sets the Layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

These commands configure the policy map to set the **CoS field 7** on packets filtered by the class map, then assigns those packets to **traffic class 4**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) #
```

**Policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # exit
switch(config-pmap-Q-PMAP_1) # show pending
policy-map type quality-of-service Q-PMAP_1
 class Q-CMap_1
 set cos 7
 set traffic-class 4

 class class-default

switch(config-pmap-Q-PMAP_1) # exit
switch(config) #
```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the ***class-default*** class, enter ***policy-map-class*** configuration mode for the class, then enter the desired ***set*** commands.

### Example

These commands enter ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)# class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
 Match: ipv6 access-group name ACLv6_1
 set cos 7
 set traffic-class 4

Class-map: class-default (match-any)
 set traffic-class 2

switch(config)#

```

### Applying Policy Maps to an Interface

The ***service-policy type qos (Interface mode)*** command applies a specified policy map to the configuration mode interface.

These commands apply ***PMAP-1*** policy map to ***interfaceEthernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
 service-policy type qos input PMAP-1
switch(config-if-Et8)#

```

## 10.2.2.3 Configuring PBR Policies Arad Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

### Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the ***class-map*** configuration mode. The ***class-map type pbr*** command enters the ***class-map*** configuration mode.

### Example

This command enters the ***class-map*** configuration mode to create a PBR class map named CMAP1.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#

```

A class map contains one or more access control lists (ACLs). The ***match (policy-map (pbr))*** command assigns an ACL to the class map. Subsequent ***match*** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

## Example

This command adds the ACL named **ACL1** to the class map.

```
switch(config-cmap-PBR-CMAP1)# match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#{/pre>
```

The **class-map** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map.

The **show active** command indicates that the configuration mode class map is not stored in **running-config**.

```
switch(config-cmap-PBR-CMAP1)# show active
switch(config-cmap-PBR-CMAP1)#{/pre>
```

The **exit** command returns the switch to the **global** configuration mode and saves pending class map changes. The **abort** command returns the switch to the **global** configuration mode and discards pending changes.

## Example

This command exits class-map configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-PBR-CMAP1)# exit
switch(config)# show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
 10 match ip access-group ACL1
switch(config)#{/pre>
```

## Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The **policy-map type pbr** command enters the **policy-map** configuration mode.

## Example

This command enters the **policy-map** configuration mode for creating a PBR policy map named **PMAP1**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#{/pre>
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the **policy-map-class** configuration mode. The **class (policy-map (pbr))** command adds a class to the configuration mode policy map and places the switch in the **policy-map-class** configuration mode, where next-hop commands are added to the class.

## Examples

- This command adds the **CMAPI** class to the policy map and places the switch into the **policy-map-class** configuration mode.

```
switch(config-pmap-PMAP1)# class CMAPI
switch(config-pmap-c-PMAP1-CMAPI)#{/pre>
```

The **set nexthop (policy-map-class pbr)** command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to **10.12.0.5** on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#

```

The **set nexthop-group (policy-map-class(pbr) Arad)** command configures a nexthop group as the next hop for data that passes the class map.

- These commands configure the policy map **PMAP1** to set the next hop to a nexthop group named **GROUP1** for traffic defined by class map **CMAP1**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#

```

The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version.

- These commands exits the **policy-map-class** configuration mode, then exits the **policy-map** configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-PMAP1-CMAP1)# exit
switch(config-pmap-PMAP1)# exit
switch(config)#

```

## Applying a PBR Policy Map to an Interface

The **service-policy type pbr (Interface mode)** command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

These commands apply the PMAP1 PBR policy map to **interface ethernet 8**.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#

```

## Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

### 10.2.3 Traffic Management Configuration FM6000 Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- [Configuring Control Plane Traffic Policies FM6000 Platform Switches](#)

- 
- Configuring QoS Traffic Policies FM6000 Platform Switches
  - Configuring PBR Policies FM6000 Platform Switches

### 10.2.3.1 Configuring Control Plane Traffic Policies FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: FM6000 Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 55: Copp-system-policy Default Classes: FM6000 Platform Switches**

| Class Name                | shape (pps) | bandwidth (pps) |
|---------------------------|-------------|-----------------|
| copp-system-arp           | 10000       | 1000            |
| copp-system-default       | 8000        | 1000            |
| copp-system-ipmcrsvd      | 10000       | 1000            |
| copp-system-ipmcmiss      | 10000       | 1000            |
| copp-system-igmp          | 10000       | 1000            |
| copp-system-l2rsvd        | 10000       | 10000           |
| copp-system-l3slowpath    | 10000       | 1000            |
| copp-system-pim-ptp       | 10000       | 1000            |
| copp-system-ospf-isis     | 10000       | 1000            |
| copp-system-selfip        | 5000        | 5000            |
| copp-system-selfip-tc6to7 | 5000        | 5000            |
| copp-system-sflow         | 25000       | 1000            |

Policy maps are modified in the **policy-map** configuration mode. The [policy-map type copp](#) command enters the **policy-map** configuration mode.

#### Example

This command enters the **policy-map** configuration mode for editing **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

The [class \(policy-map \(control-plane\) FM6000\)](#) command enters the **policy-map-class** configuration mode, where traffic resolution commands are modified for the configuration mode class.

## Example

This command enters the ***policy-map-class*** configuration mode for the copp-system-arp static class.

```
switch(config-pmap-copp-system-policy)# class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#[/pre]
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- **bandwidth (policy-map-class (control-plane) FM6000)**
- **shape (policy-map-class (control-plane) FM6000)**

## Example

These commands configure a bandwidth range of **2000** to **4000** packets per seconds (pps) for traffic filtered by the copp-system-arp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-arp)#[b] bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#[b] shape pps 4000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#[/pre]
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

## Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode, which saves the altered policy map to ***running-config***.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#[b] exit
switch(config-pmap-copp-system-policy)#[b] show pending
policy-map type copp copp-system-policy
 class CP-CMAP_1
 shape pps 4000
 bandwidth pps 2000

 class copp-system-bpdu
 class copp-system-lldp
 class copp-system-lacp
 class copp-system-arp
 class copp-system-arpresolver
 class copp-system-default

switch(config-pmap-copp-system-policy)#[b] exit
switch(config)#[/pre]
```

## Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

### 10.2.3.2 Configuring QoS Traffic Policies FM6000 Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

## Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in the **class-map** configuration mode. The `class-map type qos` command enters the **class-map** configuration mode.

### Example

This command enters the **class-map** configuration mode to create QoS class map named **Q-CMap\_1**.

```
switch(config)# class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1) #
```

A class map contains one IPv4 access control list (ACL). The `match (class-map (qos) FM6000)` command assigns an ACL to the class map. Subsequent **match** commands replace the existing **match** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

### Example

This command adds the IPv4 ACL named **ACL\_1** to the class map.

```
switch(config-cmap-Q-CMap_1) # match ip access-group ACL_1
switch(config-cmap-Q-CMap_1) #
```

The **class-map** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map. The **show pending** command displays the unsaved class map.

### Example

The **show active** command indicates that the configuration mode class map is not stored in **running-config**. The **show pending** command displays the class map to be stored upon exiting the **class-map** configuration mode.

```
switch(config-cmap-Q-CMap_1) # show active
switch(config-cmap-Q-CMap_1) # show pending
class-map type qos match-any Q-CMap_1
 match ip access-group ACL_1

switch(config-cmap-Q-CMap_1) #
```

The **exit** command returns the switch to the **global** configuration mode and saves pending class map changes. The **abort** command returns the switch to the **global** configuration mode and discards pending changes.

### Example

This command exits the **class-map** configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-CP-CMAP_1) # exit
switch(config) # show class-map type control-plane CP-CMAP_1
 Class-map: CP-CMAP_1 (match-any)
 Match: ip access-group name ACLv4_1
switch(config) #
```

## Creating Policy Maps

Policy maps are created and modified in the **policy-map** configuration mode. The `policy-map type quality-of-service` command enters the **policy-map** configuration mode.

### Example

This command places the switch in the ***policy-map*** configuration mode and creates a QoS policy map named ***Q-PMAP\_1***.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1) #
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in the ***policy-map-class*** configuration mode. The **class (policy-map (qos) FM6000)** command adds a class to the configuration mode policy map and places the switch in the ***policy-map-class*** configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the ***Q-CMap\_1*** class to the ***Q-PMAP\_1*** policy map and places the switch in the ***policy-map-class*** configuration mode.

```
switch(config-pmap-Q-PMAP_1) # class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) #
```

**set (policy-map-class (qos) FM6000)** commands configure traffic resolution methods for data that passes the class map:

- **set cos** sets the Layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

These commands configure the policy map to set the ***CoS field 7*** on packets filtered by the class map, then assigns those packets to ***traffic class 4***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) #
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1) # exit
switch(config-pmap-Q-PMAP_1) # show pending
policy-map type quality-of-service Q-PMAP_1
 class Q-CMap_1
 set cos 7
 set traffic-class 4

 class class-default

switch(config-pmap-Q-PMAP_1) # exit
switch(config) #
```

The last class in all QoS policy maps is ***class-default***. The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The ***class-default*** class map is not editable; traffic resolution commands can be added to the ***class-default*** class.

---

To modify traffic resolution commands for the ***class-default*** class, enter the ***policy-map-class*** configuration mode for the class, then enter the desired ***set*** commands.

### Example

These commands enter the ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1) #class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
 Match: ipv6 access-group name ACLv6_1
 set cos 7
 set traffic-class 4

Class-map: class-default (match-any)
 set traffic-class 2

switch(config)#

```

### Applying Policy Maps to an Interface

The [service-policy type qos \(Interface mode\)](#) command applies a specified policy map to the configuration mode interface.

These commands apply ***PMAP-1*** policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
 service-policy type qos input PMAP-1
switch(config-if-Et8)#

```

### 10.2.3.3 Configuring PBR Policies FM6000 Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or Switch Virtual Interfaces (SVIs).

#### Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the ***class-map*** configuration mode. The [class-map type pbr](#) command enters the ***class-map*** configuration mode.

### Example

This command enters the ***class-map*** configuration mode to create a PBR class map named ***CMAP1***.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#

```

A class map contains one or more IPv4 access control lists (ACLs). The [match \(policy-map \(pbr\)\)](#) command assigns an ACL to the class map. Subsequent ***match*** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a [counters per-entry \(ACL configuration modes\)](#) command in an ACL is ignored.

### Example

This command adds the IPv4 ACL named **ACL1** to the class map.

```
switch(config-cmap-PBR-CMAP1) # match ip access-group ACL1
switch(config-cmap-PBR-CMAP1) #
```

The **class-map** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map.

The **show active** command indicates that the configuration mode class map is not stored in **running-config**.

```
switch(config-cmap-PBR-CMAP1) # show active
switch(config-cmap-PBR-CMAP1) #
```

The **exit** command returns the switch to **global** configuration mode and saves pending class map changes. The **abort** command returns the switch to **global** configuration mode and discards pending changes.

### Example

This command exits the **class-map** configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-PBR-CMAP1) # exit
switch(config) # show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
 10 match ip access-group ACL1
switch(config) #
```

## Creating PBR Policy Maps

Policy maps are created and modified in the **policy-map** configuration mode. The [policy-map type pbr](#) command enters the **policy-map** configuration mode.

### Example

This command enters the **policy-map** configuration mode for creating a PBR policy map named **PMAP1**.

```
switch(config) # policy-map type pbr PMAP1
switch(config-pmap-PMAP1) #
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the **policy-map-class** configuration mode. The [class \(policy-map \(pbr\)\)](#) command adds a class to the configuration mode policy map and places the switch in the **policy-map-class** configuration mode, where next-hop commands are added to the class.

### Examples

- This command adds the **CMAPI** class to the policy map and places the switch in the **policy-map-class** configuration mode.

```
switch(config-pmap-PMAP1) # class CMAPI
switch(config-pmap-c-PMAP1-CMAPI) #
```

The [set nexthop \(policy-map-class pbr\)](#) command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to **10.12.0.5** on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#{
```

The ***policy-map*** and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version.

## Example

These commands exits the ***policy-map-class*** configuration mode, then exits the ***policy-map configuration*** mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-PMAP1-CMAP1) # exit
switch(config-pmap-PMAP1) # exit
switch(config)#
```

## Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

These commands apply the **PMAP1** PBR policy map to **interface ethernet 8**.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#

```

## Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

#### **10.2.4 Traffic Management Configuration Petra Platform Switches**

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

[Traffic Management Conceptual Overview](#) describes traffic policies.

#### **10.2.4.1 Configuring Control Plane Traffic Policies Petra Platform Switches**

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

## Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

## Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in **copp-system-policy default classes: Petra Platform Switches**. Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 56: copp-system-policy default classes: Petra Platform Switches**

| Class Name              | shape (kbps) | bandwidth (kbps) |
|-------------------------|--------------|------------------|
| copp-system-bpdu        | 2500         | 1250             |
| copp-system-default     | 2500         | 250              |
| copp-system-igmp        | 2500         | 250              |
| copp-system-ipbroadcast | 2500         | 250              |
| copp-system-ipmc        | 2500         | 250              |
| copp-system-ipmcmiss    | 2500         | 250              |
| copp-system-ipmcrsvd    | 2500         | 250              |
| copp-system-ipunicast   | NO LIMIT     | 250              |
| copp-system-l3destmiss  | 2500         | 250              |
| copp-system-l3slowpath  | 2500         | 250              |
| copp-system-l3ttl0      | 2500         | 250              |
| copp-system-l3ttl1      | 2500         | 250              |
| copp-system-lacp        | 2500         | 1250             |
| copp-system-lldp        | 2500         | 250              |
| copp-system-unicast-arp | 2500         | 250              |

Policy maps are modified in the **policy-map** configuration mode. The **policy-map type copp** command enters the **policy-map** configuration mode.

### Example

This command enters the **policy-map** configuration mode for editing **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

The **class (policy-map (control-plane) Petra)** command enters the **policy-map-class** configuration mode, where traffic resolution commands are modified for the configuration mode class.

### Example

- This command enters the **policy-map-class** configuration mode for the **copp-system-lldp** static class.

```
switch(config-pmap-copp-system-policy) # class copp-system-lldp
switch(config-pmap-copp-system-policy-copp-system-lldp) #
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Petra)** specifies the minimum bandwidth.
- shape (policy-map-class (control-plane) Petra)** specifies the maximum bandwidth.

## Example

These commands configure a bandwidth range of **2000** to **4000** kilobits per seconds (kbps) for traffic filtered by the **copp-system-arp** class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#

```

The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the configured policy map.

Petra platform switches do not support all discrete rate values. When a **bandwidth** or **shape** command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show policy-map interface type qos** command displays the converted rate and not the user configured rate.

## Example

These commands exits the **policy-map-class** configuration mode, display the pending policy-map, then exits the **policy-map** configuration mode, which saves the altered policy map to **running-config**.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
 class copp-system-bpdu

 class copp-system-lldp
 shape kbps 4000
 bandwidth kbps 2000

 class copp-system-lacp

switch(config-pmap-copp-system-policy)# exit
switch(config)#

```

Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

## Displaying Policy Maps

The **show policy-map interface type qos** command displays the traffic resolution rates of the policy maps classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

## Example

These commands exits the **policy-map-class** configuration mode, display the pending policy-map, then exits the **policy-map** configuration mode, which saves the altered policy map to **running-config**.

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
 Hardware programming status: InProgress

 Class-map: copp-system-mlag (match-any)
 shape : 10000001 kbps
 bandwidth : 10000001 kbps
 Out Packets : 0
 Drop Packets : 0

 Class-map: copp-system-lacp (match-any)
 shape : 2604 kbps

```

```

bandwidth : 1302 kbps
Out Packets : 0
Drop Packets : 0

switch(config)#

```

### Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

#### 10.2.4.2 Configuring QoS Traffic Policies Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

#### 10.2.4.3 Configuring PBR Policies Petra Platform Switches

PBR policies are not supported on Petra platform switches.

### 10.2.5 Traffic Management Configuration Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- [Configuring Control Plane Traffic Policies Trident Platform Switches](#)
- [Configuring QoS Traffic Policies Trident Platform Switches](#)
- [Configuring PBR Policies Trident Platform Switches](#)

#### 10.2.5.1 Configuring Control Plane Traffic Policies Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

#### Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in the **class-map** configuration mode. The **class-map type copp** command enters the **class-map** configuration mode.

#### Example

This command enters the **class-map** configuration mode for creating or editing a control plane dynamic class map named **CP-CMAP\_1**.

```

switch(config)# class-map type copp match-any CP-CMAP_1
switch(config-cmap-CP-CMAP_1)#

```

---

Class maps contain one IPv4 or IPv6 access control list (ACL). The [match \(class-map \(control-plane\) Trident\)](#) command assigns an ACL to the class map. Subsequent **match** commands replace the existing **match** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

### Example

This command assigns the IPv4 ACL named **ACLv4\_1** to the class map.

```
switch(config-cmap-CP-CMAP_1)# match ip access-group ACLv4_1
switch(config-cmap-CP-CMAP_1)#{
```

The **class-map** configuration mode is a group-change mode. Changes are saved by exiting the mode. The **show active** command displays the saved version of class map. The **show pending** command displays the unsaved class map.

### Example

The **show active** command indicates that the configuration mode class map is not stored in **running-config**. The **show pending** command displays the class map to be stored upon exiting the **class-map** configuration mode.

```
switch(config-cmap-CP-CMAP_1)# show active
switch(config-cmap-CP-CMAP_1)# show pending
class-map type copp match-any CP-CMAP_1
 match ip access-group ACLv4_1
switch(config-cmap-CP-CMAP_1)#{
```

The **exit** command returns the switch to the **global** configuration mode and saves pending class map changes. The **abort** command returns the switch to the **global** configuration mode and discards pending class map changes.

### Example

This command exits the **class-map** configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
 Class-map: CP-CMAP_1 (match-any)
 Match: ip access-group name ACLv4_1
switch(config)#{
```

## Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Trident Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 57: copp-system-policy default classes: Trident Platform Switches**

| Class Name                | shape (pps) | bandwidth (pps) |
|---------------------------|-------------|-----------------|
| copp-system-bpdu          | 5000        | 5000            |
| copp-system-lacp          | 5000        | 5000            |
| copp-system-selfip-tc6to7 | 5000        | 5000            |
| copp-system-selfip        | 5000        | 5000            |
| copp-system-tc6to7        | 10000       | 1000            |
| copp-system-lldp          | 10000       | 1000            |
| copp-system-ipmcrsvd      | 10000       | 1000            |
| copp-system-igmp          | 10000       | 1000            |
| copp-system-ipmcmiss      | 10000       | 1000            |
| copp-system-glean         | 10000       | 1000            |
| copp-system-tc3to5        | 10000       | 1000            |
| copp-system-arp           | 10000       | 1000            |
| copp-system-arpresolver   | 10000       | 1000            |
| copp-system-l3destmiss    | 10000       | 1000            |
| copp-system-l3slowpath    | 10000       | 1000            |
| copp-system-l3ttl1        | 10000       | 1000            |
| copp-system-default       | 8000        | 1000            |
| copp-system-aclog         | 10000       | 1000            |
| copp-system-sflow         | 25000       | 0               |

Policy maps are modified in the **policy-map** configuration mode. The **policy-map type copp** command enters the **policy-map** configuration mode.

### Example

This command enters the **policy-map** configuration mode for editing **copp-system-policy**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in the **policy-map-class** configuration mode. The **class (policy-map (control-plane) Trident)** command adds a class to the policy map and places the switch in the **policy-map-class** configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the **CP-CMAP\_1** class to the copp-system-policy policy map and places the switch in the **policy-map-class** configuration mode.

```
switch(config-pmap-copp-system-policy) # class CP-CMAP_1
switch(config-pmap-copp-system-policy-CP-CMAP_1) #
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- **bandwidth (policy-map-class (control-plane) Trident)** specifies the minimum bandwidth.

- **shape (policy-map-class (control-plane) Trident)** specifies the maximum bandwidth.

### Example

These commands configure a bandwidth range of **2000** to **4000** packets per seconds (pps) for traffic filtered by the **CP-CMAP\_1** class map:

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# shape pps 4000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1) #
```

The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

### Example

These commands exits the **policy-map-class** configuration mode, display the pending policy-map, then exits the **policy-map** configuration mode, which saves the altered policy map to **running-config**.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
 class CP-CMAP_1
 shape pps 4000
 bandwidth pps 2000

 class copp-system-bpdu

 class copp-system-lldp

 class copp-system-lacp

 class copp-system-arp

 class copp-system-arpresolver

 class copp-system-default

switch(config-pmap-copp-system-policy)# exit
switch(config) #
```

To modify traffic resolution commands for a static class, enter the **policy-map-class** configuration mode for the class, then enter the desired **bandwidth** and **shape** commands.

### Example

These commands enters the **policy-map-class** configuration mode for **copp-system-bpdu** class, change the bandwidth range for the class, then save the altered policy map to **running-config**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-bpdu
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)# shape pps 200
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)# bandwidth pps 100
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
 class CP-CMAP_1
 shape pps 4000
 bandwidth pps 2000

 class copp-system-bpdu
 shape pps 200
 bandwidth pps 100

 class copp-system-lldp

switch(config-pmap-copp-system-policy)# exit
```

```
switch(config) #
```

## Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

### 10.2.5.2 Configuring QoS Traffic Policies Trident Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

#### Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in the **class-map** configuration mode. The `class-map type qos` command enters the **class-map** configuration mode.

#### Example

This command enters the **class-map** configuration mode to create QoS class map named **Q-CMap\_1**.

```
switch(config) # class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1) #
```

A class map contains one IPv4 or IPv6 Access Control List (ACL). The `match (class-map (qos) Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

#### Example

This command adds the IPv6 ACL named **ACLv6\_1** to the class map.

```
switch(config-cmap-Q-CMap_1) # match ipv6 access-group ACLv6_1
switch(config-cmap-Q-CMap_1) #
```

The **class-map** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

#### Example

The `show active` command indicates that the configuration mode class map is not stored in **running-config**. The `show pending` command displays the class map to be stored upon exiting the **class-map** configuration mode.

```
switch(config-cmap-Q-CMap_1) # show active
switch(config-cmap-Q-CMap_1) # show pending
class-map type qos match-any Q-CMap_1
 match ipv6 access-group ACLv6_1
switch(config-cmap-Q-CMap_1) #
```

The `exit` command returns the switch to **global** configuration mode and saves pending class map changes. The `abort` command returns the switch to **global** configuration mode and discards pending class map changes.

#### Example

---

This command exits the **class-map** configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-CP-CMAP_1)# exit
switch(config)# show class-map type control-plane CP-CMAP_1
 Class-map: CP-CMAP_1 (match-any)
 Match: ip access-group name ACLv4_1
switch(config)#+
```

## Creating Policy Maps

Policy maps are created and modified in the **policy-map** configuration mode. The **policy-map type quality-of-service** command enters the **policy-map** configuration mode.

### Example

This command enters the **policy-map** configuration mode for creating a QoS policy map named **Q-PMAP\_1**.

```
switch(config)# policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#+
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in the **policy-map-class** configuration mode. The **class (policy-map (qos) Trident)** command adds a class to the configuration mode policy map and places the switch in the **policy-map-class** configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the **Q-CMap\_1** class to the **Q-PMAP\_1** policy map and places the switch in the **policy-map-class** configuration mode.

```
switch(config-pmap-Q-PMAP_1)# class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#+
```

The **set (policy-map-class (qos) Trident)** command configures traffic resolution methods for data that passes the class map:

- **set cos** sets the layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

These commands configure the policy map to set **CoS field 7** on packets filtered by the class map, then assigns those packets to **traffic class 4**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#+
```

The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

These commands exit the ***policy-map-class*** configuration mode, display the pending policy-map, then exits the ***policy-map*** configuration mode to save the altered policy map to ***running-config***.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)# exit
switch(config-pmap-Q-PMAP_1)# show pending
policy-map type quality-of-service Q-PMAP_1
 class Q-CMap_1
 set cos 7
 set traffic-class 4

 class class-default

switch(config-pmap-Q-PMAP_1)# exit
switch(config)#

```

The last class in all QoS policy maps is ***class-default***. The ***class-default*** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The ***class-default*** class map is not editable; traffic resolution commands can be added to the ***class-default*** class.

To modify traffic resolution commands for the ***class-default*** class, enter the ***policy-map-class*** configuration mode for the class, then enter the desired ***set*** commands.

### Example

These commands enters the ***policy-map-class*** configuration mode for ***class-default***, configures the stream to enter ***traffic class 2***, and saves the altered policy map to ***running-config***.

```
switch(config)# policy-map type qos Q-PMap_1
switch(config-pmap-Q-PMap_1)# class class-default
switch(config-pmap-c-Q-PMap_1-class-default)# set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)# exit
switch(config-pmap-Q-PMap_1)# exit
switch(config)# show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
 Match: ipv6 access-group name ACLv6_1
 set cos 7
 set traffic-class 4

Class-map: class-default (match-any)
 set traffic-class 2

switch(config)#

```

### Applying Policy Maps to an Interface

The ***service-policy type qos (Interface mode)*** command applies a specified policy map to the configuration mode interface.

### Example

These commands apply ***PMAP-1*** policy map to ***interface ethernet 8***.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
 service-policy type qos input PMAP-1
switch(config-if-Et8)#

```

### 10.2.5.3 Configuring PBR Policies Trident Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or Switch Virtual Interfaces (SVIs).

#### Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in the **class-map** configuration mode. The **class-map type pbr** command enters the **class-map** configuration mode.

#### Example

This command enters the **class-map** configuration mode to create a PBR class map named **CMAP1**.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1) #
```

A class map contains one or more Access Control Lists (ACLs). The **match (policy-map (pbr))** command assigns an ACL to the class map. Subsequent **match** commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

#### Examples

- This command adds the ACL named **ACL1** to the class map.

```
switch(config-cmap-PBR-CMAP1) # match ip access-group ACL1
switch(config-cmap-PBR-CMAP1) #
```

The **class-map** configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map.

- The **show active** command indicates that the configuration mode class map is not stored in **running-config**.

```
switch(config-cmap-PBR-CMAP1) # show active
switch(config-cmap-PBR-CMAP1) #
```

- The **exit** command returns the switch to **global** configuration mode and saves pending class map changes. The **abort** command returns the switch to **global** configuration mode and discards pending changes.
- This command exits the **class-map** configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-PBR-CMAP1) # exit
switch(config)# show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
 10 match ip access-group ACL1
switch(config) #
```

#### Creating PBR Policy Maps

Policy maps are created and modified in the **policy-map** configuration mode. The **policy-map type pbr** command enters policy-map configuration mode.

#### Examples

- This command enters the **policy-map** configuration mode for creating a PBR policy map named **PMAP1**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1) #
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in the **policy-map-class** configuration mode. The **class (policy-map (pbr))** command adds a class to the configuration mode policy map and places the switch in the **policy-map-class** configuration mode, where next-hop commands are added to the class.

- This command adds the **CMAP1** class to the policy map and places the switch in the **policy-map-class** configuration mode.

```
switch(config-pmap-PMAP1) # class CMAP1
switch(config-pmap-c-PMAP1-CMAP1) #
```

- The **set nexthop (policy-map-class pbr)** command configures the next hop for data that passes the class map. This command configures the policy map to set the next hop to **10.12.0.5** on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1) # set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1) #
```

- The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version. These commands exits the **policy-map-class** configuration mode, then exits the **policy-map** configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-PMAP1-CMAP1) # exit
switch(config-pmap-PMAP1) # exit
switch(config) #
```

### Applying a PBR Policy Map to an Interface

The **service-policy type pbr (Interface mode)** command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the **PMAP1** PBR policy map to **interface ethernet 8**.

```
switch(config) # interface ethernet 8
switch(config-if-Et8) # service-policy type pbr input PMAP1
switch(config-if-Et8) #
```

### Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).

## 10.2.6 Traffic Management Configuration Trident II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

---

### 10.2.6.1 Configuring Control Plane Traffic Policies Trident II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Trident II Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 58: copp-system-policy default classes: Trident II Platform Switches**

| Class Name                | shape (pps) | bandwidth (pps) |
|---------------------------|-------------|-----------------|
| copp-system-aclog         | 1000        | 10000           |
| copp-system-arp           | 1000        | 10000           |
| copp-system-arpresolver   | 1000        | 10000           |
| copp-system-bfd           | 5000        | 10000           |
| copp-system-bgp           | 5000        | 5000            |
| copp-system-bpdu          | 5000        | 5000            |
| copp-system-default       | 1000        | 8000            |
| copp-system-glean         | 1000        | 10000           |
| copp-system-igmp          | 1000        | 10000           |
| copp-system-ipmcmiss      | 1000        | 10000           |
| copp-system-ipmcrsvd      | 1000        | 10000           |
| copp-system-l3destmiss    | 1000        | 10000           |
| copp-system-l3slowpath    | 1000        | 10000           |
| copp-system-l3ttl1        | 1000        | 10000           |
| copp-system-lacp          | 5000        | 5000            |
| copp-system-lldp          | 1000        | 10000           |
| copp-system-mlag          | 5000        | 5000            |
| copp-system-selfip        | 5000        | 5000            |
| copp-system-selfip-tc6to7 | 5000        | 5000            |
| copp-system-sflow         | 0           | 25024           |
| copp-system-tc3to5        | 1000        | 10000           |
| copp-system-tc6to7        | 1000        | 10000           |
| copp-system-urm           | 1000        | 10000           |

Policy maps are modified in the **policy-map** configuration mode. The **policy-map type copp** command enters the **policy-map** configuration mode.

## Examples

- This command enters the **policy-map** configuration mode for editing **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#[/pre]
```

- The **class (policy-map (control-plane) Trident II)** command enters the **policy-map-class** configuration mode, where traffic resolution commands are modified for the configuration mode class.
- This command enters the **policy-map-class** configuration mode for the **copp-system-lacp static** class.

```
switch(config-pmap-copp-system-policy)# class copp-system-lacp
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#[/pre]
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- bandwidth (policy-map-class (control-plane) Trident II)** specifies the minimum bandwidth.
- shape (policy-map-class (control-plane) Trident II)** specifies the maximum bandwidth.

## Examples

- These commands configure a bandwidth range of **2000** to **4000** packets per seconds (pps) for traffic filtered by the **copp-system-lacp** class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# bandwidth pps
 2000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# shape pps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#[/pre]
```

- The **policy-map** and **policy-map-class** configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.
- These commands exits the **policy-map-class** configuration mode, display the pending **policy-map**, then exit **policy-map** configuration mode, which saves the altered policy map to **running-config**.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)# exit
switch(config-pmap-copp-system-policy)# show pending
policy-map type copp copp-system-policy
 class copp-system-bpdu

 class copp-system-lldp

 class copp-system-lacp
 shape pps 4000
 bandwidth pps 2000

 class copp-system-arp

switch(config-pmap-copp-system-policy)# exit
switch(config)#[/pre]
```

## Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

---

## 10.2.7 Traffic Management Configuration Commands

### Traffic Policy (Control Plane) Configuration Commands

- bandwidth (policy-map-class (control-plane) Arad)
- bandwidth (policy-map-class (control-plane) FM6000)
- bandwidth (policy-map-class (control-plane) Helix)
- bandwidth (policy-map-class (control-plane) Petra)
- bandwidth (policy-map-class (control-plane) Trident)
- bandwidth (policy-map-class (control-plane) Trident II)
- class-map type copp
- class (policy-map (control-plane) Arad)
- class (policy-map (control-plane) FM6000)
- class (policy-map (control-plane) Helix)
- class (policy-map (control-plane) Petra)
- class (policy-map (control-plane) Trident)
- class (policy-map (control-plane) Trident II)
- match (class-map (control-plane) Helix)
- match (class-map (control-plane) Trident)
- match (class-map (control-plane) Trident II)
- policy-map type copp
- shape (policy-map-class (control-plane) Arad)
- shape (policy-map-class (control-plane) FM6000)
- shape (policy-map-class (control-plane) Helix)
- shape (policy-map-class (control-plane) Petra)
- shape (policy-map-class (control-plane) Trident)
- shape (policy-map-class (control-plane) Trident II)

### Traffic Policy (PBR) Configuration Commands

- action set-ttl
- class (policy-map (pbr))
- class-map type pbr
- feature pbr
- match (class-map (pbr))
- match (policy-map (pbr))
- platform arad tcam counters feature
- policy-map type pbr
- resequence (class-map (pbr))
- resequence (policy-map (pbr))
- service-policy type pbr (Interface mode)
- set nexthop (policy-map-class pbr)
- set nexthop-group (policy-map-class(pbr) Arad)

### CPU Traffic Policy Command

- feature traffic-policy cpu
- feature traffic-policy port

### Traffic Policy (QoS) Configuration Commands

- `class-map type qos`
- `class (policy-map (qos) FM6000)`
- `class (policy-map (qos) Helix)`
- `class (policy-map (qos) Trident)`
- `class (policy-map (qos) Trident II)`
- `match (class-map (qos) FM6000)`
- `match (class-map (qos) Helix)`
- `match (class-map (qos) Trident)`
- `match (class-map (qos) Trident II)`
- `policy-map type quality-of-service`
- `policy-map type quality-of-service policer`
- `service-policy type qos (Interface mode)`
- `set (policy-map-class (qos) FM6000)`
- `set (policy-map-class (qos) Helix)`
- `set (policy-map-class (qos) Trident)`
- `set (policy-map-class (qos) Trident II)`

### Traffic Policy Display and Utility Commands

- `clear policy-map counters`
- `show class-map type control-plane`
- `show class-map type pbr`
- `show class-map type qos`
- `show policy-map type copp`
- `show policy-map type pbr`
- `show policy-map type qos`
- `show policy-map type qos counters`
- `show policy-map copp`
- `show policy-map interface type qos`
- `show policy-map interface type qos counters`
- `show traffic-policy`

---

### 10.2.7.1 action set-ttl

The TTL action is effective only when it is configured along with a set nexthop or nexthop-group action. The TCAM profile has the set-ttl-3b or set-ttl action in the pbr ip and pbr ipv6 features, such as in the tc-counters system profile.

#### Command Mode

For IP

TCAM feature PBR IP configuration mode.

For IPv6

TCAM feature PBR IPv6 configuration mode.

#### Command Syntax

```
action set-time [set-ttl | set-ttl-3b]
no action set-time [set-ttl | set-ttl-3b]
default action set-time [set-ttl | set-ttl-3b]
```

#### Parameters

- **set-ttl** Set time to live.
- **set-ttl-3b** Set 3-bit time to live.

#### Examples

- In the following example, for IP, the action sets the time to live for the next hop.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# action set-ttl
```

- In the following example, for IPv6, the action sets the time to live for the next hop group.

```
config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# feature pbr ipv6
(config-tcam-feature-pbr-ipv6)# action set-ttl
```

### 10.2.7.2 bandwidth (policy-map-class (control-plane) Arad)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Arad)**

#### Command Syntax

```
bandwidth kbps kilobits
no bandwidth
default bandwidth
```

#### Parameters

***kilobits*** Minimum data rate in kilobits per second. Value ranges from **1** to **10000000**.

#### Related Commands

- **class (policy-map (control-plane) Arad)** places the switch in the **policy-map-class** (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Arad)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Arad platform switches define these default bandwidths for control plane static classes:

- copp-system-bgp 250 copp-system-l3lpmoverflow 250
- copp-system-bpdu 1250 copp-system-l3slowpath 250
- copp-system-default 250 copp-system-l3ttl1 250
- copp-system-ipbroadcast 250 copp-system-lacp 1250
- copp-system-ipmc 250 copp-system-linklocal 250
- copp-system-ipmcmmiss 250 copp-system-lldp 250
- copp-system-ipunicast 250 copp-system-mlag 250
- copp-system-l2broadcast 250 copp-system-multicastsnoop 250
- copp-system-l2unicast 250 copp-system-OspfIsis 250
- copp-system-l3destmiss 250 copp-system-sflow 250

#### Example

These commands configure the minimum bandwidth of **500** kbps for data traffic specified by the class map **copp-system-lldp** of the default **control-plane** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
 Hardware programming status: InProgress
```

---

```
Class-map: copp-system-lldp (match-any)
 shape : 2500 kbps
 bandwidth : 500 kbps
 Out Packets : 0
 Drop Packets : 0

switch(config) #
```

### 10.2.7.3 bandwidth (policy-map-class (control-plane) FM6000)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) FM6000)**

#### Command Syntax

```
bandwidth pps packets
no bandwidth
default bandwidth
```

#### Parameters

**packets** Minimum data rate in packets per second. Value ranges from **1** to **100000**.

#### Related Commands

- **class (policy-map (control-plane) FM6000)** places the switch in **policy-map-class** (control plane) configuration mode.
- **shape (policy-map-class (control-plane) FM6000)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

FM6000 platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-pim-ptp 1000
- copp-system-ipmcrsvd 1000 copp-system-ospf-isis 1000
- copp-system-ipmcmiss 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-l2rsvd 10000 copp-system-sflow 1000

#### Example

These commands configure the minimum bandwidth of **1000** packets per second for data traffic specified by the class map **PMAP-1** in the policy map named **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1) #
```

#### 10.2.7.4 bandwidth (policy-map-class (control-plane) Helix)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

##### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Helix)**

##### Command Syntax

```
bandwidth pps packets
no bandwidth
default bandwidth
```

##### Parameter

**packets** Minimum data rate in packets per second. Value ranges from **1** to **100000**.

##### Related Commands

- [class \(policy-map \(control-plane\) Helix\)](#) places the switch in **policy-map-class** (control plane) configuration mode.
- [shape \(policy-map-class \(control-plane\) Helix\)](#) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

##### Static Classes Default Bandwidth

Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-acllog 1000 copp-system-l3ttl1 1000
- copp-system-arp 1000 copp-system-lacp 5000
- copp-system-arpresolver 1000 copp-system-lldp 1000
- copp-system-bfd 5000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-OspfIisis 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmiss 1000 copp-system-tc6to7 1000
- copp-system-ipmcrsvd 1000 copp-system-urn 1000
- copp-system-l3destmiss 1000 copp-system-vrrp 1000
- copp-system-l3slowpath 1000

##### Example

These commands configure the minimum bandwidth of **500** packets per second for data traffic specified by the class map **copp-system-lldp**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
```

```
switch(config)# show policy-map interface control-plan copp-system-policy
Service-policy input: copp-system-policy
 Number of units programmed: 4
 Hardware programming status: Successful

 Class-map: copp-system-lldp (match-any)
 shape : 10000 pps
 bandwidth : 500 pps
 Out Packets : 304996
 Drop Packets : 0

switch(config) #
```

### 10.2.7.5 bandwidth (policy-map-class (control-plane) Petra)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through [class \(policy-map \(control-plane\) Petra\)](#)

#### Command Syntax

```
bandwidth kbps kilobits
no bandwidth
default bandwidth
```

#### Parameter

***kbits*** Minimum data rate in kilobits per second. Value ranges from **1** to **10000000**.

#### Related Commands

- [class \(policy-map \(control-plane\) Petra\)](#) places the switch in **policy-map-class** (control plane) configuration mode.
- [shape \(policy-map-class \(control-plane\) Petra\)](#) specifies the maximum bandwidth for traffic defined by the associated class map in its **policy map class** configuration mode .

#### Static Classes Default Bandwidth

Petra platform switches define these default bandwidths for control plane static classes:

- copp-system-bpdu 1250 copp-system-l3destmiss 250
- copp-system-default 250 copp-system-l3slowpath 250
- copp-system-igmp 250 copp-system-l3ttl0 250
- copp-system-ipbroadcast 250 copp-system-l3ttl1 250
- copp-system-ipmc 250 copp-system-lacp 1250
- copp-system-ipmcmmiss 250 copp-system-lldp 250
- copp-system-ipmcrsvd 250 copp-system-unicast-arp 250
- copp-system-ipunicast 250

#### Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

#### Example

These commands configure a minimum bandwidth of **500** kbps for data traffic specified by the class map **copp-system-lldp** of the default **control-plane** policy map. Because the switch does not support the discrete value of **500** kbps, it converts the bandwidth up to **651** kbps.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth kbps 500
```

```
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
 Hardware programming status: InProgress

 Class-map: copp-system-lldp (match-any)
 shape : 2766 kbps
 bandwidth : 651 kbps
 Out Packets : 0
 Drop Packets : 0

switch(config)#

```

### 10.2.7.6 bandwidth (policy-map-class (control-plane) Trident II)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Trident II)**.

#### Command Syntax

```
bandwidth pps packets
no bandwidth
default bandwidth
```

#### Parameter

**packets** Minimum data rate in packets per second. Value ranges from **1** to **100000**.

#### Related Commands

- **class (policy-map (control-plane) Trident II)** places the switch in **policy-map-class** (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Trident II)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Trident II platform switches define these default bandwidths for control plane static classes:

- copp-system-acllog 1000 copp-system-l3slowpath 1000
- copp-system-arp 1000 copp-system-l3ttl1 1000
- copp-system-arpresolver 1000 copp-system-lacp 5000
- copp-system-bfd 5000 copp-system-lldp 1000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmiss 1000 copp-system-tc6to7 1000
- copp-system-ipmcrsvd 1000 copp-system-urm 1000
- copp-system-l3destmiss 1000

#### Example

These commands configure the minimum bandwidth of **500** packets per second for data traffic specified by the class map **copp-system-lldp**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# bandwidth pps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map interface control-plan copp-system-policy
```

```
Service-policy input: copp-system-policy
 Number of units programmed: 4
 Hardware programming status: Successful

 Class-map: copp-system-lldp (match-any)
 shape : 10000 pps
 bandwidth : 500 pps
 Out Packets : 304996
 Drop Packets : 0

switch(config) #
```

### 10.2.7.7 bandwidth (policy-map-class (control-plane) Trident)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Trident)**.

