- c. Router C interfaces:

```
switch-C(config)# interface vlan 10
switch-C(config-if-vl10)# ip address 10.10.1.3/24
switch-C(config-if-vl10)# interface vlan 11
switch-C(config-if-vl11)# ip address 10.10.2.2/24
```

- d. Router D interfaces:

```
switch-D(config)# interface vlan 11
switch-D(config-if-vl11)# ip address 10.10.2.1/24
switch-D(config)# interface vlan 12
switch-D(config-if-vl12)# ip address 10.10.3.1/24
```

- e. Router E interfaces:

```
switch-E(config)# interface vlan 12
switch-E(config-if-vl12)# ip address 10.10.3.2/24
switch-E(config)# interface vlan 13
```

```
switch-E(config-if-vl13) #ip address 10.10.4.1/24
```

f. Router F interfaces:

```
switch-F(config)# interface vlan 13
switch-F(config-if-vl13)# ip address 10.10.4.2/24
switch-F(config)# interface vlan 14
switch-F(config-if-vl14)# ip address 12.15.1.1/24
```

2. Attach the network segments to the areas.

a. Router A interfaces:

```
switch-A(config-if-vl10) # router ospf 1
switch-A(config-router-ospf) # router-id 170.21.0.1
switch-A(config-router-ospf) # area 1 NSSA
switch-A(config-router-ospf) # network 10.10.1.0/24 area 1
```

b. Router B interfaces:

```
switch-B(config-if-vl10) # router ospf 1
switch-B(config-router-ospf) # router-id 170.21.0.2
switch-B(config-router-ospf) # area 1 NSSA
switch-B(config-router-ospf) # network 10.10.1.0/24 area 1
```

c. Router C interfaces:

```
switch-C(config-if-vl11) # router ospf 1
switch-C(config-router-ospf) # router-id 170.21.0.3
switch-C(config-router-ospf) # area 1 NSSA
switch-C(config-router-ospf) # network 10.10.1.0/24 area 1
switch-C(config-router-ospf) # network 10.10.2.0/24 area 0
```

d. Router D interfaces:

```
switch-D(config-if-vl12) # router ospf 1
switch-D(config-router-ospf) # router-id 170.21.0.4
switch-D(config-router-ospf) # network 10.10.2.0/24 area 0
switch-D(config-router-ospf) # network 10.10.3.0/24 area 0
```

e. Router E interfaces:

```
switch-E(config-if-vl13) # router ospf 1
switch-E(config-router-ospf) # router-id 170.21.0.5
switch-E(config-router-ospf) # network 10.10.3.0/24 area 0
switch-E(config-router-ospf) # network 10.10.4.0/24 area 0
```

f. Router F interfaces:

```
switch-F(config-if-vl14) # router ospf 1
switch-F(config-router-ospf) # router-id 170.21.0.6
switch-F(config-router-ospf) # network 10.10.4.0/24 area 0
switch-F(config-router-ospf) # redistribute static
```

---

## 15.2.5 OSPFv2 Commands

### Global Configuration Mode

- ip ospf router-id output-format hostnames
- line system
- router ospf

### Interface Configuration Mode

- interface Tunnel
- ip ospf area
- ip ospf authentication
- ip ospf authentication-key
- ip ospf cost
- ip ospf dead-interval
- ip ospf disabled
- ip ospf hello-interval
- ip ospf message-digest-key
- ip ospf network point-to-point
- ip ospf priority
- ip ospf retransmit-interval
- ip ospf transmit-delay
- tunnel routes

### Router-OSPFv2 Configuration Mode

- adjacency exchange-start threshold (OSPFv2)
- area default-cost (OSPFv2)
- area filter (OSPFv2)
- area nssa (OSPFv2)
- area nssa default-information-originate (OSPFv2)
- area nssa no-summary (OSPFv2)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv2)
- area range (OSPFv2)
- area stub (OSPFv2)
- auto-cost reference-bandwidth (OSPFv2)
- compatible (OSPFv2)
- default-information originate (OSPFv2)
- distance ospf (OSPFv2)
- dn-bit-ignore (OSPFv2)
- log-adjacency-changes (OSPFv2)
- max-lsa (OSPFv2)
- max-metric router-lsa (OSPFv2)
- maximum-paths (OSPFv2)
- network area (OSPFv2)
- no area (OSPFv2)
- passive-interface default (OSPFv2)
- passive-interface (OSPFv2)
- point-to-point routes (OSPFv2)