#### Command Syntax

```
bandwidth pps packets
no bandwidth
default bandwidth
```

#### Parameter

**packets** Minimum data rate in packets per second. Value ranges from **1** to **100000**.

#### Related Commands

- [class \(policy-map \(control-plane\) Trident\)](#) places the switch in **policy-map-class** (control plane) configuration mode.
- [shape \(policy-map-class \(control-plane\) Trident\)](#) specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-lldp 1000
- copp-system-arpresolver 1000 copp-system-l3destmiss 1000
- copp-system-bpdu 5000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-l3ttl1 1000
- copp-system-glean 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmiss 1000 copp-system-sflow 0
- copp-system-ipmcrsvd 1000 copp-system-tc6to7 1000
- copp-system-lacp 5000 copp-system-tc3to5 1000

#### Example

These commands configure the minimum bandwidth of **1000** packets per second for data traffic specified by the class map **PMAP-1** in the policy map named **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#

```

### 10.2.7.8 class (policy-map (control-plane) Arad)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains **20** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove **policy-map-class** commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration accessed through **policy-map type copp** command.

#### Command Syntax

```
class class_name
no class class_name
default class class_name
```

#### Parameter

**class\_name** name of the class.

#### Static Classes

Arad platform switches provide the following static control plane classes:

- copp-system-bgp copp-system-l2broadcast copp-system-linklocal
- copp-system-bpdu copp-system-l2unicast copp-system-lldp
- copp-system-default copp-system-l3destmiss copp-system-mlag
- copp-system-ipbroadcast copp-system-l3lpmoverflow copp-system-multicastsnoop
- copp-system-ipmc copp-system-l3slowpath copp-system-OspfIisis
- copp-system-ipmcmiss copp-system-l3ttl1 copp-system-sflow
- copp-system-ipunicast copp-system-lacp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) Arad)**

- 
- **shape (policy-map-class (control-plane) Arad)**
  - **exit** saves pending class map changes, then returns the switch to global configuration mode.
  - **abort** discards pending class map changes, then returns the switch to global configuration mode.

## Related Commands

[policy-map type copp](#) places switch in ***policy-map*** (control plane) configuration mode.

## Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-lldp***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#[/pre]
```

### 10.2.7.9 class (policy-map (control-plane) FM6000)

The **class** command places the switch in **policy-map-class** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains **12** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove **policy-map-class** commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

#### Command Mode

Policy-Map (control plane) configuration accessed through **policy-map type copp** command.

#### Command Syntax

```
class class_name
no class class_name
default class class_name
```

#### Parameter

**class\_name** name of the class.

#### Static Classes

FM6000 platform switches provide the following static control plane classes:

- copp-system-arp copp-system-igmp copp-system-PimPtp
- copp-system-default copp-system-l2rsrvd copp-system-selfip
- copp-system-ipmcmiss copp-system-l3slowpath copp-system-selfip-tc6to7
- copp-system-ipmcrsvd copp-system-OspfIisis copp-system-sflow

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) FM6000)**
- **shape (policy-map-class (control-plane) FM6000)**
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.

---

## Related Commands

[policy-map type copp](#) places switch in ***policy-map*** (control plane) configuration mode.

### Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#

```

### 10.2.7.10 class (policy-map (control-plane) Helix)

The **class** command places the switch in **policy-map-class** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The **control plane** policy map contains 23 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to **policy-map** configuration mode. Saving policy-map-class changes also require an exit from **policy-map** mode, which saves the pending **policy-map-class** and **policy-map** changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the **policy-map-class** commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration accessed through **policy-map type copp** command.

#### Command Syntax

```
class class_name
no class class_name
default class class_name
```

#### Parameter

**class\_name** name of the class.

#### Static Classes

Helix platform switches provide the following static control plane classes:

- copp-system-acllog copp-system-ipmcmiss copp-system-OspfIisis
- copp-system-arp copp-system-ipmcrsvd copp-system-selfip
- copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3slowpath copp-system-sflow
- copp-system-bgp copp-system-l3ttl1 copp-system-tc3to5
- copp-system-bpdu copp-system-lacp copp-system-tc6to7
- copp-system-default copp-system-lldp copp-system-urm
- copp-system-glean copp-system-lldp copp-system-vrrp
- copp-system-igmp copp-system-lldp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- 
- [bandwidth \(policy-map-class \(control-plane\) Helix\)](#)
  - [shape \(policy-map-class \(control-plane\) Helix\)](#)
  - [exit](#) saves pending class map changes, then returns the switch to the *global* configuration mode.
  - [abort](#) discards pending class map changes, then returns the switch to the ***global*** configuration mode.

## Related Commands

[policy-map type copp](#) places switch in ***policy-map*** (control plane) configuration mode.

## Example

These commands enters ***policy-map-class*** configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#

```

### 10.2.7.11 class (policy-map (control-plane) Petra)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to **policy-map** configuration mode. Saving the **policy-map-class** changes also require an exit from **policy-map** mode, which saves the pending **policy-map-class** and **policy-map** changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the **policy-map-class** commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration accessed through [policy-map type copp](#) command.

#### Command Syntax

```
class class_name
no class class_name
default class class_name
```

#### Parameter

**class\_name** name of the class.

#### Static Classes

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu copp-system-ipmcmiss copp-system-l3ttl0
- copp-system-default copp-system-ipmcrsvd copp-system-l3ttl1
- copp-system-igmp copp-system-ipunicast copp-system-lacp
- copp-system-ipbroadcast copp-system-l3destmiss copp-system-lldp
- copp-system-ipmc copp-system-l3slowpath copp-system-unicast-arp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- [bandwidth \(policy-map-class \(control-plane\) Petra\)](#)
- [shape \(policy-map-class \(control-plane\) Petra\)](#)
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.

- 
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.

### Related Commands

[policy-map type copp](#) places switch in **policy-map** (control plane) configuration mode.

### Example

These commands enters **policy-map-class** configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-lldp**.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #
```

### 10.2.7.12 class (policy-map (control-plane) Trident II)

The **class** command places the switch in **policy-map-class** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains **23** static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Trident II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to the **policy-map** configuration mode. Saving the **policy-map-class** changes also require an exit from the **policy-map** mode, which saves the pending **policy-map-class** and **policy-map** changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the **policy-map-class** commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration accessed through **policy-map type copp** command.

#### Command Syntax

```
class class_name
no class class_name
default class class_name
```

#### Parameter

**class\_name** name of the class.

#### Static Classes

Trident II platform switches provide the following static control plane classes:

- copp-system-acllog copp-system-igmp copp-system-mlag
- copp-system-arp copp-system-ipmcmiss copp-system-selfip
- copp-system-arpresolver copp-system-ipmcrsvd copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3destmiss copp-system-sflow
- copp-system-bgp copp-system-l3slowpath copp-system-tc3to5
- copp-system-bpdu copp-system-l3ttl1 copp-system-tc6to7
- copp-system-default copp-system-lacp copp-system-urm
- copp-system-glean copp-system-lldp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) Trident II)**

- 
- **shape (policy-map-class (control-plane) Trident II)**
  - **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
  - **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.

## Related Commands

[policy-map type copp](#) places switch in **policy-map (control plane)** configuration mode.

## Example

These commands enters the **policy-map-class** configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

```
switch(config)# policy-map
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #
```

### 10.2.7.13 class (policy-map (control-plane) Trident)

The **class** command places the switch in **policy-map-class** (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to 30 dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by [match \(class-map \(control-plane\) Trident\)](#). Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the **class** command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving the **policy-map-class** changes also require an exit from **policy-map** mode, which saves the pending **policy-map-class** and **policy-map** changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the **policy-map-class** commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

#### Command Mode

Policy-Map (control plane) configuration accessed through **policy-map type copp** command.

#### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

#### Parameters

- **class\_name** name of the class.
- **PLACEMENT** Specifies the class map placement. Configurable only for dynamic classes.
  - **no parameter** New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - **insert-before dynamic\_class** Class is inserted in front of the specified dynamic class.

#### Static Classes

Trident switches provide the following static control plane classes:

- 
- copp-system-acllog copp-system-ipmcmiss copp-system-lldp
  - copp-system-arp copp-system-ipmcrsvd copp-system-selfip
  - copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7
  - copp-system-bpdu copp-system-l3slowpath copp-system-sflow
  - copp-system-glean copp-system-l3ttl1 copp-system-tc3to5
  - copp-system-igmp copp-system-lacp copp-system-tc6to7

### Commands Available in Policy-map-class (control plane) Configuration Mode

- [bandwidth \(policy-map-class \(control-plane\) Trident\)](#)
- [shape \(policy-map-class \(control-plane\) Trident\)](#)
- [exit](#) saves pending class map changes, then returns the switch to the **global** configuration mode.
- [abort](#) discards pending class map changes, then returns the switch to the **global** configuration mode.

### Related Commands

- [class-map type copp](#) places switch in the **class-map** (control-plane) configuration mode.
- [policy-map type copp](#) places switch in the **policy-map** (control plane) configuration mode.

### Example

These commands add **CM-1** class to the **copp-system-policy** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class CM-1
switch(config-pmap-c-copp-system-policy-CM-1) #
```

#### 10.2.7.14 class (policy-map (pbr))

The **class (policy-map (pbr))** command places the switch in **policy-map-class (pbr)** configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the **abort** command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in the **class-map (pbr)** configuration mode.
- Set commands can be used to specify the next hop for a given class. Set commands are configured in **policy-map-class (pbr)** configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packets contents.

The **exit** command returns the switch to the **policy-map (pbr)** configuration mode. However, saving the policy-map-class changes also requires an exit from **policy-map (pbr)** configuration mode. This saves all the pending policy map and policy-map-class changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (pbr) Configuration accessed through **policy-map type pbr**.

#### Command Syntax

```
[sequence_number] class class_name
no [sequence_number] class class_name
default [sequence_number] class class_name
no [sequence_number]
default [sequence_number]
```

#### Parameters

- **sequence\_number** Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- **class\_name** name of the class.

#### Commands Available in Policy-map-class (pbr) Configuration Mode

- **set nexthop (policy-map-class pbr)** sets next hop for the class.
- **exit** saves pending class changes and returns switch to **policy-map (pbr)** configuration mode.
- **abort** discards pending class changes and returns switch to **policy-map (pbr)** configuration mode.

#### Related Commands

- 
- **class-map type pbr** places switch in the ***class-map*** (**pbr**) configuration mode.
  - **policy-map type pbr** places switch in the ***policy-map (pbr)*** configuration mode.

### Example

These commands add the **CMAP1** class map to the **PMAP1** policy map, then place the switch in **policy-map-class** configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```
switch(config) # policy-map type pbr PMAP1
switch(config-pmap-PMAP1) # class CMAP1
switch(config-pmap-c-PMAP1-CMAP1) #
```

### 10.2.7.15 class (policy-map (qos) FM6000)

The **class** command places the switch in **policy-map-class** (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in the **class-map** (qos) configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in the **policy-map-class** (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the **policy-map** configuration mode. However, saving policy-map-class changes also require an exit from the **policy-map** mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration accessed through **policy-map type quality-of-service**.

#### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

#### Parameters

- **class\_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - **no parameter** Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) FM6000)**
- **exit** saves pending class changes and returns switch to **policy-map (qos)** configuration mode.
- **abort** discards pending class changes and returns switch to **policy-map (qos)** configuration mode.

#### Related Commands

- **class-map type qos** places switch in the **class-map** (QoS) configuration mode.
- **policy-map type quality-of-service** places switch in the **policy-map** (QoS) configuration mode

#### Example

---

These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in the **policy-map-class** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

### 10.2.7.16 class (policy-map (qos) Helix)

The **class** command places the switch in the **policy-map-class** (QoS) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in the **class-map** (qos) configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in the **policy-map-class** (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the **policy-map** configuration mode. However, saving policy-map-class changes also require an exit from the **policy-map** mode. This saves all the pending policy map and policy-map-class changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration accessed through **policy-map type quality-of-service** command.

#### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

#### Parameters

- **class\_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - **no parameter** Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (QoS) Configuration Mode

- **set (policy-map-class (qos) Helix)**
- **exit** saves pending class changes and returns switch to **policy-map (qos)** configuration mode.
- **abort** discards pending class changes and returns switch to **policy-map (qos)** configuration mode.

#### Related Commands

- **class-map type qos** places switch in the **class-map** (qos) configuration mode.
- **policy-map type quality-of-service** places switch in the **policy-map** (QoS) configuration mode.

#### Example

---

These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in **policy-map-class** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

### 10.2.7.17 class (policy-map (qos) Trident II)

The **class** command places the switch in the **policy-map-class** (QoS) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in **class-map (qos)** configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in **policy-map-class (qos)** configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to the **policy-map** configuration mode. However, saving the policy-map-class changes also require an exit from the **policy-map** mode. This saves all the pending policy map and policy-map-class changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration accessed through **policy-map type quality-of-service** command.

#### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

#### Parameters

- **class\_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - **no parameter** Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) Trident II)**
- **exit** saves pending class changes and returns switch to **policy-map (qos)** configuration mode.
- **abort** discards pending class changes and returns switch to **policy-map (qos)** configuration mode.

#### Related Commands

- **class-map type qos** places switch in **class-map (qos)** configuration mode.
- **policy-map type quality-of-service** places switch in **policy-map (qos)** configuration mode.

#### Example

---

These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in **policy-map-class** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

### 10.2.7.18 class (policy-map (qos) Trident)

The **class** command places the switch in **policy-map-class (qos)** configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in **class-map (qos)** configuration mode.
- **Set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **Set** commands are configured in **policy-map-class (qos)** configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to **policy-map** configuration mode. However, saving policy-map-class changes also require an exit from **policy-map** mode. This saves all the pending policy map and policy-map-class changes to **running-config** and returns the switch to the **global** configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration accessed through **policy-map type quality-of-service** command.

#### Command Syntax

```
class class_name [PLACEMENT]
no class class_name [PLACEMENT]
default class class_name [PLACEMENT]
```

#### Parameters

- **class\_name** name of the class.
- **PLACEMENT** Specifies the map placement within the list of class maps.
  - **no parameter** Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) Trident)**
- **exit** saves pending class changes and returns switch to **policy-map (qos)** configuration mode.
- **abort** discards pending class changes and returns switch to **policy-map (qos)** configuration mode.

#### Related Commands

- **class-map type qos** places switch in **class-map (qos)** configuration mode.
- **policy-map type quality-of-service** places switch in **policy-map (qos)** configuration mode.

#### Example

---

These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in **policy-map-class** configuration mode.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

### 10.2.7.19 class-map type copp

The **class-map type copp** command places the switch in **Class-Map** (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The **exit** command saves pending class map changes to **running-config** and returns the switch to the **global** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to the **global** configuration mode.

The **no class-map type copp** and **default class-map type copp** commands delete the specified class map by removing the corresponding **class-map type copp** command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type copp match-any class_name
no class-map type copp [match-any] class_name
default class-map type copp [match-any] class_name
```

#### Parameter

***class\_name*** Name of class map.

#### Commands Available in Class-Map (Control Plane) Configuration Mode

[match \(class-map \(control-plane\) Trident\)](#)

#### Related Commands

- [policy-map type copp](#)
- [class \(policy-map \(control-plane\) Trident\)](#)
- [class-map type qos](#)

#### Example

This command creates the control plane class map named **CP-MAP-1** and places the switch in **class-map** configuration mode.

```
switch(config)# class-map type copp match-any CP-CMAP-1
switch(config-cmap-CP-CMAP-1) #
```

---

### 10.2.7.20 class-map type pbr

The **class-map type pbr** command places the switch in the **class-map (pbr)** configuration mode for the specified class map, and creates the class map if one does not already exist. The **class-map (PBR)** configuration mode is a group change mode that modifies a class map for Policy-Based Routing (PBR). PBR class maps contain one or more **match** statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The **exit** command saves pending class map changes to **running-config**, then returns the switch to the **global** configuration mode. Class map changes are also saved by directly entering a different configuration mode. The **abort** command discards pending changes and returns the switch to the **global** configuration mode.

The **no class-map type pbr** and **default class-map type pbr** commands delete the specified class map by removing the corresponding **class-map type pbr** command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type pbr match-any map_name
no class-map type pbr match-any map_name
default class-map type pbr match-any map_name
```

#### Parameter

**map\_name** Name of class map.

#### Commands Available in Class-Map (PBR) configuration mode

- [match \(class-map \(pbr\)\)](#)
- [resequence \(class-map \(pbr\)\)](#)

#### Related Commands

- [policy-map type pbr](#)
- [class \(policy-map \(pbr\)\)](#)

#### Example

This command creates the PBR class map named **MAP1** and places the switch in **class-map (pbr)** configuration mode where match criteria can be configured for the class.

```
switch(config)# class-map type pbr match-any MAP1
switch(config-cmap-MAP1) #
```

### 10.2.7.21 class-map type qos

The **class-map type qos** command places the switch in the **class-map** (QoS) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to the **global** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to the **global** configuration mode.

The **no class-map type qos** and **default class-map type qos** commands delete the specified class map by removing the corresponding **class-map type qos** command and its associated configuration. The **class-map** and **class-map type qos** commands are equivalent.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type qos match-any class_name
no class-map type qos match-any class_name
default class-map type qos match-any class_name
```

#### Parameters

**class\_name** Name of class map.

#### Commands Available in Class-Map (QoS) Configuration Mode

- [match \(class-map \(qos\) FM6000\)](#)
- [match \(class-map \(qos\) Trident\)](#)

#### Conditions

**class-map map\_name** and **class-map type qos map\_name** are identical commands.

#### Related Commands

- [policy-map type quality-of-service](#)
- [class \(policy-map \(qos\) FM6000\)](#)
- [class \(policy-map \(qos\) Trident\)](#)

#### Example

This command creates the QoS class map named **MAP-1** and places the switch in **class-map** configuration mode.

```
switch(config)# class-map type qos match-any MAP-1
switch(config-cmap-MAP-1) #
```

---

### 10.2.7.22 clear policy-map counters

The **clear policy-map** command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear policy-map INTERFACE_NAME counters MAP_NAME
```

#### Parameters

- **INTERFACE\_NAME** Interface for which command clears table counters. Options include:
  - **interface control-plane** Control plane.
- **MAP\_NAME** Policy map for which command clears counters. Options include:
  - **copp-system-policy** Name of only policy map supported for the control plane.

### 10.2.7.23 feature pbr

Policy-Based Routing (PBR) is a feature that is applied on IPv4 or IPv6 routable ports, to preferentially route packets. Forwarding is based on a policy that is enforced at the ingress of the applied interface and overrides normal routing decisions. In addition to matches on regular ACLs, PBR policy-maps can also include “raw match” statements that look like a single entry of an ACL as a convenience for users.

#### Configuration Mode

For IP:

TCAM PBR profile set TTL configuration mode.

For IPv6:

TCAM feature PBR IP configuration mode.

#### Command Syntax

For IP:

```
feature pbr ip [copy]
no feature pbr ip [copy]
default feature pbr ip [copy]
```

For IPv6:

```
feature pbr ipv6 [copy | bank]
no feature pbr ipv6 [copy | bank]
default feature pbr ipv6 [copy | bank]
```

#### Parameters

For IP:

**copy** Copy a feature from a TCAM profile.

For IPv6:

- **copy** Copy a feature from a TCAM profile.
- **bank** TCAM banks to reserve.

#### Examples

- In the following example, the PBR is configured on an IP routable port.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
```

- In the following example, the PBR is configured on an IPv6 routable port.

```
(config)# hardware tcam
(config-tcam)# profile pbr-set-ttl copy default
(config-tcam-profile-pbr-set-ttl)# feature pbr ip
(config-tcam-feature-pbr-ip)# feature pbr ipv6
```

---

#### 10.2.7.24 feature traffic-policy cpu

The **feature traffic-policy cpu** command configures the CPU traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The **no feature traffic-policy cpu** and **default feature traffic-policy cpu** commands remove the CPU policy configurations from *running-config*.

##### Command Mode

Hardware TCAM

##### Command Syntax

```
feature traffic-policy cpu [ipv4 | ipv6]
no feature traffic-policy cpu [ipv4 | ipv6]
default feature traffic-policy cpu [ipv4 | ipv6]
```

##### Parameters

- **ipv4** CPU traffic policy for IPv4 traffic.
- **ipv6** CPU traffic policy for IPv6 traffic.

##### Example

These commands places the switch in the hardware TCAM profile mode and configures the CPU traffic policy features for IPv4 traffic in the TCAM profile test.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile test
switch(config-hw-tcam-profile-test)# feature traffic-policy cpu ipv4
```

### 10.2.7.25 feature traffic-policy port

The **feature traffic-policy port** command configures the port-related traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The **no feature traffic-policy port** and **default feature traffic-policy port** commands remove the CPU policy configurations from *running-config*.

#### Command Mode

Hardware TCAM

#### Command Syntax

```
feature traffic-policy port [ipv4 | ipv6]
no feature traffic-policy port [ipv4 | ipv6]
default feature traffic-policy port [ipv4 | ipv6]
```

#### Parameters

- **ipv4** port traffic policy for IPv4 traffic.
- **ipv6** port traffic policy for IPv6 traffic.

#### Example

These commands places the switch in the hardware TCAM profile mode and configures the port traffic policy features for IPv4 traffic in the TCAM profile test.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile test
switch(config-hw-tcam-profile-test)# feature traffic-policy port ipv4
```

---

### 10.2.7.26 match (class-map (control-plane) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Helix)** command.

The **class map** (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (control plane) configuration accessed through **class-map type copp** command.

#### Command Syntax

```
match ip access-group list_name
no match ip access-group list_name
default match ip access-group list_name
```

#### Parameters

**list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type copp** places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map (control-plane) Helix)** assigns a **class map** to a **policy map**.

#### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting **class-map (control plane)** configuration mode.

#### Example

These commands add the IP ACL **list\_1** to the **map\_1** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config) #
```

### 10.2.7.27 match (class-map (control-plane) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Trident II)** command.

The **class map** (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (control plane) configuration accessed through **class-map type copp** command.

#### Command Syntax

*list\_name*

*list\_name*

*list\_name*

#### Parameter

**list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type copp** places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map (control-plane) Trident II)** assigns a class map to a **policy map**.

#### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting **class-map (control plane)** configuration mode.

#### Example

These commands add the IP ACL **list\_1** to the **map\_1** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#

```

### 10.2.7.28 match (class-map (control-plane) Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Trident)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (control plane) configuration accessed through **class-map type copp** command

#### Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list\_name*** name of ACL assigned to class map.

#### Related Commands

- **class-map type copp** places the switch in **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map (control-plane) Trident)** assigns a class map to a policy map.

#### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting **class-map (control plane)** configuration mode.

#### Example

These commands add the IPv4 ACL names ***list\_1*** to the ***map\_1*** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type copp map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#

```

### 10.2.7.29 match (class-map (pbr))

The **match** command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

**Class map (pbr)** configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

**Note:** PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

#### Command Mode

Class-map (pbr) configuration accessed through **class-map type pbr** command.

#### Command Syntax

```
[sequence_number] match [ip | ipv6] access-group list_name
no [sequence_number] match [ip | ipv6] access-group list_name
default [sequence_number] [ip | ipv6] access-group list_name
no [sequence_number]
default [sequence_number]
```

#### Parameters

- **sequence\_number** Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the class maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type pbr** places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map (pbr))** assigns a class map to a policy map.

#### Example

These commands add the IPv4 ACL named **list1** to the **map1** class map, then save the change by exiting **class-map** mode.

```
switch(config)# class-map type pbr map1
switch(config-cmap-map1)# match ip access-group list1
switch(config-cmap-map1)# exit
switch(config)#

```

---

### 10.2.7.30 match (class-map (qos) FM6000)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

The **class map (qos)** configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-map (qos) configuration accessed through **class-map type qos** command.

#### Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map (qos) FM6000)** assigns a **class map** to a **policy map**.

#### Example

These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config) #
```

### 10.2.7.31 match (class-map (qos) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

the **class map (QoS)** configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (QoS) configuration accessed through [class-map type qos](#) command.

#### Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list\_name*** name of ACL assigned to class map.

#### Related Commands

- [class-map type qos](#) places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- [class \(policy-map \(qos\) Helix\)](#) assigns a class map to a policy map.

#### Example

These commands add the IPv4 ACL named ***list\_1*** to the ***map\_1*** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#{
```

---

### 10.2.7.32 match (class-map (qos) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

The **class map (QoS)** configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

The **class-map (qos)** configuration accessed through [class-map type qos](#) command.

#### Command Syntax

**IP\_VERSION list\_name**

**IP\_VERSION list\_name**

**IP\_VERSION list\_name**

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- [class-map type qos](#) places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- [class \(policy-map \(qos\) Trident\)](#) assigns a class map to a policy map.

#### Example

These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#

```

### 10.2.7.33 match (class-map) (qos) Trident

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (QoS) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (qos) configuration accessed through **class-map type qos** command.

#### Command Syntax

```
match IP_VERSION access-group list_name
no match IP_VERSION access-group list_name
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ipv4** IPv4.
  - **ipv6** IPv6.
- ***list\_name*** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in the **class-map** configuration mode.
- **exit** saves pending class map changes, then returns the switch to the **global** configuration mode.
- **abort** discards pending class map changes, then returns the switch to the **global** configuration mode.
- **class (policy-map) (qos) Trident** assigns a **class map** to a **policy map**.

#### Example

These commands add the IPv4 ACL named ***list\_1*** to the ***map\_1*** class map, then saves the command by exiting **class-map** mode.

```
switch(config)# class-map type qos map_1
switch(config-cmap-map_1)# match ip access-group list_1
switch(config-cmap-map_1)# exit
switch(config)#

```

### 10.2.7.34 match (policy-map (pbr))

The **match** command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packets properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The **no match** and **default match** commands remove the **match** statement from the configuration mode policy map by deleting the corresponding command from **running-config**.

#### Command Mode

Policy-Map (pbr) Configuration accessed through **policy-map type pbr** command.

#### Command Syntax

```
[sequence_number] match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1
[NH-addr_2] ... [NH-addr_n]]

no match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ...
[NH-addr_n]]

default match match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1
[NH-addr_2] ... [NH-addr_n]]

no SEQ_NUM

default SEQ_NUM
```

#### Parameters

- **sequence\_number** Sequence number assigned to the rule. If no number is entered, the number is derived by adding **10** to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- **SOURCE\_ADDR** and **DEST\_ADDR** source and destination address filters. Options include:
  - **network\_addr** subnet address (CIDR or address-mask).
  - **any** packets from or to all addresses are matched.
  - **host ip\_addr** IP address (dotted decimal notation).Source and destination subnet addresses support discontiguous masks.
- **recursive** enables recursive next hop resolution.
- **NH\_addr** IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

#### Related Commands

- **policy-map type pbr** enters the policy-map (PBR) configuration mode.
- **show policy-map type pbr** displays the PBR policy maps.

#### Example

These commands create a match rule in policy map **PMAP1** which sets the next hop to **192.168.3.5** for packets received from **172.16.0.0/12** regardless of their destination, then exit the mode to save the changes.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# match ip 172.16.0.0/12 any set nexthop 192.163.3.5
switch(config-pmap-PMAP1)# exit
switch(config)#+
```

### 10.2.7.35 platform arad tcam counters feature

The **platform arad tcam counters feature** command enables incrementing PBR hardware counters corresponding to ACL. If counters for PBR are enabled, then counters for ACL will be automatically disabled in all cases. If counters for ACL are enabled, then counters for PBR will be automatically disabled in all cases.

The **no platform arad tcam counters feature** command disables PBR/ACL counters selection. The **default platform arad tcam counters feature** commands resets the default behavior.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform arad tcam counters feature [OPTIONS]
no platform arad tcam counters feature [OPTIONS]
default platform arad tcam counters feature [OPTIONS]
```

#### Parameters

**OPTIONS** Assign the TCAM counters feature. Options include:

- **pbr** assign the TCAM counters feature PBR hardware counters.
- **acl** assign the TCAM counters feature ACL hardware counters.

#### Examples

- This command enables incrementing ACL hardware counters selection.

```
switch(config)# platform arad tcam counters feature acl
switch(config)#[/pre]
```

- This command disables incrementing ACL hardware counters selection.

```
switch(config)# no platform arad tcam counters feature acl
switch(config)#[/pre]
```

### 10.2.7.36 policy-map type copp

The **policy-map type copp** command places the switch in the **policy-map** (control plane) configuration mode, which is a group change mode that modifies a **control-plane** policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The **copp-system-policy** policy map is supplied with the switch and is always applied to the control plane. The **copp-system-policy** is the only valid control plane policy map.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to the **global** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no policy-map type copp** and **default policy-map type copp** commands delete the specified policy map by removing the corresponding **policy-map type copp** command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type copp copp-system-policy
no policy-map type copp copp-system-policy
default policy-map type copp copp-system-policy
```

The **copp-system-policy** is supplied with the switch and is the only valid control plane policy map.

#### Commands Available in Policy-Map Configuration Mode

- [class \(policy-map \(control-plane\) FM6000\)](#)
- [class \(policy-map \(control-plane\) Trident\)](#)

#### Related Commands

[class-map type copp](#) enters the **control-plane class-map** configuration mode for modifying a control-plane dynamic class map.

Only Helix and Trident platform switches support dynamic classes for control plane policing.

#### Example

This command places the switch in the **policy-map** configuration mode to edit the **copp-system-policy** policy map.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

### 10.2.7.37 policy-map type pbr

The **policy-map type pbr** command places the switch in ***policy-map (pbr)*** configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to ***running-config*** and returns the switch to the ***global*** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to the ***global*** configuration mode.

The **no policy-map type pbr** and **default policy-map type pbr** commands delete the specified policy map by removing the corresponding **policy-map type pbr** command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type pbr map_name
no policy-map type pbr map_name
default policy-map type pbr map_name
```

#### Parameter

***map\_name*** Name of policy map.

#### Commands Available in Policy-Map Configuration Mode

- [class \(policy-map \(pbr\)\)](#)
- [match \(policy-map \(pbr\)\)](#)

#### Related Commands

- [class-map type pbr](#)
- [service-policy type pbr \(Interface mode\)](#)

#### Example

This command creates the PBR policy map named ***PMAP1*** and places the switch in ***policy-map*** configuration mode.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1) #
```

### 10.2.7.38 policy-map type quality-of-service

The **policy-map type quality-of-service** command places the switch in the **policy-map (QoS)** configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to the **global** configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to the **global** configuration mode.

The **no policy-map type quality-of-service** and **default policy-map type quality-of-service** commands delete the specified policy map by removing the corresponding **policy-map type quality-of-service** command and its associated configuration. The **policy-map** and **policy-map type quality-of-service** commands are equivalent.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type quality-of-service map_name
no policy-map type quality-of-service map_name
default policy-map type quality-of-service map_name
```

#### Parameter

***map\_name*** Name of policy map.

#### Commands Available in Policy-Map Configuration Mode

- [class \(policy-map \(qos\) FM6000\)](#)
- [class \(policy-map \(qos\) Trident\)](#)

#### Conditions

**policy-map *map\_name*** and **policy-map type quality-of-service *map\_name*** are identical commands.

#### Related Commands

- [class-map type qos](#)
- [service-policy type qos \(Interface mode\)](#)

#### Example

This command creates the QoS policy map named **PMAP-1** and places the switch in the **policy-map** configuration mode.

```
switch(config)# policy-map PMAP-1
switch(config-pmap-PMAP-1) #
```

### 10.2.7.39 policy-map type quality-of-service policer

The `policy-map type quality-of-service policer copy` command is used to copy an existing QoS policy map to the policy map ***policer***.

The `policy-map type quality-of-service policer drop counter` command is used to enable drop counters for the QoS policy map ***policer***.

The `no policy-map type quality-of-service policer` and `default policy-map type quality-of-service policer` commands delete the policy map ***policer*** by removing the corresponding `policy-map type quality-of-service policer` command and its associated configuration.

The `no policy-map type quality-of-service policer drop counter` and `default policy-map type quality-of-service policer drop counter` commands disable drop counters for the policy map ***policer***.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type quality-of-service policer copy map_name
policy-map type quality-of-service policer drop counter
no policy-map type quality-of-service policer
default policy-map type quality-of-service policer
```

#### Parameter

***map\_name*** Name of policy map to copy.

#### Related Commands

- [class-map type qos](#)
- [service-policy type qos \(Interface mode\)](#)

#### Examples

- This command copies the QoS policy map named ***PMAP-1*** to the policy map ***policer***.

```
switch(config)#policy-map type quality-of-service policer copy PMAP-1
switch(config-pmap-PMAP-1) #
```

- This command enables drop counters for the QoS policy map ***policer***.

```
switch(config)#policy-map type quality-of-service policer drop counter
switch(config) #
```

---

#### 10.2.7.40 resequence (class-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to **10** on the exiting **class-map (pbr)** configuration mode.

Maximum rule sequence number is **4294967295**.

#### Command Mode

Class-Map (PBR) Configuration accessed through **class-map type pbr** command.

#### Command Syntax

**resequence [start\_num [inc\_num]]**

#### Parameters

- **start\_num** sequence number assigned to the first rule. Default is **10**.
- **inc\_num** numeric interval between consecutive rules. Default is **10**.

#### Example

The **resequence** command renames the rules in **CMAPI**, starting the first command at number **100** and incrementing subsequent lines by **20**.

```
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)# show active
class-map type pbr match-any CMAP1
10 match ip access-group group1
20 match ip access-group group2
30 match ip access-group group3
switch(config-cmap-CMAP1)# resequence 100 20
switch(config-cmap-CMAP1)# exit
switch(config)# class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)# show active
class-map type pbr match-any CMAP1
100 match ip access-group group1
120 match ip access-group group2
140 match ip access-group group3
```

#### 10.2.7.41 resequence (policy-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to **10** on the exiting **policy-map (pbr)** configuration mode.

Maximum rule sequence number is **4294967295**.

#### Command Mode

Policy-Map (PBR) Configuration accessed through **policy-map type pbr** command

#### Command Syntax

**resequence [start\_num [inc\_num]]**

#### Parameters

- **start\_num** sequence number assigned to the first rule. Default is **10**.
- **inc\_num** numeric interval between consecutive rules. Default is **10**.

#### Example

The **resequence** command renames the rules in **PMAP1**, starting the first command at number **100** and incrementing subsequent lines by **20**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# show active
policy-map type pbr PMAP1
10 class CMAP1
set nexthop 172.16.1.1
20 class CMAP2
set nexthop 172.16.2.2
30 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1)# resequence 100 20
switch(config-pmap-PMAP1)# exit
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# show active
class-map type pbr PMAP1
100 class CMAP1
set nexthop 172.16.1.1
120 class CMAP2
set nexthop 172.16.2.2
140 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1) #
```

#### 10.2.7.42 service-policy type pbr (Interface mode)

The **service-policy pbr** command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The **no service-policy pbr** and **default service-policy pbr** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy pbr** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
service-policy type pbr TRAFFIC_DIRECTION map_name
no service-policy type pbr TRAFFIC_DIRECTION map_name
default service-policy type pbr TRAFFIC_DIRECTION map_name
```

#### Parameters

- **TRAFFIC\_DIRECTION** IP address or peer group name. Values include:
  - **input** Policy map applies to inbound packet streams.
- **map\_name** Name of policy map.

#### Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual interface Ethernet configuration. Members that are removed from a port channel revert to the policy map implementation specified by its interface Ethernet configuration.

#### Related Commands

[policy-map type pbr](#)

#### Example

This command applies the PBR policy map **PMAP1** to *interface Ethernet 8*.

```
switch# config
switch(config)# interface ethernet 8
switch(config-if-Et8)# service-policy type pbr input PMAP1
switch(config-if-Et8)#

```

#### 10.2.7.43 service-policy type qos (Interface mode)

The **service-policy** command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The **no service-policy** and **default service-policy** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
service-policy [type qos] TRAFFIC_DIRECTION map_name
no service-policy [type qos] TRAFFIC_DIRECTION map_name
default service-policy [type qos] TRAFFIC_DIRECTION map_name
```

#### Parameters

- **type qos** Parameter has no functional effect.
- **TRAFFIC\_DIRECTION** Direction of data stream to which command applies. Options include:
  - **input** Policy map applies to inbound packet streams.
  - **map\_name** Name of policy map.

#### Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual interface Ethernet configuration. Members that are removed from a port channel revert to the policy map implementation specified by its interface Ethernet configuration.

DCS-7500E and DCS-7280E limitations:

- A maximum of **31** QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart causes unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:

- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI results in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.

---

## Related Commands

[policy-map type quality-of-service](#)

## Example

This command applies the **PMAP-1** policy map to **interface ethernet 8**.

```
switch# config
switch(config)# interface ethernet 8
switch(config-if-Et8)# show active
switch(config-if-Et8)# service-policy input PMAP-1
switch(config-if-Et8)# show active
interface Ethernet8
 service-policy type qos input PMAP-1
switch(config-if-Et8)#
switch#
```

#### 10.2.7.44 set (policy-map-class (qos) FM6000)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

#### Command Mode

Policy-map-class (qos) configuration

accessed through **class (policy-map (qos) FM6000)** command.

#### Command Syntax

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

#### Parameters

- **QOS\_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on **QOS\_TYPE**.
  - **QOS\_TYPE** is **cos** Value ranges from **0** to **7**.
  - **QOS\_TYPE** is **dscp** Value ranges from **0** to **63**.
  - **QOS\_TYPE** is **traffic-class** Value ranges from **0** to **7**.

#### Related Commands

- [policy-map type quality-of-service](#)
- [class \(policy-map \(qos\) FM6000\)](#)

#### Example

These commands configure the policy map to set **CoS field 7** to data traffic specified by the class map **CMAP-1**, then assigns that data to traffic class **queue 4**.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#

```

#### 10.2.7.45 set (policy-map-class (qos) Helix)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (**cos**, **dscp**) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from **running-config**.

#### Command Mode

Policy-map-class (qos) configuration accessed through **class (policy-map (qos) Helix)** command.

#### Command Syntax

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

#### Parameters

- **QOS\_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS\_TYPE** is **cos** Value ranges from **0** to **7**.
  - **QOS\_TYPE** is **dscp** Value ranges from **0** to **63**.
  - **QOS\_TYPE** is **traffic-class** Value ranges from **0** to **7**.

#### Related Commands

- [policy-map type quality-of-service](#)
- [class \(policy-map \(qos\) Helix\)](#)

#### Example

These commands configure the policy map to set **CoS field 7** to data traffic specified by the class map **CMAP-1**, then assigns that data to **traffic class queue 4**.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#{
```

#### 10.2.7.46 set (policy-map-class (qos) Trident II)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from ***running-config***.

##### Command Mode

Policy-map-class (qos) configuration accessed through **class (policy-map (qos) Trident)** command.

##### Command Syntax

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

##### Parameters

- **QOS\_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS\_TYPE** is **cos** Value ranges from **0** to **7**.
  - **QOS\_TYPE** is **dscp** Value ranges from **0** to **63**.
  - **QOS\_TYPE** is **traffic-class** Value ranges from **0** to **7**.

##### Related Commands

- [policy-map type quality-of-service](#)
- [class \(policy-map \(qos\) Trident\)](#)

##### Example

These commands configure the policy map to set **CoS field 7** to data traffic specified by the class map **CMAP-1**, then assigns that data to **traffic class queue 4**.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

#### 10.2.7.47 set (policy-map-class (qos) Trident)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the Layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from **running-config**.

#### Command Mode

Policy-map-class (qos) configuration accessed through **class (policy-map (qos) Trident)** command.

#### Command Syntax

```
set QOS_TYPE value
no set QOS_TYPE
default set QOS_TYPE
```

#### Parameters

- **QOS\_TYPE** Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- **value** Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - **QOS\_TYPE** is **cos** Value ranges from **0** to **7**.
  - **QOS\_TYPE** is **dscp** Value ranges from **0** to **63**.
  - **QOS\_TYPE** is **traffic-class** Value ranges from **0** to **7**.

#### Related Commands

- [policy-map type quality-of-service](#)
- [class \(policy-map \(qos\) Trident\)](#)

#### Example

These commands configure the policy map to set **CoS field 7** to data traffic specified by the **class map CMAP-1**, then assigns that data to **traffic class queue 4**.

```
switch(config)# policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)# class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)# set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)# set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

#### 10.2.7.48 set nexthop (policy-map-class pbr)

The **set nexthop** command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The **no set nexthop** and **default set nexthop** commands remove the specified action from the class map by deleting the associated **set nexthop** command from ***running-config***.

#### Command Mode

Policy-map-class (pbr) configuration accessed through **class (policy-map (pbr))** command.

#### Command Syntax

```
set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]
no set nexthop [recursive]
default set nexthop [recursive]
```

#### Parameters

- **recursive** enables recursive next hop resolution.
- **NH\_addr** IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

#### Related Commands

- [policy-map type pbr](#)
- [class \(policy-map \(pbr\)\)](#)

#### Example

These **192.168.5.3** commands configure the policy map **PMAP1** to set the next hop to for traffic defined by class map **CMAP1**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop 192.168.5.3
switch(config-pmap-c-PMAP1-CMAP1) #
```

---

#### 10.2.7.49 set nexthop-group (policy-map-class(pbr) Arad)

The **set nexthop-group** command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The **no set nexthop-group** and **default set nexthop-group** commands remove the specified action from the class map by deleting the associated **set nexthop-group** command from **running-config**.

#### Command Mode

Policy-map-class (pbr) configuration accessed through **class (policy-map (pbr))** command.

#### Command Syntax

```
set nexthop-group group_name
no set nexthop-group group_name
default set nexthop-group group_name
```

#### Parameters

**group\_name** name of ECMP group to use as next hop.

#### Related Commands

- [policy-map type pbr](#)
- [class \(policy-map \(pbr\)\)](#)

#### Example

These commands configure the policy map **PMAP1** to set the next hop to a nexthop group named **GROUP1** for traffic defined by class map **CMAP1**.

```
switch(config)# policy-map type pbr PMAP1
switch(config-pmap-PMAP1)# class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)# set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1) #
```

### 10.2.7.50 shape (policy-map-class (control-plane) Arad)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through [class \(policy-map \(control-plane\) Arad\)](#)

#### Command Syntax

#### Parameter

**kilobits** Maximum data rate in kilobits per second. Value ranges from 1 to 10000000.

#### Related Commands

- [class \(policy-map \(control-plane\) Arad\)](#) places the switch in the **policy-map-class (control plane)** configuration mode.
- [bandwidth \(policy-map-class \(control-plane\) Arad\)](#) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Static Classes Default Shape

Arad platform switches define these default shapes for static classes:

- copp-system-bgp 2500 copp-system-l3lpmoverflow 2500
- copp-system-bpdu 2500 copp-system-l3slowpath 2500
- copp-system-default 2500 copp-system-l3ttl1 2500
- copp-system-ipbroadcast 2500 copp-system-lacp 2500
- copp-system-ipmc 2500 copp-system-linklocal 2500
- copp-system-ipmcmiss 2500 copp-system-lldp 2500
- copp-system-ipunicast NO LIMIT copp-system-mlag 2500
- copp-system-l2broadcast 2500 copp-system-multicastsnoop 2500
- copp-system-l2unicast NO LIMIT copp-system-OspfIsis 2500
- copp-system-l3destmiss 2500 copp-system-sflow 2500

#### Example

These commands configure the maximum bandwidth of **2000** kbps for data traffic specified by the class map **copp-system-lldp** of the default **control-plane policy map**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
 shape : 2000 kbps
 bandwidth : 250 kbps
 Out Packets : 0
 Drop Packets : 0
```

---

```
switch(config) #
```

### 10.2.7.51 shape (policy-map-class (control-plane) FM6000)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through [class \(policy-map \(control-plane\) FM6000\)](#).

#### Command Syntax

```
shape pps packets
no shape
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- [class \(policy-map \(control-plane\) FM6000\)](#) places the switch in the **policy-map-class (control plane)** configuration mode.
- [bandwidth \(policy-map-class \(control-plane\) FM6000\)](#) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Static Classes Default Shape

FM6000 platform switches define these default shapes for static classes:

- copp-system-arp 10000 copp-system-l3slowpath 10000
- copp-system-default 8000 copp-system-pim-ptp 10000
- copp-system-ipmcrsvd 10000 copp-system-ospf-isis 10000
- copp-system-ipmcmiss 10000 copp-system-selfip 5000
- copp-system-igmp 10000 copp-system-selfip-tc6to7 5000
- copp-system-l2rsvd 10000 copp-system-sflow 25000

#### Example

These commands configure a maximum bandwidth of **5000** packets per second for data traffic specified by the class map **PMAP-1** in the policy map named **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#

```

### 10.2.7.52 shape (policy-map-class (control-plane) Helix)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through [class \(policy-map \(control-plane\) Helix\)](#).

#### Command Syntax

```
shape pps packets
no shape
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from **1** to **100000**.

#### Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-acllog 10000 copp-system-l3ttl1 10000
- copp-system-arp 10000 copp-system-lacp 5000
- copp-system-arpresolver 10000 copp-system-lldp 10000
- copp-system-bfd 10000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-OspfIisis 10000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmiss 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000
- copp-system-l3destmiss 10000 copp-system-vrrp 5000
- copp-system-l3slowpath 10000

#### Related Commands

- [class \(policy-map \(control-plane\) Helix\)](#) places the switch in the **policy-map-class (control plane)** configuration mode.
- [bandwidth \(policy-map-class \(control-plane\) Helix\)](#) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Example

These commands configure a maximum bandwidth of **5000** packets per second for data traffic specified by the **copp-system-lldp** of the default control-plane policy map.

```
switch(config)# policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
```

```
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
 shape : 5000 pps
 bandwidth : 500 pps
 Out Packets : 305961
 Drop Packets : 0

switch(config)#+
```

### 10.2.7.53 shape (policy-map-class (control-plane) Petra)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through [class \(policy-map \(control-plane\) Petra\)](#)

#### Command Syntax

```
shape kbps kilobits
no shape
default shape
```

#### Parameter

***kilobits*** Maximum data rate in kilobits per second. Value ranges from **1** to **10000000**.

#### Related Commands

- [class \(policy-map \(control-plane\) Petra\)](#) places the switch in policy-map-class (control plane) configuration mode.
- [bandwidth \(policy-map-class \(control-plane\) Petra\)](#) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Static Classes Default Shape

Petra platform switches define these default shapes for static classes:

- copp-system-bpdu 2500 copp-system-l3destmiss 2500
- copp-system-default 2500 copp-system-l3slowpath 2500
- copp-system-igmp 2500 copp-system-l3ttl0 2500
- copp-system-ipbroadcast 2500 copp-system-l3ttl1 2500
- copp-system-ipmc 2500 copp-system-lacp 2500
- copp-system-ipmcmmiss 2500 copp-system-lldp 2500
- copp-system-ipmcrsvd 2500 copp-system-unicast-arp 2500
- copp-system-ipunicast No Limit

#### Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

#### Example

These commands configure the maximum bandwidth of **2000** kbps for data traffic specified by the class map **copp-system-lldp** of the **default control-plane** policy map. Because the switch does not support the discrete value of **2000** kbps, it converts the bandwidth up to **2115** kbps.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-copp-system-policy-copp-system-lldp)# shape kbps 2000
switch(config-pmap-c-copp-copp-system-policy-copp-system-lldp)# exit
```

```
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
 shape : 2115 kbps
 bandwidth : 325 kbps
 Out Packets : 0
 Drop Packets : 0

switch(config)#

```

---

### 10.2.7.54 shape (policy-map-class (control-plane) Trident II)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through **class (policy-map (control-plane) Trident II)**.

#### Command Syntax

```
shape pps packets
no shape
default shape
```

#### Parameter

**packets** Maximum data rate in packets per second. Value ranges from **1** to **100000**.

#### Static Classes Default Shape

Trident II platform switches define these default shapes for static classes:

- copp-system-acllog 10000 copp-system-l3slowpath 10000
- copp-system-arp 10000 copp-system-l3ttl1 10000
- copp-system-arpresolver 10000 copp-system-lacp 5000
- copp-system-bfd 10000 copp-system-lldp 10000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmiss 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000

#### Related Commands

- **class (policy-map (control-plane) Trident II)** places the switch in **policy-map-class (control plane)** configuration mode.
- **bandwidth (policy-map-class (control-plane) Trident II)** specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Example

These commands configure a maximum bandwidth of **5000** packets per second for data traffic specified by the **copp-system-lldp** of the **default control-plane policy** map.

```
switch(config)# policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)# class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)# exit
switch(config-pmap-copp-system-policy)# exit
switch(config)# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Class-map: copp-system-lldp (match-any)
```

```
shape : 5000 pps
bandwidth : 500 pps
Out Packets : 305961
Drop Packets : 0

switch(config) #
```

### 10.2.7.55 shape (policy-map-class (control-plane) Trident)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through [class \(policy-map \(control-plane\) Trident\)](#).

#### Command Syntax

```
shape pps packets
no shape
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

#### Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-arp 10000 copp-system-lldp 10000
- copp-system-arpresolver 10000 copp-system-l3destmiss 10000
- copp-system-bpdu 5000 copp-system-l3slowpath 10000
- copp-system-default 8000 copp-system-l3ttl1 10000
- copp-system-glean 10000 copp-system-selfip 5000
- copp-system-igmp 10000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmiss 10000 copp-system-sflow 25000
- copp-system-ipmcrsvd 10000 copp-system-tc3to5 10000
- copp-system-lacp 5000 copp-system-tc6to7 10000

#### Related Commands

- [class \(policy-map \(control-plane\) Trident\)](#) places the switch in the **policy-map-class (control plane)** configuration mode.
- [bandwidth \(policy-map-class \(control-plane\) Trident\)](#) specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Example

These commands configure a maximum bandwidth of **5000** packets per second for data traffic specified by the class map **PMAP-1** in the policy map named **copp-system-policy**.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-copp-copp-system-policy)# class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)# shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)
```

### 10.2.7.56 show class-map type control-plane

The `show class-map` command displays contents of available control-plane class maps. **Control-plane** class maps can be added to the **copp-system-policy** policy map. **Control-plane** class maps can be static class maps defined by the system or dynamic maps created in **class-map** configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

#### Command Mode

EXEC

#### Command Syntax

`show class-map type control-plane [MAP_NAME]`

#### Parameters

**MAP\_NAME** Name of class map displayed by the command. Options include:

- **no parameter** Command displays all control plane class maps.
- **name\_text** Command displays specified control-plane class maps.

#### Related Command

- `show class-map` command displays QoS class maps.
- `show class-map type qos` displays control plane class maps.

#### Example

This command displays the available control plane class maps.

```
switch# show class-map type control-plane
Class-map: CM-CP1 (match-any)
 Match: ip access-group name LIST-CP1
Class-map: copp-system-acllog (match-any)
Class-map: copp-system-arp (match-any)
Class-map: copp-system-arpresolver (match-any)
Class-map: copp-system-bpdu (match-any)
Class-map: copp-system-glean (match-any)
Class-map: copp-system-igmp (match-any)
Class-map: copp-system-ipmcmiss (match-any)
Class-map: copp-system-ipmcrsvd (match-any)
Class-map: copp-system-l3destmiss (match-any)
Class-map: copp-system-l3slowpath (match-any)
Class-map: copp-system-l3t11 (match-any)
Class-map: copp-system-lacp (match-any)
Class-map: copp-system-lldp (match-any)
Class-map: copp-system-selfip (match-any)
Class-map: copp-system-selfip-tc6to7 (match-any)
Class-map: copp-system-sflow (match-any)
Class-map: copp-system-tc3to5 (match-any)
Class-map: copp-system-tc6to7 (match-any)
switch>
```

---

### 10.2.7.57 show class-map type pbr

The **show class-map** command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

#### Command Mode

EXEC

#### Command Syntax

```
show class-map type pbr [map_name]
```

#### Parameters

***map\_name*** Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

#### Related Command

[show policy-map type pbr](#) displays PBR policy maps.

#### Example

This command displays the contents of the PBR class map **CMAP1**.

```
switch# show class-map type pbr CMAP1
Class-map: CMAP1 (match-any)
 Match: 10 ip access-group PBRgroup1
 Match: 20 ip access-group PBRgroup2
 Match: 30 ip access-group PBRgroup3 switch>
```

### 10.2.7.58 show class-map type qos

The **show class-map** command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in **class-map** configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

#### Command Mode

EXEC

#### Command Syntax

**show class-map type qos [MAP\_NAME]**

#### Parameters

**MAP\_NAME** Name of class map displayed by the command.

- **no parameter** Command displays all QoS class maps.
- **name\_text** Command displays specified QoS class maps.

**show class-map** and **show class-map type qos** are identical commands.

#### Related Command

[show class-map type control-plane](#) displays control plane class maps.

#### Example

This command displays the available QoS class maps.

```
switch# show class-map type qos
 Class-map: CM-Q1 (match-any)
 Match: ipv6 access-group name LIST-1
 Class-map: CM-Q2 (match-any)
 Match: ip access-group name LIST-2
```

---

### **10.2.7.59 show policy-map copp**

The **show policy-map copp** command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane, and copp-system-policy is the only supported policy map.

#### **Command Mode**

EXEC

#### **Command Syntax**

**show policy-map copp copp-system-policy**

#### **Example**

This command displays the contents and throughput of the policy map applied to the control plane.

```
switch# show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
 Number of units programmed: 1
 Hardware programming status: Successful

 Class-map: copp-system-bpdu (match-any)
 shape : 5000 pps
 bandwidth : 5000 pps
 Out Packets : 2
 Drop Packets : 0

 Class-map: copp-system-lacp (match-any)
 shape : 5000 pps
 bandwidth : 5000 pps
 Out Packets : 0
 Drop Packets : 0
switch>
```

### 10.2.7.60 show policy-map interface type qos counters

The **show policy-map interface** command displays the quantity of packets that are filtered by ACLs applied to a interface.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map [INTERFACE_NAME][type qos][TRAFFIC] counters
```

#### Parameters

- **INTERFACE\_NAME** Filters policy map list by interfaces. Options include:
  - **no parameter** Displays data for all configured interfaces.
  - **interface ethernet e\_range** Ethernet ports for which command displays policy maps.
  - **interface port-channel p\_range** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - **no parameter** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

#### Example

This command displays the policy maps applied to interfaces Ethernet **7** and **8**.

```
switch# show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
 Hardware programming status: Successful

 Class-map: cmap-1 (match-any)
 Match: ip access-group name LIST-2
 set cos 6

 Class-map: class-default (match-any)

Service-policy input: PMAP-2
 Hardware programming status: Successful

 Class-map: cmap-2 (match-any)
 Match: ip access-group name LIST-2
 set dscp 10

 Class-map: class-default (match-any)
```

---

### 10.2.7.61 show policy-map interface type qos

The **show policy-map interface** command displays contents of the policy maps applied to specified interfaces or to the control plane.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map interface INTERFACE_NAME [type qos] [TRAFFIC]
```

#### Parameters

- **INTERFACE\_NAME** Filters policy map list by interfaces. Options include:
  - **ethernet e\_range** Ethernet ports for which command displays policy maps.
  - **port-channel p\_range** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - **no parameter** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

#### Example

This command displays the policy maps applied to interfaces Ethernet **7** and **8**.

```
switch# show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
 Hardware programming status: Successful

 Class-map: cmap-1 (match-any)
 Match: ip access-group name LIST-2
 set cos 6

 Class-map: class-default (match-any)

Service-policy input: PMAP-2
 Hardware programming status: Successful

 Class-map: cmap-2 (match-any)
 Match: ip access-group name LIST-2
 set dscp 10

 Class-map: class-default (match-any)
```

### 10.2.7.62 show policy-map type copp

The **show policy-map type copp** command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map type copp copp-system-policy [CMAP_NAME]
```

#### Parameters

**CMAP\_NAME** Name of class map displayed by the command.

- **no parameter** Command displays all class maps in specified policy map.
- **class\_name** Command displays specified class map.

#### Example

This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.

```
switch# show policy-map type copp copp-system-policy class copp-system-bpdu
 Class-map: copp-system-bpdu (match-any)
 shape : 5000 pps
 bandwidth : 5000 pps
```

---

### 10.2.7.63 show policy-map type pbr

The **show policy-map pbr** command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map type pbr [PMAP_NAME][DATA_LEVEL]
```

#### Parameters

- **PMAP\_NAME** Name of policy map displayed by the command.
  - **no parameter** Command displays all policy maps.
  - **policy\_map** Command displays specified policy map.
- **DATA\_LEVEL** Type of information the command displays. Values include:
  - **no parameter** Command displays all class maps in specified policy map.
  - **summary** Command displays summary data for the specified policy map.

#### Example

This command displays the contents of all PBR policy maps in *running-config*.

```
switch# show policy-map type pbr
Service policy PMAP1
Configured on:
Applied on:
10: Class-map: CMAP1 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 20 ip access-group PBRgroup2
Match: 30 ip access-group PBRgroup3
Configured actions: set nexthop 172.16.10.12
20: Class-map: CMAP2 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 10 ip access-group PBRgroup4
Match: 20 ip access-group PBRgroup5
Configured actions: set nexthop 192.168.15.15
```

#### 10.2.7.64 show policy-map type qos counters

The **show policy-map counters** command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

##### Command Mode

EXEC

##### Command Syntax

```
show policy-map type qos pmap_name [TRAFFIC] counters [INFO_LEVEL]
```

##### Parameters

- ***pmap\_name*** Name of policy map displayed by the command.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - **no parameter** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - **no parameter** displays summarized information about the policy map.
  - **detail** displays detailed policy map information.

---

### 10.2.7.65 show policy-map type qos

The **show policy-map qos** command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map [type qos][PMAP_NAME [CMAP_NAME]]
```

#### Parameters

- **PMAP\_NAME** Name of policy map displayed by the command.
  - **no parameter** Command displays all policy maps.
  - **policy\_map** Command displays specified policy map.
- **CMAP\_NAME** Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - **no parameter** Command displays all class maps in specified policy map.
  - **class\_name** Command displays specified class map.

#### Example

This command displays the contents of all QoS policy maps in **running-config**.

```
switch# show policy-map type qos
Service-policy input: PMAP-1
 Hardware programming status: Successful

 Class-map: xeter (match-any)
 Match: ip access-group name LIST-1
 set cos 6

 Class-map: class-default (match-any)

Service-policy PMAP-2

 Class-map: class-default (match-any)
```

---

### 10.2.7.66 show traffic-policy

The **show traffic-policy** command displays traffic policy information on the interface.

#### Command Mode

EXEC

#### Command Syntax

```
show traffic-policy NAME interface
show traffic-policy interface [DETAILS]
```

#### Parameters

**DETAILS** Details requested. Options include:

- **summary** Display summary information about the policy.
- **errors** Display all configured remote grantees, associated profile name and latest update.
- **details** Display all interfaces on which the policy has been configured.

**Examples**

- This command displays the summary information configured on the switch interfaces.

```
switch(config-traffic-policies)# show traffic-policy interface summary
Traffic policy samplePolicy
 Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
 Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
 Applied on interfaces for IPv6 traffic:
 Total number of rules configured: 3
 match SIMPLE ipv4
 match ipv4-all-default ipv4
 match ipv6-all-default ipv6
```

- This command displays information about the traffic policy named **samplePolicy**.

```
switch(config-traffic-policies)# show traffic-policy samplePolicy interface
Traffic policy samplePolicy
 Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
 Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1, ...
 Applied on interfaces for IPv6 traffic:
 Total number of rules configured: 3
 match SIMPLE ipv4
 Source prefix: 192.0.2.0/24
 198.51.100.0/24
 Destination prefix: 203.0.113.0/24
 Protocol: tcp
 Source port: 50-100
 110-200
 Actions: Drop
 match ipv4-all-default ipv4
 match ipv6-all-default ipv6
```

- This command displays all interfaces on which **samplePolicy** has been configured.

```
switch(config-traffic-policies)# show traffic-policy interface detail
Traffic policy samplePolicy
 Configured on interfaces: Ethernet1/1, Ethernet2/1, Ethernet3/1, Ethernet4/1
 Applied on interfaces for IPv4 traffic: Ethernet1/1, Ethernet2/1, Ethernet3/1, Ethernet4/1
 Applied on interfaces for IPv6 traffic:
 Total number of rules configured: 3
 match SIMPLE ipv4
 Source prefix: 192.0.2.0/24
 198.51.100.0/24
 Destination prefix: 203.0.113.0/24
 Protocol: tcp
 Source port: 50-100
 110-200
 Actions: Drop
 match ipv4-all-default ipv4
 match ipv6-all-default ipv6
```

- This command displays installation errors for a match statement. The example has no errors.

```
switch(config-traffic-policies)# show traffic-policy interface errors
Traffic policy samplePolicy
 Failed on interface for IPv4 traffic:
 Failed on interface for IPv6 traffic:
```

## Interface Configuration

---

This chapter describes Ethernet ports supported by Arista switches as well as channel groups, port channels, port channel interfaces, Link Aggregation Control Protocol (LACP), and Multi-Chassis Link Aggregation. This chapter contains the following sections:

- [Ethernet Ports](#)
- [Port Channels and LACP](#)
- [Multi-Chassis Link Aggregation](#)
- [Data Transfer](#)
- [Octal Port Renumber to Four Interfaces](#)

### 11.1 Ethernet Ports

This section describes Ethernet ports supported by Arista switches. Topics covered in this section include:

- [Ethernet Ports Introduction](#)
- [Ethernet Standards](#)
- [Ethernet Physical Layer](#)
- [Interfaces](#)
- [MRU Enforcement](#)
- [Displaying Interface Interactions](#)
- [Dynamic Link Flap Damping](#)
- [Ethernet Configuration Procedures](#)
- [Ethernet Configuration Commands](#)

#### 11.1.1 Ethernet Ports Introduction

Arista switches support a variety of Ethernet network interfaces. This chapter describes the configuration and monitoring options available in Arista switching platforms.

#### 11.1.2 Ethernet Standards

Ethernet, standardized in *IEEE 802.3*, is a group of technologies used for communication over local area networks. Ethernet communication divides data streams into frames containing addresses (source and destination), payload, and Cyclical Redundancy Check (CRC) information.

*IEEE 802.3* also describes two types of optical fiber: Single-Mode Fiber (SMF) and Multi-Mode Fiber (MMF). MMF range limits from **50** to **500** meters range.

### 11.1.2.1 100 Gigabit Ethernet

The 100 Gigabit Ethernet (100GbE) standard defines an Ethernet implementation with a nominal data rate of 100 billion bits per second over 10x10G, 4x25G, or 1x100G. 100 Gigabit Ethernet implements full duplex point-to-point links connected by network switches. Arista switches support 100GBASE-10SR through MXP ports.

### 11.1.2.2 40 Gigabit Ethernet

The 40 Gigabit Ethernet (40GbE) standard defines an Ethernet implementation with a nominal data rate of 40 billion bits per second over multiple 10 gigabit lanes. 40 Gigabit Ethernet implements full duplex point to point links connected by network switches. 40 Gigabit Ethernet standards use the “**40GBASE-xyz**” naming scheme, as explained in [40GBASE-xyz Interpretation](#).

**Table 59: 40GBASE-xyz Interpretation**

| x                                                                                                                             | y                                     | z                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------|
| Non-fiber media type, or fiber wavelength<br>C = Copper F = Serial SMF K = Backplane<br>L = Long (1310 nm) S = Short (850 nm) | PHY encoding<br>R = LAN PHY (64B/66B) | Number of WWDM wavelengths or XAUI Lanes<br>No value = 1 (serial) 4 = 4 WWDM wavelengths or XAUI Lanes |
|                                                                                                                               |                                       |                                                                                                        |

### 11.1.2.3 10 Gigabit Ethernet

The 10 Gigabit Ethernet (10GbE) standard defines an Ethernet implementation with a nominal data rate of 10 billion bits per second. 10 Gigabit Ethernet implements full duplex point-to-point links connected by network switches. Half duplex operation, hubs, and CSMA/CD do not exist in 10GbE. The standard encompasses several PHY standards; a networking device may support different PHY types through pluggable PHY modules. 10GbE standards are named **10GBASE-xyz**, as interpreted by [10GBASE-xyz Interpretation](#).

**Table 60: 10GBASE-xyz Interpretation**

| x                                                                                                                                                                                         | y                                                                                        | z                                                                                                               |

|                                                                                                                                                                                           |                                                                                          |                                                                                                                 |

### 11.1.2.4 Gigabit Ethernet

The Gigabit Ethernet (GbE) standard, defined by **IEEE 802.3-2008**, describes an Ethernet version with a nominal data rate of one billion bits per second. GbE cables and equipment are similar to those used in previous standards. While full-duplex links in switches are the typical implementation, the specification permits half-duplex links connected through hubs.

Gigabit Ethernet physical layer standards that Arista switches support include 1000BASE-X (optical fiber), 1000BASE-T (twisted pair cable), and 1000BASE-CX (balanced copper cable).

- 1000BASE-SX is a fiber optic standard that utilizes multi-mode fiber supporting 770 to 860 nm, near-infrared (NIR) light wavelength to transmit data over distances ranging from **220** to **550** meters. Network

---

designs typically leverage 1000BASE-SX for intra-building links in large office buildings, co-location facilities, and carrier-neutral Internet exchanges.

- 1000BASE-LX is a fiber standard that utilizes a long wavelength laser (**1,2701,355 nm**) with an RMS spectral width of 4 nm to transmit data up to **5 km**. 1000BASE-LX can run on all common types of multi-mode fiber with a maximum segment length of **550 m**.
- 1000BASE-T is a standard for gigabit Ethernet over copper wiring. Each 1000BASE-T network segment can be a maximum length of **100** meters.

#### 11.1.2.5 10/100/1000BASE-T

Arista switches provide 10/100/1000BASE-T Ethernet out-of-band management ports. Auto-negotiation is enabled on these interfaces. Speed (10/100/1000), duplex (half/full), and flow control settings are available using the appropriate **speed** and **flowcontrol** commands.

#### 11.1.2.6 Power over Ethernet (PoE)

Selected Arista switches provide Power over Ethernet (PoE) to power connected devices. Arista's PoE implementation is compliant with IEEE standards *802.3af* and *802.3at* and includes partial support for *802.3bt*.

When a standards-compliant Powered Device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its power class is determined by hardware negotiation; more granular power adjustments can then be managed by the Link Layer Discovery Protocol (LLDP).

#### 11.1.2.7 Link Fault Signaling

Link Fault Signaling (LFS) is a mechanism by which a port transmits remote link fault signals to its peer over the link that is experiencing problems by configuring specific actions. LFS operates between the remote Reconciliation Sublayer (remote RS) and the local Reconciliation Sub-layer (local RS). The local RS treats faults detected between the remote RS and the local RS as local faults.

LFS enables monitoring FCS and symbol errors on an interface, and if they exceed a configured threshold, one of the following three actions is enabled:

- Disable the error on the interface.
- Generate system log messages.
- Generate a link fault.

### 11.1.3 Ethernet Physical Layer

The Ethernet Physical Layer (PHY) includes hardware components connecting a switch's MAC layer to a transceiver, a cable, and ultimately to a peer link partner.

Data exist in digital form at the MAC layer. On the line side of the PHY, data exist as analog signals: light blips on optical fiber or voltage pulses on copper cable. Signals may be distorted while in transit and recovery may require signal processing. Ethernet physical layer components include a PHY and a transceiver.

### 11.1.3.1 PHYs

The PHY provides translation services between the MAC layer and the transceiver. It also helps to establish links between the local MAC layer and peer devices by detecting and signaling fault conditions. The PHY line-side interface receives Ethernet frames from the link partner as analog waveforms. The PHY uses signal processing to recover the encoded bits, then sends them to the MAC layer.

PHY line-side interface components and their functions include:

- Physical Medium Attachment (PMA): Framing, octet synchronization, scrambling/ descrambling.
- Physical Medium Dependent (PMD): Consists of the transceiver.
- Physical Coding Sublayer (PCS): Performs auto-negotiation and coding (8B/10B or 64B/66B).

The MAC sublayer of the PHY provides a logical connection between the MAC layer and the peer device by initializing, controlling, and managing the connection with the peer.

The PHY's system-side interface receives Ethernet frames transmitted by the switch as a sequence of digital bits. The PHY encodes them into a media-specific waveform for transmission through the line-side interface and transceiver to the link peer. This encoding may include signal processing, such as pre-distortion and forward error correction.

PHY system-side interface components and their functions include:

- **10 Gigabit Attachment Unit Interface (XAUI):** Connects an Ethernet MAC to a 10 Gb/s PHY.
- **Serial Gigabit Media Independent Attachment (SGMII):** Connects an Ethernet MAC to a 1 Gb/s PHY.

### 11.1.3.2 Transceivers

A transceiver connects the PHY to an external cable (optical fiber or twisted-pair copper) and through a physical connector (LC jack for fiber or RJ-45 jack for copper).

- Optical transceivers convert the PHY signal into light pulses that are sent through optical fiber.
- Copper transceivers connect the PHY to twisted-pair copper cabling.

Arista Small Form-Factor Pluggable (SFP+) and Quad Small Form Factor Pluggable (QSFP+) modules and cables provide high-density, low-power Ethernet connectivity over fiber and copper media. Arista offers transceivers that span data rates, media types, and transmission distances.

#### **Arista 10 Gigabit Ethernet SFP+ Modules**

- 10GBASE-SR (Short Reach)
  - Link length: maximum 300 meters over multi-mode fiber.
- Optical interoperability with 10GBASE-SRL.
- 10GBASE-SRL (Short Reach Lite)
  - Link length: maximum 100 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SR.
- 10GBASE-LRL (Long Reach Lite)
  - Link length: maximum 1 km over single-mode fiber.
  - Optical interoperability with 10GBASE-LR (1 km maximum).
- 10GBASE-LR (Long Reach)
  - Link length: maximum 10 km over single-mode fiber.

- 
- Optical interoperability with 10GBASE-LRL (1 km maximum).
  - 10GBASE-LRM (Long Reach Multi-mode)
    - Link length: maximum 220 meters over multi-mode fiber (50 um and 62.5 um).
  - 10GBASE-ER (Extended Reach)
    - Link length: maximum 40 km over single-mode fiber.
  - 10GBASE-ZR (Ultra-Extended Reach)
    - Link length: maximum 80 km over single-mode fiber.
  - 10GBASE-DWDM (Dense Wavelength Division Multiplexing)
    - Link length: maximum 80 km over single-mode fiber (40 color options).
    - Tunable SFP+ Optics Module, Full C-Band 50 GHz ITU Grid, up to 80km over duplex SMF.

### **Arista 10 Gigabit Ethernet CR Cable Modules**

- 10GBASE-CR SFP+ to SFP+ Cables
  - Link lengths of 0.5, 1, 1.5, 2, 2.5, 3, 5, and 7 meters over twinax copper cable.
  - Includes SFP+ connectors on both ends.
- 4 x 10GbE QSFP+ to 4 x SFP+ twinax copper cables.
  - Link lengths of 0.5, 1, 2, 3, and 5 meters over twinax copper cable.

### **Arista 25 Gigabit Ethernet Modules**

- 25GBASE-CR SFP28 Cable
  - Capable of 10G/25Gb/s speeds with link lengths of 1 to 5 meters.
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable.
  - Link lengths of 3 to 30 meters.
- SFP-25G-SR SFP28 Optics Module
  - Link length of up to 70 m over OM3 MMF or 100 m over OM4 MMF.
- SFP-25G-LR SFP28 Optics Module
  - Link length of up to 10 kilometers over duplex SMF.

### **Arista 40 Gigabit Ethernet QSFP+ Cables and Optics**

- 40GBASE-SR4 QSFP+ Transceiver.
  - Link length: maximum 100 meters over parallel OM3 or 150 meters over OM4 MMF.
  - Optical interoperability with 40GBASE-XSR4 (maximum distance of 100/150 meters).
- 40GBASE-XSR4 QSFP+ Transceiver.
  - Link length maximum 300 meters over parallel OM3 or 450 meters over OM4 MMF.
  - Optical interoperability with 40GBASE-SR4 (maximum distance of 100/150 meters).
- 40GBASE-LR4 QSFP+.
  - Link length: maximum 10 km over duplex single-mode fiber.
- 40GBASE-CR4 QSFP+ to QSFP+ twinax copper cables.

- Link lengths of 1, 2, 3, 5, and 7 meters over twinax copper cable.
- 40GBASE-BIDI Bidirectional QSFP+ Optic.
  - Link length: up to 100 meters over parallel OM3 or 150 meters over OM4 MMF.
- 40GBASE-UNIV QSFP+ Optic.
  - Link length: up to 150 meters over duplex OM3/OM4 MMF and 500 meters over duplex SMF.
- 40GBASE-LRL QSFP+ Optic.
  - Link length: up to 1 kilometer over duplex SMF.
- 40GBASE-PLRL4 QSFP+ Optic.
  - Link length: up to 1 kilometer over parallel SMF (i.e., 4x10G LR up to 1 km).
- 40GBASE-PLR4 QSFP+ Optic
  - Link length: up to 10 kilometers over parallel SMF (i.e., 4x10G LR up to 1 km).
- 40GBASE-ER QSFP+ Optic.
  - Link length: up to 40 kilometers over duplex SMF.

### **Arista Gigabit Ethernet SFP Options**

- 1000BASE-SX (Short Haul).
  - Multi-mode fiber.
  - Link length: up to 550 meters.
- 1000BASE-LX (Long Haul).
  - Single-mode fiber.
  - Link length: up to 10 km (single mode).
- 1000BASE-T (RJ-45 Copper).
  - Category 5 cabling.
  - Full duplex 1000 Mbps connectivity.

### **Arista 100 Gigabit Ethernet QSFP Modules**

- 100GBASE-SR4 QSFP transceiver.
  - Link length: up to 70 meters over parallel OM3 or 100 meters over OM4 multi-mode fiber.
- 100GBASE-SWDM4 QSFP transceiver.
  - Link length: up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-BIDI QSFP transceiver.
  - Link length: up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-PSM4 40G/100G dual speed QSFP Optics Module.
  - Link length: up to 500 meters over parallel single-mode fiber.
- 100GBASE-CWDM4 40G/100G dual speed QSFP Optics Module.
  - Link length: up to 2 km over duplex single-mode fiber.
- 100GBASE-LRL4 QSFP Optics Module.

- 
- Link length: up to 2 km over duplex single-mode fiber.
  - 100GBASE-LR4 QSFP Optics Module.
    - Link length: up to 10 km over duplex single-mode fiber.
  - 100GBASE-ERL4 QSFP Optics Module.
    - Link length: up to 40 km over duplex single-mode fiber.
  - 100GBASE-ZR4 QSFP Optics Module.
    - Link length: up to 80 km over single-mode fiber.
  - 100GBASE-CR4 QSFP to QSFP Twinax copper cable.
    - Link lengths of 1 to 5 meters.
  - 100GBASE-CR4 QSFP to 4 x 25GbE SFP Twinax copper cable.
    - Link lengths of 1 to 5 meters.

### **Internal Ports**

Several Arista switches include internal ports that connect directly to an external cable through an RJ-45 jack. Internal ports available on Arista switches include:

- 100/1000BASE-T (7048T-A).
- 100/1000/10GBASE-T (7050-T).

### **AOC Cables**

- AOC-Q-Q-100G QSFP 100GbE Active Optical Cable.
  - Link lengths of 3 to 30 meters.
- AOC-Q-Q-40G QSFP+ to QSFP+ 40GbE Active Optical Cable.
  - Link lengths of 3 to 100 meters.
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable.
  - Link lengths of 3 to 30 meters.

#### **11.1.3.2.1 400GBASE-ZR Transceivers**

400GBASE-ZR transceiver is the industry's first multi-vendor DWDM standard, a Digital Coherent Optical module with tunable laser, using DWDM multiplexing and 16QAM modulation and capable of delivering 400G per port over distances up to 120 km.

Key software features supported:

- Compliance with CMIS4.0/CMIS4.1 (CMIS5.0) and Coherent CMIS.
- Frequency tuning (100 GHz and 75 GHz grids).
- DOM monitoring, including VDM (Versatile Diagnostics Monitoring) pages, defined in CMIS4.0.
- Coherent alarms and faults, including pages, defined by Coherent CMIS.
- Configurable Tx output power.
- A separate command for shutting down the Tx output path for unidirectional mode.

- 1-second update of pre-FEC BER, OSNR, ESNR.
- 400GBASE-ZR transceiver with Open Forward Error Correction (O-FEC) (*EOS release 4.25.2F.*)
- 4x100 Gb/s mode for the 400GBASE-ZR transceivers (*EOS release 4.25.2F.*)
- Override a transceiver slot's maximum power limit (*EOS release 4.25.2F.*)

### Platform Compatibility

The 400GBASE-ZR transceiver is a power class 8 module with a power consumption of up to 20W, the highest power consumption among 400G transceivers.

In theory, every 400GBASE OSFP or QSFP-DD switch is qualified to host 400GBASE-ZR transceivers. However, the actual number of 400GBASE-ZR modules that can be used by a switch simultaneously may vary, depending on platform (modular vs. fixed) and ASIC type. It is always recommended to discuss the installation of 400GBASE-ZR modules with Arista support.

### Using 400GBASE-ZR in Combination with OSFP-LS

Arista EOS allows the use of OSFP-LS (pluggable line system in the OSFP form factor), instead of traditional DCI line systems.

#### 11.1.3.2.1.1 Configuring 400GBASE-ZR Transceivers

##### Laser Frequency Configuration

All coherent modules, including 400GBASE-ZR, require their laser frequency to be explicitly configured. To configure the laser frequency for 400GBASE-ZR, use the `transceiver frequency` command under the defined interface, providing a frequency expressed in Gigahertz in the range of **191.3-196.1** THz. If a laser frequency is not configured or is configured outside the valid range, all interfaces associated with the port are put into error-disabled state.

```
switch# conf
switch(config)#
switch(config)# interface Ethernet12/1
switch(config-if-Et12/1)# transceiver frequency 193100
switch(config-if-Et12/1)#

```

Configured and operational frequency settings can be verified using the `show interface transceiver hardware` command.

##### Note:

- 
- It can take up to **90** seconds for the 400GBASE-ZR module to fully complete frequency tuning.
  - The frequency plan for 400GBASE-ZR modules support channel spacings of **100 GHz** or **75 GHz**. It is recommended to use operating frequency channel definitions in chapter 15 of [4].

### Transmit Output Power Configuration

CMIS4.0 defines support of configurable transmit output power as an optional feature. Check the output of `show interface transceiver eeprom` command for page 04h, registers **196-201**, to see if it is supported.

```
Programmable output power advertisement (04h:196-201):
Lane programmable output power supported (04h:196): true
Min programmable output power (04h:198-199): -14 dB
Max programmable output power (04h:200-201): -10 dB
```

Transmit output power can be configured using the **transceiver transmitter signal power** command.

```
switch# conf
switch(config)# interface Ethernet14/1
switch(config-if-Et14/1)# transceiver transmitter signal-power ?
switch(config-if-Et14/1)# transceiver transmitter signal-power -10
```

You can check the configured TX power using the **show interface transceiver hardware** command and the actual operational TX power using the **show interface transceiver** command.

**Note:**

- 400GBASE-ZR does not have a recommended level of transmit laser power. In most cases, it is okay to keep the default power.
- Some vendors may not populate the range of supported output powers correctly. The range **-10 to -14 dBm** should be supported. Contact Arista Support if you are planning to configure the output power outside of this range.

## Transmit Output Disable and Unidirectional Mode

In coherent optics, the **shutdown** command impacts both transmit and receive paths and can't be used to set up a unidirectional mode. To shut down the TX output path, use the **transceiver transmitter disabled** command:

```
switch# conf
switch(config)# interface Ethernet14/1
switch(config-if-Et14/1)# transceiver transmitter DISABLED
```

To re-enable the transmit path, use the **no** or **default** version of the above configuration command.

## Configuring 4x100 Gb/s mode for 400GBASE-ZR transceivers

4x100 Gb/s mode connects four host Ethernet interfaces over 100GAUI-2 electrical interfaces to a single optical lane acting as a 4x1 muxponder. To enable this mode on a 400GBASE-ZR transceiver, configure the speed on each of the four interfaces.