- redistribute (OSPFv2)
- redistribute ospf instance
- router-id (OSPFv2)
- shutdown (OSPFv2)
- summary-address
- timers lsa rx min interval (OSPFv2)
- timers lsa tx delay initial (OSPFv2)
- timers spf delay initial (OSPFv2)

### **TCAM Profile Configuration Mode**

- packet
- system profile

### **Display and Clear Commands**

- clear ip ospf neighbor
- show hardware tcam profile
- show ip ospf
- show ip ospf border-routers
- show ip ospf database database-summary
- show ip ospf database <link state list>
- show ip ospf database <link-state details>
- show ip ospf interface
- show ip ospf interface brief
- show ip ospf lsa-log
- show ip ospf neighbor
- show ip ospf neighbor adjacency-changes
- show ip ospf neighbor state
- show ip ospf neighbor summary
- show ip ospf request queue
- show ip ospf retransmission queue
- show ip ospf spf-log
- show line system dom thresholds
- show line system status

---

### 15.2.5.1 auto-cost reference-bandwidth (OSPFv2)

The `auto-cost reference-bandwidth` command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

OSPFv2-cost = (auto-cost value \* 1 Mbps) / interface bandwidth.

The switch uses a minimum OSPFv2-cost of **1**. The switch rounds down all non-integer results.

On a 10G Ethernet interface:

- if auto-cost = **100**, then OSPFv2-cost = **100** Mbps / 10 Gbps = **0.01**, and the default cost is set to **1**.
- if auto-cost = **59000**, then OSPFv2-cost = **59000** Mbps / 10 Gbps = **5.9**, and the default cost is set to **5**.

The `no auto-cost reference-bandwidth` and `default auto-cost reference-bandwidth` command removes the `auto-cost reference-bandwidth` command from *running-config*. When this parameter is not set, the default cost for Ethernet interfaces is the default `ip ospf cost` value of 10.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
auto-cost reference-bandwidth rate
no auto-cost reference-bandwidth rate
default auto-cost reference-bandwidth rate
```

#### Parameter

**rate** Values range from **1** to **4294967**. Default is **100**.

#### Examples

To configure a default cost of **20** on 10G Ethernet interfaces:

1. Calculate the required auto-cost value:

auto-cost = (OSPFv2-cost\*interface bandwidth)/1 Mbps = (**20\*10000** Mbps) / **1** Mbps = **200000**

2. Configure this value as the auto-cost reference-bandwidth.

```
switch(config)# router ospf 6
switch(config-router-ospf)# auto-cost reference-bandwidth 200000
switch(config-router-ospf) #
```

### 15.2.5.2 adjacency exchange-start threshold (OSPFv2)

The **adjacency exchange-start threshold** command sets the exchange-start options for an OSPF instance.

The **no adjacency exchange-start threshold** and **default adjacency exchange-start threshold** command resets the default by removing the corresponding a **adjacency exchange-start threshold** command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

#### Parameter

**peers** Value ranges from **1- 4294967295**. Default value is **10**.

#### Example

This command sets the adjacency exchange start threshold to **20045623**.

```
switch(config)# router ospf 6
switch(config-router-ospf)# adjacency exchange-start threshold 20045623
switch(config-router-ospf)#{/pre}
```

---

### 15.2.5.3 area default-cost (OSPFv2)

The `area default-cost` command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to **10**.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to **10** by removing the corresponding `area default-cost` command from **running-config**. The `no area (OSPFv2)` command removes all area commands for the specified area from **running-config**, including the `area default-cost` command.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost def_cost
default area area_id default-cost def_cost
```

#### Parameters

- ***area\_id*** Area number: **0 to 4294967295** or **0.0.0.0** to **255.255.255.255** **running-config** stores value in dotted decimal notation.
- ***def\_cost*** Value ranges from **1** to **65535**. Default value is **10**.