```
switch(config-if-Et4/1)# speed 100g-2
switch(config-if-Et4/3,4/5,4/7)# speed 100g-2

switch# show interfaces ethernet 4/1-5/8 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et4/1 connected 1 full 100G 400GBASE-ZR
Et4/3 connected 1 full 100G 400GBASE-ZR
Et4/5 connected 1 full 100G 400GBASE-ZR
Et4/7 connected 1 full 100G 400GBASE-ZR
Et5/1 connected 1 full 100G 400GBASE-ZR
Et5/3 connected 1 full 100G 400GBASE-ZR
Et5/5 connected 1 full 100G 400GBASE-ZR
Et5/7 connected 1 full 100G 400GBASE-ZR
```

Each of the Ethernet interfaces can be independently shut down without affecting the transmission over the other interfaces.

```
switch(config-if-Et4/1,4/3,4/5)# shutdown
switch# show interfaces ethernet 4/1-5/8 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et4/1 disabled 1 full 100G 400GBASE-ZR
Et4/3 disabled 1 full 100G 400GBASE-ZR
Et4/5 disabled 1 full 100G 400GBASE-ZR
Et4/7 connected 1 full 100G 400GBASE-ZR
Et5/1 notconnect 1 full 100G 400GBASE-ZR
Et5/3 notconnect 1 full 100G 400GBASE-ZR
```

```

Et5/5 notconnect 1 full 100G 400GBASE-ZR
Et5/7 connected 1 full 100G 400GBASE-ZR

switch# show interfaces ethernet 4/1 transceiver
If device is externally calibrated, only calibrated values are printed.
N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
 Bias Optical Optical
 Temp Voltage Current Tx Power Rx Power
Port (Celsius) (Volts) (mA) (dBm) (dBm) Last Update
----- ----- ----- ----- ----- ----- -----
Et4/1 59.00 3.25 279.70 -9.46 -8.29 0:00:01 ago

```

However, shutting down all four interfaces disables the laser:

```

switch(config-if-Et4/7)# shutdown
switch# show interfaces ethernet 4/1-5/8 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et4/1 disabled 1 full 100G 400GBASE-ZR
Et4/3 disabled 1 full 100G 400GBASE-ZR
Et4/5 disabled 1 full 100G 400GBASE-ZR
Et4/7 disabled 1 full 100G 400GBASE-ZR
Et5/1 notconnect 1 full 100G 400GBASE-ZR
Et5/3 notconnect 1 full 100G 400GBASE-ZR
Et5/5 notconnect 1 full 100G 400GBASE-ZR
Et5/7 notconnect 1 full 100G 400GBASE-ZR

switch# show interfaces ethernet 4/1 transceiver
If device is externally calibrated, only calibrated values are printed.
N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
 Bias Optical Optical
 Temp Voltage Current Tx Power Rx Power
Port (Celsius) (Volts) (mA) (dBm) (dBm) Last Update
----- ----- ----- ----- ----- ----- -----
Et4/1 44.00 3.33 0.00 -30.00 -30.00 0:00:01 ago

```

### Configuring Open Forward Error Correction on 400GBASE-ZR

Open FEC (O-FEC) is a Forward Error Correction encoder and decoder, specified in the Open ZR+ MSA [2], with an overhead of 15.3% and a net coding gain of 11.6 dB for 16QAM modulation. Compared to Concatenated FEC (C-FEC), which is a default FEC specified for 400GBASE-ZR coherent transceivers by CMIS4.0, O-FEC provides higher coding gain (11.6dB for O-FEC vs 10.8 dB for C-FEC /16QAM), and it can correct a pre-FEC BER of up to 2E-2.

The **error-correction encoding <FEC>** command configures the transceiver's optical transmission to use O-FEC:

```
switch(config-if-Et4/1)# error-correction encoding open
```

### Transceiver Slot's Maximum Power Limit

The **transceiver power ignore** command allows EOS to bypass the power check for the transceivers to be operational.

```
switch(config-if-Et4/1)# transceiver power ignore
! You can risk damaging hardware by using transceiver modules with high power consumption. We
recommend that you do this only under direction from Arista Networks.
```

#### 11.1.3.2.1.2 Show Commands

- **show interface transceiver eeprom**

The **show interface transceiver eeprom** command displays the parsed capabilities.

## Example

For 400GBASE-ZR, the display of frequency tuning, power tuning (page 04h), and VDM configuration pages (20h-23h) is added.

```
switch# show interface Ethernet15/1 transceiver eeprom
Ethernet15 EEPROM:
...
Frequency tuning support (04h:128-129):
 Grid spacing capabilities (04h:128):
 100 GHz grid supported (04h:128): true
 12.5 GHz grid supported (04h:128): false
 25 GHz grid supported (04h:128): false
 3.125 GHz grid supported (04h:128): false
 33 GHz grid supported (04h:128): false
 50 GHz grid supported (04h:128): false
 6.25 GHz grid supported (04h:128): false
 75 GHz grid supported (04h:128): true
Tunable wavelength (04h:128): true

```

- **show interface transceiver dom**

The **show interface transceiver dom** command displays the most important current performance data on the media (line) side.

## Example

```
switch# show interface Ethernet11/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Port 11
Last update: 0:00:05 ago
 Value

Case temperature 66.59 C
Voltage 3.26 V
```

|                                   |               |
|-----------------------------------|---------------|
| TX power                          | -10.23 dBm    |
| RX total power                    | -11.61 dBm    |
| RX channel power                  | -11.94 dBm    |
| Pre-FEC BER                       | 1.82e-03      |
| Post-FEC errored frames ratio     | 0.00e+00      |
| Chromatic dispersion (short link) | 0.00 ps/nm    |
| Chromatic dispersion (long link)  | 0.00 ps/nm    |
| Differential group delay          | 9.31 ps       |
| SOPMD                             | 0.00 ps^2     |
| Polarization dependent loss       | 0.40 dB       |
| Received OSNR estimate            | 35.10 dB      |

| Laser temperature                 | 59.54 C       |
| Laser frequency                   | 193100.00 GHz |

- BER: Bit Error Rate
- FEC: Forward Error Correction
- OSNR: Optical Signal to Noise Ratio
- ESNR: Electrical Signal to Noise Ratio
- SOP: State of Polarization
- SOPMD: State of Polarization Mode Dispersion
- **show interfaces hardware**

The **show interfaces hardware** command displays the speed capabilities of a module. A 400GBASE-ZR supports 4x100 Gb/s mode if the **100G-2/full** speed is supported.

### Example

```
switch# show interfaces ethernet 4/1 hardware
* = Requires speed group setting change
Ethernet4/1
 Model: DCS-7280PR3K-24
 Type: 400GBASE-ZR
Speed/duplex: 100G-2/full,400G-8/full(default)
 Flowcontrol: rx-(off,on),tx-(off)
 Modulation: 16QAM
 Error correction: C-FEC(16QAM(default)), O-FEC(16QAM)
```

The **show interface status** command displays the status and characteristics of the Ethernet interfaces:

```
switch#show interfaces ethernet 4/1,4/3,4/5,4/7 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et4/1 connected 1 full 100G 400GBASE-ZR
Et4/3 connected 1 full 100G 400GBASE-ZR
Et4/5 connected 1 full 100G 400GBASE-ZR
Et4/7 connected 1 full 100G 400GBASE-ZR
```

- **show transceiver status interface**

The **show transceiver status interface** command displays the most important alarms, faults, interface statuses, and the existence of four host interfaces in the example below.

### Example

For 400GBASE-ZR modules, media and host-side coherent alarms, host-side pre-FEC BER (defined in the Coherent CMIS), and post-FEC BER have been added to the command's output:

```
switch# show transceiver status interface Ethernet 4/1,4/3,4/5,4/7
Current State Changes Last Change
----- ----- -----
Port 4
 Transceiver 400GBASE-ZR 3 2:32:34 ago
```

|                               |           |    |             |
|-------------------------------|-----------|----|-------------|
| Transceiver SN                | 204653947 |    |             |

```

- **Wavelength/Frequency and Output Power Status**

The **show interface transceiver hardware** command displays the configured and programmed wavelength and output power. It takes a short time for the configured wavelength or output power to be programmed into the transceiver. The configured wavelength/output power and programmed wavelength/output power should not differ for an extended period of time.

```

switch# show interface Ethernet23/1 trans hardware
Name: Et23/1
Media type: 400GBASE-ZR
Maximum module power (W): 20.0
Maximum slot power (W): 20.0
Configured frequency (GHz): 193100.0
Computed wavelength (nm): 1552.52
Operational frequency (GHz): 193,100.0
Operational wavelength (nm): 1552.52
Configured TX power (dBm): -10.0
Operational TX power (dBm): -10.0

```

**Note:** Configured transmit output power and operational transmit output power are only displayed if configurable output power is supported by the module.

#### 11.1.3.2.1.3 Troubleshooting

1. Check the transceiver type: make sure it is 400GBASE-ZR.
2. Check the peer transceiver: make sure it is also 400GBASE-ZR.
3. Check that the channel/frequency is configured and the interfaces are not in error-disabled state.
4. Check that the selected frequency is matching on both sides of the optical link.
5. Check that transmit output is not disabled.
6. If the TX power is not configured, check that it is from -6 dB to -12 dB.

- 
7. If the TX power is configured, check that it matches its configured values on both sides of the optical link.
  8. Check the RX power. The best performance of an optical link is achieved when the received power is -10dB.
  9. Collect the output of the CLI commands listed in the “Show commands” section before requesting support from the development team.
  10. Check that the pre-FEC BER (`show transceiver dom` command) is in the correct range (less than 1E-2).
  11. In the `show transceiver status interface` output, check that the module state is *Ready* and that data path state is *Activated*. Check for possible alarms and faults.

### Link Issues

If a link has issues, the following commands and files are useful for debugging and for Arista TAC.

- `show interfaces <interfaceName> phy detail.`
- `show interfaces <interfaceName> transceiver detail.`
- `show idprom transceiver <interfaceName> ext.`
- Files in `/var/log/agents/*.`
- Files in `/var/log/qt/*.`
- `/var/log/messages*.`

#### 11.1.3.2.1.4 Limitations

400GBASE-ZR transceivers are relatively new. The modules could be Arista-branded or 3rd party, from multiple vendors. For 3rd party optics, some optional properties (TX output power, support of 75 GHz grid) or DOM properties in the VDM pages may not be implemented.

#### 11.1.3.3 MXP Ports

MXP ports provide embedded optics that operate in one of three modes: 10GbE (12 ports), 40GbE (3 ports), and 100GbE (1 port). Each mode requires a specified cable and is implemented through configuration commands. MXP ports utilize multi-mode fiber to provide support over 150 meters.

- The 100GbE mode requires an MTP-24 to MTP-24 cable, which uses 20 of 24 fibers to carry 100GbE across 10 send and 10 receive channels. When connecting two 100GbE MXP ports, the TX lanes must be crossed with the RX lanes.
- The 40GbE mode requires an MTP cable that provides a split into three MTP-12 ends. The cable splits the MXP port into three MTP-12 ends, each compatible with standard-based 40GBASE-SR4 ports over OM3 or OM4 fiber up to a 100 m or 150 m distance.
- The 10GbE mode requires an MTP cable that provides a split into 12x10GbE links with LC connectors to adapt the MXP port into 12x10GbE ports. The cable splits the MXP port into twelve LC ends to connect to SR or SRL optics over multi-mode OM3/OM4 cables.

## 11.1.4 Interfaces

Arista switches provide two physical interface types that receive, process, and transmit Ethernet frames: Ethernet interfaces and Management interfaces.

Each Ethernet interface is assigned a 48-bit MAC address and communicates with other interfaces by exchanging data packets. Each packet contains the MAC address of its source and destination interface. Ethernet interfaces establish link level connections by exchanging packets. Interfaces do not typically accept packets with a destination address of a different interface.

Ethernet data packets are frames. A frame begins with preamble and start fields, followed by an Ethernet header that includes source and destination MAC addresses. The middle section contains payload data, including headers for other protocols carried in the frame. The frame ends with a 32-bit Cyclic Redundancy Check (CRC) field that interfaces use to detect data corrupted during transmission.

### 11.1.4.1 Ethernet Interfaces

Ethernet speed and duplex configuration options depend on the media type of the interface:

- 40GbE, OSFP, QSFP+, QSFP-DD, and QSFP200: Default operation is as four 10GbE ports. The `speed` command options support the configuration as a single 40GbE port.
- 1000BASE-T / 2.5GBASE-T / 5GBASE-T / 10GBASE-T (copper): The default configuration enables the **Clause 28 auto-negotiation** feature for the port to negotiate the speed based on the peer's capabilities. Depending on the individual SKU's capabilities, these ports support 10 Mbps, 100 Mbps, 1 Gbps, 2.5 Gbps, 5 Gbps, and 10 Gbps rates and half/full-duplex mode of operation. The `speed auto speed_value` command limits the port advertisements to a specific speed. The `speed speed_value` command disables the Clause 28 auto-negotiation and uses the specified speed as the forced speed setting.
- 10GBASE-T (SFP+): The port operates as a single 10GbE port. The `speed` command does not affect the configuration.
- 100GbE CFP2: It operates at 100 Gb/s speed. You cannot split the interface or change its speed.
- 100GbE MXP: Operates as three 40GbE ports on the 7050 platform. The available speed/duplex settings are: three 40GbE ports or twelve 10GbE ports. You can make adjustments with the `speed` command.
- 100GbE QSFP100: Available speeds are transceiver-dependent. The QSFP100 transceiver supports a single 100GbE port, four 25GbE ports, or two 50GbE ports; the QSFP+ transceiver supports one 40GbE port or four 10GbE ports; the CWDM transceiver supports all five configurations. You can make adjustments with the `speed` command.
- The **1000BASE-T SFP** transceivers advertise one speed at a time only. Hence, the desired speed must be configured explicitly using one of the following commands:
  - `speed auto`: auto-negotiates the 1 Gbps speed (this is because no speed is specified, defaulting to advertise 1 Gbps).
  - `speed auto 1Gfull / speed auto`: auto-negotiate the 1 Gbps speed (note that per the 1000BASE-T standard, 1 Gbps must be negotiated).
  - `speed auto 100full`: auto-negotiates the 100 Mbps speed.
  - `speed 100full`: forces the non-negotiated 100 Mbps speed.
- The **10GBASE-T SFP** transceivers advertise one speed at a time only, similarly to how 1000BASE-T SFPs operate, unlike native BASE-T ports. The `no speed` and `default speed` commands configure the PHY to advertise only 10 Gbps.

For information relating to transceivers, see [Transceivers](#).

---

#### 11.1.4.2 Subinterfaces

Subinterfaces divide a single Ethernet port or a port channel interface into multiple logical Layer 3 interfaces based on the 802.1Q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in a device at the boundary between L2 and L3 domains, but they can also be used to isolate 802.1Q-tagged traffic between L3 peers by assigning each subinterface to a different VRF.

While subinterfaces can be configured on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel
- An interface that is a member of a port channel should not have subinterfaces configured
- A subinterface cannot be made a member of a port channel

Subinterfaces on multiple ports can be assigned the same **VLAN ID**, but there is no bridging between subinterfaces (or between subinterfaces and SVIs) as each subinterface is associated with a separate bridge domain.

Subinterfaces support the following features:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- ACL
- VRF
- VRRP
- SNMP
- Subinterface counters (on some platforms)
- VXLAN (on some platforms)
- MPLS (on some platforms)
- GRE (on some platforms)
- PBR (on some platforms)
- QoS (on some platforms)
- Inheriting QoS settings (trust mode and default DSCP) from the parent interface
- Inheriting MTU setting from parent interface

The following capabilities instead are not supported:

- Per-subinterface MTU setting
- Per-subinterface SFLOW settings
- Per-subinterface mirroring settings

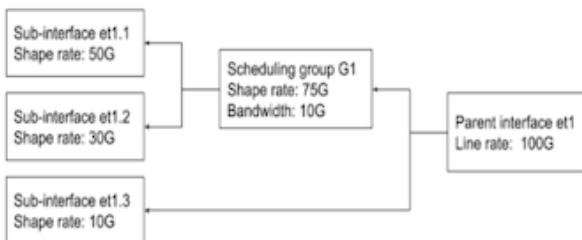

#### 11.1.4.2.1 Shared Shaper across Multiple Subinterfaces

Sub-interfaces can be grouped into logical units called scheduling groups, which are shaped as a single unit. Each scheduling group may be assigned a scheduling policy which defines a shape rate in kbps and optionally a guaranteed bandwidth, also in kbps.

The guaranteed bandwidth is used if the sum of the shape rates of all scheduling groups and sub-interfaces that are not part of groups for a parent interface exceeds the available bandwidth. Each sub-interface within that scheduling group may have its own independent shape rate which are applied in a hierarchical manner.

Adding a sub-interface to a scheduling group results in allocation of dedicated Virtual Output Queues (VOQ) for the sub-interface.

### 11.1.4.2.1.1 Configuring Shared Shaper

Scheduling groups and scheduling policies are configured in the **qos scheduling** CLI mode.

1. First, configure one or more sub-interfaces.
2. Then, create a scheduling policy with the desired shape rate and optional guaranteed bandwidth:

```

switch(config)# qos scheduling
switch(config-qos-scheduling)# scheduling policy P1
switch(config-qos-scheduling-policy-P1)# shape rate 75000000
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed 10000000

```

3. The shape rate and guaranteed bandwidth may also be defined as percents of the next highest level of the hierarchy (in this case line rate):

```

switch(config-qos-scheduling-policy-P1)# shape rate 75 percent
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed percent 10

```

4. Create the scheduling group on the parent interface:

```

switch(config)# qos scheduling
switch(config-qos-scheduling)# interface et1
switch(config-qos-scheduling-intf-Ethernet1)# scheduling group G1

```

5. Assign a policy to the scheduling group:

```

switch(config-qos-scheduling-intf-Ethernet1-group-G1)# policy P1

```

6. Assign members to the scheduling group (members may be put all on one line or on separate lines):

```

switch(config-qos-scheduling-intf-Ethernet1-group-G1)# members et1.1 et1.2

```

### 11.1.4.2.1.2 Show Commands

- QoS configuration on one or more scheduling groups. Both group name and parent interface name are optional, in which case all groups are displayed as shown in the example below:

#### Example

```

switch# show qos scheduling group G1 Ethernet1
Interface: Eti
Scheduling Group Name: G1
Bandwidth: 10.1 / 10.0 (Gbps)
Shape Rate: 75.2 / 75.0 (Gbps)

Member Bandwidth Shape Rate
 (units) (units)
----- ----- -----

```

```

Et1.1 - / - (-) 50.1 / 50.0 (Gbps)
Et1.2 - / - (-) 30.1 / 30.0 (Gbps)

```

- QOS configuration on a parent interface will show scheduling groups configured on the parent interface.

#### Example

```

switch# show qos interface Ethernet1
Ethernet1:

 Trust Mode: DSCP
 Default COS: 0
 Default DSCP: 0

 Port shaping rate: disabled

 Scheduling Group Bandwidth
 (units) Shape Rate
 (units)
 ----- -----
 G1 10.1 / 10.0 (Gbps) 75.1 / 75.0 (Gbps)

```

- The entire scheduling hierarchy for a subinterface can be displayed. This displays the shape rate for each transmit queue and then the shape rate and guaranteed bandwidth at every other level of the hierarchy.

#### Example

```

switch# show qos scheduling hierarchy Ethernet1.1
Interface Hierarchy Level Bandwidth
 (units) Shape Rate
 (units)
 ----- -----
 Et1/1.100 tx queue (0) - / -
 - / - 100 / 100 (Mbps)
 tx queue (2) - / - 200 / 200 (Mbps)
 subinterface (Et1/1.1) 100 / 100 (Mbps) 500 / 500 (Mbps)
 group (G1) 10 / 10 (Gbps) 75 / 75 (Gbps)
 parent (Et1/1) (100 Gbps) - / - - / - (-)

```

### 11.1.4.3 Agile Ports

Agile ports are a feature of the 7150S series that allows the user to configure blocks of 4 adjacent SFP+ interfaces as a single 40GbE link. The hardware configuration restricts the set of interfaces that can be combined to form a higher speed port: only interfaces that pass through a common PHY component can be combined.

One interface within a combinable set is designated as the primary port. When the primary interface is configured as a higher speed port, all configuration tasks are performed on that interface. All other interfaces in the set are subordinated to the primary interface and are not individually configurable when the primary interface is configured as the higher speed port. This feature allows the 7150S-24 to behave as a 4x40GbE switch (using 16 SFP+ modules) while the remaining SFP+ modules provide eight 10GbE ports. On the 7150S-52 this capability supports up to 13 40GbE ports (all 52 ports configured in groups of four, each running at 40 Gb/s speed) and on the 7150S-64 agile ports enable the switch to be deployed with up to 16 40GbE interfaces: four are native QSFP+ ports while the remaining 12 are configured as 4xSFP+ groups.

### 11.1.4.4 Management Interfaces

A management interface is a Layer 3 host port that is typically connected to a management station for performing out-of-band switch management tasks. Each switch has one or two management interfaces. Only one port needs to manage the switch; the second port, when available, provides redundancy.

Management interfaces are 10/100/1000 BASE-T interfaces. By default, auto-negotiation is enabled on management interfaces. All combinations of 10/100/1000 speeds and full or half duplex are enforceable on these interfaces through the **speed** command.

Management ports are enabled by default. The switch cannot route packets between management ports and network ports because they are in separate routing domains. When the management station is multiple hops from the management port, packet exchanges through Layer 3 devices between the management port and management station may require the enabling of routing protocols.

The Ethernet management ports can be accessed remotely over a common network or locally through a directly connected computer. An IP address and a static route to the default gateway must be configured to be able to access the switch through a remote connection.

#### 11.1.4.5 Tunable SFP Modules

Tuning of DWDM 10GbE SFP+ transceivers (10GBASE-DWDM) includes:

- Tuning the transceiver wavelength/frequency by channel number.
- Showing the wavelengths/frequencies for specified channels supported by the transceiver.
- Showing the current wavelength/frequency settings of the transceiver interface.

For information about tuning the transceiver wavelength/frequency by channel number, refer to the command **transceiver channel**. To show the current wavelength/frequency settings for specified channels, refer to the command **show interfaces transceiver channels**. To show the current wavelength/frequency settings of an interface, refer to the command **show interfaces transceiver hardware**.

#### 11.1.5 MRU Enforcement

Maximum Receive Unit (MRU) enforcement provides the ability to drop frames that exceed a configured threshold on the ingress interface.

##### 11.1.5.1 Configuring MRU Enforcement

MRU is configurable per-interface, and can be configured on Ethernet and Port-Channel interfaces. Frames with size greater than the configured MRU value drop on the ingress, and do not forward to the destined egress interface. MRU enforcement happens at the Ethernet interface and applies to both L2 and L3 traffic. Note that FCS (frame check sequence) is included in the frame size.

###### Ethernet Interface

```
switch(config)# interface ethernet 1
switch(config)# 12 mru 9000
```

Frames with size greater than **9000** bytes ingressing into **Ethernet1** are dropped.

###### Port-Channel Interface

Members of a Port-Channel interface inherit the Port-Channel interface's MRU value. Members' MRU configured in the **Ethernet interface configuration mode** has no effects.

```
switch(config)# interface ethernet 1 - 4
switch(config-if-Et1-4)# channel-group 10 mode active
switch(config)# interface port-Channel 10
switch(config-if-Po10) #
```

Frames with size greater than **9000** bytes ingressing into **Ethernet1, 2, 3, and 4** are dropped.

## Sub-interfaces

MRU configured on an Ethernet interface or Port-Channel are applied to all of its sub-interfaces.

## Default Behaviours

By default, MRU is set to the maximum value.

- For DCS-7280R3 and DCS-7500R3 series.
  - The maximum MRU is **10240** bytes.
- For other supported platforms
  - In TapAgg mode, the maximum MRU is **10240** bytes.
  - In non TapAgg mode, the maximum MRU is **10200** bytes.

### 11.1.5.2 MRU Enforcement Show Commands

The **show interface** output displays the MRU on an interface.

```
switch(config)# show interface ethernet 1
Ethernet1 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 444c.a8b7.1ed8 (bia 444c.a8b7.1ed8)
 Member of Port-Channel10
 Ethernet MTU 10178 bytes, Ethernet MRU 1500 bytes, BW 10000000 kbit
 Full-duplex, 10Gb/s, auto negotiation: off, uni-link: disabled.
```

## Counters

MRU-dropped packets are counted per-chip.

The **show platform fap mapping** output displays the mapping between the chips and their corresponding Ethernet interfaces.

```
switch(config)# show platform fap mapping interface Ethernet 1
Jericho0 (FapId: 0 BaseSystemCoreId: 0)
Port SysPhyPort Voq Core FapPort OtmPort BaseQPair QPairs Xlge NifPort

Ethernet1 100 2608 0 2 0 0 8 8 33
```

The **show hardware counter drop** output displays the per-chip *Reassembly Errors* counters.

```
switch(config)# show hardware counter drop
Type Chip CounterName : Count : First Occurrence : Last Occurrence

A Jericho0 ReassemblyErrors : 12132989 : 2020-09-22 17:05:45 : 2020-09-22 17:22:40
```

### 11.1.6 Displaying Interface Interactions

The **show interfaces interactions** command provides a resource that explains various relationships between Ethernet interfaces. It describes interactions in which a configuration on an interface causes another set of interfaces to become inactive or have reduced capabilities. Examples include a primary interface consuming subordinate interfaces to service four-lane speed or platform restrictions that require four interfaces to operate at the same speed.

## No Interactions

If no interaction information exists for the given interfaces, the output displays **No interfaces interactions**. Depending on what configurations have interactions, the line could appear at a number of different indentation levels. The display rules are as follows:

1. If all specified interfaces have no interactions, print at the first indentation level.
2. If only some specified interfaces have no interactions and those interfaces have no interactions at any speeds, print at the second indentation level for those interfaces.
3. If only some specified interfaces have no interactions and those interfaces only have interactions at some speeds, print at the third indentation level for those speeds.

```
switch# show int et1,2 interactions
No interfaces interactions

switch# show int et1,2,5/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1
 No interactions with other interfaces
Ethernet2
 No interactions with other interfaces
Ethernet5/1
 For speed 40G
 Ethernet5/2-4 become inactive
 For speed 10G*
 No interactions with other interfaces
```

## Inactive Interfaces

If a configuration on an interface causes other interfaces to become inactive, a message similar to the ones bolded below is displayed. A common example of this is configuring a QSFP28 port for 100GbE speed, which results in the **/2**, **/3**, and **/4** interfaces becoming inactive. Note that display information for inactive interfaces is included in the specified range, ignoring whether or not inactive interfaces are exposed.

```
switch# show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
 For speed 100G-4
Ethernet11/2-4 become inactive
 For speed 50G-2
Ethernet11/2,11/4 become inactive
 Ethernet11/3 is limited to 50G-2
 For speed 40G
Ethernet11/2-4 become inactive
 For speed 25G
 Ethernet11/2-4 are limited to 25G
 For speed 10G*
 Ethernet11/2-4 are limited to 10G*
Ethernet11/3:
 For speed 50G-2
Ethernet11/4 becomes inactive
 Primary interface Ethernet11/1 must be operating at 50G-2
 For speed 25G
 Primary interface Ethernet11/1 must be operating at 25G
 For speed 10G*
 Primary interface Ethernet11/1 must be operating at 10G*
```

## Required Primary Interface Configuration

Some interface configurations require a particular primary interface configuration to function. These interactions are captured with messages similar to the ones bolded below.

```
switch#show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
```

```

For speed 100G-4
 Ethernet1/2-4 become inactive
For speed 50G-2
 Ethernet1/2,11/4 become inactive
 Ethernet1/3 is limited to 50G-2
For speed 40G
 Ethernet1/2-4 become inactive
For speed 25G
 Ethernet1/2-4 are limited to 25G
For speed 10G*
 Ethernet1/2-4 are limited to 10G*
 Ethernet1/3:
For speed 50G-2
 Ethernet1/4 becomes inactive
Primary interface Ethernet1/1 must be operating at 50G-2
For speed 25G
Primary interface Ethernet1/1 must be operating at 25G
For speed 10G*
Primary interface Ethernet1/1 must be operating at 10G*

```

## Hardware Speed-Group Requirements

Some interface configurations require an additional speed-group configuration to operate correctly. If speed-group configurations are required, a message is displayed similar to the ones bolded below.

**Note:** A single speed-group may include more than one compatibility setting. Using the example below as reference, **Ethernet1/1 at 100G-4** speed and **Ethernet2/1 at 40G** speed are compatible configurations as long as hardware speed-group 1 can include **50g** and **10g** rates simultaneously.

```

switch# show interfaces et1/1,2/1 interactions* = includes less than 10G speeds that the interface
is capable of

Ethernet1/1:
For speed 100G-4
 Ethernet1/2-4 become inactive
Hardware speed-group 1 must include 50g
For speed 40G
 Ethernet1/2-4 become inactive
Hardware speed-group 1 must include 10g
For speed 25G
 Ethernet2/1,2/3 become inactive
 Ethernet1/3 is limited to 25G/10G
Hardware speed-group 1 must include 25g
For speed 10G
 Ethernet2/1,2/3 become inactive
 Ethernet1/3 is limited to 25G/10G
Hardware speed-group 1 must include 10g
 Ethernet2/1:
For speed 100G-4
 Ethernet2/3 becomes inactive
 Ethernet1/1 must be operating at 100G-4/50G-2/40G
Hardware speed-group 1 must include 50g
For speed 40G
 Ethernet2/3 becomes inactive
 Ethernet1/1 must be operating at 100G-4/50G-2/40G
Hardware speed-group 1 must include 10g

```

## Compatible Parent Interface Configuration

The parent interface may be configured to any one of the compatible rates on the list. Additionally, more than one interface may be required to be configured at a compatible rate. These interactions are captured with messages similar to the ones bolded below

**Note:** Using the example below as a reference, suppose that **Ethernet1/1** is configured to **100G-4** and that the goal is to configure **Ethernet1/8** to **50G-1**. According to the display, **Ethernet1/1** is configured to a compatible rate. In order for **Ethernet1/1** to operate at the **100G-4** speed, **hardware speed-group 1** must be configured to include the **25g** compatibility setting. Additionally, hardware

speed-group 1 must also include the 50g compatibility setting to enable **Ethernet1/8** to operate at **50G-1**. Interactions on **Ethernet1/5** and **Ethernet1/7** must be considered as well.

```
switch# show interfaces et1/1,1/8 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1/1:
 Ethernet1/1-4/8 share 18 interface hardware resources
 For speed 400G-8
 Ethernet1/2-8 become inactive
 Hardware speed-group 1 must include 50g
 For speed 200G-4
 Ethernet1/2-4 become inactive
 Hardware speed-group 1 must include 50g
 For speed 100G-2
 Ethernet1/2 becomes inactive
 Hardware speed-group 1 must include 50g
 For speed 100G-4
 Ethernet1/2-4 become inactive
 Hardware speed-group 1 must include 25g
 For speed 50G-1
 Hardware speed-group 1 must include 50g
 For speed 50G-2
 Ethernet1/2 becomes inactive
 Hardware speed-group 1 must include 25g
 For speed 40G
 Ethernet1/2-4 become inactive
 Hardware speed-group 1 must include 10g
 For speed 25G
 Hardware speed-group 1 must include 25g
 For speed 10G
 Hardware speed-group 1 must include 10g
Ethernet1/8:
 For speed 50G-1
 Ethernet1/1 must be operating at 200G-4/100G-2/100G-4/50G-1/50G-2/40G/25G/10G
 Ethernet1/5 must be operating at 100G-2/50G-1/50G-2/25G/10G
 Ethernet1/7 must be operating at 50G-1/25G/10G
 Hardware speed-group 1 must include 50g
```

## Speed-limited Interfaces

Some interface configurations limit the speed at which other interfaces can operate. If such limitations occur, a message is displayed similar to the ones bolded below.

```
switch# show interfaces et11/1,11/3 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet11/1:
 For speed 100G-4
 Ethernet11/2-4 become inactive
 For speed 50G-2
 Ethernet11/2,11/4 become inactive
 Ethernet11/3 is limited to 50G-2
 For speed 40G
 Ethernet11/2-4 become inactive
 For speed 25G
 Ethernet11/2-4 are limited to 25G
 For speed 10G*
 Ethernet11/2-4 are limited to 10G*
Ethernet11/3:
 For speed 50G-2
 Ethernet11/4 becomes inactive
 Primary interface Ethernet11/1 must be operating at 50G-2
 For speed 25G
 Primary interface Ethernet11/1 must be operating at 25G
 For speed 10G*
 Primary interface Ethernet11/1 must be operating at 10G*
```

## Interfaces Sharing Logical Ports

Some interface ranges share logical port resources. If an interface shares logical ports with other interfaces, a message displays similar to the ones bolded below.

**Note:** There must be logical ports available for an interface to become operational. Not all interfaces sharing logical ports can be operational simultaneously. Inactive interfaces do not consume a resource.

```
switch# show interfaces et1/1,4/1 interactions
* = includes less than 10G speeds that the interface is capable of

Ethernet1/1:
Ethernet1/1-4/8 share 18 interface hardware resources
 For speed 400G-8
 ...
Ethernet4/1:
Ethernet1/1-4/8 share 18 interface hardware resources
 For speed 400G-8
 ...
```

## 11.1.7 Dynamic Link Flap Damping

### Overview

Dynamic Link Flap Damping detects interfaces with excessive numbers of update messages (flapping) on the network and triggers a damping mechanism temporarily holding the interface's link in a **down** state. This mechanism smooths out link flapping occurrences and reduces network churn.

The EOS Link Flap Damping algorithm uses the BGP Route Flap Damping algorithm described in IETF RFC 2439 as the basis for this feature. The algorithm maintains a demerit metric to represent the quality of the link. A higher metric indicates a poor quality of the link. When the link status transitions from an **up** to a **down** status, the demerit value of the link increases proportionally by a configured parameter. After the link demerit metric reaches the configured threshold, the link status changes to **damped**, and the status changes to **down**. Over time, the demerit metric exponentially decreases, and after the value reaches the configured reuse threshold, the link status changes to **up**, and the link becomes available on the network.

### Link Flap Damping Algorithm Parameters

- **Remote Fault Penalty** - The value added to the link demerit metric when the interface reports a remote fault.
- **Local Fault Penalty** - The value added to the link demerit metric when the interface reports a local fault.
- **Suppress Threshold** - The link demerit value for link damping.
- **Reuse Threshold** - The link demerit value for a damped interface to recover and become available on the network.
- **Tracking Threshold** - The link demerit value to stop the tracking of the interface for link damping. The value uses half of the reuse threshold value.
- **Maximum Threshold** - The maximum possible value configured for the demerit metric.
- **Demerit Half Life Time** - The time required for the demerit metric to degrade to half of the current value with no interface flaps. A lower half-life time translates to a faster recovery from the **damped** state.

## 11.1.8 Ethernet Configuration Procedures

These sections describe Ethernet and Management interface configuration procedures:

- [Physical Interface Configuration Modes](#)
- [Assigning a MAC Address to an Interface](#)

- Port Groups (QSFP+ and SFP+ Interface Selection)
- Referencing Modular Ports
- Referencing Multi-lane Ports
- Hitless Speed Change with Dynamic Logical Ports
- QSFP+ Ethernet Port Configuration
- QSFP100 Ethernet Port Configuration
- CFP2 Ethernet Port Configuration
- Default QSFP Mode Support
- MXP Ethernet Port Configuration
- Port Speed Capabilities
- Agile Ports
- Subinterface Configuration
- Maximum Latency Tail-drop Thresholds
- Autonegotiated Settings
- Displaying Ethernet Port Properties
- Ingress Counters
- Configuring Ingress Traffic-Class Counters
- Ingress and Egress Per Port for IPv4 and IPv6 Counters Overview
- Hardware Counter Support

#### 11.1.8.1 Physical Interface Configuration Modes

The switch provides two configuration modes for modifying Ethernet parameters:

- **Interface-Ethernet** mode configures parameters for specified Ethernet interfaces.
- **Interface-Management** mode configures parameters for specified management Ethernet interfaces.

Physical interfaces cannot be created or removed.

Multiple interfaces can be configured simultaneously. Commands are available for configuring Ethernet-specific, Layer 2, Layer 3, and application layer parameters. Commands that modify protocol-specific settings in Ethernet configuration mode are listed in the protocol chapters.

- The `interface ethernet` command places the switch in **Ethernet-interface** configuration mode.
- The `interface management` command places the switch in **management-interface** configuration mode.

#### Examples

- This command places the switch in **Ethernet-interface** mode for **interface ethernet 5-7** and **10**.

```
switch(config)# interface ethernet 5-7,10
switch(config-if-Et5-7,10) #
```

- This command places the switch in **management-interface** mode for **management interface 1**.

```
switch(config)# interface management 1
switch(config-if-Ma1) #
```

### 11.1.8.2 Assigning a MAC Address to an Interface

Ethernet and management interfaces are assigned a MAC address when manufactured. This address is the burn-in address.

The **mac-address** command assigns a MAC address to an interface in place of the burn-in address. The **no mac-address** command reverts an interface's current MAC address to its burn-in address.

#### Examples

- This command assigns the MAC address of **001c.2804.17e1** to **Ethernet interface 7**.

```
switch(config-if-Et7) # mac-address 001c.2804.17e1
```

- This command displays the MAC address of **interface ethernet 7**. The active MAC address is **001c.2804.17e1**. The burn-in address is **001c.7312.02e2**.

```
switch(config-if-Et7) # show interface ethernet 7
Ethernet7 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
 Description: b.e45
switch(config-if-Et7) #
```

### 11.1.8.3 Port Groups (QSFP+ and SFP+ Interface Selection)

Several of Arista's fixed switches limit the number of 10 Gb/s data lanes in operation through the use of port groups. A port group is a set of interfaces that can be configured as four SFP+ interfaces or a single QSFP+ interface. When configured in SFP+ mode, the port group enables four standalone 10GbE interfaces using SFP+ optics. When configured in QSFP+ mode, the port group enables a single QSFP+ interface (in addition to the dedicated QSFP+ ports), which can operate as a single 40GbE port or as four 10GbE ports with the appropriate breakout cabling.

Hardware port groups are used on the following systems:

- DCS-7050Q-16
- DCS-7050QX-32S

Use the **hardware port-group** command to select the interface mode for the specified port group.

**Note:** The **hardware port-group** command restarts the forwarding agent, which disrupts traffic on all switch ports.

#### Example

These commands configure the DCS-7050-Q16 switch to enable four SFP+ interfaces and one extra QSFP+ interface by enabling the SFP+ interfaces in **port-group 1** and the QSFP+ interface in **port-group 2**.

```
switch(config)# hardware port-group 1 select Et17-20
switch(config)# hardware port-group 2 select Et16/1-4
```

The **show hardware port-group** command displays the status of ports in the port groups.

### Example

This command displays the status of the flexible ports within the two port groups on a DCS-7050Q-16 switch.

```
switch# show hardware port-group

Portgroup: 1 Active Ports: Et17-20
Port State

Ethernet17 Active
Ethernet18 Active
Ethernet19 Active
Ethernet20 Active
Ethernet15/1 ErrDisabled
Ethernet15/2 ErrDisabled
Ethernet15/3 ErrDisabled
Ethernet15/4 ErrDisabled

Portgroup: 2 Active Ports: Et16/1-4
Port State

Ethernet16/1Active
Ethernet16/2Active
Ethernet16/3Active
Ethernet16/4Active
Ethernet21ErrDisabled
Ethernet22ErrDisabled
Ethernet23ErrDisabled
Ethernet24ErrDisabled
```

#### 11.1.8.3.1 DCS-7280CR3-36S

The DCS-7280CR3-36S has 28 dedicated 100Gb/s QSFP ports, plus two port groups. The port groups support either two additional QSFP-DD (400Gb/s) ports or four QSFP56 (200Gb/s) ports as shown in [Table 61: DCS-7280CR3-36S Port Groups](#).

**Table 61: DCS-7280CR3-36S Port Groups**

| <b>Port Group 1</b><br><b>Active Interface(s)</b> |                                         | <b>Port Group 2</b><br><b>Active Interface(s)</b> |                                         |
|---------------------------------------------------|-----------------------------------------|---------------------------------------------------|-----------------------------------------|
| In QSFP-DD Mode                                   | In QSFP56 Mode (Default)                | In QSFP-DD Mode                                   | In QSFP56 Mode (Default)                |
| Et33/1-8<br>(one QSFP-DD port)                    | Et33/1-4,Et34/1-4<br>(two QSFP56 ports) | Et35/1-8<br>(one QSFP-DD port)                    | Et35/1-4,Et36/1-4<br>(two QSFP56 ports) |

#### 11.1.8.3.2 DCS-7050Q-16

The DCS-7050Q-16 has 14 dedicated QSFP+ ports plus two port groups. The port groups support either two additional QSFP+ ports or eight SFP+ ports, as shown in [DCS-7050Q-16 Port Groups](#).

---

**Table 62: DCS-7050Q-16 Port Groups**

| Port Group 1<br>Active Interface(s) |                              | Port Group 2<br>Active Interface(s) |                              |
|-------------------------------------|------------------------------|-------------------------------------|------------------------------|
| In SFP+ Mode                        | In QSFP+ Mode (Default)      | In SFP+ Mode                        | In QSFP+ Mode (Default)      |
| Et17-20<br>(four SFP+ ports)        | Et15/1-4<br>(one QSFP+ port) | Et21-24<br>(four SFP+ ports)        | Et16/1-4<br>(one QSFP+ port) |

#### 11.1.8.3.3 DCS-7050QX-32S

The DCS-7050QX-32S has 31 dedicated QSFP+ ports plus one port group. The port group supports either one additional QSFP+ port or four SFP+ ports, as shown in [DCS-7050QX-32S Port Groups](#).

**Table 63: DCS-7050QX-32S Port Groups**

| Port Group 1<br>Active Interface(s) |                             |
|-------------------------------------|-----------------------------|
| In SFP+ Mode                        | In QSFP+ Mode (Default)     |
| Et1-4<br>(four SFP+ ports)          | Et5/1-4<br>(one QSFP+ port) |

#### 11.1.8.4 Referencing Modular Ports

Arista modular switches provide port access through installed line cards. A modular switch's maximum number of line cards varies with the switch series and model.

Several CLI commands modify modular parameters for all ports on a specified line card or controlled by a specified chip. This manual uses these conventions to reference modular components:

- **card\_x** refers to a line card.
- **module\_y** refers to a QSFP+ module.
- **port\_z** refers to a line card or module port.

Commands that display Ethernet port status use the following conventions:

- **SFP ports:** **card\_x/port\_z** to label the line card/port location of modular ports.
- **QSFP ports:** **card\_x/module\_y/port\_z** to label the line card/port location of modular ports.

The [QSFP+ Ethernet Port Configuration](#) section describes QSFP+ module usage.

#### Example

This command displays the status of interfaces **1** to **9** on **line card 4**:

```
switch# show interface ethernet 4/1-9 status
Port Name Status Vlan Duplex Speed Type
Et4/1 connected 1 full 10G Not Present
Et4/2 connected 1 full 10G Not Present
Et4/3 connected 1 full 10G Not Present
Et4/4 connected 1 full 10G Not Present
```

|       |           |   |      |     |             |         |
|-------|-----------|---|------|-----|-------------|---------|
| Et4/5 | connected | 1 | full | 10G | Not Present |         |
| Et4/6 | connected | 1 | full | 10G | Not Present |         |
| Et4/7 | connected | 1 | full | 10G | Not Present |         |
| Et4/8 | connected | 1 | full | 10G | Not Present |         |
| Et4/9 | connected | 1 | full | 10G | Not Present | switch> |

### 11.1.8.5 Referencing Multi-lane Ports

EOS supports two types of Ethernet ports:

- single-lane (also called fixed-lane).
- multi-lane (also called flexible-lane).

Single-lane (or fixed-lane) ports are always modeled as a single interface within EOS. While the speed of the interface may be configurable, the physical port can never be broken out into multiple lower-speed interfaces. Single-lane ports use the following naming scheme:

- Ethernet <port #> (for fixed switches).
- Ethernet <module #>/<port #> (for modular switches).

Multi-lane (or flexible lane) ports comprise multiple parallel lanes, each served by its own laser. Multi-lane ports can be configured to combine the lanes and operate as a single native high-speed interface (a 40GbE or 100GbE interface) or to operate each lower-speed interface independently (four 10GbE or 25GbE interfaces). Multi-lane ports use the following naming scheme:

- Ethernet **port #/lane #** (for fixed switches).
- Ethernet **module #/port #/lane #** (for modular switches).

The operational state displayed for each lane of a multi-lane port is determined by the configuration applied to the primary lane(s), as shown in the [Lane States](#) table. When broken out into multiple lower-speed interfaces, all lanes are active in parallel, and each will display its operational state as **connected** or **not connected**. In high-speed mode, only the primary lane(s) are displayed as active, with the remaining lanes showing as **errdisabled**. The exception is the CFP2 module: when it is configured as a single 100GbE port, the primary lane is displayed as active in the CLI while the other lanes are hidden.

**Table 64: Lane States**

| Parent Port<br>Configured Mode | Primary Lane(s)                     | Secondary Lanes                     |
|--------------------------------|-------------------------------------|-------------------------------------|
| single high-speed interface    | active<br>(connected/not connected) | inactive<br>(errdisabled)           |
| multi-interface breakout       | active<br>(connected/not connected) | active<br>(connected/not connected) |

A multi-lane port is configured as a single high-speed interface or multiple breakout interfaces by using the [speed](#) command on the port's primary lane(s). For specific configuration instructions and details regarding the primary lane(s) of a specific interface, refer to the configuration section of the appropriate interface type:

- [QSFP+ Ethernet Port Configuration](#)
- [QSFP100 Ethernet Port Configuration](#)
- [CFP2 Ethernet Port Configuration](#)
- [MXP Ethernet Port Configuration](#)

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

### 11.1.8.6 Hitless Speed Change with Dynamic Logical Ports

Higher speed ports on several switches can be broken out into multiple interfaces that can be configured at lower speeds. Each of these interfaces is called a Logical Port (LP). Switches such as the DCS-7260CX3-64 allocate and deallocate the logical ports dynamically to optimize hardware resources. Care must be taken for hitless speed changes, as a speed change on a Dynamic Logical Port (DLP) may impact the status of one or more related DLP(s).

#### Checking the Status of DLPs

The following example applies to a switch that supports a breakout of a 100GbE physical port into 4 25GbE DLPs.

The following command displays the status of *Et45/1-4* when a 100GbE physical port is broken out into 4 25GbE DLPs.

```
switch(config)# show interfaces ethernet 45/1-4 status
Port Name Status Vlan Duplex Speed Type Flags
Et45/1 notconnect 1 full 25G Not Present
Et45/2 notconnect 1 full 25G Not Present
Et45/3 notconnect 1 full 25G Not Present
Et45/4 notconnect 1 full 25G Not Present
```

The following example displays the inactive interfaces (DLPs) when the 100GbE physical port is configured to the 100G speed.

```
switch(config)# show interfaces ethernet 45/1-4 status
Port Name Status Vlan Duplex Speed Type Flags
Et45/1 notconnect 1 full 100G Not Present
Et45/2 inactive 1 unconf unconf Not Present
Et45/3 inactive 1 unconf unconf Not Present
Et45/4 inactive 1 unconf unconf Not Present
```

By default, this command does not display inactive interfaces. To enable (or disable) showing them, use the following command.

```
switch(config)# [no] service interface inactive expose
```

Only systems without DLP allocation have enough logical ports for every interface to be active simultaneously.

The following example displays the logical port pool information and current logical port allocation status for a fully loaded switch.

```
switch> show hardware logical-port pool status
Pool Max Free Configured Interfaces

 1 18 2 16 Et2/5/1-2/8/4,3/5/1-3/8/4,4/5/1-4/8/4,5/9/1-5/12/4
 2 18 2 16 Et2/1/1-2/4/4,3/9/1-3/12/4,4/1/1-4/4/4,5/5/1-5/8/4
 3 18 2 16 Et2/9/1-2/12/4,3/1/1-3/4/4,4/9/1-4/12/4,5/1/1-5/4/4
 4 18 2 16 Et2/13/1-2/16/4,3/13/1-3/16/4,4/13/1-4/16/4,5/13/1-5/16/4
 5 18 2 16 Et6/13/1-6/16/4,7/13/1-7/16/4,8/13/1-8/16/4,9/13/1-9/16/4
 6 18 2 16 Et6/1/1-6/4/4,7/9/1-7/12/4,8/1/1-8/4/4,9/9/1-9/12/4
 7 18 2 16 Et6/5/1-6/8/4,7/1/1-7/4/4,8/9/1-8/12/4,9/1/1-9/4/4
```

```
8 18 2 16 Et6/9/1-6/12/4,7/5/1-7/8/4,8/5/1-8/8/4,9/5/1-9/8/4
```

The following example displays the logical port pool information and current logical port allocation status for a switch with only line cards **3**, **4**, **5**, and **7** inserted.

```
switch> show hardware logical-port pool status
Pool Max Free Configured Interfaces

1 18 8 10 Et3/5/1-3/8/4,4/2/1-8,5/3/1-8
2 18 12 6 Et3/9/1-3/12/4,4/1/1-8,5/2/1-8
3 18 8 10 Et3/1/1-3/4/4,4/3/1-8,5/1/1-8
4 18 7 11 Et3/13/1-3/16/4,4/4/1-8,5/4/1-8
5 18 16 2 Et7/13/1-7/16/4
6 18 14 4 Et7/9/1-7/12/4
7 18 14 4 Et7/1/1-7/4/4
8 18 12 6 Et7/5/1-7/8/4
```

### 11.1.8.7 QSFP+ Ethernet Port Configuration

Each QSFP+ module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This arrangement allows a QSFP+ Ethernet port to be configured as a single 40GbE interface or four 10GbE interfaces.

When the four lanes are combined to form a 40GbE interface, show commands display lane **/1** as **connected** or **not connected** and display lanes **/2** through **/4** as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

#### 11.1.8.7.1 Configuring a QSFP+ Module as a Single 40GbE Interface

To configure a port as a single 40GbE interface, combine the module's four data lanes using the **speed** command (**speed forced 40g full**) on the port's **/1** lane (the primary lane).

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane **/1** of the QSFP+ Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 40gfull
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
 <-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 40G 40GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 40GBASE-SR4
 <-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 11.1.8.7.2 Configuring a QSFP+ Module as Four 10GbE Interfaces

To configure a port as four 10GbE interfaces, use the **speed** command (**speed 10000full**) on the port's /1 lane (the primary lane).

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP+ Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 10000full
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
PortNameStatusVlanDuplexSpeedTypeFlags
Et1connected2full11G10GBASE-T
Et5/1/1connected1full110G40GBASE-SR4
Et5/1/2connected1full110G40GBASE-SR4
Et5/1/3connected1full110G40GBASE-SR4
Et5/1/4connected1full110G40GBASE-SR4
```

### 11.1.8.8 QSFP100 Ethernet Port Configuration

Each QSFP100 module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This arrangement allows a QSFP100 Ethernet port to be configured as a single 100GbE interface, a single 40GbE interface, or four 10GbE interfaces. The default mode is a single 100GbE interface.

The 7060X, 7260X, and 7320X platforms also allow a QSFP100 port to be configured as two 50GbE interfaces or four 25GbE interfaces.

When the lanes are combined to form a higher-speed interface, show commands display the primary lane(s) as **connected** or **not connected** and the other lanes as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

#### 11.1.8.8.1 Configuring a QSFP100 Module as a Single 100GbE Interface

By default, a QSFP100 module operates as a single 100GbE interface. Applying the **default speed** or **no speed** command on the primary lane restores the default behavior.

To explicitly configure the port as a single 100GbE interface, combine the module's four data lanes using the **speed** command (**speed 100gfull**) on the port's /1 lane (the primary lane).

 **Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter the interface Ethernet configuration mode for lane **/1** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 100gfull
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 100G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 11.1.8.2 Configuring a QSFP100 Module as Two 50GbE Interfaces

To configure a port as two 50GbE interfaces, configure the module's four data lanes using the **speed** command (**speed 50gfull**) on the port's **/1** and **/3** lanes. This configuration is available on the 7060X, 7260X, and 7320X platforms.

 **Note:**

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, s7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter the interface Ethernet configuration mode for lane **/1** of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 50gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 50gfull
```

3. Repeat the above steps for lane **/3**.

```
switch(config-if-Et5/1/1)# interface ethernet 5/1/3
switch(config-if-Et5/1/3)# speed 50gfull
```

- 
4. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 50G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 connected 1 full 50G 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 11.1.8.3 Configuring a QSFP100 Module as a Single 40GbE Interface

To configure a port as a single 40GbE interface, combine the module's four data lanes by using the **speed** command (**speed 40gfull**) on the ports /1 lane (the primary lane).

**Note:**

 Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 40gfull
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 40G 100GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 100GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 11.1.8.4 Configuring a QSFP100 Module as Four 10GbE Interfaces

To configure a port as four 10GbE interfaces, use the **speed** command (**speed 10000full**) on the port's /1 lane (the primary lane).

 **Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter the interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1)# speed 10000full
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 10G 100GBASE-SR4
Et5/1/2 connected 1 full 10G 100GBASE-SR4
Et5/1/3 connected 1 full 10G 100GBASE-SR4
Et5/1/4 connected 1 full 10G 100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 11.1.8.9 CFP2 Ethernet Port Configuration

Each CFP2 module contains ten data lanes. The configuration options available on the port depend on the optic inserted:

- CFP2-100G-LR4 optics operate only in 100GbE mode.
- CF2-100G-ER4 optics operate only 100GbE mode.
- CFP2-100G-XSR10 optics can be configured as a single 100GbE interface or as ten 10GbE interfaces.

When the port is configured as ten 10GbE interfaces, each lane is active and visible in the CLI show commands. When the lanes are combined to form a single 100GbE interface, show commands display the primary lane as **connected** or **not connected** and all other lanes are hidden.

The following sections describe the configuration of CFP2 ports.

#### 11.1.8.9.1 Configuring a CFP2 Module as a Single 100GbE Interface

To configure a port as a single 100GbE interface (the default configuration), combine the module's ten data lanes by using the **speed** command (**speed 100gfull**) on the port's /1 lane (the primary lane).

This configuration is available for all pluggable optics.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter the interface Ethernet configuration mode for **lane /1** of the **CFP2** Ethernet interface.

```
switch(config)# interface ethernet 5/1/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1) # speed 100gfull
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1) # show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 100G 100GBASE-SR1
Et5/2/1 connected 1 full 100G 100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 11.1.8.9.2 Configuring a CFP2 Module as Ten 10GbE Interfaces

To configure a port as four 10GbE interfaces, use the **speed** command (**speed 10000full**) on the port's /1 lane (the primary lane).

This configuration is available only for CFP2-100G-XSR10 optics.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter the interface Ethernet configuration mode for lane /1 of the CFP2 Ethernet interface.

```
switch(config) # interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/1/1) # speed 10000full
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/1/1) # show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 10G 100GBASE-SR1
Et5/1/2 connected 1 full 10G 100GBASE-SR1
Et5/1/3 connected 1 full 10G 100GBASE-SR1
Et5/1/4 connected 1 full 10G 100GBASE-SR1
Et5/1/5 connected 1 full 10G 100GBASE-SR1
Et5/1/6 connected 1 full 10G 100GBASE-SR1
Et5/1/7 connected 1 full 10G 100GBASE-SR1
Et5/1/8 connected 1 full 10G 100GBASE-SR1
Et5/1/9 connected 1 full 10G 100GBASE-SR1
Et5/1/10 connected 1 full 10G 100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 11.1.8.10 Default QSFP Mode Support

A QSFP+ transceiver supports 40GbE and 4x10GbE. This feature supports changing the default QSFP mode between 40GbE and 4x10GbE on all ports with QSFP+ transceivers.

### 11.1.8.10.1 Configuration

On all front panel ports that support this feature, the following global configuration command changes their default QSFP mode from 40GbE to 4x10GbE.

```
transceiver qsfp default-mode 4x10G
```

The **no** or **default** version of the command reverts the default QSFP mode to 40GbE.

**Note:** This configuration command is not honored on ports that do not support this feature (such as QSFP100 ports with external PHY, always choose 40GbE as the default QSFP mode).

### 11.1.8.10.2 Show Commands

There is no explicit show command to display the default QSFP mode. Use the **show running-config** command to determine whether the default QSFP mode is 4x10GbE or 40GbE. Use the **show interfaces hardware** command to check the default QSFP mode on the given ports.

- When the default QSFP mode is configured as 4x10GbE, the output of **show running-config** contains **transceiver qsfp default-mode 4x10G**. In the output of the **show interfaces hardware** command, **10G** is shown as the default speed.

```
switch(config)# transceiver qsfp default-mode 4x10G
switch(config)# show running-config | grep 4x10G
transceiver qsfp default-mode 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
* = Requires speed group setting change
Ethernet35/1
 Model: DCS-7280CR3-32P4
 Type: 40GBASE-CR4
 Speed/Duplex: 10G/full (default),40G/full,auto
 Flowcontrol: rx-(off,on,desired),tx-(off)
```

- When the QSFP mode configuration is reverted to its default state with the **no transceiver qsfp default-mode** command, the output of the **show running-config** command does not contain **transceiver qsfp default-mode 4x10G**. In addition, the output of the **show interfaces hardware** command shows **40G** as the default speed.

```
switch(config)# no transceiver qsfp default-mode
switch(config)# show running-config | grep 4x10G
switch(config)# show interfaces ethernet 35/1 hardware
* = Requires speed group setting change
Ethernet35/1
 Model: DCS-7280CR3-32P4
 Type: 40GBASE-CR4
 Speed/Duplex: 10G/full,40G/full (default),auto
 Flowcontrol: rx-(off,on,desired),tx-(off)
```

### 11.1.8.10.3 Limitations

There is support for the **no transceiver qsfp default-mode 4x10G** command on the DCS-7300X series, but the default QSFP mode remains 4x10GbE.

### 11.1.8.11 MXP Ethernet Port Configuration

Each MXP module contains twelve data lanes which can be used individually or combined to form one or more higher-speed interfaces. This arrangement allows an MXP Ethernet port to be configured as a single 100GbE interface, as up to twelve 10GbE interfaces, or as a mixture of 40GbE and 10GbE ports.

MXP ports do not use pluggable optics. Instead, an MTP-24 cable is inserted directly into the port. The remote end of the MTP-24 cable must then be broken out using a splitter cable or a cartridge based on the operational mode and speed of the MXP port.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands show the primary lane of that group as **connected or not connected** and the other three lanes as **errdisabled**.

The following sections describe the configuration of MXP interfaces.

#### 11.1.8.11.1 Configuring an MXP Module as a Single 100GbE Interface

To configure a port as a single 100GbE interface (the default configuration), enter the **speed** command (**speed 100gfull**) on the port's **/1** lane (the primary lane). This configuration combines lanes **1-10** and disables lanes **11** and **12**.

With this configuration, show commands display lane **/1** as **connected or not connected**, and lanes **/2-12** as **errdisabled**.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane **/1** of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/49/1)# speed 100gfull
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/49/1)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 - connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/49/1 - connected 1 full 100G 100GBASE-SR1
Et5/49/2 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/3 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/4 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/5 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/6 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/7 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/8 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/9 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/10 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/11 - errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/12 - errdisabled 1 unconf unconf 100GBASE-SR1
```

### 11.1.8.11.2 Configuring an MXP Module With 40GbE Interfaces

Each set of four lanes on an MXP module is independently configurable as a single 40GbE interface or four 10GbE interfaces. To configure four lanes as a single 40GbE interface, enter the **speed** command (**speed forced 40gfull**) on the group's primary lane (/1, /5, or /9). To revert a group of four lanes to functioning as four independent 10GbE interfaces, enter the **speed 10000full** command on the primary lane of the group.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected** or **not connected** and the other three lanes as **errdisabled**. In groups of four lanes configured as four independent 10GbE interfaces, each lane will be displayed as **connected** or **not connected** in the CLI.

Note that entering a **speed forced 100gfull** command on the /1 lane takes precedence over **speed 40gfull** commands on the /5 and /9 lanes.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless but, if the command changes the number of port lanes, packets may be dropped on unrelated ports.

The following example shows the steps for configuring an MXP module as three 40GbE interfaces.

1. Enter interface Ethernet configuration mode for lane **/1** of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/49/1)# speed 40gfull
```

3. Repeat the above steps for **lanes /5** and **/9**.

```
switch(config-if-Et5/49/1)# interface ethernet 5/49/5
switch(config-if-Et5/49/5)# speed 40gfull
switch(config-if-Et5/49/5)# interface ethernet 5/49/9
switch(config-if-Et5/49/9)# speed 40gfull
```

4. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/49/9)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/49/1 connected 1 full 40G 100GBASE-SR1
Et5/49/2 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/3 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/4 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/5 connected 1 full 40G 100GBASE-SR1
Et5/49/6 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/7 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/8 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/9 connected 1 full 40G 100GBASE-SR1
Et5/49/10 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/11 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/12 errdisabled 1 unconf unconf 100GBASE-SR1
```

### 11.1.8.11.3 Configuring an MXP Module as Twelve 10GbE Interfaces

Each lane of an MXP port functions as a 10GbE interface when it is not included in a higher-speed interface configuration (either actively or as an **errdisabled** port).

To explicitly configure a port as twelve 10GbE interfaces, use the **speed** command (**speed 10000full**) on all twelve lanes of the port.

When each lane is configured as an independent 10GbE interface, show commands display each lane as **connected** or **not connected**.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280CR3, 7280SE, 7300X, 7320X, and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which results in traffic disruption. On the 7160 series platform, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for all twelve lanes of the MXP Ethernet interface.

```
switch(config)# interface ethernet 5/49/1-12
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for **60** seconds or more.

```
switch(config-if-Et5/49/1-12)# speed 10000full
```

3. Use the **show interfaces status** command to confirm the change in the configuration.

```
switch(config-if-Et5/49/1-12)# show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 10G 100GBASE-SR1
Et5/1/2 connected 1 full 10G 100GBASE-SR1
Et5/1/3 connected 1 full 10G 100GBASE-SR1
Et5/1/4 connected 1 full 10G 100GBASE-SR1
Et5/1/5 connected 1 full 10G 100GBASE-SR1
Et5/1/6 connected 1 full 10G 100GBASE-SR1
Et5/1/7 connected 1 full 10G 100GBASE-SR1
Et5/1/8 connected 1 full 10G 100GBASE-SR1
Et5/1/9 connected 1 full 10G 100GBASE-SR1
Et5/1/10 connected 1 full 10G 100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 11.1.8.12 Port Speed Capabilities

The [Supported Speeds \(Gb/s\)](#) table shows the various speeds supported on each Arista platform per interface type.

**Table 65: Supported Speeds (Gb/s)**

| Platform    | SFP+        | SFP28     | QSFP+     | QSFP100                | MXP         | CFP2     |
|-------------|-------------|-----------|-----------|------------------------|-------------|----------|
| 7050        | 100M, 1, 10 | N/A       | 1, 10, 40 | N/A                    | N/A         | N/A      |
| 7050X       | 100M, 1, 10 | N/A       | 1, 10, 40 | N/A                    | 10, 40      | N/A      |
| 7050X2      | 100M, 1, 10 | N/A       | 1, 10, 40 | N/A                    | N/A         | N/A      |
| 7050X3      | 100M, 1, 10 | 1, 10, 25 | N/A       | 10, 25, 40, 50,<br>100 | N/A         | N/A      |
| 7250X       | N/A         | N/A       | 1, 10, 40 | N/A                    | N/A         | N/A      |

#### 11.1.8.13 Agile Ports

An agile port is an interface that can function as a 10GbE port or can subsume a predefined set of 10GbE interfaces to form an interface with higher speed capabilities.

---

The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

- To view the set of available agile ports and the subsumable interfaces that comprise them, enter the **show platform fm6000 agileport map** command.
- To configure the primary port as a higher speed port, enter **speed 40gfull** or **speed auto 40gfull**.
- To revert the primary port and its subsumed ports to 10GbE interfaces, enter **no speed**.

#### 11.1.8.14 Subinterface Configuration

For a subinterface to be operational on an Ethernet or port channel interface, the parent interface must be configured as a routed port, must be administratively up, and a VLAN must be configured on the subinterface. If the parent interface goes down, all subinterfaces automatically go down as well. After the parent interface comes back up, also the subinterfaces come back up with the same configuration.

Note that a port channel should not contain Ethernet interfaces configured with subinterfaces. Subinterfaces cannot be members of a port channel.

Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface. Note that the subinterface number has no relation to the ID of the VLAN corresponding to the subinterface.

Subinterfaces are available on the following platforms:

- DCS-7050X
- DCS-7060X
- DCS-7250X
- DCS-7260X
- DCS-7280E
- DCS-7300X
- DCS-7320X
- DCS-7500E

##### 11.1.8.14.1 Creating a Subinterface

To create a subinterface on an Ethernet or port channel interface, follow these steps:

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# no switchport
switch(config-if-Et1/1)# no shutdown
```

2. Configure a VLAN on the subinterface. The **encapsulation dot1q vlan** command associates a VLAN with the subinterface (and, in other scenarios, it is also used for VLAN translation).

```
switch(config-if-Et1/1)# interface Ethernet1/1.1
switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100
```

3. Configure an IP address on the subinterface (optional) and ensure that it is not shut down.

```
switch(config-if-Et1/1)# ip address 10.0.0.1/24
switch(config-if-Et1/1)# no shutdown
switch(config-if-Et1/1)#
```

#### 11.1.8.14.2 Creating a Range of Subinterfaces

A range of subinterfaces can also be configured simultaneously. The following example configures subinterfaces **1** to **100** on **Ethernet interface 1/1** and assigns **VLANs 501** through **600** to them. Note that the range of interfaces must be the same size as the range of VLAN IDs.

##### Example

```
switch(config) # interface eth1/1.1-100
switch(config-if-Et1/1.1-100) # no shutdown
switch(config-if-Et1/1.1-100) # encapsulation dot1q vlan {501,600}
switch(config-if-Et1/1.1-100) # exit
switch(config) #
```

#### 11.1.8.14.3 Parent Interface Configuration

For subinterfaces to function, the parent interface must be administratively up and configured as a routed port.

Subinterfaces inherit some settings from the parent interface. These include QoS (trust mode and default DSCP) and MTU.

Additionally, on the DCS-7050X, DCS-7250X, and DCS-7300X platforms, the parent interface may be configured with an IP address. In this case, untagged packets are treated as incoming traffic on the parent interface.

#### 11.1.8.14.4 Configuring Routing Features on a Subinterface

After you create a subinterface, you can configure the following features on it:

- Unicast and multicast routing.
- BGP, OSPF, ISIS, PIM.
- VRF.
- VRRP.
- SNMP.
- Inheritance of QoS (trust mode and default DSCP) and MTU settings from the parent interface.

Additionally, these features can be configured on subinterfaces on Arad (DCS-7500E and DCS-7280E) platforms:

- Subinterface counters on ingress.
- VXLAN.
- MPLS.
- GRE.
- PBR.
- QoS.

#### 11.1.8.14.5 Displaying Subinterface Information

Subinterface information is displayed using the same **show** commands as for other interfaces.

##### Examples

- The following command displays the summary information for all IP interfaces on the switch, including subinterfaces.

```
switch# show ip interfaces brief
Interface IP Address Status Protocol MTU
Ethernet1/1 10.1.1.1/24 up up 1500
Ethernet1/1.1 10.0.0.1/24 up up 1500
Ethernet1/2 unassigned up up 1500
```

- The following command shows the specific information about subinterface Ethernet 1/1.1.

```
switch# show interface ethernet 1/1.1
Ethernet1/1.1 is down, line protocol is lowerlayerdown (notconnect)
 Hardware is Subinterface, address is 001c.735d.65dc
 Internet address is 10.0.0.1/24
 Broadcast address is 255.255.255.255
 Address determined by manual configuration
 IP MTU 1500 bytes , BW 10000000 kbit
 Down 59 seconds switch>
```

- The following command displays the status information for all subinterfaces configured on the switch.

| switch# show interfaces status sub-interfaces |      |         |      |        |       |                     |       |
|-----------------------------------------------|------|---------|------|--------|-------|---------------------|-------|
| Port                                          | Name | Status  | Vlan | Duplex | Speed | Type                | Flags |
| Etl.1                                         |      | connect | 101  | full   | 10G   | dot1q-encapsulation |       |
| Etl.2                                         |      | connect | 102  | full   | 10G   | dot1q-encapsulation |       |
| Etl.3                                         |      | connect | 103  | full   | 10G   | dot1q-encapsulation |       |
| Etl.4                                         |      | connect | 103  | full   | 10G   | dot1q-encapsulation |       |

### 11.1.8.15 Maximum Latency Tail-drop Thresholds

The maximum latency for tail-drop thresholds can be configured in interface configuration mode or in the QoS profile. **QoS profile** configuration mode is a group change mode.

#### Example

The following commands configure the maximum latency value for the VOQ tail-drop threshold on **transmit queue 3** on **interface Ethernet1**. The maximum latency value that can be specified is **50 ms**. Either milliseconds or microseconds can be used in the configuration.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# tx-queue 3
switch(config-if-Et1-txq-3)# latency maximum <1-50000> microseconds
switch(config-if-Et1-txq-3)# latency maximum <1-50> milliseconds
switch(config) #
```

### 11.1.8.16 Auto-negotiated Settings

In auto-negotiation, the transmission speed, duplex setting, and flow control parameters used for Ethernet-based communication can be automatically negotiated between connected devices to establish optimized common settings.

#### 11.1.8.16.1 Speed and Duplex

In configuration mode the **speed** command affects the transmission speed and duplex setting of an interface. When a **speed** command is in effect on an interface, auto-negotiation of speed and duplex settings is disabled for the interface; to enable auto-negotiation, use the **speed auto** command.

The scope and effect of the **speed** command depends on the interface type; see [Ethernet Interfaces](#) and [Ethernet Configuration Procedures](#) for detailed information on the speed settings for different interfaces.

### 11.1.8.16.2 Flow Control

Flow control is a data transmission option that temporarily stops a device from sending data because of a peer data overflow condition. If a device sends data faster than the receiver can accept, the receiver's buffer can overflow. The receiving device then sends a PAUSE frame, instructing the sending device to halt transmission for a specified period.

Flow control commands configure administrative settings for flow control frames.

- The **flowcontrol receive** command configures the port's ability to receive flow control pause frames.
  - **off**: the port does not process the pause frames that it receives.
  - **on**: the port processes the pause frames that it receives.
  - **desired**: the port auto-negotiates; it processes pause frames if the peer is set to **send** or **desired**.
- The **flowcontrol send** command configures the port's ability to transmit flow control pause frames.
  - **off**: the port does not send pause frames.
  - **on**: the port sends pause frames.
  - **desired**: the port auto-negotiates; it sends pause frames if the peer is set to **receive** or **desired**.

**Desired** is not an available parameter option. Ethernet *data ports* cannot be set to **desired**.

Management ports are set to **desired** by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. [Compatible Settings for Flow Control Negotiation](#) lists the compatible flow control settings.

**Table 66: Compatible Settings for Flow Control Negotiation**

| local port      | peer port                                   |
|-----------------|---------------------------------------------|
| receive on      | send on or send desired                     |
| receive off     | send off or send desired                    |
| receive desired | send on, send off, or send desired          |
| send on         | receive on or receive desired               |
| send off        | receive off or receive desired              |
| send desired    | receive on, receive off, or receive desired |

#### Example

These commands set the flow control receive and send parameters to **on** on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# flowcontrol receive on
switch(config-if-Et5)# flowcontrol send on
switch(config-if-Et5)#

```

### 11.1.8.17 Displaying Ethernet Port Properties

Show commands are available to display various Ethernet configurations and operational statuses on each interface. Viewable Ethernet settings include:

- Port Type
- PHY Status

- Negotiated Settings
- Flow Control
- Capabilities

## Port Type

The port type is viewable from the output of **show interfaces status**, **show interfaces hardware**, and **show interfaces transceiver properties** commands.

## Examples

- This **show interfaces status** command displays the status of Ethernet interfaces **1-5**.

```
switch# show interfaces status
Port Name Status Vlan Duplex Speed Type
Et1 Et1 connected 1 full 10G 10GBASE-SRL
Et2 Et2 connected 1 full 10G 10GBASE-SRL
Et3 Et3 connected 1 full 10G 10GBASE-SRL
Et4 Et4 connected 1 full 10G 10GBASE-SRL
Et5 Et5 notconnect 1 full 10G Not Present
```

- This **show interfaces hardware** command displays the speed, duplex, and flow control capabilities of Ethernet interfaces **2** and **18**.

```
switch# show interfaces ethernet 2,18 hardware
Ethernet2
 Model: DCS-7150S-64-CL
 Type: 10GBASE-CR
 Speed/Duplex: 10G/full,40G/full,auto
 Flowcontrol: rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
 Model: DCS-7150S-64-CL
 Type: 10GBASE-SR
 Speed/Duplex: 10G/full
 Flowcontrol: rx-(off,on),tx-(off,on)
```

- This command displays the media type, speed, and duplex properties for Ethernet interfaces **1**.

```
switch# show interfaces ethernet 1 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL
```

## PHY

The **show interfaces phy** command displays PHY information for each Ethernet interface.

## Example

This command summarizes PHY information for Ethernet interfaces **1-3**.

```
switch# show interfaces ethernet 1-3 phy
Key:
 U = Link up
 D = Link down
 R = RX Fault
 T = TX Fault
 B = High BER
 L = No Block Lock
 A = No XAUI Lane Alignment
 0123 = No XAUI lane sync in lane N

 State Reset
 Port PHY state Changes Count PMA/PMD PCS XAUI
```

```

Ethernet1 linkUp 14518 1750 U.. U.... U.....
Ethernet2 linkUp 13944 1704 U.. U.... U.....
Ethernet3detectingXcvr 3 1 D..A0123
```

## Negotiated Settings

The **show interfaces hardware** command displays speed, duplex, and flow control settings. PHY information for each Ethernet interface can be viewed by entering the **show interfaces hardware**, **show interfaces flow-control**, and **show interfaces status** commands.

## Examples

- This command displays speed/duplex and flow control settings for Ethernet interface **1**.

```
switch# show interfaces ethernet 1 hardware
Ethernet1
 Model: DCS-7150S-64-CL
 Type: 10GBASE-SR
 Speed/Duplex: 10G/full
 Flowcontrol: rx-(off,on),tx-(off,on)
```

- This command shows the flow control settings for Ethernet interfaces **1-2**.

```
switch# show flow-control interface ethernet 1-2
Port Send FlowControl Receive FlowControl RxPause TxPause
 admin oper admin oper

Et1 off off off off 0 0
Et2 off off off off 0 0
```

- This command displays the speed type and duplex settings for management interfaces **1-2**.

```
switch# show interfaces management 1-2 status
Port Name Status Vlan Duplex Speed Type
 Ma1 connected routed a-full a-100M 10/100/1000
 Ma2 connected routed a-full a-1G 10/100/1000
```

---

### 11.1.8.18 Ingress and Egress Per Port for IPv4 and IPv6 Counters Overview

This feature supports per-interface ingress and egress packet and byte counters for IPv4 and IPv6.

This section describes ingress and egress per-port counters for IPv4 and IPv6, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Configuring IPv4 and IPv6 Ingress and Egress Counters
- Dedicated ARP Entry for IPv4 and IPv6 Egress Counters
- Ingress and Egress Counters for IPv4 and IPv6 Commands

#### 11.1.8.18.1 Configuring IPv4 and IPv6 Ingress and Egress Counters

IPv4 and IPv6 ingress counters support **bridged and routed** traffic only on switches with front-panel ports. These counters can be enabled and disabled using the **hardware counter feature ip** command.

EOS supports IPv4 and IPv6 ingress and egress counters for **routed** traffic on Layer 3 interfaces, such as routed ports and Layer 3 subinterfaces, only on the DCS-7300X, DCS-7250X, DCS-7050X, and DCS-7060X platforms. IPv4 and IPv6 **packet** counters for **routed** traffic do not require any configuration, because EOS collects them by default. Other platforms such as the DCS-7280SR, DCS-7280CR, and DCS-7500-R must have the feature enabled.

##### Examples

```
switch# hardware counter feature ip in layer3
switch# hardware counter feature ip out layer3
```

#### 11.1.8.18.2 Dedicated ARP Entry for IPv4 and IPv6 Egress Counters

IPv4 and IPv6 egress Layer 3 counters (**hardware counter feature ip out layer3**) on the DCS-7280SR, DCS-7280CR, and DCS-7500-R platforms rely on the ARP entry of the next hop.

By default, both IPv4 and IPv6 next hops resolve to the same MAC address and interface with a shared ARP entry. To differentiate the counters between IPv4 and IPv6, disable ARP entry sharing with the following command:

```
ip hardware fib next-hop arp dedicated
```

On the DCS-7280SR, DCS-7280CR, and DCS-7500-R platforms this command is required to support IPv4 and IPv6 egress counters.

#### 11.1.8.18.3 Ingress and Egress Per Port IPv4 and IPv6 Commands

##### Configuration Commands

- [hardware counter feature ip](#)

##### Show Commands

- [show interfaces counters ip](#)

### 11.1.8.19 Ingress Counters

Ingress counters enable the switch to count the ingress traffic on the Layer 3 ports of the switch.

Any ingress traffic on Layer 3 sub-interfaces and VLAN interfaces with IPv4 and IPv6 addresses is accounted for, irrespective of the routing decision. VLAN counters are supported on the DCS-7050x, DCS-7250x, and DCS-7300x series switches. They are not supported on any routed ports.

#### 11.1.8.19.1 Configuring Ingress Counters

The **hardware counter feature <...> in** command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interfaces with IPv4 and IPv6 addresses is accounted for, irrespective of the routing decision.

##### Examples

- This command configures the ingress traffic count on the sub-interfaces. The **no** form of the command disables the counter configuration from the switch ports.

```
switch# hardware counter feature subinterface in
```

- This command configures the ingress traffic count on VLAN interfaces. The **no** form of the command disables the counter configuration from VLAN-configured switch ports.

```
switch# hardware counter feature vlan-interface in
```

#### 11.1.8.19.2 Displaying the Ingress Counter Information

The **show interface counters** command displays the Layer 3 ingress traffic count information.

Run this command to view the traffic counts on a sub-interface or VLAN interface of the switch. The **clear counters** command resets the counters to **0**.

##### Example

This command displays the ingress traffic count on a VLAN interface **vl12**.

```
switch# show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
Vl12 3136 47 2
```

### 11.1.8.20 Configuring Ingress Traffic-Class Counters

Ingress traffic-class counter support is enabled to display per traffic-class counters on ingress interfaces and is supported on routed ports and subinterfaces. Both packet and octet counts are displayed.

##### Examples

- This command enables traffic-class counter support.

```
switch(config)# hardware counter feature traffic-class in
```

- This command enables the TCAM profile **tc-counters**, if this profile is configured.

```
switch(config)# hardware tcam profile tc-counters
```

### 11.1.8.21 Hardware Counter Support

Hardware counter support enables features requiring programmable hardware counter resources.

Hardware counter support can be used to count the following feature-specific values:

- Ingress VLAN-interface counters count the *packets/octets ingressing through a VLAN interface*.
- Egress VLAN-interface counters count the *packets/octets egressing a VLAN interface*.
- Ingress subinterface counters count the *packets/octets ingressing through a subinterface*.
- Egress subinterface counters count the *packets/octets egressing a subinterface*.
- VXLAN VNI counters count the *packets/octets encapsulated/decapsulated per VNI*.
- VXLAN VTEP counters count the *packets/octets encapsulated/decapsulated per VTEP*.
- Route counters for IPv4/IPv6 routes count the *packets/octets routed using the route entry*.
- Ingress GRE tunnel interface counters count the *packets/octets ingressing a GRE tunnel interface*.
- Egress GRE tunnel interface counters count the *packets/octets egressing a GRE tunnel interface*.

#### 11.1.8.21.1 Hardware Counter Support Configuration

You can enable hardware counter support on a per-feature basis using the **hardware counter feature** command. The **no hardware counter feature** command disables this setting. Multiple ingress and egress hardware counter features can work concurrently.

**Note:** Enabling *hardware counter features* may impact the transit traffic.

##### 11.1.8.21.1.1 Ingress VLAN Interface Counters

The **hardware counter feature vlan-interface in** command enables the counting of ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.

#### Example

```
switch# [no] hardware counter feature vlan-interface in
```

##### 11.1.8.21.1.2 Egress VLAN Interface Counters

The **hardware counter feature vlan-interface out** command enables the counting of egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the VLAN interface for every VLAN interface configured in the system.

#### Example

```
switch# [no] hardware counter feature vlan-interface out
```

### 11.1.8.21.1.1 Ingress SubInterface Counters

The **hardware counter feature subinterface in** command enables the counting of ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the subinterface for every L3 subinterface configured in the system.