#### Example

This command configures a cost of **15** for default summary routes that an ABR sends into area **23**.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 23 default-cost 15
switch(config-router-ospf)#{
```

#### 15.2.5.4 area filter (OSPFv2)

The **area filter** command prevents an area from receiving Type 3 Summary LSAs and Type 4 APSR Summary LSAs from a specified subnet.

The **no area filter** and **default area filter** commands remove the specified **area filter** command from **running-config**. The **no area** command (see [no area \(OSPFv2\)](#)) removes all area commands for the specified area from **running-config**, including **area filter** commands.

##### Command Mode

Router-OSPF Configuration

##### Command Syntax

```
area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr
```

##### Parameters

- **area\_id** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. **running-config** stores value in dotted decimal notation.
- **net\_addr** Network IP address. Entry formats include address-prefix (CIDR) and address-mask. **running-config** stores value in CIDR notation.

##### Example

This command prevents the switch from entering Type 3 LSAs and Type 4 LSAs originating from the **10.1.1.0/24** subnet into its area **2** LSDB.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 2 filter 10.1.1.0/24
switch(config-router-ospf)#

```

---

### 15.2.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The `area not-so-stubby lsa type-7 convert type-5` command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The `no area not-so-stubby lsa type-7 convert type-5` and `no area not-so-stubby lsa type-7 convert type-5` commands allow LSAs to be translated dynamically by removing the `no area not-so-stubby lsa type-7 convert type-5` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
no area area_id not-so-stubby lsa type-7 convert type-5
default area area_id not-so-stubby lsa type-7 convert type-5
```

#### Parameters

***area\_id*** Area number.

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- ***running-config*** stores value in dotted decimal notation.

#### Example

This command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

```
switch(config-router-ospf)# area 3 not-so-stubby lsa type-7 convert type-5
switch(config-router-ospf)#{/pre}
```

### 15.2.5.6 area nssa (OSPFv2)

The **area nssa** command configures an OSPFv2 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from ***running-config***.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id nssa [TYPE]
no area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

#### Parameters

- ***area\_id*** All parameters except ***area\_id*** can be placed in any order.
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
  - ***running-config*** stores value in dotted decimal notation.
- ***TYPE*** Area type. Values include:
  - **no parameter**
  - **nssa-only**

#### Example

This command configures area **3** as a NSSA area.

```
switch(config-router-ospf)# area 3 nssa nssa-only
switch(config-router-ospf)#{/pre}
```

### 15.2.5.7 area nssa default-information-originate (OSPFv2)

The `default area nssa default-information-originate` command sets default route origination for the Not-So-Stubby Area (NSSA), allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the [redistribute \(OSPFv2\)](#) command). The `no area nssa default-information-originate` command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See [Advertisement of Default Route](#) for details.

Areas are **normal** by default; area type configuration is required only for stub and NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the [default-information originate \(OSPFv2\)](#) command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the [area nssa default-information-originate \(OSPFv2\)](#) or [area nssa no-summary \(OSPFv2\)](#) command.

**Table 78: Advertisement of Default Route**

| Static Default Route Installed | Redistribute Static | Command Form         | Advertise in ABR | Advertise in ASBR |
|--------------------------------|---------------------|----------------------|------------------|-------------------|
| no                             | no                  | <b>default or no</b> | no               | no                |
| no                             | no                  | standard             | yes              | no                |
| no                             | yes                 | <b>default</b>       | yes              | yes               |
| no                             | yes                 | <b>no</b>            | no               | no                |
| no                             | yes                 | standard             | yes              | no                |
| yes                            | no                  | <b>default or no</b> | no               | no                |
| yes                            | no                  | standard             | yes              | yes               |
| yes                            | yes                 | <b>default</b>       | yes              | yes               |
| yes                            | yes                 | <b>no</b>            | no               | no                |
| yes                            | yes                 | standard             | yes              | yes               |

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

```
no area area_id nssa default-information-originate
```

```
default area area_id nssa default-information-originate
```

#### Parameters

- area\_id*** All parameters except ***area\_id*** can be placed in any order.
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
  - running-config*** stores value in dotted decimal notation.

- **VALUE** Values include:
  - **no parameter** Default value of **1**.
  - **metric 1-65535**.
- **TYPE** Values include:
  - **no parameter**.
  - **metric-type 1-2**.
- **EXCL** Values include:
  - **no parameter**.
  - **nssa-only**.

### Example

This command configures area **3** as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf)# area 3 nssa default-information-originate nssa-only
switch(config-router-ospf)#[/pre]
```