#### Example

```
switch# [no] hardware counter feature subinterface in
```

### 11.1.8.21.1.2 Egress SubInterface Counters

The **hardware counter feature subinterface out** command enables the counting of egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the subinterface for every L3 subinterface configured in the system.

#### Example

```
switch# [no] hardware counter feature subinterface out
```

### 11.1.8.21.1.5 VXLAN VNI Encapsulation Counters

The **hardware counter feature vni encap** command enables per-VNI encapsulation counters. When enabled, the switch counts the number of packets and bytes egressing a VNI through a VTI, the number of encapsulated BUM packets, and the number of encapsulated packets dropped for any reason.

#### Example

```
switch(config)# [no] hardware counter feature vni encap
```

### 11.1.8.21.1.6 VXLAN VNI Decapsulation Counters

The **hardware counter feature vni decap** command enables the per-VNI decapsulation counters. When enabled, the switch counts the number of packets/octets received from a VTEP and decapsulated for each VNI.

#### Example

```
switch(config)# [no] hardware counter feature vni decap
```

### 11.1.8.21.1.7 Route Counters

The **hardware counter feature route** command configures the route counters for the specified IP version, IP address or IP prefix. When enabled, the switch counts the number of packets/bytes hitting a route. The VRF name is optional. The default VRF is assumed if no VRF is specified.

#### Example

```
switch(config)# [no] hardware counter feature route [ipv4|ipv6] [vrf <name>] [ip-address|ip-prefix]
```

#### **11.1.8.21.1.8 GRE Tunnel Interface Encapsulation Counters**

The **hardware counter feature gre tunnel interface out** command enables GRE tunnel interface encapsulation counters. When enabled, the switch counts the number of unicast GRE packets and of total octets encapsulated on the tunnel interface.

##### **Example**

```
switch(config)# [no] hardware counter feature gre tunnel interface out
```

#### **11.1.8.21.1.9 GRE Tunnel Interface Decapsulation Counters**

The **hardware counter feature gre tunnel interface in** command enables GRE Tunnel Interface decap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the Tunnel Interface.

##### **Example**

```
switch(config)# [no] hardware counter feature gre tunnel interface in
```

#### **11.1.8.21.2 MRU Enforcement Show Commands**

The **show interface** output displays the MRU on an interface.

```
switch(config)# show interface ethernet 1
Ethernet1 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 444c.a8b7.1ed8 (bia 444c.a8b7.1ed8)
 Member of Port-Channel10
 Ethernet MTU 10178 bytes, Ethernet MRU 1500 bytes, BW 10000000 kbit
 Full-duplex, 10Gb/s, auto negotiation: off, uni-link: disabled.
```

##### **Counters**

MRU-dropped packets are counted per-chip.

The **show platform fap mapping** output displays the mapping between the chips and their corresponding Ethernet interfaces.

```
switch(config)# show platform fap mapping interface Ethernet 1
Jericho0 (FapId: 0 BaseSystemCoreId: 0)
Port SysPhyPort Vqo Core FapPort OtmPort BaseQPair QPairs Xlge NifPort

Ethernet1 100 2608 0 2 0 0 8 8 33
```

The **show hardware counter drop** output displays the per-chip *Reassembly Errors* counters.

```
switch(config)# show hardware counter drop
Type Chip CounterName : Count : First Occurrence : Last Occurrence

A Jericho0 ReassemblyErrors : 12132989 : 2020-09-22 17:05:45 : 2020-09-22 17:22:40
```

### 11.1.8.22 Configuring Power over Ethernet (PoE)

Power over Ethernet (PoE) is enabled by default on all Ethernet ports of PoE-capable switches, which can detect IEEE-compliant Powered Devices (PDs) when they are plugged into a port and can supply power appropriately.

#### Limitations

- Ethernet ports will not detect non-IEEE-compliant devices by default and may not be able to detect or power them even if configured to do so.
- If attached PDs overload the switch, it will power off. This can occur when an attached PD increases its power demand via LLDP, when too many PDs are connected to the switch, or when a power supply fails on a heavily loaded dual-supply switch.
- Power-cycling the switch will cause temporary loss of power to attached PDs.
- PoE is not available on management interfaces.

#### Disabling PoE on an Interface

On switches that support it, PoE is enabled by default on all Ethernet ports but can be disabled per port with the **poe disabled** command.

#### Example

This command disables PoE on Ethernet interface 5.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe disabled
switch(config-if-Et5) #
```

#### PoE Power Settings

When an IEEE-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its initial power needs are determined by hardware negotiation, after which further negotiation is managed through the Link Layer Discovery Protocol (LLDP). For details, see [Configuring LLDP for Power over Ethernet](#).

PoE power output can be limited on a port using the **poe limit** command. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

**Note:** LLDP uses Power Via MDI type-length-value elements (TLVs) to allow the switch to dynamically negotiate power needs with PDs. LLDP will not include Power Via MDI TLVs for the interface if a power limit has been configured on it.

#### Examples

- These commands limit nominal PoE power output on Ethernet interface **5** to **10 W**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe limit 10 watts
switch(config-if-Et5) #
```

- These commands limit nominal PoE power output on Ethernet interface **7** to **4 W**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit class 1
```

```
switch(config-if-Et7) #
```

## Detecting Legacy PDs

IEEE-compliant Powered Devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. By default, legacy PD detection is disabled, and legacy devices are not powered.

To configure an interface to use hardware detection for these non-compliant PoE devices and attempt to power them, use the [poe legacy detect](#) command.

**Note:** Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

## Example

These commands configure **interface ethernet 5** to attempt to detect and power non-compliant PDs.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe legacy detect
switch(config-if-Et5) #
```

## Displaying PoE Information

To display PoE information for a specific interface range or for all Ethernet interfaces, use the [show poe](#) command.

## Example

This command displays PoE information for **Ethernet interface 46**.

```
switch(config)# show poe interface ethernet 46
show poe interface ethernet 46
PSELLDPowerGrantedPort
Port Enabled Enabled Limit Power State Class Power Current Voltage Temperature
----- -----
46 True True 15.40W 15.40W powered class0 1.40W 27.00mA 55.04V 41.25C
switch(config-if-Et7) #
```

### 11.1.8.23 Configuring Link Fault Signaling

As part of the Link Fault Signaling (LFS) configuration, a new configuration mode called the Ethernet Operations Administration and Management (EOAM) mode is introduced. The EOAM profile has a link-error sub-mode wherein the threshold, action, and period are configured for FCS and symbol errors. The period can be in seconds or in number of frames. The default values are threshold **0**, action **syslog**, and period **0** seconds. If the errors exceed the threshold within the given period, the configured action is executed. The recovery time configures the recovery timeout value for link fault signaling. Only one EOAM profile is associated with a port.

The following steps enable configuring the LFS parameters:

1. Enable the EOAM mode.

```
switch(config)# monitor ethernet oam
```

2. Create an EOAM profile named **profile1**.

```
switch(config-eoam) # profile profile1
```

3. Enter the EOAM **link-error sub-mode**.

```
switch(config-eoam-profile-profile1)# link-error
```

4. Enter the commands in the profile's **link-error submode** to configure a specific LFS parameter.

```
switch(config-eoam-profile-profile1-link-error)# symbol action errdisable
switch(config-eoam-profile-profile1-link-error)# symbol period 300 frames
switch(config-eoam-profile-profile1-link-error)# symbol threshold 20
switch(config-eoam-profile-profile1-link-error)# recovery-time 40
```

5. Apply the EOAM profile **profile1** to the Ethernet interface **1/1**.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# monitor ethernet oam profile profile1
```

#### 11.1.8.24 Ethernet OAM Connectivity Fault Management (CFM)

This section contains the following topics:

- [Connectivity Fault Management Overview](#)
- [Configuring Ethernet OAM Connectivity Fault Management \(CFM\)](#)
- [Displaying CFM Status Information](#)
- [Ethernet OAM CFM Commands](#)

#### Connectivity Fault Management Overview

As Ethernet technologies merge into Metropolitan Area Networks (MAN) and Wide Area Networks (WAN), these services, used by service providers, provide end-to-end connectivity to customers. Typically, the service provider locations span large geographical areas and may rely on certain internet backbone providers, called *operators*, to provide connectivity when the geographical area becomes too large for coverage. In response, the responsibilities of managing the networks by tasks including Operations, Administration, and Maintenance (OAM) become challenging, and the ability of the service providers to respond to network interruptions directly impacts competitiveness in the market.

To facilitate the fault detection, isolation, and recovery processes at the Ethernet layer, the Ethernet OAM Connectivity Fault Management (CFM) protocol became available with the release of the IEEE 802.1ag standard. In this standard, the nodes on a network periodically transmit an Ethernet Continuity Check (ETH-CC) message indicating the status of reachability to remote nodes, and also track the reachability of remote nodes in the network. The Ethernet OAM CFM functionality uses special Ethernet frames with the *0x8902* Ethernet type value to achieve this functionality.

#### Terminology

Review the list of terms used in the documentation.

- CCM - Continuity Check Message
- CFM - Connectivity Fault Management
- ETH-CC - Ethernet Continuity Check
- eOAM - Ethernet Operation, Administration, and Management
- LOC - Loss of Continuity
- MA - Maintenance Association
- MD - Maintenance Domain

- 
- MEP - Maintenance Association End Point
  - RMEP - Remote Maintenance Association End Point
  - MP - Maintenance Point
  - OAM - Operations, Administration, and Maintenance
  - RDI - Remote Defect Indication>

## Ethernet OAM Delay Measurement Overview

The Ethernet OAM Connectivity Fault Management functionality supports Single-End or Two-way Delay measurement. The transmitter generates a Delay Measurement Message (DMM) PDU that records and timestamps the time of transmission. After receiving the DMM, the responder records the time of reception and generates a Delay Measurement Reply (DMR) PDU which records and timestamps the transmission time in the DMR and the transmission time of the DMM.

When the transmitter receives the DMR PDU, it records the receiving time of the DMR PDU and calculates the Two-way Delay. The feature does not require clock synchronization between the transmitter and the receiver.

## Ethernet OAM Loss and Synthetic Loss Measurement

The Ethernet OAM Loss (LM) and Synthetic Loss (SLM) measurement functionality supports single-ended Loss and Synthetic Loss measurement in the proactive mode and periodically computes the configured performance measurements.

### Single-ended Ethernet OAM Loss Management

When configured for Single-ended loss measurement, an endpoint (MEP) on a Maintenance Association (MA) becomes the Initiator, sending frames with ETH-LM request information to a peer MEP, the responder, and receives frames with ETH-LM reply information from the Responder to begin loss measurements. The Protocol Data Unit (PDU) used as a single-ended ETH-LM request acts as the Loss Measurement Message (LMM), and the PDU used for ETH-LM replies acts as the Loss Measurement Reply (LMR).

The Initiator generates an LMM with the following informational element:

- **TxF Cf** - The local counter value for the data frames (TxFCl) transmitted towards the Responder at the time of the LMM frame transmission.

After receiving the LMM, the Responder generates an LMR with the following informational elements:

- The TxF Cf from the LMM used to generate the LMR.
- **RxF Cf** - The local counter value of data frames (RxFCl) received from the Initiator at the time of LMM reception.
- **TxF Cb** - The local counter value of data frames (TxFCl) transmitted to the Initiator at the time of LMR transmission.

After receiving the LMR, the Initiator computes the near-end and far-end loss measurements.

### Single-ended Ethernet Synthetic Loss Measurement

When configured for Single-ended synthetic loss measurement, an endpoint (MEP), the Initiator on a Maintenance Association (MA) sends frames with ETH-SLM request information to the peer MEP, a Responder, and receives frames with ETH-SLM reply information from the Responder to calculate loss measurements. The PDU for single-ended SLM acts as the SLM and the PDU uses the ETH-SLM reply as the SLR.

The Initiator generates an LMM with the following informational element:

- **TxF Cf** - The local counter value for the synthetic data frames (TxFCl) transmitted towards the Responder at the time of the SLM frame transmission.

After receiving the SLM, the Responder generates an SLR with the following informational elements:

- The TxFCf from the SLM used to generate the SLM.
- **TxFcB** - The local counter value of data frames (TxFCI) transmitted to the Initiator at the time of LMR transmission.

After receiving the SLRR, the Initiator records the number of SLR frames received from the responder. At the end of each measurement, the Initiator computes near-end and far-end loss measurements.

#### 11.1.8.24.1 Configuring Ethernet OAM Connectivity Fault Management (CFM)

##### CFM Support

EOS supports MEPs on the following ports:

- Up and down MEPs on Pseudowire front panel ports.
- Up MEP continuity check on L2 front panel trunk ports.
- Down MEP continuity check support for L2 front panel ports in the following scenarios:
  - MEP interface on an access port
  - MEP interface on a trunk port with a native VLAN equal to an association VLAN.
  - MEP interface on a trunk port with a native VLAN not equal to an association VLAN.

##### Adding CFM to the Hardware TCAM Profile

**Note:** If the network has Maintenance Association End Points (MEPs) in the **Up** state, then add the **CFM** feature to the operational TCAM profile.

Use the following commands to add the profile *new-cfm* to the hardware TCAM:

```
switch(config) # hardware tcam
switch(config-tcam) # profile new-cfm copy default
switch(config-tcam-profile-new-cfm) # feature cfm
switch(config-tcam) # system profile new-cfm
```

##### Configuring the Modular Database (MDB) Profile

Use the following command to set the MDB profile to *balanced* or *balanced-xl*:

```
switch(config) # platform sand mdb profile balanced-xl
```

##### Configuring CFM

Use the commands available in **cfm** mode to add CFM configurations. Multiple MEPs can share CFM properties when configuring CFM profiles, and CFM profiles can be associated with one or more MAs.

Use the following command to enter **cfm** mode:

```
switch(config) # cfm
```

Enable the LOC action for Layer 3 interfaces:

```
switch(config) #continuity-check loc-state action disable interface routing
```

Create a new CFM profile *cfm-profile1*:

```
switch(config) #profile cfm-profile1
```

---

Add continuity checking to the configuration:

```
switch(config-cfm-profile-cfm-profile1)#continuity-check
```

Set the time interval to every 10 minutes for periodic transmission of CCM packets:

```
switch(config-cfm-profile-cfm-profile1)#continuity-check tx-interval 10 minutes
```

To set the transmission level to the default value of one (1) second, use the `default`. EOS supports the following types of transmission levels:

- 3.33 milliseconds
- 10 milliseconds
- 100 milliseconds
- 1 second
- 10 seconds
- 1 minute
- 10 minutes

### Configuring the Class of Service (CoS)

Add Class of Service (CoS) to the configuration:

```
switch(config-cfm-profile-cfm-profile1)# continuity-check qos cos 7
```

Configure alarms for defects on the network using the following parameters:

```
switch(config-cfm-profile-cfm-profile1)#continuity-check alarm defect defects
```

Select from the following list of defects:

- **cross-connection** - Enables the `CFM_MEP_CROSS_CONNECTION_DETECTED` alarm and logged when a local MEP receives a CCM PDU from a different maintenance association.
- **error-ccm** - Enables the `CFM_MEP_ERROR_CCM_DETECTED` alarm and logged when a local MEP receives a CCM PDU with the wrong CCM tx-interval or has an RMEP id identical to a local MEP id.
- **loc-state** - Enabled by default, and enables the `CFM_MEP_LOC_DETECTED` alarm, and logged when a local MEP loses connectivity with a remote MEP.
- **rdi-ccm** - Enabled by default and enables the `CFM_MEP_RDI RECEIVED` alarm, and logged when a local MEP receives a CCM with the RDI flag set to true from the remote MEP.

### Configuring a Maintenance Domain

Use the following command to configure a Maintenance Domain with the name `mdom_1` and a level of 5:

```
switch(config-cfm)# domain mdom_1 level 5
```

The `domain_level` can be an integer between 0 -7.

### Configuring the Maintenance Association

Use the following command to configure a Maintenance Association, `mainassoc1`, under a Maintenance Domain:

```
switch(config-cfm-mdom_1)# association mainassoc1
```

The command supports an integer value between 1 to 655335.

Use the following command to apply a CFM profile to a Maintenance Association:

```
switch(config-cfm-md-mdom_1-ma-mainassoc1) # profile profile1
```

The CFM profile applies to all MEPs in the Maintenance Association.

To configure the CFM direction for a Maintenance Association, use the following command:

```
switch(config-cfm-md-mdom_1-ma-255) # direction [up | down]
```

This configures all MEPs under a Maintenance Association with the same direction.

### Configuring a MAC Address for a Remote MEP

Configure a MAC address for a remote MEP by first entering the remote end-point mode, and adding the MAC address:

```
switch(config-cfm-md-mdom_1-ma-255) # remote end-point end_point_id
```

```
switch(config-cfm-md-mdom_1-ma-255-rmep-rep_25) # mac address 06:00:00:00:00:00
```

### Configuring a Local MEP

Use the following command to configure a local endpoint (MEP) for a Maintenance Association:

```
switch(config-cfm-md-mdom_1-ma-255) # end-point end_point_id
```

The **end\_point\_id** can only be an integer between 1 and 8191.

### Configuring the Maintenance Association VLAN

For LM support on subinterfaces with unmatched flexible encapsulation, the MA VLAN must be configured to specify the bridging domain for sending LM or SLM packets. Use the following command to set the VLAN as 101:

```
switch(config-cfm-md-LM-MD-ma-LM-Assoc) # VLAN 101
```

The **cos cos\_value** has a default value of 7.

### Configuring a Remote MEP under a local MEP

To configure a remote MEP under a local MEP, use the following command:

```
switch(config-cfm-md-mdom_1-ma-255-mep-mep_25) # remote end-point [add | remove] end_point_ID
```

Use any of the following options with the configuration:

- **no** or **default** removes all of the remote MEPs under the local MEP.
- **end\_point\_id** can only be an integer between 1 and 8191.
- **add** adds the remote MEP to the existing list of MEPs.
- **delete** removes the remote MEP from the list of existing MEPs.

- **remote end-point end\_point\_ID** parameter without the **add** keyword overwrites the existing remote MEPs under the local MEP.

### Adding an Interface to a Local MEP

To configure an interface for a local MEP, use the following command:

```
switch(config-cfm-md-mdom_1-ma-255-mep-mep_25) # interface interface-name
```

#### 11.1.8.24.2 Displaying CFM Status Information

The following examples allow you to display status information about your CFM configuration.

##### Current Status

To display the current status of the CFM endpoints, use the following command:

```
switch# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared
 ----- -----
 2 reachable never never
```

In this example, the endpoint displays reachability and no loss of continuity (LOC). Because no LOC occurred, the TX RDI state returns false, meaning the local MEP transmits the CCMs with the RDI flag set to false.

##### Loss of Continuity

To display the current status of the CFM endpoints, use the following command:

```
switch# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: true, Last TX RDI set: 0:00:04 ago
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared
 ----- -----
 2 unreachable 0:00:04 ago never
```

The remote MEP became unreachable and LOC occurred on the network. Since LOC exists for the connection, the TX RDI state returns true, meaning the local MEP transmits the CCMs with the RDI flag set to true.

##### Layer 3 Interface with LOC Enabled

Display information with the LOC action enabled and a Layer 3 interface detects it.

```
switch# show interfaces Ethernet1.1
Ethernet1.1 is up, line protocol is up (connected)
Hardware is Subinterface, address is 2cdd.e9c0.ed7b
```

```

Internet address is 1.0.1.1/24
Broadcast address is 255.255.255.255
IPv6 link-local address is unassigned
IPv6 global unicast address(es):
 2002::100:101, subnet is 2002::100:100/120 [INACTIVE]
CFM connectivity status for IPv4, IPv6 is DOWN
IP MTU 1500 bytes (default), BW 100000000 kbit

```

## LOC Recovery

Displays the status for the MEP as reachable, but LOC occurred at some point on the network.

```

switch# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: false, Last TX RDI cleared: 0:00:01 ago
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared

 2 reachable 0:05:09 ago 0:00:01 ago

```

## Remote Defects for CFM

Shows the remote MEP as reachable, but other defects occurred for the local MEP. The **detail** option provides more information regarding the defects.

```

Arista# show cfm continuity-check end-point detail
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: false, Last TX RDI cleared: 0:00:01 ago
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared

 2 reachable 0:05:09 ago 0:00:01 ago

Unknown RMEPs
MD Level MAID RMEP ID Received Error Status First CCM received Last CCM
received

1 4 5 100 MAID mismatch 0:05:09 ago
0:0:10 ago
1 1 5 100 Unconfigured RMEP 0:05:09 ago
0:0:10 ago
1 1 1 100 Duplicate RMEP 0:05:09 ago
0:0:10 ago

```

## RDI Detected

RDI displays the status, **undetected**, and CCMs received from this remote MEP have the RDI flag set to true.

```

switch# show cfm continuity-check end-point remote-defect
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up
Maintenance end point ID: 1, Interface: Ethernet1.1
RDI condition: undetected
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID RDI State RDI Detected RDI Cleared

 2 undetected never never

```

## RDI Undetected

RDI displays the status, **undetected**, and CCMs received from this remote MEP have the RDI flag set to false.

```
switch# show cfm continuity-check end-point remote-defect
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up
Maintenance end point ID: 1, Interface: Ethernet1.1
RDI condition: detected, last detected 0:00:09 ago
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID RDI State RDI Detected RDI Cleared
 ----- ----- ----- -----
 2 detected 0:00:09 ago never
```

## RDI Recovered

RDI displays the status, **undetected** but recovered the connection.

```
switch# show cfm continuity-check end-point remote-defect
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up
Maintenance end point ID: 1, Interface: Ethernet1.1
RDI condition: cleared, last detected 0:02:10 ago, last cleared 0:00:03 ago
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID RDI State RDI Detected RDI Cleared
 ----- ----- ----- -----
 2 cleared 0:02:10 ago 0:00:03 ago
```

## Continuity Check Counters (Software CFM)

The **counters** parameter displays relevant counters for software CFM configurations. This parameter displays the counters per MEP. Using the **details** option displays the counters for each interface VLAN in addition to the MEP configured on an interface VLAN.

```
switch# cfm continuity-check counters
Maintenance domain: acWWbXp5Z7, Level: 4
Maintenance association: 9783
Maintenance end point ID: 1, Interface: Ethernet14/1, VLAN: 1756
Total TX packets: 296
Total TX packet failures: 0
Total RX packets: 296
Total RX packet discards: 0
RX - CCM packet parse errors: 0
RX - Domain name invalid: 0
RX - Association name invalid: 0
RX - Traffic direction mismatch: 0
RX - CCM interval invalid: 0
RX - Remote MEP ID invalid: 0
RX - Duplicate remote MEP: 0
RX - Unconfigured remote MEP: 0
```

## Continuity Check Counters Details

This example adds the **details** parameter.

```
switch# show cfm continuity-check counters
Interface: Ethernet11/1, VLAN: 1176
```

```

Total TX packets: 373
Total TX packet failures: 0
Total RX packets: 372
Total RX packet discards: 0
RX - No MEP configured: 0
RX - Ethernet header parse errors: 0
RX - CFM header parse errors: 0
RX - Domain level mismatch: 0
RX - TLV offset invalid: 0
Maintenance domain: aCWWbXp5Z7, Level: 4
Maintenance association: 9783
Maintenance end point ID: 2, Interface: Ethernet11/1, VLAN: 1176
Total TX packets: 373
Total TX packet failures: 0
Total RX packets: 372
Total RX packet discards: 0
RX - CCM packet parse errors: 0
RX - Domain name invalid: 0
RX - Association name invalid: 0
RX - Traffic direction mismatch: 0
RX - CCM interval invalid: 0
RX - Remote MEP ID invalid: 0
RX - Duplicate remote MEP: 0
RX - Unconfigured remote MEP: 0

```

### 11.1.8.24.3 Ethernet OAM CFM Commands

#### Global Configuration Commands

- [cfm](#)

#### Configuration Commands

- [cfm continuity-check](#)
- [cfm domain](#)
- [cfm measurement](#)
- [cfm profile](#)

#### Show Commands

- [show cfm continuity-check end-point](#)
- [show cfm endpoint](#)

### 11.1.8.25 Configuring Ethernet OAM Delay Measurement

#### Configuring the TCAM Profile for Delay Measurement

Add the CFM feature to the TCAM profile using the following commands:

```

switch(config) # hardware tcam
switch(config-tcam) # profile CFM copy default
switch(config-tcam-profile-CFM) # feature cfm
switch(config-tcam-feature-cfm) # packet non-ip forwarding bridged
switch(config-tcam-feature-cfm) # packet ipv4 forwarding bridged
switch(config-tcam-feature-cfm) # packet ipv6 forwarding bridged
switch(config-tcam-feature-cfm) # exit
switch(config-tcam-profile-CFM) # exit

```

```
switch(config-tcam) # system profile CFM-test
```

## Configuring the Modular Database (MDB) Profile

Use the following command to set the MDB profile to `balanced` or `balanced-xl`:

```
switch(config) # platform sand mdb profile balanced-xl
```

The MDB profile provides a common database of forwarding and lookup resources to the ingress and egress stages on the switch.

## Configuring Delay Measurement

To configure Delay Measurement, use the `cfm` command to enter CFM Configuration Mode.

```
switch(config) # cfm
switch(config-cfm) #
```

Use the following commands to configure a Delay Measurement profile, *DMM*, and add a single-ended transmitter on the switch:

```
switch(config-cfm) # profile DMM
switch(config-cfm-profile-DMM-profile) # measurement delay single-ended
```

This enables the transmission of Two-way or Single-ended DMM PDUs in proactive mode, the default mode for Delay Measurement.

Use the parameter, `tx-interval` to set the transmission time interval between DMM PDUs to 10000 milliseconds (10 seconds). Delay Measurement uses 1000 milliseconds (1 second) by default.

```
switch(config-cfm-profile-DMM-profile) # measurement delay tx-interval 10000
milliseconds
```

## Configuring a Maintenance Domain (MD)

Ethernet OAM Delay Measurement supports up to eight (8) MDs. Use the following commands to add an MD, *DMM-MD*, with a maintenance level of 5, to the switch:

```
switch(config-cfm) # domain DMM-MD level 5
switch(config-cfm-md-DMM-MD) #
```

## Configuring a Maintenance Association (MA)

Currently, EOS supports only the 2B integer format for a MA name. Use the following command to create an MA, *DMM-Assoc*, on the switch:

```
switch(config-cfm-md-DMM-MD) # association DMM-Assoc
```

## Setting the Maintenance End Point (MEP) Direction

EOS supports both up and down MEPs. In this configuration, set the direction as *up*.

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc) # direction up
```

## Adding a CFM Profile

Use the following command to add the CFM profile, DMM1, to the configuration:

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc) # profile DMM1
```

## Configuring the Maintenance Association VLAN

For DMM support on subinterfaces with unmatched flexible encapsulation, the MA VLAN must be configured to specify the bridging domain for sending DMM packets. Use the following command to set the VLAN as 101:

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc) # VLAN 101
```

## Configuring a Local MEP

Use the following command to set the local maintenance end point for DMM as 25:

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc-mep-25) # end-point 25
```

## Setting the MEP Interface

EOS supports Layer 2 and LAG subinterfaces on up and down MEP direction and specifically supports Layer 3 and LAG for MEPs configured in the down direction. Use the following command to set the interface to *Eth1/1*:

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc-mep-25) # interface Eth1/1
```

## Adding Remote MEPs

Delay Measurement requires Point-to-Point (P2P) Ethernet connectivity and a single remote MEP configured for a local MEP. Use the following command to add a remote MEP, 30, to the local MEP25:

```
switch(config-cfm-md-DMM-MD-ma-DMM-Assoc-mep-25) # remote end-point 30
```

## Example Configuration

### Configuring a Transmitter

The following commands use these parameters to configure a transmitter on switch1:

- CFM Profile - DMM
- Measurement Delay - single-ended
- Transmit Time Interval - 1000 milliseconds
- Local MEP - MEP1
- Local MEP direction - up
- Ethernet Interface - eth1/2.1
- Maintenance Domain and level - Domain1 level 1
- Maintenance Association - Assoc1
- Remote MEP - MEP2

```
switch1(config) # cfm
switch1(config-cfm) # profile DMM
switch1(config-cfm-profile-dmm) # measurement delay singled-ended
```

```

switch1(config-cfm-profile-dmm) # measurement delay tx-interval 1000 milliseconds
switch1(config-cfm-profile-dmm) # exit
switch1(config-cfm) # domain Domain1 level 1
switch1(config-cfm-md-Domain1) # association Assoc1
switch1(config-cfm-md-Domain1-ma-Assoc1) # profile DMM
switch1(config-cfm-md-Domain1-ma-Assoc1) # direction up
switch1(config-cfm-md-Domain1-ma-Assoc1) # end-point MEP1
switch1(config-cfm-md-Domain1-ma-Assoc1-MEP1) # remote end-point MEP2
switch1(config-cfm-md-Domain1-ma-Assoc1-MEP1) # interface et1.1.2

```

## Configuring a Responder

The following commands use these parameters to configure a responder on switch2:

- Local MEP - MEP2
- Local MEP direction - up
- Ethernet Interface - eth2/1.1
- Maintenance Domain and level - Domain1 level 1
- Maintenance Association - Assoc1
- Remote MEP - MEP1

```

switch2(config-cfm) # domain Domain1 level 1
switch2(config-cfm-md-Domain1) # association Assoc1
switch2(config-cfm-md-Domain1-ma-Assoc1) # direction up
switch2(config-cfm-md-Domain1-ma-Assoc1) # end-point MEP2
switch2(config-cfm-md-Domain1-ma-Assoc1-MEP2) # remote end-point MEP1
switch2(config-cfm-md-Domain1-ma-Assoc1-MEP2) # interface et2/1.1

```

If you have an Arista device and want to configure it as the responder, then configure only the local MEP and the remote MEP on the switch. An Arista device does not require Delay Measurement configuration as a responder.

## Displaying Ethernet OAM Delay Measurement Information

Execute the **show cfm measurement delay proactive** command on the transmitter switch to display the Delay Measurement configuration:

```

switch1# show cfm measurement delay proactive
Maintenance domain: Domain1
Maintenance association: Assoc1, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: MEP1, Interface: Ethernet1/2.1
Remote MEP ID: MEP2, Status: enabled
Start time: 0:00:01 ago
Number of samples: 2
Average two-way delay: 315 usec
Average two-way delay variation: 4 usec
Best case two-way delay: 310 usec at 0:00:01 ago
Worst case two-way delay: 320 usec at 0:00:00 ago

```

Execute the **show cfm measurement delay proactive detail** command on the transmitter switch to display detailed information about the Delay Measurement configuration:

```

switch1# show cfm measurement delay proactive detail
Maintenance domain: Domain1
Maintenance association: Assoc1, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: MEP1, Interface: Ethernet1/2.1
Remote MEP ID: MEP2, Status: enabled
Start time: 0:01:22 ago
Number of samples: 83
Average two-way delay: 320 usec

```

```
Average two-way delay variation: 20 usec
Best case two-way delay: 264 usec at 0:00:07 ago
Worst case two-way delay: 395 usec at 0:00:34 ago
Index Two-way Delay (usec)

1 305.178
2 306.878
3 283.742
4 349.322
5 291.718
6 305.607
7 317.472
8 264.792
9 311.296
10 328.36
```

### 11.1.8.26 Configuring Ethernet OAM Loss Measurement

#### Configuring the TCAM Profile for Loss Measurement

Add the CFM feature to the TCAM profile using the following commands:

```
switch(config) # hardware tcam
switch(config-tcam) # profile CFM copy default
switch(config-tcam-profile-CFM) # feature cfm
switch(config-tcam-feature-cfm) # packet non-ip forwarding bridged
switch(config-tcam-feature-cfm) # packet ipv4 forwarding bridged
switch(config-tcam-feature-cfm) # packet ipv6 forwarding bridged
switch(config-tcam-feature-cfm) # exit
switch(config-tcam-profile-CFM) # exit
switch(config-tcam) # system profile CFM-test
```

#### Configuring the Modular Database (MDB) Profile

Use the following command to set the MDB profile to **balanced** or **balanced-xl**:

```
switch(config) # platform sand mdb profile balanced-xl
```

The MDB profile provides a common database of forwarding and lookup resources to the ingress and egress stages on the switch.

#### Configuring Loss Measurement

To configure Loss Measurement, use the **cfm** command to enter CFM Configuration Mode.

```
switch(config) # cfm
switch(config-cfm) #
```

Use the following command to enable loss measurement on the Initiator and the Responder:

```
switch(config) # measurement loss inband
```

Use the following command to enable synthetic loss measurement on the Initiator and the Responder:

```
switch(config) # measurement loss synthetic
```

## Configuring a Maintenance Domain (MD)

Ethernet OAM Loss Measurement supports up to eight (8) MDs. Use the following commands to add an MD, *LM-MD*, with a maintenance level of 5, to the switch:

```
switch(config-cfm) # domain LM-MD level 5
switch(config-cfm-md-LM-MD) #
```

## Configuring a Maintenance Association (MA)

Currently, EOS supports only the 2B integer format for a MA name. Use the following command to create an MA, *LM-Assoc*, on the switch:

```
switch(config-cfm-md-LM-MD) # association LM-Assoc
```

## Configuring the Maintenance Association VLAN

For LM support on subinterfaces with unmatched flexible encapsulation, the MA VLAN must be configured to specify the bridging domain for sending LM or SLM packets. Use the following command to set the VLAN as 101:

```
switch(config-cfm-md-LM-MD-ma-LM-Assoc) # VLAN 101
```

## Adding Remote MEPs

Loss Measurement requires Point-to-Point (P2P) Ethernet connectivity and a single remote MEP configured for a local MEP. Use the following command to add a remote MEP, 30,

```
switch(config-cfm-md-LM-MD-ma-LM-Assoc) # remote end-point 30
```

## Adding a Remote MEP MAC Address

Configure a MAC address, 30, for the remote MEP, 08:65:18:9C:F3:C5:

```
switch(config-cfm-md-LM-MD-ma-DMM-Assoc-mep-30) # mac address 08:65:18:9C:F3:C5
```

## Configuring the CFM Profile on the Initiator

Use the following commands to configure a Loss Measurement profile on the Initiator, *LMM*, and add a single-ended Initiator on the switch:

```
switch(config-cfm) # profile LMM
switch(config-cfm-profile-LMM) # measurement loss single-ended
```

This enables the transmission of Two-way or Single-ended LMM PDUs in proactive mode, the default mode for Loss Measurement.

Use the parameter, *tx-interval* to set the transmission time interval between LM PDUs to 10000 milliseconds (10 seconds). Loss Measurement uses 1000 milliseconds (1 second) by default.

```
switch(config-cfm-profile-LMM) # measurement loss tx-interval 10000 milliseconds
```

## Configuring the CoS Value for LMM

Set the Class of Service (CoS) for transmitted frames. By default, LMM uses a CoS value of 7 for LMM frames.

```
switch(config-cfm-profile-LMM) # measurement loss tx-interval cos 0
```

## Configuring Synthetic Loss Measurement on the Initiator

Use the following commands to configure a Synthetic Loss Measurement profile on the Initiator, *SLM*, and add a single-ended Initiator on the switch:

```
switch(config-cfm) # profile SLM
switch(config-cfm-profile-SLM) # measurement loss synthetic single-ended
```

Use the parameter, **tx-interval** to set the transmission time interval between LM PDUs to 10 milliseconds. Synthetic Loss Measurement uses 1000 milliseconds (1 second) by default.

```
switch(config-cfm-profile-SLM) # measurement loss synthetic tx-interval 10
milliseconds
```

Set the SLM transmission period, the time interval to compute loss from transmitted synthetic frames, to 10 milliseconds:

```
switch(config-cfm-profile-SLM) # measurement loss synthetic tx-interval 10
milliseconds period 10
```

## Displaying Ethernet OAM Loss Measurement Information

Use the **show cfm measurement loss proactive** to display information about Loss Measurement:

```
switch(config) # show cfm measurement loss proactive
Maintenance domain: EZUTUOu3JG, Level: 5
Maintenance association: 3967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet14/1.4097
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:27 ago
Number of samples: 87
Average far-end frame loss: 0
Average near-end frame Loss: 0

Maintenance domain: EZUTUOu3JG, Level: 5
Maintenance association: 3967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 2, Interface: Ethernet14/1.4098
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:27 ago
Number of samples: 87
Average far-end frame loss: 0
Average near-end frame Loss: 0
```

Use the **show cfm measurement loss synthetic proactive** command to display information about Synthetic Loss Management:

```
switch(config) # show cfm measurement loss synthetic proactive
Maintenance domain: CPASIYdcnN, Level: 3
Maintenance association: 4967, Direction: up
```

```

Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet20/1.4095, COS: 2
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance end point ID: 1, Interface: Ethernet20/1.4095, COS: 5
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance domain: CPASlYdcnN, Level: 3
Maintenance association: 4967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 2, Interface: Ethernet20/1.4096, COS: 2
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance end point ID: 2, Interface: Ethernet20/1.4096, COS: 5
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000

```

### 11.1.8.27 Configuring Hardware TCAM

Ternary Content-Addressable Memory (TCAM) is a specialized type of high-speed memory that increases the speed of route look-up, packet classification, packet forwarding, and access control list-based commands.

You can use the **hardware tcam** command to configure and place the switch in TCAM mode. In this mode the user can configure a few TCAM-related commands such as **feature**, **profile**, and **system**.

In TCAM mode, use the **feature** command to configure the reservation of TCAM banks for features such as ACL, IPsec, flow-spec, I2-protocol, PBR, QoS, TCP-MSS-ceiling, and traffic-policy. The **profile** command configures a new TCAM profile, or you can just copy a TCAM profile which is already created using the **hardware tcam profile** command: default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, VXLAN-routing. Similarly, the **system** command configures the system-wide TCAM profiles.

#### Example

This command places the switch into TCAM configuration mode.

```

switch(config)# hardware tcam
switch(config-hw-tcam)#

```

This is the list of the configuration commands in TCAM mode.

#### Examples

- This command allows the switch to configure a TCAM feature.

```

switch(config)# hardware tcam

```

```
switch(config-hw-tcam) # feature
```

- This command allows the switch to configure a TCAM profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam) # profile
```

- This command allows the switch to configure a TCAM system profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam) # system
```

### 11.1.8.28 CPU Traffic Policy

Create a TCAM profile to enable actions such as permit, deny, and police in hardware before the traffic gets to the kernel for processing. The action is taken based on IP packet header information such as DSCP, L4 port values, fragmentation bits, etc.

#### TCAM Profile Example

The following file extract displays an example of a TCAM profile, **cpu-traffic-policy**, with features configured to enable CPU traffic policy.

```
hardware tcam
 profile cpu-traffic-policy
 feature acl port ip
 sequence 45
 key size limit 160
 key field dscp dst-ip ip-frag ip-protocol 14-dst-port 14-ops 14-src-port src-ip tcp-
control ttl
 action count drop
 packet ipv4 forwarding bridged
 packet ipv4 forwarding routed
 packet ipv4 forwarding routed multicast
 packet ipv4 mpls ipv4 forwarding mpls decap
 packet ipv4 mpls ipv6 forwarding mpls decap
 packet ipv4 non-VXLAN forwarding routed decap
 packet ipv4 VXLAN eth ipv4 forwarding routed decap
 packet ipv4 VXLAN forwarding bridged decap
 feature acl port ipv6
 sequence 25
 key field dst-ipv6 ipv6-next-header ipv6-traffic-class 14-dst-port 14-ops-3b 14-src-port
src-ipv6-high src-ipv6-low tcp-control
 action count drop mirror
 packet ipv6 forwarding bridged
 packet ipv6 forwarding routed
 packet ipv6 forwarding routed multicast
 packet ipv6 ipv6 forwarding routed decap
 feature acl subintf ip
 sequence 40
 key size limit 160
 key field dscp dst-ip ip-frag ip-protocol 14-dst-port 14-ops-18b 14-src-port src-ip tcp-
control ttl
 action count drop mirror
 packet ipv4 forwarding routed
 feature acl subintf ipv6
 sequence 15
 key field dst-ipv6 ipv6-next-header 14-dst-port 14-src-port src-ipv6-high src-ipv6-low
tcp-control
 action count drop mirror redirect
 packet ipv6 forwarding routed
 feature counter lfib
 sequence 85
 feature mpls
 sequence 5
 key size limit 160
 action drop redirect set-ecn
 packet ipv4 mpls ipv4 forwarding mpls decap
 packet ipv4 mpls ipv6 forwarding mpls decap
```

```

packet mpls ipv4 forwarding mpls
packet mpls ipv6 forwarding mpls
packet mpls non-ip forwarding mpls
feature mpls pop ingress
sequence 90
feature pbr mpls
sequence 65
key size limit 160
key field mpls-inner-ip-tos
action count drop redirect
packet mpls ipv4 forwarding mpls
packet mpls ipv6 forwarding mpls
packet mpls non-ip forwarding mpls
feature qos ip
sequence 75
key size limit 160
key field dscp dst-ip ip-frag ip-protocol 14-dst-port 14-ops 14-src-port src-ip
action set-dscp set-policer set-tc
packet ipv4 forwarding routed
packet ipv4 forwarding routed multicast
packet ipv4 mpls ipv4 forwarding mpls decap
packet ipv4 mpls ipv6 forwarding mpls decap
packet ipv4 non-VXLAN forwarding routed decap
feature qos ipv6
sequence 70
key field dst-ipv6 ipv6-next-header ipv6-traffic-class 14-dst-port 14-src-port src-ipv6-
high src-ipv6-low
action set-dscp set-policer set-tct
packet ipv6 forwarding routed
feature traffic-policy cpu ipv4
sequence 1
key size limit 160
key field dst-ip ip-frag ip-protocol 14-dst-port 14-src-port src-ip
action count set-drop-precedence set-policer
feature traffic-policy cpu ipv6
sequence 2
key field dst-ipv6 ipv6-next-header 14-dst-port 14-src-port src-ipv6-high src-ipv6-low
action count set-drop-precedence set-policer
system profile cpu-traffic-policy

```

## Configuring the Policy

The following command configures a **cpu traffic-policy** under the traffic-policies global configuration mode.

```

traffic-policies
cpu traffic-policy <name> vrf <vrf-list>
traffic-policy <name>
 match <rule-name> <ipv4 | ipv6> [<after | before> <rule-name>]
 source prefix A.B.C.D/E [A.B.C.D/E]
 destination prefix A.B.C.D/E [A.B.C.D/E]
 protocol <protocol-list> | {tcp,udp}
 [source port <port-list> |
 field-set <port-set-name>] |
 [destination port <port-list> |
 field-set <port-set-name>]
 actions
 drop
 police rate <rate> <unit>
 count

```

The following command applies a policy to all the VRFs. The policy is applied to all the interfaces belonging to each VRF.

```

traffic-policies
cpu traffic-policy <name> vrf all

```

## Default Rules

The **ipv4-all-default** and **ipv6-all-default** rules are programmed by default and cannot be reordered or removed. Only the associated action can be changed. The **permit** rule is never installed and is the default action for packet processing.

## Examples

### L3 Protocol Match Criteria (protocol neighbors bgp)

The following example displays the configuration of a profile to match a set of configured protocol peers, allowing only TCP traffic from those BGP peers.

```

traffic-policies
 cpu traffic-policy <name> vrf <vrf-list>
 traffic-policy <name>
 match <rule-name> <ipv4 | ipv6> [<after | before> <rule-name>]
 source prefix A.B.C.D/E [A.B.C.D/E]
 destination prefix A.B.C.D/E [A.B.C.D/E]
 protocol <protocol-list> | {tcp,udp}
 [source port <port-list> |
 field-set <port-set-name>] |
 [destination port <port-list> |
 field-set <port-set-name>]
 actions
 drop
 police rate <rate> <unit>
 count

traffic-policies
 cpu traffic-policy <traffic-policy-name> vrf all
 match <rule-name> <ipv4 | ipv6> [<after | before> <rule-name>]
 protocol neighbors bgp
 actions
 drop

traffic-policies
 cpu traffic-policy foo vrf all
 traffic-policy foo
 match BGP ipv4
 protocol neighbors bgp

```

The following policy permits dynamic peers from the listen-range **2.0.0.0/24** and all IPv6 BGP LL peers.

```

traffic-policies
 traffic-policy cpuPolicy
 match BGP ipv4
 protocol neighbors bgp
 match BGP-DYN ipv4
 source prefix 2.0.0.0/24
 match BGP-LL ipv6
 source prefix fe80::/64

```

**Note:** Configuring any match criteria will result in a CLI error when combined with the **protocol neighbor bgp** match criteria as these conflict with the expanded BGP rules.

The following displays error messages with conflicting configurations.

```

traffic-policies
 traffic-policy cpuPolicy
 match BGP ipv4
 protocol neighbors bgp
 source prefix 1.0.0.1/32
! The 'source prefix' subcommand is not supported when the 'protocol neighbors' subcommand is
configured.

traffic-policies
 traffic-policy cpuPolicy
 match BGP ipv4
 source prefix 1.0.0.1/32
 protocol neighbors bgp
! The 'protocol neighbors' subcommand is not supported when any other match subcommands are
configured.

```

---

Disable the ability to add implicit rules matching on fragmented packets:

```
switch(config-traffic-policies)# cpu traffic-policy fragment implicit-permit disabled.
```

### Deny other BGP Traffic

The following example displays a policy to permit BGP and BFD sessions with management IPv4 addresses. This policy is inadequate/non optimal as it attempts to create BGP sessions (for example) from **1.0.0.0/24** which pass through this policy unfiltered.

```
traffic-policies
 cpu traffic-policy CPU vrf all
 traffic-policy CPU
 match BGP ipv4
 protocol neighbors bgp
 match BFD ipv4
 source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop
```

The following example displays a policy to permit (or drop) specific BGP and BFD sessions with management IPv4 addresses. This policy is more granular than the previous one and easier to implement for administrators.

```
traffic-policies
 cpu traffic-policy CPU
 traffic-policy CPU
 match BGP ipv4
 protocol neighbors bgp
 match BGP-REST ipv4
 protocol tcp udp destination port 179
 actions
 drop
 match BFD ipv4
 source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop
```

The following example also shows a policy to permit (or drop) specific BGP and BFD sessions with management IPv4 addresses. This policy is also granular and easier to implement for administrators. The clause matches any inbound traffic destined for the configured BGP port(s).

```
traffic-policies
 cpu traffic-policy CPU
 traffic-policy CPU
 match BGP ipv4
 protocol neighbors bgp
 match BGP-REST ipv4
 protocol bgp
 actions
 drop
 match BFD ipv4
 source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop
```

## Actions

**Drop:** the packet is discarded on a match

**Police:** tracks the usage of each BGP neighbor and holds it to a maximum rate.

The **police rate <rate-value> [rate-unit]** command sets the policing rate. The optional **rate-unit** values are bps, kbps (default), mbps, and gbps. The following example configures a policing rate of 15 kbps for each BGP neighbor.

```
traffic-policies
 cpu traffic-policy CPU vrf all
 traffic-policy CPU
 match BGP ipv4
 protocol neighbors bgp
 actions
 police rate 15 kbps
```

## Count

The following example enables counters for the CPU traffic policy to count all packets matching the rule in which the **count** action is configured.

```
no hardware counter feature acl out <address-family>
hardware counter feature traffic-policy cpu

traffic-policies
 cpu traffic-policy CPU vrf all
 traffic-policy CPU
 match BGP ipv4
 protocol neighbors bgp
 actions
 count
```

## Use-case Scenarios

### Securing BGP Neighbors

The following implements a policy to secure BGP neighbors.

```
traffic-policies
 cpu traffic-policy CPU-DEFAULT vrf all
 traffic-policy CPU-DEFAULT
 match ICMPV6 ipv6
 protocol icmpv6
 match BGP ipv4
 protocol neighbors bgp
 match BGP-OTHER ipv4
 protocol bgp
 actions
 drop
 match BGP6 ipv6
 protocol neighbors bgp
 match BGP-OTHER6 ipv6
 protocol bgp
 actions
 drop
 match OSPF ipv4
 protocol ospf
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop
```

## Whitelist BFD Neighbors (not neighbor-specific)

Add the following rule to permit BFD neighbors.

```
traffic-policies
```

```

traffic-policy CPU-DEFAULT
 match BFD-DPORT ipv4
 protocol udp destination port 3784-3785
 match BFD-SPORT ipv4
 protocol udp source port 49152
 match BFD-DPORT6 ipv6
 protocol udp destination port 3784-3785
 match BFD-SPORT6 ipv6
 protocol udp source port 49152
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop

```

### **Whitelist a few Common Control-plane Protocols and Deny others**

Add the following rule to permit protocols such as ICMPv6 while denying others.

```

traffic-policies
cpu traffic-policy CPU-DEFAULT vrf all
traffic-policy CPU-DEFAULT
 match ICMPV6 ipv6
 protocol icmpv6
 match BGP ipv4
 protocol neighbors bgp
 match BGP-OTHER ipv4
 protocol bgp
 actions
 drop
 match BGP6 ipv6
 protocol neighbors bgp
 match BGP-OTHER6 ipv6
 protocol bgp
 actions
 drop
 match OSPF ipv4
 protocol ospf
 match PIM4 ipv4
 protocol pim
 match PIM6 ipv6
 protocol pim
 match ipv4-all-default ipv4
 actions
 drop
 match ipv6-all-default ipv6
 actions
 drop

```

#### **11.1.8.29 URL-based Field Sets in Traffic Policy**

##### **Overview**

Using field sets in Traffic Policies allows you to easily reuse groups of prefixes, ports, and VLAN IDs in multiple rules without copying and pasting the configuration to each rule. The number of entries in a field set could be a very large number up to hundreds of thousands entries. Loading a large configuration can be costly in terms of time and length of output. Using a URL-based approach allows you to use multiple field sets in a URL and update the entries in a single location.

The field sets update when exiting from the traffic-policies configuration mode or manually using the [refresh traffic-policy field-set](#) command.

##### **Configuring URL-based Field Sets for Traffic Policies**

Use the following commands to configure a URL-based field set for an IPv4 field set:

```
switch(configure)# traffic-policies
```

```
switch(config-traffic-policies)# field-set ipv4 prefix mybigfieldset 10.0.0.0/8
switch(config-traffic-policies-field-set-ipv4-mybigfieldset)# source http://10.0.0.1/mybigfield
set.txt
```

IPv4 addresses can use the format **A.B.C.D** or **A.B.C.C/E**. IPv6 addresses can use the format **A:B:C:D:E:F:G:H** or **A:B:C:D:E:F:G:H/I**.

Use the parameter **except** to create exceptions for specific IPv4 addresses:

```
switch(config-traffic-policies-field-set-ipv4-mybigfieldset)# 10.0.0.0/8 except 10.0.0.21
```

Use the parameter **remove** to remove IP prefixes from the IP prefix set:

```
switch(config-traffic-policies-field-set-ipv4-mybigfieldset)# remove 10.0.0.0/8
```

Add your URL location to the configuration in one of the following formats:

- **and-results** - AND option to join two field sets together.
- **bgp** - Provide a list of BGP prefixes.
- **file:** - Use local URL to load the field set entries.
- **flash:** - Use the local URL from a flash drive and add the field set entries.
- **http:** - Use a remote URL to load the field set entries.
- **https:** - Use a remote URL to load the field set entries
- **scp:** - Use a remote URL to load the field set entries.
- **static** - Configure a static entry for field sets.

#### 11.1.8.30 Configuring Dynamic Link Flap Damping

To configure Dynamic Link Flap Damping, create profiles and then apply the profiles to interfaces. A profile contains the following set of configurable parameters required by the damping algorithm:

- **Remote Fault Penalty**
- **Local Fault Penalty**
- **Maximum Threshold**
- **Suppress Threshold**
- **Reuse Threshold**
- **Demerit Half Life Time**

#### Configuring Link Flap Damping Profiles

To create a new damping profile or modify an existing profile, use the **monitor link-flap policy** command to enter the damping profile configuration mode.

##### Example

Use the following commands to configure a damping profile, *MyDampingProfile*:

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile MyDampingProfile damping
switch(config-link-flap-damping-profile-MyDampingProfile)# penalty mac
fault local 1500
switch(config-link-flap-damping-profile-MyDampingProfile)# penalty mac
fault remote 1800
switch(config-link-flap-damping-profile-MyDampingProfile)# penalty
threshold reuse 800 suppression 2200 maximum 15000
```

```
switch(config-link-flap-damping-profile-MyDampingProfile) # penalty
decay half-life 90 seconds
```

## Applying Damping Profiles to Interfaces

Apply the configured damping profiles to interfaces or to groups of interfaces on the switch using one of two methods:

- Create a damping profile and assign it to an interface or a group of interfaces.
- Create a damping profile and designate it as the **default** profile. This profile automatically applies to all interfaces without Link Flap Damping explicitly disabled that do not have damping profiles assigned to them.

### Example

To apply the damping profile, **MyDampingProfile**, to the interface, **Ethernet3/9/1**, use the following commands:

```
switch(config) # interface Ethernet3/9/1
switch(config-if-Et3/9/1) # monitor link-flap profiles MyDampingProfile
```

Assign multiple profiles to an interface using the following command:

```
switch(config) # interface Ethernet3/9/1
switch(config-if-Et3/9/1) # monitor link-flap profiles dp1 dp2 dp3
```

Any of the profiles can assign the **damped** state to the interface. The interface stays in the **damped** state if one of the profiles assigned to it assigns the **damped** state to it.

To remove all profiles from the interface, use the following commands:

```
switch(config) # interface Ethernet3/9/1
switch(config-if-Et3/9/1) # no monitor link-flap profiles
```

## Adding Default Damping Profiles

Configure one or more damping profiles as default profiles on the switch. Profiles automatically apply to all interfaces on the switch without damping profiles that do not explicitly disable Link Flap Damping. Default profiles also apply to interfaces subsequently added to the switch.

### Examples

Use the following commands to set a damping profile or group of profiles as the default damping profile on the switch:

```
switch(config) # monitor link-flap policy
switch(config-link-flap) # default-profiles dp1 dp2 dp5
```

To remove the default profiles, use the following commands:

```
switch(config) # monitor link-flap policy
```

```
switch(config-link-flap) # no default-profiles
```

## Enabling and Disabling Link Flap Damping

Link Flap Damping can be enabled or disabled on a per-interface basis.

### Examples

To enable Link Flap Damping on interface, **Ethernet3/9/1**, use the following commands:

```
switch(config) # interface Ethernet3/9/1
switch(config-if-Et3/9/1) # default monitor link-flap
```

To disable Link Flap Damping on interface, **Ethernet3/9/1**, use the following commands:

```
switch(config) # interface Ethernet3/9/1
switch(config-if-Et3/9/1) # no monitor link-flap
```

## Displaying Dynamic Link Flap Damping

To display the current status of all interfaces enabled with Link Flap Damping, use the **show interface link-flap damping** command:

### Example

```
switch(config) # show interface link-flap damping
Interface Profile Penalty Suppressed Re-use
----- -----
Ethernet1 TestProfile1 2000 2023-10-24 18:47:00 2023-10-24 18:48:25
Ethernet1 TestProfile2 0 -
Ethernet3 TestProfile1 2500 2023-10-24 18:46:59 2023-10-24 18:48:43
Ethernet3 TestProfile2 300 -
```

The output displays the following information about Link Flap Damping:

- **Interface** - The name of interfaces with one or more damping profiles assigned to them. An interface may be displayed more than once if it gets assigned multiple profiles.
- **Profile** - The name of the assigned profile on the interface
- **Penalty** - The current Damping Demerit value assigned to the profile.
- **Suppressed** - The timestamp when the profile placed the interface into *damped* state. If not in *damped* state, no information is displayed for the interface.
- **Re-use** - The timestamp when the profile releases the interface from the *damped* state if no further link flapping is detected on the interface.

## Displaying the Interface Status

Use the **show interfaces status** command to display the status of interfaces on the switch. When configured on an interface, Link Flap Damping information is displayed in the output of the command.

### Example

```
switch(config) # show interfaces Ethernet3/9/1 status
Port Name Status Vlan Duplex Speed Type Flags
Encapsulation
Et3/9/1 notconnect 1 full 100G 100GBASE-CR4 d
```

---

```
Flags : m - Under Maintenance
v - Violating traffic threshold
d - Interface state is damped
```

### 11.1.8.31 TCAM Profile for Configurable Port Qualifier Sizing

You can create a TCAM profile from scratch, or changes can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

#### Modifying a Default TCAM Profile to allow Dynamic Sizing for ACL Labels

The following commands create a copy of the default TCAM profile, name it **port-qualifier-size**, and configure it to support a 6-bit dynamic sizing for ACL labels for IPKGV. After the profile has been created, it can be applied to the system.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile port-qualifier-size copy default
switch(config-hw-tcam-profile-port-qualifier-size)# feature port-qualifier-size ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-size)# port-qualifier-
size 6
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-size)# exit
switch(config-hw-tcam-profile-port-qualifier-size)# feature acl port ip
switch(config-hw-tcam-profile-port-qualifier-size)# exit
switch(config-hw-tcam)# exit
switch(config) #
```

#### Verifying the Configuration of Dynamic Qualifier Size

The following command verifies the configuration.

```
switch# show running-config
hardware tcam
 profile port-qualifier-size
 feature acl port ip
 port qualifier size 6 bits
```

#### Verifying the Configuration of System Profile

You can use the following command to verify the system profile was configured and applied successfully. The profile name appears in both the Configuration and Status columns.

```
switch# show hardware tcam profile
 Configuration Status
Linecard1 port-qualifier-size
Linecard2 port-qualifier-size
Linecard3 port-qualifier-size
```

When the profile is not applied correctly, the Status column shows ERROR.

```
switch# show hardware tcam profile
 Configuration Status
Linecard1 port-qualifier-size
Linecard2 port-qualifier-size
Linecard3 port-qualifier-size
```

**Note:** The packet type, the key field must be set. The dynamic qualifier size can be set for ACL. Not all hardware platforms support this feature. Modular systems require all line cards to support this feature for the profile to be applicable.

### 11.1.8.32 Internet Control Message Protocol (ICMP) Probing

ICMP probing provides a method of querying interface status from an ARP or Neighbor Discovery table remotely. It uses a request and a response protocol, similar to ping, but instead of simply responding to the request, the response returns information about a local interface or a remote neighbor. ICMP probing sends the request to the proxy node which can be identified by an interface index, interface name, or an IP address. A neighbor adjacent to the proxy node can be identified by the IP address.

#### Configuring ICMP Probing

Configure ICMP probing using the Router General Configuration Mode to add the functionality to the switch.

```
switch(config) # router general
switch(config-router-general) # icmp probe
switch(config-router-general-icmp-probe) # probe vrf default
switch(config-router-general-icmp-probe) # query-types all
```

The ICMP probing responds all probing requests on the default VRF. Permit each query type using the following parameters:

- **addr** - Allow query by interface address.
- **all** - Allow all query types.
- **ifindex** - Allow query by interface address.
- **ifname** - Allow query by interface name.
- **remote** - Allow query by remote node address.

EOS permits probe requests using the default control plane ACL. To add limitations to the control plane ACL that permits or denies probe requests, use the parameter **icmp-extended-echo**.

#### Example

To allow probe requests from only the subnet 10.255.0.0/24, use the following commands:

```
switch(config-acl-control-plane) # permit icmp 10.255.0.0/24 any
 extended-echo-request
switch(config-acl-control-plane) # deny icmp any any extended-echo-request
```

#### Sending ICMP Probe Requests

To send a probe request to a remote system, use the **probe** execute command. Specify the destination and the identification of the interface or remote neighbor to probe. Additional parameters identify the probe target such as an interface local to the proxy node or a neighbor adjacent to the proxy node. Use IPv4 or IPv6 addresses, the interface index, or the interface name to specify the local host. Specify a remote neighbor using an IPv4 or IPv6 address. to specify a local inter

```
switch# probe 10.255.1.1
```

Additional parameters can be specified including the following:

- **interval** - Specify the interval between probe messages..
- **repeat** - Specify the number of times to send the probe message.
- **source** - Specify the source address or choose an address from the specified interface.

### Example

To send a probe to 10.255.1.1 with an interface index of 1, use the following command:

```
switch> probe 10.255.1.1 ifindex 1
PROBE 10.255.1.1 ifIndex 1
Interface active with IPv4 configured from 10.255.1.1: icmp_seq=0
time=0.680 ms
Interface active with IPv4 configured from 10.255.1.1: icmp_seq=1
time=0.477 ms
Interface active with IPv4 configured from 10.255.1.1: icmp_seq=2
time=0.362 ms
--- 10.255.1.1 PROBE statistics ---
3 packets transmitted, 3 received, 0% packet loss
3 (100%) successful probes
3 (100%) Interface active with IPv4 configured
```

## Displaying ICMP Probing Information

The **show icmp probe** command displays the following information:

```
switch# show icmp probe
VRF default:
Probe responses are enabled
Query types allowed: ifname, ifindex, addr, remote

PROBE requests received: 0
PROBE requests dropped due to size of queue: 0
PROBE responses sent: 0
PROBE requests received but too short: 0
PROBE requests received with an incorrect ICMP checksum: 0
PROBE requests received with a malformed ICMP extension header: 0
PROBE requests received with an incorrect ICMP extension checksum: 0
PROBE requests received with a bad ICMP extension object: 0
PROBE requests received with a request type that is not allowed: 0
PROBE requests for which we could not determine the interface: 0
PROBE requests which requested an interface in a different VRF: 0
PROBE requests for a remote node but specify an interface name or index: 0
PROBE responses that could not be sent due to a socket error: 0
The most recent socket error when sending a response: none
```

The first section displays the status as the location of the VRF with probe responses enable and the types of permitted queries.

The second section displays the counters for probe requests received from a client and the failure reason when not generating a successful response.

## 11.1.9 Ethernet Configuration Commands

### Global Configuration Commands

- [clear counters](#)
- [clear VXLAN counters](#)
- [hardware port-group](#)
- [hardware counter feature](#)
- [hardware counter feature in \(DCS-7050x, 7350x, 7300x\)](#)
- [hardware tcam](#)
- [interface ethernet](#)
- [interface ethernet create](#)
- [interface management](#)
- [monitor ethernet oam](#)
- [monitor link-flap policy default-profiles](#)
- [monitor link-flap policy profile damping](#)
- [traffic-policies field-set](#)
- [transceiver channel](#)
- [transceiver qsfp default-mode](#)

### EOAM Configuration Commands

- [link-error](#)
- [monitor ethernet oam profile](#)
- [profile](#)

### Connectivity Fault Management (CFM) Commands

- [cfm](#)
- [cfm continuity-check](#)
- [cfm domain](#)
- [cfm measurement](#)
- [cfm measurement delay](#)
- [cfm measurement loss](#)
- [cfm profile](#)
- [show cfm continuity-check end-point](#)
- [show cfm endpoint](#)
- [show cfm measurement delay proactive](#)
- [show cfm measurement loss proactive](#)

### Hardware TCAM Commands

- [feature](#)
- [system](#)

### Ethernet and Management Interfaces Commands

- [flowcontrol receive](#)
- [flowcontrol send](#)
- [link-debounce](#)
- [mac-address](#)

- 
- poe disabled
  - poe legacy detect
  - poe limit
  - power budget
  - power budget exceed action (warning | hold-down)
  - speed

### **Link-error Configuration Commands**

- action
- period
- phy link detection aggressive
- recovery-time
- threshold

### **Link-Flap Damping Profile Configuration Commands**

- penalty mac fault
- penalty threshold

### **Traffic Policies Commands**

- refresh traffic-policy field-set
- traffic-policies field-set

### **Interface Display Commands**

- show hardware counter
- show hardware port-group
- show hardware system forwarding-chips
- show interface counters
- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters ip
- show interfaces counters queue
- show interfaces counters rates
- show interfaces flow-control
- show interfaces hardware
- show interfaces hardware default
- show interfaces interactions
- show interface link-flap damping
- show interfaces negotiation
- show interfaces phy
- show interfaces status
- show interfaces status errdisabled
- show interfaces transceiver
- show interfaces transceiver channels
- show interfaces transceiver hardware
- show interfaces transceiver properties
- show monitor ethernet oam profile

- show platform fm6000 agileport map
- show platform trident flexcounters
- show platform trident flexcounters l3intf
- show poe
- show route counters
- show VXLAN counters vni

**400GBASE-ZR Transceivers Display Commands**

- show interface transceiver dom
- show interface transceiver eeprom
- show transceiver status interface

**Shared Support across Multiple Subinterfaces Commands**

- qos scheduling
- show qos scheduling

---

### 11.1.9.1 action

The **action** command configures the link monitoring action that is specified for the link fault signaling event.

The **no action** command removes the action type specified for the chosen link fault signaling. The **default action** command configures the link monitoring action as system log type.

#### Command Mode

Link-error Configuration

#### Command Syntax

```
{fcs | symbol} action [linkfault | errdisable | log]
no {fcs | symbol} action [linkfault | errdisable | log]
default {fcs | symbol} action [linkfault | errdisable | log]
```

#### Parameters

- **fcs** Inbound packets with frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **linkfault** The link fault action type.
- **errdisable** The errdisable action type.
- **log** The system log action type.

#### Related Commands

- [period](#)
- [threshold](#)

#### Example

These commands set the errdisable action for symbol error in link-error configuration mode in profile **profile1**.

```
switch(config)# monitor ethernet oam
switch(config-oeam)# profile profile1
switch(config-oeam-profile-profile1)# link-error
switch(config-oeam-profile-profile1-link-error)# symbol action errdisable
```

### 11.1.9.2 clear counters

The **clear counters** command in **privileged EXEC** mode resets the counters to zero for the specified interfaces including VLAN interfaces, sub-interfaces, and GRE tunnel interfaces.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear counters [vlan vlanId | tunnel tunnelID][[route][[ipv4 | ipv6][vrf]]]
```

#### Parameters

- **vlan *vlanId*** Clears the VLAN Interface and subinterface Ingress and Egress counters.
- **tunnel *tunnelID*** Clears the counters only for the specified tunnel.
- **route** Clears the route counters.
  - **ipv4** Allows targeting the clearing of IPv4 route counters.
  - **ipv6** Allows targeting the clearing of IPv6 route counters.
- **vrf** Allows specifying a VRF to only clear the route counters for that VRF.

#### Examples

- Clears the VLAN interface and subinterface ingress and egress counters.

```
switch# clear counters vlan vlanId
```

- Clears the GRE tunnel interface ingress and egress counters.

```
switch# clear counters tunnel tunnelID
```

---

### 11.1.9.3 clear VXLAN counters

Use the **clear VXLAN counters** command to clear the VXLAN encapsulation and decapsulation counters.

#### Command Mode

EXEC

#### Command Syntax

```
clear VXLAN counters [[vni | [vtep [vtep-ip-address | unlearnt]]]
```

#### Parameters

- **vni** Clears the VXLAN counters.
- **vtep** Clears the VTEP counters.
  - **vtep-ip-address** Clears the counters for the specified VTEP.
  - **unlearnt** Clears the counters for unlearned VTEPs. Unlearned VTEPs track the counts of packets the switch receives before the VTEP is learned.

#### 11.1.9.4 cfm

The **cfm** command places the switch in CFM configuration mode to configure connectivity fault management on a Layer 3 interface.

The **default** or **no** commands remove the profile from the configuration.

##### Command Mode

Global Configuration

##### Command Syntax

```
switch(config-cfm)# continuity-check {loc-state | action | disable | interface | routing}
switch(config-cfm)# domain domain_name level 0-7 intermediate-point
```

##### Parameters

- **continuity-check** - Configure continuity check global settings.
- • **loc-state** - Configure settings when LOC detected.
  - **action** - Configure the action to take based on LOC state.
  - **disable** - Toggle the interface based on LOC state.
  - **interface** - Apply the action to the interfaces.
  - **routing** - Disable routing for the interfaces.
- **domain** - Configure a maintenance domain.
  - **domain-name** - Configure a name for the maintenance domain.
- **level** - Configure a maintenance domain level from 0 to 7.
- **intermediate-point** - Configure the switch as a Maintenance intermediate point in this domain.

##### Example

To display details about a CFM continuity-check configuration on a switch, use the following command:

```
switch(config-cfm)# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared
----- -----
 2 reachable never never
```

---

### 11.1.9.5 cfm continuity-check

The **cfm** command places the switch in CFM configuration mode to configure connectivity fault management on a Layer 3 interface.

The **default** command sets the default alarms for defects to **loc-state**. The **no** command disables the alarms for the defect.

#### Command Mode

Global Configuration

#### Command Syntax

```
continuity-check loc-state action disable interface routing
```

#### Parameters

- **continuity-check** - Configure continuity check global settings.
- • **loc-state** - Configure settings when LOC detected.
  - **action** - Configure the action to take based on LOC state.
  - **disable** - Toggle the interface based on LOC state.
  - **interface** - Apply the action to the interfaces.
  - **routing** - Disable routing for the interfaces.

#### Example

The following command configures the switch in **cfm** configuration mode and disables routing for the interfaces.

```
switch(config-cfm)# continuity-check loc-state action disable interface routing
```

### 11.1.9.6 cfm domain

The **cfm domain *domain-name*** command places the switch in CFM configuration mode to configure a maintenance domain on a device.

The **no** or **default** commands unconfigures the maintenance domain.

#### Command Mode

Global Configuration

#### Command Syntax

```
switch(config-cfm)# domain domain-name level 0-7 intermediate-point
```

#### Parameters

- **domain** - Configure a maintenance domain.
  - *domain-name* - Configure a name for the maintenance domain.
- **level** - Configure a maintenance domain level from 0 to 7.
- **maintenance-association** - Configure a maintenance association name.
  - *1-65535* - Maintenance association name
  - **direction [up | down]** - Set local maintenance end point direction as **down** or **up**.
  - **end-point 1-8191** - Configure local maintenance end point and set the local maintenance end point ID.
  - **profile *profile\_name*** - Apply a connectivity fault management profile.
  - **remote end-point 1-8191** - Configure remote parameters for an end-point.
  - **vlan 1-4094** - Set the VLAN in the maintenance association.

#### Example

To configure a maintenance domain with the name *main-domain* and a level of 5, use the following command:

```
switch(config-cfm)# domain main-domain level 5
```

---

### 11.1.9.7 cfm measurement

The **cfm measurement** command places the switch in CFM configuration mode to configure Ethernet OAM loss on a device.

#### Command Mode

Global Configuration

#### Command Syntax

```
measurement loss [inband | synthetic]
```

#### Parameters

- **loss** - Ethernet OAM loss measurement functions.
  - **inband** - Enable hardware support for OAM loss measurement.
  - **synthetic** - Enable hardware support for OAM synthetic loss measurement.

#### Example

To configure measurement for CFM as `inband`, use the following command:

```
switch(config-cfm)# measurement loss inband
```

### 11.1.9.8 cfm measurement delay

The **cfm measurement delay** command configures Ethernet OAM Delay Measurement on a transmitter switch. Ethernet OAM Measurement Delay determines the network delay between a transmitter and a responder to manage network connectivity.

#### Command Mode

CFM Configuration Mode

#### Command Syntax

```
measurement delay single-ended tx-interval [10 | 100 | 1000 | 10000 | 60000 | 600000] milliseconds
```

#### Parameters

- **singled-ended** - Enables transmission of Two-way or Single-ended DMM PDUs in proactive mode.
- **tx-interval** - Configure the interval between successive measurement frames. EOS supports the following interval lengths:
  - **10 milliseconds** - Specify 10 milliseconds.
  - **100 milliseconds** -Specify 100 milliseconds.
  - **1000 milliseconds** - Specify 1000 milliseconds (1 second).
  - **10000 milliseconds** - Specify 10000 milliseconds (10 seconds).
  - **60000 milliseconds** - Specify 60000 milliseconds (1 minute).
  - **600000 milliseconds** - Specify 600000 milliseconds (10 minutes).

EOS supports only the listed times in milliseconds.

#### Example

Use the following command to configure the switch as a Delay Measurement transmitter in proactive mode and set the transmit interval to 10000 milliseconds:

```
switch(config)# cfm
switch(config-cfm)# measurement delay single-ended
switch(config-cfm)# measurement delay tx-interval 10000 milliseconds
```

---

### 11.1.9.9 cfm measurement loss

The **cfm measurement loss** command configures a switch as an Initiator or Responder for Ethernet OAM Loss Measurement for frame loss on large networks. The **no** | **default** parameters remove the configuration from the **running-config** on the switch.

#### Command Mode

CFM Configuration Mode

#### Command Syntax

```
measurement loss [inband | synthetic] tx-interval [10 | 100 | 1000 | 10000 |
60000 | 600000] milliseconds period transmission_frames
```

#### Parameters

- **inband** - Configure Ethernet OAM frame loss between connections.
- **inband** - Configure Ethernet OAM synthetic frame loss between connections.
- **singled-ended** - Enables transmission of Two-way or Single-ended LMM PDUs in proactive mode.
- **tx-interval** - Configure the interval between successive measurement frames. EOS supports the following interval lengths:
  - **10 milliseconds** - Specify 10 milliseconds.
  - **100 milliseconds** -Specify 100 milliseconds.
  - **1000 milliseconds** - Specify 1000 milliseconds (1 second).
  - **10000 milliseconds** - Specify 10000 milliseconds (10 seconds).
  - **60000 milliseconds** - Specify 60000 milliseconds (1 minute).
  - **600000 milliseconds** - Specify 600000 milliseconds (10 minutes).

EOS supports only the listed times in milliseconds.

#### Example

Use the following command to configure the switch as a Loss Measurement transmitter in proactive mode and set the transmit interval to 10000 milliseconds:

```
switch(config) # cfm
 switch(config-cfm) # measurement loss singled-ended
 switch(config-cfm) # measurement loss tx-interval 10000 milliseconds
```

### 11.1.9.10 cfm profile

The **cfm profile** command places the switch in CFM configuration mode to configure a CFM profile.

The **no** or **default** commands unconfigures the CFM profile.

#### Command Mode

Global Configuration

#### Command Syntax

`profile profile-name alarm indication client level 0-7 tx-interval 1-1 [minutes |seconds]`

#### Parameters

- **alarm** - Configure alarm indication signal protocol parameters.
  - **indication** - Configure alarm indication signal protocol parameters.
  - **client** - Configure client maintenance domain level for AIS transmission.
  - **level 0-7** - Configure client maintenance domain level for AIS transmission. Choose a level between 0 and 7.
  - **tx-interval [minutes | seconds]** - Sets the time for periodic transmission of CCMs. Configure *interval* in minutes or seconds. For example, set the interval and unit to one of the following supported transmission intervals:
    - 3.33 milliseconds
    - 10 milliseconds
    - 100 milliseconds
    - 1 second
    - 10 seconds
    - 1 minute
    - 10 minutes

The **no** or **default** command sets the transmission interval to the default value of 1 second.

- **continuity-check alarm defect** - Configure defects that raise alarms.
  - **cross-connection** - Raise alarms when cross connection defects occur on the network. The defect logs when a local MEP receives a CCM PDU from another maintenance association.
  - **error-ccm** - Raise alarms when invalid CCMs occur on the network. The defect logs when a local MEP receives a CCM PDU with the wrong CCM transmission interval or has an unconfigured RMEP ID or the RMEP ID is the same as the local MEP ID.
  - **loc-state** - Raise alarms when a loss of connectivity occurs on the network. The defect logs when a local MEP loses connectivity with a remote MEP. Enabled by default.
  - **rdi-ccm** - Raise alarms when CCMs with the RDI bit set occur on the network. The defect logs when a local MEP receives a CCM with the RDI flag set to *true* from the remote MEP. Enabled by default.
- **measurement [delay | loss]** - Configure delay or loss measurement.
  - **delay**
    - **qos cos 0-7** - Configure QoS parameters and set **cos** to a value between 0 and 7.
    - **single-ended** - Configure single-ended performance measurement.
    - **tx-interval [minutes | seconds]** - Sets the time for periodic transmission of CCMs. Configure **interval** in minutes or seconds. For example, set the interval and unit to one of the following supported transmission intervals:

- 
- 3.33 milliseconds
  - 10 milliseconds
  - 100 milliseconds
  - 1 second
  - 10 seconds
  - 1 minute
  - 10 minutes
- **loss**
    - **qos cos 0-7** - Configure QoS parameters and set **cos** to a value between 0 and 7.
    - **single-ended** - Configure single-ended performance measurement.
    - **synthetic** - Configure synthetic loss measurement.
    - **qos cos 0-7** - Configure QoS parameters and set **cos** to a value between 0 and 7.
    - **single-ended** - Configure single-ended performance measurement.
  - **tx-interval [minutes | seconds]** - Sets the time for periodic transmission of CCMs. Configure **interval** in minutes or seconds. For example, set the interval and unit to one of the following supported transmission intervals:
    - 3.33 milliseconds
    - 10 milliseconds
    - 100 milliseconds
    - 1 second
    - 10 seconds
    - 1 minute
    - 10 minutes

### 11.1.9.11 feature

The **feature** command allows the user to reserve the number of TCAM banks for the following features: ACL, flow-spec, IPsec, I2-protocol, PBR, QoS, TCP-MSS-ceiling, and traffic-policy.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Hardware TCAM

#### Command Syntax

```
feature
```

#### Example

This command allows the switch to configure the TCAM flow-spec feature for IPv4 ports.

```
switch(config-hw-tcam) # feature flow-spec port ipv4 bank maximum count 12
```

### 11.1.9.12 flowcontrol receive

The **flowcontrol receive** command configures administrative settings for inbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The **flowcontrol receive** command configures the configuration mode port's ability to receive flow control pause frames.

- **off**: the port does not process the pause frames that it receives.
- **on**: the port processes the pause frames that it receives.
- **desired**: the port auto-negotiates flow control; it processes pause frames if the peer is set to *send desired*.

*desired* is not an explicit parameter option. Ethernet data ports *cannot be set to desired*. Management ports are set to *desired* by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. The table below lists the compatible flow control settings.

**Table 67: Compatible Settings for Flow Control Negotiation – Local Port Receiving**

| local port      | peer port                          |
|-----------------|------------------------------------|
| receive on      | send on or send desired            |
| receive off     | send off or send desired           |
| receive desired | send on, send off, or send desired |

The **no flowcontrol receive** and **default flowcontrol receive** commands restore the default flowcontrol setting for the configuration mode interface by removing the corresponding **flowcontrol receive** command from **running-config**. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
flowcontrol receive state
no flowcontrol receive
default flowcontrol receive
```

#### Parameters

Options for the **state** flow control pause frame processing setting include:

- **on**
- **off**

#### Example

These commands set the flow control receive setting on Ethernet interface 5.

```
switch(config)# interface ethernet 5
```

```
switch(config-if-Et5)# flowcontrol receive on
switch(config-if-Et5)#+
```

### 11.1.9.13 flowcontrol send

The **flowcontrol send** command configures administrative settings for outbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The **flowcontrol send** command configures the configuration mode port's ability to transmit flow control pause frames.

- **off**: the port does not send pause frames.
- **on**: the port sends pause frames.
- **desired**: the port auto-negotiates flow control; it sends pause frames if the peer is set to *receive desired*.

*desired* is not an explicit parameter option. Ethernet data ports *cannot be set to desired*. Management ports are set to *desired* by default and with the **no flowcontrol send** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. [Compatible Settings for Flow Control Negotiation Local Port Transmitting](#) lists the compatible flow control settings.

**Table 68: Compatible Settings for Flow Control Negotiation Local Port Transmitting**

| local port   | peer port                                   |
|--------------|---------------------------------------------|
| send on      | receive on or receive desired               |
| send off     | receive off or receive desired              |
| send desired | receive on, receive off, or receive desired |

The **no flowcontrol send** and **default flowcontrol send** commands restore the default flow control setting for the configured interface by removing the corresponding **flowcontrol send** command from the **running-config**. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
flowcontrol send state
no flowcontrol send
default flowcontrol send
```

#### Parameters

Options for the **state** flow control send setting include:

- **on**
- **off**

#### Example

These commands set the flow control send setting on Ethernet interface **5**.