---

### 15.2.5.8 area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the Not-So-Stubby Area (NSSA) in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id nssa no-summary
no area area_id nssa no-summary
default area area_id nssa no-summary
```

#### Parameters

***area\_id*** Area number.

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- **running-config** stores value in dotted decimal notation.

#### Examples

- This command directs the device not to import type-3 summary LSAs into the NSSA area

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#{/pre}
```

- This command directs the device to import type-3 summary LSAs into the NSSA area.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#{/pre}
```

### 15.2.5.9 area range (OSPFv2)

The **area range** command configures OSPF Area Border Routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The **no area (OSPFv2)** command removes all area commands for the specified area from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

#### Parameters

- **area\_id** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255** *running-config* stores value in dotted decimal notation.
- **net\_addr**.
- **ADVERTISE\_SETTING** Values include:
  - **no parameter**
  - **advertise**
  - **not-advertise**
- Values include:
  - **no parameter**
  - **cost range cost** Value ranges from **1** to **65535**.

#### Examples

- The **network area** command assigns two subnets to an area. The **area range** command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config)# router ospf 6
switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf) #
```

- The **network area** command assigns a subnet to an area, followed by an **area range** command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)# network 10.12.31.0/24 area 5
switch(config-router-ospf)# area 5 range 10.12.31.0/24 not-advertise
switch(config-router-ospf) #
```

---

### 15.2.5.10 area stub (OSPFv2)

The **area stub** command sets the area type of an OSPF area to **stub**. All devices in an Area Stub (AS) must specify the same area type for identically numbered areas.

The **no area stub** command remove the specified stub area from the OSPFv2 instance by deleting all **area stub** commands from **running-config** for the specified area.

The **no area stub** command configures the specified area as a normal area.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id stub [summarize]
no area area_id stub [summarize]
default area area_id stub [summarize]
```

#### Parameters

- **area\_id** Area number.
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
  - **running-config** stores value in dotted decimal notation.
- **summarize** Area type. Values include:
  - **no parameter**
  - **no-summary**

#### Examples

- These commands configure area **45** as a stub area.

```
switch(config)# router ospf 3
switch(config-router-ospf)# area 45 stub
switch(config-router-ospf) #
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf) # area 10.92.148.17 stub
switch(config-router-ospf) #
```

### 15.2.5.11 clear ip ospf neighbor

The `clear ip ospf` command clears the neighbors statistics per interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip ospf [PROCESS_ID] neighbor [LOCATION][VRF_INSTANCE]
```

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - no parameter
  - 1 to 65535.
- **LOCATION** Address or interface peer group name. Values include:
  - \* clears all OSPF IPv4 neighbors.
  - *ipv4\_addr*
  - *ethernet e\_num*
  - *loopback l\_num*
  - *port-channel p\_num*
  - *vlan v\_num*
- **VRF\_INSTANCE** Specifies the VRF instance.
  - *vrf vrf\_name* configures the *vrf\_name* instance.

#### Examples

- This command resets all OSPF neighbor statistics.

```
switch# clear ip ospf neighbor *switch#
```

- This command resets the OSPF neighbor statistics for the specified **ethernet 3** interface.

```
switch# clear ip ospf neighbor ethernet 3
switch#
```

---

### 15.2.5.12 compatible (OSPFv2)

The **compatible** command allows the selective disabling of compatibility with *RFC 2328*.

The **no compatible** and **default compatible** commands reverts OSPF to *RFC 2328* compatible and removes the compatible statement from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
compatible rfc1583
no compatible rfc1583
default compatible rfc1583
```

#### Examples

- This command sets the OSPF compatibility list with *RFC 1583*.

```
switch(config)# router ospf 6
switch(config-router-ospf)# compatible rfc1583
switch(config-router-ospf) #
```

- This command disables *RFC 1583* compatibility.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no compatible rfc1583
switch(config-router-ospf) #
```

### 15.2.5.13 default-information originate (OSPFv2)

The **default-information originate** command enables default route origination for normal areas. The user may configure the metric value and metric type used in LSAs. The **always** option will cause the ASBR to create and advertise a default route whether or not one is configured.

The **no default-information originate** command prevents the advertisement of the default route. The **default default-information originate** command enables default route origination with default values (metric type 2, metric=1).

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
default-information originate [FORCE][VALUE][TYPE][MAP]
no default-information originate
default default-information originate
```

#### Parameters

All parameters can be placed in any order.