```
switch(config)# interface ethernet 5
```

```
switch(config-if-Et5)# flowcontrol send on
switch(config-if-Et5)#+
```

---

#### 11.1.9.14 hardware counter feature

You can enable the **hardware counter feature** functionality from global configuration mode on a per feature basis. The **no hardware counter feature** command disables the functionality. Multiple ingress and egress hardware counter features can work concurrently.

##### Command Mode

Global configuration mode

##### Command Syntax

```
hardware counter feature [[vlan-interface | subinterface] [in | out]][[vni [encap | decap]]][[route [ipv4 |
ipv6][vrf name][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]]
no hardware counter feature [[vlan-interface | subinterface] [in | out]][[vni [encap | decap]]][[route [ipv4 |
ipv6][vrf name][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]]
```

##### Parameters

- **vlan-interface** Enables VLAN interface counters.
  - **in** Enables ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.
  - **out** Enables egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the VLAN interface for every VLAN interface configured in the system.
- **subinterface** Enables the counting subinterface counters.
  - **in** Enables ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the subinterface for every L3 subinterface configured in the system.
  - **out** Enables egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the subinterface for every L3 subinterface configured in the system.
- **vni** Enables per-VNI counters.
  - **encap** Enables the per-encapsulation counters. When enabled, the switch counts the number of packets/octets received from the edge, encapsulated on the device, and directed towards the core.
  - **decap** Enables the per-VTEP decapsulation counters. When enabled, the switch counts the number of packets/octets coming from the core, decapsulated on the device, and heading towards the edge per each VTEP.
- **route** Configures the route counters for the specified IP version and IP address/IP prefix. When enabled, the switch counts the number of packets/bytes hitting a route.
  - **ipv4** Identifies the IPv4 route.
  - **ipv6** Identifies the IPv6 route.
- **vrf name** The VRF name is optional. The default VRF is assumed if no VRF is specified.
- **ip-address** Specifies the target IP address.
- **ip-address-prefix** Specifies the target IP address prefix.
- **gre tunnel interface** Enables GRE tunnel interface counters.
  - **in** Enables GRE tunnel interface decapsulation counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the tunnel interface.

- **out** Enables GRE tunnel interface encapsulation counters. When enabled, the switch counts the number of unicast GRE packets and total octets encapsulated on the tunnel interface.

## Examples

```
switch# hardware counters feature vlan-interface in
```

```
switch# hardware counter feature vlan-interface out
```

```
switch# hardware counter feature subinterface in
```

```
switch# hardware counter feature subinterface out
```

```
switch(config)# hardware counter feature vni encap
```

```
switch(config)# hardware counter feature vni decap
```

```
switch(config)# hardware counter feature vtep encap
```

```
switch(config)# hardware counter feature vtep decap
```

```
switch(config)# hardware counter feature gre tunnel interface in
```

```
switch(config)# hardware counter feature gre tunnel interface out
```

---

### 11.1.9.15 hardware counter feature in (DCS-7050x, 7350x, 7300x)

The **hardware counter feature** command enables the switch to count the ingress traffic on a Layer 3 port of the switch. The switch accounts for any traffic on Layer 3 sub-interfaces and VLAN interfaces with IPv4 and IPv6 addresses irrespective of the routing decision.

The **no hardware counter feature in** command disables the counter configuration from the switch ports. By default the ingress counter feature is disabled on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware counter feature [interface] in
no hardware counter feature [interface] in
```

#### Parameters

**interface** Layer 3 interface on the switch.

- **subinterface** Displays the subinterface traffic count.
- **vlan-interface** Displays the VLAN interface traffic count.

#### Examples

- This command configures the ingress traffic count on the sub-interfaces.

```
switch# hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interfaces.

```
switch# hardware counter feature vlan-interface in
```

- These commands enable the QSFP+ interface in port **group 1** and SFP+ interfaces in port **group 2** on a DCS-7050Q-16 switch, display the port group status, and display the interface status.

```
switch(config)# hardware port-group 1 select Et15/1-4
switch(config)# hardware port-group 2 select Et21-24
switch(config)# show hardware port-group

### 11.1.9.16 hardware port-group

The **hardware port-group** command configures a port group to activate either a single interface at a higher speed, such as a QSFP-DD at 400 Gb/s, or multiple interfaces at a lower speed, such as QSFP-56 interfaces at 200 Gb/s.

The **no hardware port-group** and **default hardware port-group** commands restore the default settings for the specified port group by removing the corresponding **hardware port-group** command from the **running-config**.

The **hardware port-group** command is available on the DCS-7280CR3-36S, DCS-7050Q-16, and DCS-7050QX-32S switches and has different parameters on each platform.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware port-group port_group_id select port_group_mode
no hardware port-group port_group_id [select port_group_mode]
default hardware port-group port_group_id [select port_group_mode]
```

#### Parameters

- ***port\_group\_id***  
Label of the port group. On the 7280CR3-36S and 7050Q-16, the valid options are **1** and **2**. On the 7050QX-32S, only label **1** is available.
- ***port\_group\_mode***  
Ports activated by the command. Options vary by platform and depend on the ***port\_group\_id*** value.
  - DCS-7280CR3-36
    - Port group **1**:
      - **1x-qsfppd(Et33)**: Ethernet33/1 is capable of 400Gb/s. Ethernet34 is inactive.
      - **2x-qsfpp-56(Et33,Et34)**: Ethernet33/1 is not capable of 400Gb/s. Ethernet34 is active.
    - Port group **2**:
      - **1x-qsfppd(Et35)**: Ethernet35/1 is capable of 400Gb/s. Ethernet36 is inactive.
      - **2x-qsfpp-56(Et35,36)**: Ethernet35/1 is not capable of 400Gb/s. Ethernet36 is active.
  - DCS-7050Q-16
    - Port group **1**:
      - **Et15/1-4**: QSFP+ port is activated on port group **1**.
      - **Et17-20**: SFP+ ports are activated on port group **1**.
    - Port group **2**:
      - **Et16/1-4**: QSFP+ port is activated on port group **2**.
      - **Et21-23**: SFP+ ports are activated on port group **2**.
  - DCS-7050QX-32S
    - Port group **1**:

- ***Et15/1-4***: QSFP+ port is activated on port group **1**.
- ***Et17-20***: SFP+ ports are activated on port group **1**.
- Port group **2**:
  - Invalid port group.

## Examples

- On a DCS-7280CR3-36S switch, the following commands activate Ethernet35/1 as a QSFP-DD (400 Gb/s) port, deactivate Ethernet36, and then display the port group status.

```
switch(config)# hardware port-group 2 select 1x-qsfpp-dd(Et35)
!
WARNING!
Changing the port-group mode will cause all
interfaces on ports 35,36 to flap.

### 11.1.9.17 hardware tcam

The **hardware tcam** command places the switch in Hardware TCAM configuration mode.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware tcam
```

#### Related Commands

- [profile](#)
- [interface ethernet](#)

#### Example

This command places the switch in Hardware TCAM configuration mode.

```
switch(config) # hardware tcam
switch(config-hw-tcam) #
```

---

### 11.1.9.18 interface ethernet create

The **interface ethernet create** command is used to configure a range of Ethernet subinterfaces. The command places the switch in Ethernet interface configuration mode for the specified range of subinterfaces.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface ethernet create sub_range
```

#### Parameters

***sub\_range*** Range of subinterfaces to be configured. Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface.

#### Example

This command enters interface configuration mode for Ethernet subinterfaces **1/1.1-100**:

```
switch(config)# interface ethernet create 1/1.100
switch(config-if-Et1/1.1-100) #
```

### 11.1.9.19 interface ethernet

The **interface ethernet** command places the switch in Ethernet-interface configuration mode for the specified interfaces. The command can specify a single interface or multiple interfaces.

Ethernet interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available in Ethernet interface configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

`interface ethernet e_range`

#### Parameter

**e\_range** Ethernet interfaces (number, range, or comma-delimited list of numbers and ranges). Valid Ethernet numbers depend on the switch available Ethernet interfaces.

#### Examples

- This command enters interface configuration mode for Ethernet interfaces **1** and **2**:

```
switch(config)# interface ethernet 1-2
switch(config-if-Et1-2) #
```

- This command enters interface configuration mode for **interface ethernet 1**:

```
switch(config)# interface ethernet 1
switch(config-if-Et1) #
```

---

### 11.1.9.20 interface management

The **interface management** command places the switch in management-interface configuration mode for the specified interfaces. The list can specify a single interface or multiple interfaces if the switch contains more than one management interface.

Management interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from **management-interface** configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

`interface management m_range`

#### Parameter

***m\_range*** Management interfaces (number, range, or comma-delimited list of numbers and ranges).

Valid management numbers depend on the switch's available management interfaces. A value of **0**, where available, configures the virtual management interface on a dual-supervisor modular switch. Management interface **0** accesses management port **1** on the active supervisor of a dual-supervisor modular switch.

#### Examples

- This command enters the **interface configuration** mode for management interfaces **1** and **2**.

```
switch(config)# interface management 1-2
switch(config-if-Ma1-2) #
```

- This command enters the **interface configuration** mode for management interface **1**:

```
switch(config)# interface management 1
switch(config-if-Ma1) #
```

### 11.1.9.21 link-debounce

The **link-debounce** command configures the link debounce time for the configuration mode interface. The link debounce time is the amount of time advertisements for new link states are delayed after the link state is established. By default, debounce time is set to zero, disabling link debounce.

You can configure independent debounce times for link up and link down transitions.

- **Link-up debounce time:** the delay before an interface advertises link down to link up transitions.
- **Link-down debounce time:** the delay before an interface advertises link up to link down transitions.

The **no link-debounce** and **default link-debounce** commands restore the default debounce setting for the configuration mode interface by removing the corresponding **link-debounce** command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
link-debounce time wait_time
no link-debounce time wait_time
default link-debounce time wait_time
```

#### Parameters

**wait\_time** Link debounce period (milliseconds). Debounce time values range from 0 (disabled) to 30000 (30 seconds). Options include:

- **0 - 30000** One debounce value assigned as both link up and link down.
- **0 - 30000 0 - 30000** Two debounce values: link up is first, link down is second.

#### Examples

- These commands set the link-up and link-down debounce period to **10** seconds on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 10000
switch(config-if-Et5) #
```

- These commands set the link-up debounce to **10** seconds and the link-down debounce period to zero on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 10000 0
switch(config-if-Et5) #
```

- These commands set the link-up debounce to **0** and the link-down debounce period to **12.5** seconds on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# link-debounce time 0 12500
switch(config-if-Et5) #
```

---

### 11.1.9.22 link-error

The **link-error** command places the Ethernet Operations, Administration, and Management (EOAM) profile in the EOAM link-error sub-mode.

The **no link-error** and **default link-error** commands exit from the EOAM link-error sub-mode.

#### Command Mode

EOAM Configuration

#### Command Syntax

```
link-error
no link-error
default link-error
```

#### Related Commands

- [monitor ethernet oam profile](#)
- [show monitor ethernet oam profile](#)

#### Example

These commands place the EOAM profile **profile1** in the **link-error** sub-mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)#{
```

### 11.1.9.23 mac-address

The **mac-address** command assigns a MAC address to the configuration mode interface. An interface's default MAC address is its burn-in address.

The **no mac-address** and **default mac-address** commands revert the interface to its default MAC address by removing the corresponding **mac-address** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
mac-address address
no mac-address
default mac-address
```

#### Parameter

**address** MAC address assigned to the interface. Its format is the dotted hex notation (**H.H.H**). Disallowed addresses are **0.0.0** and **FFFF.FFFF.FFFF**.

#### Example

These commands assign the **001c.2804.17e1** MAC address to **interface ethernet 7**, then display the interface parameters including the assigned address.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# mac-address 001c.2804.17e1
switch(config-if-Et7)# show interface ethernet 7
Ethernet3 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
 Description: b.e45
 MTU 9212 bytes, BW 10000000 Kbit
 Full-duplex, 10Gb/s, auto negotiation: off
 Last clearing of "show interface" counters never
 5 seconds input rate 7.84 kbps (0.0% with framing), 10 packets/sec

---

### 11.1.9.24 monitor ethernet oam profile

The **monitor ethernet oam profile** command applies the EOAM profile to the specific interface in interface configuration mode.

The **no monitor ethernet oam profile** and **default monitor ethernet oam profile** commands remove the EOAM profile from the interface.

#### Command Mode

Interface Configuration

#### Command Syntax

```
monitor ethernet oam profile name
no monitor ethernet oam profile
default monitor ethernet oam profile
```

#### Parameters

***name*** The EOAM profile name. You cannot name an EOAM profile *summary*.

#### Related Commands

- [link-error](#)
- [show monitor ethernet oam profile](#)

#### Example

These commands apply the EOAM profile ***profile1*** to the **interface ethernet 1/1**.

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# monitor ethernet oam profile profile1
```

### 11.1.9.25 monitor ethernet oam

The **monitor ethernet oam** command places the switch in the Ethernet Operations, Administration, and Management (EOAM) configuration mode.

The **no monitor ethernet oam** and **default monitor ethernet oam** commands exit from the EOAM configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor ethernet oam
no monitor ethernet oam
default monitor ethernet oam
```

#### Example

This command places the switch in the **EOAM** configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam) #
```

---

### 11.1.9.26 monitor link-flap policy default-profiles

The **monitor link-flap policy default-profiles** command permits you to enter the link-flap configuration mode and add a list of damping profiles as default profiles for the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor link-flap policy [default-profiles | profiles]
```

#### Parameters

- **link-flap** - Specify the flap setting values for the link flap errdisable cause
- **policy** - Manage profiles for link flap detection.
- **default-profiles *profile\_name*** - Add default damping profiles to a switch.

#### Example

Use the following command to add damping profiles *dp1*, *dp2*, *dp5* to the list of default damping profiles:

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# default-profiles dp1, dp2, dp5
```

### 11.1.9.27 monitor link-flap policy profile damping

The **monitor link-flap policy profile** command puts the switch in link-flap configuration mode and allows you to add damping profiles to the configuration. This command then enters the link-flap damping profile configuration mode.

The **no monitor link-flap policy profiles** command removes all damping profiles from an interface.

#### Command Mode

Link-Flap Configuration Mode

#### Command Syntax

```
monitor link-flap profile profile_name damping
```

#### Parameter

***profile\_name*** - Specify the name of the damping profile.

#### Example

Use the following command to create a damping profile, *MyDampingProfile*:

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile MyDampingProfile damping
switch(config-link-flap-damping-profile-MyDampingProfile) #
```

---

### 11.1.9.28 **penalty mac fault**

The **penalty mac fault** parameter permits configuration of the Damping policy MAC fault changes after entering the Link-Flap Damping Profile Configuration mode.

#### **Command Mode**

Link-Flap Damping Profile Configuration Mode

#### **Command Syntax**

```
penalty mac fault [local | remote] penalty_value
```

#### **Parameters**

- **mac** - Configures the penalty for MAC address state changes.
- **fault** - Configures the penalty for MAC fault changes.
- **local** - Configures the penalty for local fault changes.
- **remote** - Configures the penalty for remote fault changes.
- **penalty\_value** - Configures a value between 1 and 5000. Specify 0 for no penalty.

#### **Example**

Use the following commands to configure a local MAC fault penalty of 2500 for the Damping profile, MyDampingProfile:

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile MyDampingProfile damping
switch(config-link-flap-damping-profile-MyDampingProfile)# penalty mac fault
 local 2500
```

### 11.1.9.29 penalty threshold

The **penalty threshold** parameter permits the configuration of the link-flap damping threshold for the penalty after entering the link-flap damping profile configuration mode.

#### Command Mode

Link-Flap Damping Profile Configuration Mode

#### Command Syntax

```
penalty threshold [maximum | reuse | suppression] penalty_value
```

#### Parameters

- **maximum *penalty\_value*** - Configures the maximum penalty value for a link. Specify a penalty value between 0 and 1000000 with a default value of 12000.
- **reuse *penalty\_value*** - Configures the penalty value to trigger the reuse of a suppressed link. Specify a penalty value between 0 and 1000000 with a default value of 750.
- **suppression *penalty\_value*** - Configures the penalty value to trigger suppression of a link. Specify a penalty value between 0 and 1000000 with a default value of 200.

#### Example

Use the following commands to configure the penalty thresholds, *reuse 800*, *suppression 2200*, and *maximum 15000* for the damping profile, MyDampingProfile:

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile MyDampingProfile damping
switch(config-link-flap-damping-profile-MyDampingProfile)# penalty reuse 800
suppression 2200 maximum 15000
```

---

### 11.1.9.30 period

The **period** command configures the link monitoring period for a link error in terms of number of frames or seconds.

The **no period** command removes the period type specified for the chosen link error. The **default period** command configures the link monitoring period as zero seconds.

#### Command Mode

Link-error Configuration

#### Command Syntax

```
{fcs | symbol} period num {seconds | frames}
no {fcs | symbol} period num {seconds | frames}
default {fcs | symbol} period num {seconds | frames}
```

#### Parameters

- **fcs** Inbound packets with Frame Check Sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **num** The link monitoring period in frames or seconds. The frame value ranges from **1** to **4000000000**. The time value ranges from **2** to **200** seconds. The default value is **2** seconds.
  - **seconds** Specifies the link monitoring period in seconds.
  - **frames** Specifies the link monitoring period in frames.

#### Related Commands

- [action](#)
- [threshold](#)

#### Example

These commands set the frames period type for the profile **profile1** in the Link-error configuration mode for **300** frames.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# symbol period 300 frames
```

### 11.1.9.31 phy link detection aggressive

The **phy link detection aggressive** command allows the configuration of interfaces for aggressive link-up declaration (~50 ms) on those interfaces.

The **no/default phy link detection aggressive** configuration reverts to a more reliable link-up with at least a two-second delay. When the aggressive mode is not supported, the system generates an advisory message.

#### Command Mode

Global Configuration

#### Command Syntax

```
phy link detection aggressive
no phy link detection aggressive
default phy link detection aggressive
```

#### Examples

- This command configures aggressive link detection.

```
switch(config-if-Et1)# phy link detection aggressive
switch(config-if-Et1)#

```

- This command configures aggressive link detection but fails on a platform that does not support the feature.

```
switch(config-if-Et1)# phy link detection aggressive
detection detection not supported on this hardware platform
switch(config-if-Et1)#

```

---

### 11.1.9.32 poe disabled

Power over Ethernet (PoE) is enabled on all Ethernet ports by default on switches that support PoE. The **poe disabled** command disables PoE on the configuration-mode interface.

The **no poe disabled** and **default poe disabled** commands restore PoE on the interface by removing the corresponding **poe disabled** command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
poe disabled
no poe disabled
default poe disabled
```

#### Example

These commands disable PoE on **interface ethernet 7**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe disabled
switch(config-if-Et7) #
```

### 11.1.9.33 poe legacy detect

IEEE-compliant Powered Devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. The **poe legacy detect** command causes the configuration-mode interface to attempt to use hardware detection for these non-compliant PoE devices and power them. By default, legacy PD detection is disabled, and legacy devices are not powered.

**Note:** Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

The **no poe legacy detect** and **default poe legacy detect** commands restore the default behavior by removing the corresponding **poe legacy detect** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
poe legacy detect
no poe legacy detect
default poe legacy detect
```

#### Example

These commands configure **interface ethernet 7** to attempt to detect and power capacitive PDs.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe legacy detect
switch(config-if-Et7) #
```

### 11.1.9.34 poe limit

Power over Ethernet (PoE) power output is limited by the hardware-negotiated power level and by the total power capacity of the switch. The **poe limit** command sets an additional maximum power output for the configuration-mode interface. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

**Note:** If a power limit is set by this command, Power Via MDI TLVs will not be sent from the interface. See [Configuring LLDP for Power over Ethernet](#) for details.

The **no poe limit** and **default poe limit** commands restore the default power limitation by removing the corresponding **poe limit** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
poe limit {class class_num | watt_num watts}
```

```
no poe limit
```

```
default poe limit
```

#### Parameters

- **class\_num** Specifies the power output limit by power class. Values range from 0-6 as follows:
  - Class 0 = 15.4 W
  - Class 1 = 4 W
  - Class 2 = 7 W
  - Class 3 = 15.4 W
  - Class 4 = 30 W
  - Class 5 = 45 W
  - Class 6 = 60 W
- **watt\_num** Specifies the power output limit in watts. Values range from **0-60**. A value of **0** watts prevents the port from providing PoE power.

#### Examples

- These commands limit nominal PoE power output on **interface ethernet 7** to **10 W**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit 10 watts
switch(config-if-Et7) #
```

- These commands limit nominal PoE power output on **interface ethernet 7** to **4 W**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# poe limit class 1
switch(config-if-Et7) #
```

### 11.1.9.35 power budget

Power over Ethernet (PoE) budget is not set on all Ethernet ports by default on switches that support PoE. The **power budget [n] watts** command sets a limit of 'n' watts available for use by the ports on the switch. Otherwise, available power for PoE is limited to the sum of all power provided by the PSUs minus the power reserved for the chassis.

The **no power budget** restores the default state.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
power budget [n] watts
no power budget
```

#### Example

The following command sets the PoE power budget to **600 W**.

```
switch(config)# power budget 600 watts
```

---

### **11.1.9.36 power budget exceed action (warning | hold-down)**

When the Power over Ethernet (PoE) ports exceeds the budgeted amount, the switch issues a warning and continues to provide additional power above the budgeted limit. The **power budget exceed action hold-down** command causes the switch to issue a warning and limit the power to the configured limit.

The **no power budget** restores the default state.

#### **Command Mode**

Interface-Ethernet Configuration

#### **Command Syntax**

```
power budget exceed action hold-down
no power budget
```

#### **Example**

The following commands set the PoE power budget to **600W** and configure the switch to not exceed the limit.

```
switch(config)# power budget 600 watts
switch(config)# power budget exceed action hold-down
```

### 11.1.9.37 profile

The **profile** command creates an Ethernet Operations, Administration, and Management (EOAM) profile in the EOAM configuration mode.

The **no profile** and **default profile** commands exit from the EOAM configuration mode.

#### Command Mode

EOAM Configuration

#### Command Syntax

```
profile profile_name
no profile profile_name
default profile profile_name
```

#### Parameter

**profile\_name** The profile name that is specified.

#### Related Commands

- [monitor ethernet oam profile](#)
- [show monitor ethernet oam profile](#)

#### Guidelines

Run the **shutdown** or **no shutdown** command to return the port to its normal state.

#### Example

These commands create an EOAM profile **profile1** in the **EOAM** configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)#{
```

---

### 11.1.9.38 qos scheduling

The **qos scheduling** command places the switch in the QoS scheduling mode under which the scheduling groups and scheduling policies are configured for shared shaper across multiple subinterfaces.

The **no qos scheduling** command removes the QoS scheduling configuration from the **running-config**.

#### Command Mode

QoS Scheduling Mode

#### Command Syntax

```
qos scheduling
no qos scheduling
```

#### Example

These commands create a scheduling policy with the desired shape rate and optional guaranteed bandwidth:

```
switch(config)# qos scheduling
switch(config-qos-scheduling)# scheduling policy P1
switch(config-qos-scheduling-policy-P1)# shape rate 75000000
switch(config-qos-scheduling-policy-P1)# bandwidth guaranteed 10000000
```

### 11.1.9.39 recovery-time

The **recovery-time** command configures the recovery timeout value for link fault signaling.

The **no recovery-time** command and the **default recovery-time** command remove the recovery timeout value specified for the chosen link error.

#### Command Mode

Link-error Configuration

#### Command Syntax

```
recovery-time value
no recovery-time value
default recovery-time value
```

#### Parameters

**value** Specifies the recovery timeout value for LFS. The value ranges from **20** to **200**.

#### Related Commands

- [action](#)
- [period](#)
- [threshold](#)

#### Example

These commands set a recovery time value of **40** for profile **profile1** in link-error configuration mode.

```
switch(config)# monitor ethernet oam
switch(config-eoam)# profile profile1
switch(config-eoam-profile-profile1)# link-error
switch(config-eoam-profile-profile1-link-error)# recovery-time 40
```

---

#### 11.1.9.40 refresh traffic-policy field-set

The **refresh traffic-policy field-set** provides the ability to refresh a field set for a traffic policy. Refresh all field sets or a field set by name.

##### Command Mode

EXEC

##### Command Syntax

```
refresh traffic-policy field-set [all | integer | ipv4 | ipv6 | 14-port | mac |
vlan] prefix prefix_name
```

##### Command parameters

- **all** - Refresh all field sets.
- **integer** - Refresh a field set of integer ranges.
- **ipv4** - Refresh a field set of IPv4 address ranges.
- **ipv6** - Refresh a field set of IPv6 address ranges.
- **14-ports** - Refresh a field set of Layer 4 port ranges.
- **mac** - Refresh a field set of MAC addresses.
- **vlan** - Refresh a field set of VLAN IDs.
- **prefix *prefix\_name*** - Refresh a specific field set.

##### Example

Use the following command to refresh the IPv4 field set, *mybigfieldset*:

```
switch# refresh traffic-policy field-set ipv4 mybigfieldset
Refreshed ipv4 field-set mybigfieldset source URL
Number of accept prefixes: 100
Number of except prefixes: 0
```

The following error messages can be displayed if a problem exists with the configuration:

- **! IPv4 prefix field-set 'mybigfieldset' is not defined.** - Undefined field set in the configuration.
- **% Failed to import file:/tmp/mybigfieldset.txt: aborted due to CLI error** - An error exists in the URL contents.
- **% Failed to import file:/tmp/foo.txt: IPv4 prefix field-set 'mybigfieldset' not found in the URL** - Cannot locate the field set in the URL.
- **% Failed to import file:/tmp/foo.txt: [Errno 2] No such file or directory: '/tmp/mybigfieldset.txt'** - The URL no longer reachable or cannot find the requested file.

#### 11.1.9.41 show cfm continuity-check end-point

The **show cfm continuity-check** command displays continuity and connectivity information for a CFM configuration.

##### Command Mode

EXEC

##### Command Syntax

```
show cfm continuity-check end-point [remote-defect | counters] [domain domain_name] [association association_ID][end-point end_point_id]]
```

##### Parameters

- **domain *domain\_name*** - Name of the domain for the endpoint.
- **association *association\_ID*** - The CFM association ID for the endpoint.
- **end-point *end\_point\_id*** - The endpoint ID of the desired endpoint.
- **remote-defect** - Display the remote defects for the endpoint.
- **counters** - Display counters for software CFM configurations.

##### Examples

- To display the current status of the CFM endpoints, use the following command:

```
switch# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: false, Last TX RDI cleared: never
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared
 ----- -----
 2 reachable never never
```

- In this example, the endpoint displays reachability and no loss of continuity (LOC). Because no LOC occurred, the TX RDI state returns false, meaning the local MEP transmits the CCMs with the RDI flag set to false.

```
switch# show cfm continuity-check end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Interface: Ethernet1.1
TX RDI state: true, Last TX RDI set: 0:00:04 ago
 Remote MEP ID Connectivity Last LOC Detected Last LOC Cleared
 ----- -----
 2 unreachable 0:00:04 ago never
```

The remote MEP became unreachable and LOC occurred on the network. Since LOC exists for the connection, the TX RDI state returns true, meaning the local MEP transmits the CCMs with the RDI flag set to true.

---

#### 11.1.9.42 show cfm endpoint

The **show cfm** command displays information about a CFM configuration.

##### Command Mode

EXEC

##### Command Syntax

```
show cfm end-point [domain domain_name][association association_ID][end-point end_point_id]]
```

##### Parameters

- **domain *domain\_name*** - Name of the domain for the endpoint.
- **association *association\_ID*** - The CFM association ID for the endpoint.
- **end-point *end\_point\_id*** - The endpoint ID of the desired endpoint.

##### Example

To display the current status of the CFM endpoints, use the following command:

```
switch# show cfm end-point
Maintenance domain: domain6, Level: 6
Maintenance association: 100, Direction: up, CCM TX interval: 1 seconds
Maintenance end point ID: 1, Status: active, Interface: Ethernet1.1
 Remote MEP ID Status
----- -----
 2 active
```

### 11.1.9.43 show cfm measurement delay proactive

The **show cfm measurement delay proactive** command displays statistical information about the Ethernet OAM Delay Measurement configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show cfm measurement delay proactive [details]
```

#### Parameter

**details** - displays detailed statistical information about Delay Measurement on the switch.

#### Examples

Use the following command to display statistical information about the Ethernet OAM Delay Measurement configuration:

```
switch1(config)# show cfm measurement delay proactive
Maintenance domain: domain1
Maintenance association: 1, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet1/2.1
Remote MEP ID: 2, Status: enabled
Start time: 0:00:01 ago
Number of samples: 2
Average two-way delay: 315 usec
Average two-way delay variation: 4 usec
Best case two-way delay: 310 usec at 0:00:01 ago
Worst case two-way delay: 320 usec at 0:00:00 ago
```

Use the following command to display detailed statistical information about the Ethernet OAM Delay Measurement configuration:

```
switch1(config)# show cfm measurement delay proactive detail
Maintenance domain: domain1
Maintenance association: 1, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet1/2.1
Remote MEP ID: 2, Status: enabled
Start time: 0:01:22 ago
Number of samples: 83
Average two-way delay: 320 usec
Average two-way delay variation: 20 usec
Best case two-way delay: 264 usec at 0:00:07 ago
Worst case two-way delay: 395 usec at 0:00:34 ago
Index Two-way Delay (usec)

1 305.178
2 306.878
3 283.742
4 349.322
5 291.718
6 305.607
7 317.472
8 264.792
9 311.296
```

---

10

328.36

#### 11.1.9.44 show cfm measurement loss proactive

The **show cfm measurement loss proactive** command displays statistical information about the Ethernet OAM Loss Measurement configuration.

##### Command Mode

EXEC

##### Command Syntax

```
show cfm measurement loss [inband | synthetic] proactive [details]
```

##### Parameters

- **inband | synthetic** - displays statistical information about inband loss or synthetic loss measurement on the switch.
- **details** - displays additional details about the configuration.

##### Examples

Use the following command to display information about an inband loss measurement configuration:

```
switch(config)# show cfm measurement loss proactive
Maintenance domain: EZUTUOu3JG, Level: 5
Maintenance association: 3967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet14/1.4097
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:27 ago
Number of samples: 87
Average far-end frame loss: 0
Average near-end frame Loss: 0

Maintenance domain: EZUTUOu3JG, Level: 5
Maintenance association: 3967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 2, Interface: Ethernet14/1.4098
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:27 ago
Number of samples: 87
Average far-end frame loss: 0
Average near-end frame Loss: 0
```

Use the following command to display information about a synthetic loss measurement configuration:

```
switch(config)# show cfm measurement loss synthetic proactive
Maintenance domain: CPASIYdcnN, Level: 3
Maintenance association: 4967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 1, Interface: Ethernet20/1.4095, COS: 2
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance end point ID: 1, Interface: Ethernet20/1.4095, COS: 5
Remote MEP ID: 4096, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
```

---

```
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance domain: CPASIYdcnN, Level: 3
Maintenance association: 4967, Direction: up
Measurement type: proactive, TX interval: 1000 milliseconds
Maintenance end point ID: 2, Interface: Ethernet20/1.4096, COS: 2
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
Average near-end synthetic frame Loss: 0.000

Maintenance end point ID: 2, Interface: Ethernet20/1.4096, COS: 5
Remote MEP ID: 4097, Status: enabled
Start time: 0:01:49 ago
Number of measurements: 36, Measurement period: 3000 milliseconds
Average far-end synthetic frame loss: 0.000
```

#### 11.1.9.45 show hardware counter

The **show hardware counter** command displays counter events across time intervals.

##### Command Mode

EXEC

##### Command Syntax

```
show hardware counter
```

##### Example

This command displays counter events across all time intervals, which are currently more than one standard deviation apart from a given time interval.

```
switch(config-handler-eventHandler1-counters)# show hardware counter events

Interval | Event Name | Chip | First | Last | Count | Z-Score
| | Name | Occurrence | Occurrence | |

5 Min | MacCounters | All | 2017-01-31 09:31:35 | 2017-01-31 09:44:32 | 5 | -6.9430
10 Min | MacCounters | All | 2017-01-31 09:39:43 | 2017-01-31 09:44:32 | 3 | -4.8123

switch(config-handler-eventHandler1-counters)#

```

---

#### 11.1.9.46 show hardware port-group

The **show hardware port-group** command displays the status of DCS-7050Q-16 port-groups. Port groups contain one QSFP+ interface and a set of four SFP+ interfaces. In each port group, either the QSFP+ interface or the SFP+ interface set is enabled. The port groups are configured independently of each other.

- **Port group 1** contains **interface 15** (QSFP+) and **interfaces 17-20** (SFP+).
- **Port group 2** contains **interface 16** (QSFP+) and **interfaces 21-24** (SFP+).

#### Command Mode

EXEC

#### Command Syntax

```
show hardware port-group
```

#### Guidelines

The **hardware port-group** command is available on the DCS-7050Q-16 switches.

#### Example

This command displays the status of ports in the two port groups on a DCS-7050Q-16 switch.

```
switch# show hardware port-group

Portgroup: 1 Active Ports: Et15/1-4
Port State

Ethernet17 ErrDisabled
Ethernet18 ErrDisabled
Ethernet19 ErrDisabled
Ethernet20 ErrDisabled
Ethernet15/1 Active
Ethernet15/2 Active
Ethernet15/3 Active
Ethernet15/4 Active

Portgroup: 2 Active Ports: Et16/1-4
Port State

Ethernet16/1 Active
Ethernet16/2 Active
Ethernet16/3 Active
Ethernet16/4 Active
Ethernet21 ErrDisabled
Ethernet22 ErrDisabled
Ethernet23 ErrDisabled
Ethernet24 ErrDisabled
switch>
```

### 11.1.9.47 show hardware system forwarding-chips

The command **show hardware system forwarding-chips** displays information about the forwarding chips on your switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
show hardware system forwarding-chips
```

#### Example

Use the following command to display information about the forwarding chips on your switch.

The output displays the following information:

- **Slot** - the location of the forwarding chip
- **Chip Label** - the type of forwarding chip
- **Chip Version** - the version of the forwarding chip
- **Chip Name** - the name of the forwarding chip
- **Forwarding Agent** - the type of forwarding agent on the chip

| Slot      | Chip Label   | Chip Version | Chip Name   | Forwarding Agent |
|-----------|--------------|--------------|-------------|------------------|
| Fabric1   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric1   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Fabric2   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric2   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Fabric3   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric3   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Fabric4   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric4   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Fabric5   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric5   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Fabric6   | FabricAsic-0 | 88775B0      | Fe3200      | Sand             |
| Fabric6   | FabricAsic-1 | 88775B0      | Fe3200      | Sand             |
| Linecard3 | SwitchAsic-0 | 88682A1      | JerichoPlus | Sand             |
| Linecard3 | SwitchAsic-1 | 88682A1      | JerichoPlus | Sand             |
| Linecard3 | SwitchAsic-2 | 88682A1      | JerichoPlus | Sand             |
| Linecard3 | SwitchAsic-3 | 88682A1      | JerichoPlus | Sand             |
| Linecard6 | SwitchAsic-0 | 88682A1      | JerichoPlus | Sand             |
| Linecard6 | SwitchAsic-1 | 88682A1      | JerichoPlus | Sand             |
| Linecard6 | SwitchAsic-2 | 88682A1      | JerichoPlus | Sand             |
| Linecard6 | SwitchAsic-3 | 88682A1      | JerichoPlus | Sand             |

---

#### 11.1.9.48 show interface counters

Use the **show interface counters** command to view the VLAN interface, subinterface, and the GRE Tunnel interface ingress and egress counters. The **show interface counters** command output includes the L3 interfaces when the corresponding hardware counter feature is enabled.

##### Command Mode

EXEC

##### Command Syntax

```
show interface counters
```

##### Example

Use the **show interface counters** command to display the VLAN interface, subinterface, GRE tunnel interface ingress and egress counters:

```
switch# show interface counters
L3 Interface InOctets InUcastPkts InMcastPkts
Vl12 0 0 0
Et1.1 0 0 0
 InOctets InPkts
Tun1 0 0

L3 Interface OutOctets OutUcastPkts OutMcastPkts
Vl12 0 0 0
Et1.1 0 0 0
 OutOctets OutPkts
Tun1 0 0
```

### 11.1.9.49 show interfaces counters ip

Use the **show interfaces counters ip** command to display IPv4, IPv6 packets, and octets.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces counters ip
```

#### Example

The following command IPv4 and IPv6 ingress and egress counters: configuration mode.

```
switch# show interfaces counters ip
Interface IPv4InOctets IPv4InPkts IPv6InOctets IPv6InPkts
Et1/1 0 0 0 0
Et1/2 0 0 0 0
Et1/3 0 0 0 0
Et1/4 0 0 0 0
...
Interface IPv4OutOctets IPv4OutPkts IPv6OutOctets IPv6OutPkts
Et1/1 0 0 0 0
Et1/2 0 0 0 0
Et1/3 0 0 0 0
Et1/4 0 0 0 0
...
```

---

### 11.1.9.50 show interfaces counters bins

The **show interfaces counters bins** command displays packet counters, categorized by packet length, for the specified interfaces. Packet length counters that the command displays include:

- 64 bytes
- 65-127 bytes
- 128-255 bytes
- 256-511 bytes
- 512-1023 bytes
- 1024-1522 bytes
- larger than 1522 bytes

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [interface] counters bins
```

#### Parameters

**interface** Interface type and numbers. Options include:

- **no parameter** All interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters errors](#)
- [show interfaces counters queue](#)
- [show interfaces counters rates](#)

#### Example

This command displays packet counter results for **interface ethernet 1** and **interface ethernet 2**.

```
switch# show interfaces ethernet 1-2 counters bins
Input

Port 64 Byte 65-127 Byte 128-255 Byte 256-511 Byte

Et1 2503 56681135 1045154 1029152
Et2 8 50216275 1518179 1086297

Port 512-1023 Byte 1024-1522 Byte 1523-MAX Byte

Et1 625825 17157823 8246822
Et2 631173 27059077 5755101 switch>
```

### 11.1.9.51 show interfaces counters errors

The **show interfaces counters errors** command displays the error counters for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [interface] counters errors
```

#### Parameters

**interface** Interface type and numbers. Options include:

- **no parameter** All interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.

#### Display Values

The table displays the following counters for each listed interface:

- **FCS**: Inbound packets with CRC error and proper size.
- **Align**: Inbound packets with improper size (undersized or oversized).
- **Symbol**: Inbound packets with symbol error and proper size.
- **Rx**: Total inbound error packets.
- **Runts**: Outbound packets that terminated early or dropped because of underflow.
- **Giants**: Outbound packets that overflowed the receiver and were dropped.
- **Tx**: Total outbound error packets.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters queue](#)
- [show interfaces counters rates](#)

#### Examples

This command displays the error packet counters on **interface ethernet 1** and **interface ethernet 2**.

| Port | FCS | Align | Symbol | Rx | Runts | Giants | Tx |
|------|-----|-------|--------|----|-------|--------|----|
| Et1  | 0   | 0     | 0      | 0  | 0     | 0      | 0  |
| Et2  | 0   | 0     | 0      | 0  | 0     | 0      | 0  |

---

### 11.1.9.52 show interfaces counters queue

The **show interfaces counters queue** command displays the queue drop counters for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

**show interfaces [interface] counters queue**

#### Parameters

**interface** Interface type and numbers. Options include:

- **no parameter** All interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters errors](#)
- [show interfaces counters rates](#)

#### Example

This command displays the queue drop counters for **interface ethernet 1** and **interface ethernet 2**.

```
switch# show interfaces ethernet 1-2 counters queue
Port InDrops
Et1 180
Et2 169 switch>
```

### 11.1.9.53 show interfaces counters rates

The **show interfaces counters rates** command displays the received and transmitted packet rate counters for the specified interfaces. Counter rates include megabits per second (Mbps), thousands of packets per second (Kpps), and utilization percentage.

All port rates are approximately calculated. Note that, when displaying the rate information of a port channel, the rate value of the port channel differs from the sum of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports except for port channels with single ports. The rate values of individual member ports are less inaccurate than the rate values of the port channel as a whole.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [interface] counters rates
```

#### Parameters

**interface** Interface type and numbers. Options include:

- **no parameter** All interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters errors](#)
- [show interfaces counters queue](#)

#### Example

This command displays rate counters for **interface ethernet 1** and **interface ethernet 2**.

```
switch# show interfaces ethernet 1-2 counters rates
Port Intvl In Mbps % In Kpps Out Mbps % Out Kpps
Et1 0:05 53.3 0.5% 5 31.2 0.3% 2
Et2 0:05 43.3 0.4% 4 0.1 0.0% 0
switch#
```

### 11.1.9.54 show interfaces counters

The **show interface counters** command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface. The clear counters command resets the counters to zero. Counters displayed by the command include:

- inbound bytes
- inbound unicast packets
- inbound multicast packets
- inbound broadcast packets
- outbound bytes
- outbound unicast packets
- outbound multicast packets
- outbound broadcast packets

#### Command Mode

EXEC

#### Command Syntax

show interfaces [**interface**] counters [*incoming*]

#### Parameters

- **interface** Interface type and numbers. Options include:
  - **no parameter** All interfaces.
  - **ethernet e\_range** Ethernet interface range specified by **e\_range**.
  - **management m\_range** Management interface range specified by **m\_range**.
  - **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
  - **subinterface** Displays subinterface traffic counts.
  - **vlan-interface** Displays VLAN interface traffic counts.
- **incoming** Displays the traffic count for the ingress port.

**Note:** When no interface is specified, the output starts with ingress and egress counters section for regular interfaces, followed by section for the ingress L3 Interface counters.