- **FORCE** Advertisement forcing option. Values include:
  - **no parameter**
  - **always**
- **VALUE** Values include:
  - **no parameter**
  - **metric 1-65535**
- **TYPE** Values include:
  - **no parameter**
  - **metric-type 1-2**
- **MAP** Sets attributes in the LSA based on a route map. Values include:
  - **no parameter**
  - **route-map *map\_name***.

#### Examples

- These commands always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate always
switch(config-router-ospf)# show active
router ospf 1
 default-information originate always
```

- These commands advertise a default route with a metric of **100** and an external metric type of **1** if a default route is configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate metric 100 metric-type 1
```

#### 15.2.5.14 **distance ospf** (OSPFv2)

The **distance ospf** command specifies the administrative distance for intra-area, inter-area, or external OSPF routes. The command must be issued separately for each route type being configured. The default administrative distance for all routes is **110**.

The **no distance ospf** and **default distance ospf** commands remove the corresponding **distance ospf** command from **running-config**, returning the OSPFv2 administrative distance setting for the specified route type to the default value of **110**.

**Note:** OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the **distance ospf** command directly through the CLI or by applying a configuration file that contains the command.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
distance ospf [external | inter-area | intra-area]
no distance ospf [external | inter-area | intra-area]
default distance ospf [external | inter-area | intra-area]
```

#### Parameters

- **external** Sets administrative distance for external routes.
- **inter-area** Sets administrative distance for inter-area routes.
- **intra-area** Sets administrative distance for intra-area routes.
- **distance** Values range from **1 to 255**. Default value is **110** for all types.

#### Example

This command configures an administrative distance of **85** for all OSPFv2 intra-area routes on the switch. If issued while OSPF is running, this command will cause OSPF links to flap.

```
switch(config)# router ospf 6
switch(config-router-ospf)# distance ospf intra-area 85
switch(config-router-ospf)#{/pre>
```

### 15.2.5.15 distribute-list in

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The **distribute-list in** command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **no distribute-list in** and **default distribute-list in** commands remove the **distribute-list in** command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
distribute-list {prefix-list | route-map} list_name in
no distribute-list {prefix-list | route-map}
default distribute-list {prefix-list | route-map}
```

#### Parameters

- **prefix-list** Specifies a prefix-list as the filter.
- **route-map** Specifies a route-map as the filter.
- ***list\_name*** The name of the prefix-list or route-map used to filter routes from incoming LSAs.

#### Related Commands

- [area filter \(OSPFv2\)](#)
- [redistribute \(OSPFv2\)](#)

#### Example

These commands configure a prefix list named **dist\_list1** in OSPF instance **5** to filter certain routes from incoming OSPF LSAs.

```
switch(config)# router ospf 5
switch(config-router-ospf)# distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#{
```

---

### 15.2.5.16 dn-bit-ignore (OSPFv2)

The **dn-bit-ignore** command results in the DN bit in Type 3 Summary LSAs to be ignored during the Shortest Path First (SPF) calculations.

The **no dn-bit-ignore** and **default dn-bit-ignore** commands result in the DN bit in Type 3 Summary LSAs to not be ignored during SPF calculations.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
dn-bit-ignore
no dn-bit-ignore
default dn-bit-ignore
```

#### Examples

- This command ignores the DN bit.

```
switch(config)# router ospf 6
switch(config-router-ospf)# dn-bit-ignore
switch(config-router-ospf) #
```

- This command causes the DN bit not to be ignored.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no dn-bit-ignore
switch(config-router-ospf) #
```

### 15.2.5.17 interface Tunnel

OSPF packets by default are sent with Time to Live (TTL) value **1**. This may not work in tunnel scenarios where the peer tunnel end point could be more than one hop away. It is recommended to explicitly configure TTL on the tunnel interface. TTL configuration is allowed only if **path-mtu-discovery** is configured.

#### Command Mode

Configuration mode

#### Command Syntax

interface Tunnel *Tunnel No*

#### Parameter

**Tunnel No** Tunnel number.

#### Example

```
(config)# interface Tunnel 5
(config-if-Tu0)# tunnel path-mtu-discovery
(config-if-Tu0)# tunnel ttl 5
```

### 15.2.5.18 ip ospf area

The **ip ospf area** command enables OSPFv2 on an interface and associates the area to the interface.

The **no ip ospf area** and **default ip ospf area** commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

**Note:** The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the **ip ospf area** command has precedence over the area configured by the **network area** command.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf area area_id
```

```
no ip ospf area area_id
```

```
default ip ospf area area_id
```

#### Parameters

**area\_id** The area ID. The valid values are **0** to **4294967295** or a decimal range between **0.0.0.0** and **255.255.255.255**.

#### Example

These commands enable OSPFv2 on the **et2** interface and associates area identifier **1.1.1.1** to the interface.

```
switch(config)# Interface ethernet 2
switch(config-if-Et2)# ip address 1.0.0.1/24
switch(config-if-Et2)# ip ospf area 1.1.1.1
router ospf 1
```

### 15.2.5.19 ip ospf authentication

The **ip ospf authentication** command enables OSPFv2 authentication for the configuration mode interface..

The **no ip ospf authentication** and **default ip ospf authentication** commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding **ip ospf authentication** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf authentication [METHOD]
```

```
no ip ospf authentication
```

```
default ip ospf authentication
```

#### Parameters

**METHOD** OSPFv2 authentication method. Options include:

- **no parameter**
- **message-digest**

#### Examples

- This command enables simple authentication on **vlan 12**.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf authentication
```

- This command enables message-digest authentication on **vlan 12**.

```
switch(config-if-vl12)# ip ospf authentication message-digest
```

---

### 15.2.5.20 ip ospf authentication-key

The **ip ospf authentication-key** command configures the OSPFv2 authentication password for the configuration mode interface.

The **no ip ospf authentication-key** and **default ip ospf authentication-key** commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding **ip ospf authentication-key** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf authentication-key [ENCRYPT_TYPE] key_text
no ip ospf authentication-key
default ip ospf authentication-key
```

#### Parameters

- **ENCRYPT\_TYPE** Encryption level of the **key\_text** parameter. Values include:
  - **no parameter** the **key\_text** is in clear text.
  - **0 key\_text** is in clear text. Equivalent to **no parameter**.
  - **7 key\_text** is MD5 encrypted.
- **key\_text** the authentication-key password.

#### Example

This command specifies a password in clear text.

```
switch(config)# interface vlan 12
switch(config-if-Vl12)# ip ospf authentication-key 0 code123
switch(config-if-Vl12)# show active
interface Vlan12
 ip ospf authentication-key 7 baYllFzVbcx4yHq1IhmMdw==
switch(config-if-Vl12) #
```

The *running-config* stores the password as an encrypted string.

### 15.2.5.21 ip ospf cost

The **ip ospf cost** command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the [auto-cost reference-bandwidth \(OSPFv2\)](#) command.
- Port channel: **10**.
- VLAN: **10**.

The **no ip ospf cost** and **default ip ospf cost** commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding **ip ospf cost** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf cost interface_cost
```

```
no ip ospf cost
```

```
default ip ospf cost
```

#### Parameter

***interface\_cost*** Value ranges from **1 to 65535**; default is **10**.

#### Example

This command configures a cost of **15** for **vlan 2**.

```
switch(config)# interface vlan 2
switch(config-if-V12)# ip ospf cost 15
switch(config-if-V12)#

```

---

### 15.2.5.22 ip ospf dead-interval

The **ip ospf dead-interval** command configures the dead interval for the configuration mode interface.

The **no ip ospf dead-interval** and **default ip ospf dead-interval** commands restore the default dead interval of **40** seconds on the configuration mode interface by removing the corresponding **ip ospf dead-interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf dead-interval time
no ip ospf dead-interval
default ip ospf dead-interval
```

#### Parameter

**time** Value ranges from **1 to 8192**; default is **40**.

#### Example

This command configures a dead interval of **120** seconds for **vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-V14)# ip ospf dead-interval 120
switch(config-if-V14)#

```

### 15.2.5.23 ip ospf disabled

The **ip ospf disabled** command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the [shutdown \(OSPFv2\)](#) command.

The **no ip ospf disabled** and **default ip ospf disabled** commands enable OSPFv2 on the configuration mode interface by removing the corresponding **ip ospf disabled** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf disabled
no ip ospf disabled
default ip ospf disabled
```

#### Examples

- This command shuts down OSPFv2 activity on **vlan 5**.

```
switch(config)# interface vlan 5
switch(config-if-Vl5)# ip ospf disabled
switch(config-if-Vl5)#

```

- This command resumes OSPFv2 activity on **vlan 5**.

```
switch(config-if-Vl5)# no ip ospf disabled
switch(config-if-Vl5)#

```

---

#### 15.2.5.24 ip ospf hello-interval

The **ip ospf hello-interval** command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for Each OSPFv2 neighbor, and should not be longer than any neighbors dead interval.

The **no ip ospf hello-interval** and **default ip ospf hello-interval** commands restore the default hello interval of **10** seconds on the configuration mode interface by removing the **ip ospf hello-interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf hello-interval time
no ip ospf hello-interval
default ip ospf hello-interval
```

#### Parameter

**time** Hello interval (seconds). Values range from **1 to 8192**; default is **10**.

#### Example

This command configures a hello interval of **30** seconds for **vlan 2**.

```
switch(config)# interface vlan 2
switch(config-if-Vl2)# ip ospf hello-interval 30
switch(config-if-Vl2)#

```

### 15.2.5.25 ip ospf message-digest-key

The **ip ospf message-digest-key** command configures a message digest authentication key for the configuration mode interface.

The **no ip ospf message-digest-key** and **default ip ospf message-digest-key** commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding **ip ospf message-digest-key** command from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf message-digest-key key_id md5 ENCRYPT_TYPE key_text
no ip ospf message-digest-key key_id
default ip ospf message-digest-key key_id
```

#### Parameters

- **key\_id** Key ID number. Value ranges from **1 to 255**.
- **ENCRYPT\_TYPE** Encryption level of the **key\_text** parameters. Values include:
  - **no parameter**
  - **0 key\_text**
  - **7 key\_text**
- **key\_text** message key (password).

#### Example

This command configures **code123** as the MD5 key with a corresponding key ID of **23**.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf message-digest-key 23 md5 0 code123
switch(config-if-vl12)#

```

The ***running-config*** stores the password as an encrypted string.

---

### 15.2.5.26 ip ospf network point-to-point

The **ip ospf network point-to-point** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no ip ospf network** and **default ip ospf network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ip ospf network** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf network point-to-point
no ip ospf network
default ip ospf network
```

#### Examples

- These commands configure ethernet interface **10** as a point-to-point link.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# ip ospf network point-to-point
switch(config-if-Et10) #
```

- This command restores ethernet interface **10** as a broadcast link.

```
switch(config-if-Et10)# no ip ospf network
switch(config-if-Et10) #
```

### 15.2.5.27 ip ospf retransmit-interval

The **ip ospf retransmit-interval** command configures the link state advertisement retransmission interval for the interface.

The **no ip ospf retransmit-interval** and **default ip ospf retransmit-interval** commands restore the default retransmission interval of **5** seconds on the configuration mode interface by removing the corresponding **ip ospf retransmit-interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf retransmit-interval period
no ip ospf retransmit-interval
default ip ospf retransmit-interval
```

#### Parameter

**period** Retransmission interval (seconds). Value ranges from **1 to 8192**; default is **5**.

#### Example

This command configures a retransmission interval of **15** seconds for **vlan 3**.

```
switch(config)# interface vlan 3
switch(config-if-V13)# ip ospf retransmit-interval 15
switch(config-if-V13) #
```

---

### 15.2.5.28 ip ospf router-id output-format hostnames

The **ip ospf router-id output-format hostnames** command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- **show ip ospf**
- **show ip ospf border-routers**
- **show ip ospf database <link state list>**
- **show ip ospf database database-summary**
- **show ip ospf database <link-state details>**
- **show ip ospf interface**
- **show ip ospf neighbor**
- **show ip ospf request queue**
- **show ip ospf retransmission queue**

The **no ip ospf router-id output-format hostnames** and **default ip ospf router-id output-format hostnames** commands remove the **ip ospf router-id output-format hostnames** command from **running-config**, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ospf router-id output-format hostnames
no ip ospf router-id output-format hostnames
default ip ospf router-id output-format hostnames
```

#### Example

This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)# ip ospf router-id output-format hostnames
switch(config)#End
```

### 15.2.5.29 ip ospf transmit-delay

The `ip ospf transmit-delay` command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The `no ip ospf transmit-delay` and `default ip ospf transmit-delay` commands restore the default transmission delay (1 second) on the configuration mode interface by removing the corresponding `ip ospf transmit-delay` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf transmit-delay trans
no ip ospf transmit-delay
default ip ospf transmit-delay
```

#### Parameter

***trans*** LSA transmission delay (seconds). Value ranges from **1 to 8192**; default is **1**.

#### Example

This command configures a transmission delay of **5** seconds for **vlan 6**.

```
switch(config)# interface vlan 6
switch(config-if-Vl6)# ip ospf transmit-delay 5
switch(config-if-Vl6) #
```

---

### 15.2.5.30 ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface..

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (1) on the configuration mode interface by removing the corresponding **ip ospf priority** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
ip ospf priority priority_level
no ip ospf priority
default ip ospf priority
```

#### Parameter

**priority\_level** priority level. Value ranges from **0 to 255**. Default value is **1**.

#### Examples

- This command configures a router priority of **15** for **vlan 8**.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# ip ospf priority 15
switch(config-if-Vl8)#

```

- This command restores the router priority of **1** for **vlan 7**.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# no ip ospf priority
switch(config-if-Vl7)#

```

### 15.2.5.31 line system

The **line system** command places the switch in the OSPF - Line System configuration mode.

The **no line system** command removes the Line System configurations from the *running-config*.

#### Command Mode

Global Configuration Mode

#### Command Syntax

```
line system
no line system
```

#### Parameters

The following parameters are allowed to be configured under LS mode.

- **port number** Transceiver slot number. Value ranges from **1 - 66**.
  - The following parameters are allowed under **LS port mode**:
    - booster Booster settings
    - pre-amp Pre-amp settings

#### Example

This command places the switch in the OSPF Line System configuration mode.

```
switch# config
switch(config)# line system
switch(config-ls)#{
```

---

### 15.2.5.32 log-adjacency-changes (OSPFv2)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from **running-config**.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in **running-config**.

The **no log-adjacency-changes** disables link state change syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
log-adjacency-changes detail
no log-adjacency-changes
default log-adjacency-changes
```

#### Examples

- This command configures the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)# router ospf 6
switch(config-router-ospf)# log-adjacency-changes
switch(config-router-ospf)#{/pre>
```

- After entering the command, **show active** does not display a **log-adjacency-changes** statement.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)#{/pre>
```

- This command configures the switch to send a Syslog message when it detects any link state change.

```
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#{/pre>
```

- After entering the command, **show active** displays a **log-adjacency-changes detail** command.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#{/pre>
```

### 15.2.5.33 maximum-paths (OSPFv2)

The **maximum-paths** command controls the number of parallel routes that OSPFv2 supports. The default maximum is **16** paths.

The **no maximum-paths** and **default maximum-paths** commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the **maximum-paths 16** statement in **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

#### Parameters

**paths** Maximum number of parallel routes.

Value ranges from **1** to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad:** Value ranges from **1 to 128**. Default value is **128**.
  - **FM6000:** Value ranges from **1 to 32**. Default value is **32**.
  - **PetraA:** Value ranges from **1 to 16**. Default value is **16**.
  - **Trident:** Value ranges from **1 to 32**. Default value is **32**.
  - **Trident II:** Value ranges from **1 to 128**. Default value is **128**.

#### Example

This command configures the maximum number of OSPFv2 parallel paths to **12**.

```
switch(config)# router ospf 6
switch(config-router-ospf)# maximum-paths 12
switch(config-router-ospf)#{
```

### 15.2.5.34 max-lsa (OSPFv2)

The **max-lsa** command specifies the maximum number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- **Warning:** the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown:** when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is five minutes).
- **Permanent shutdown:** the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is **5**). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

The **no max-lsa** and **default max-lsa** commands restore all LSA overload parameters to their default settings.

**Note:** if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
max-lsa lsa_num [WARNING] [IGNORE_TIME][IGNORE_COUNT][RESET]
```

```
no max-lsa
```

```
default max-lsa
```

#### Parameters

- ***lsa\_num*** Maximum number of LSAs. Value ranges from **0 to 100,000**.
  - **0** Disables overload protection.
  - **1 to 100000** Specifies maximum value; default value is **12,000**.
- **WARNING** Warning threshold, as a percentage of the maximum number of LSAs (% of ***lsa\_num***).
  - **no parameter** Default of **75%**.
  - **percent** Ranges from **25 to 99**.
- **IGNORE\_TIME** Temporary shutdown period (minutes). Options include:
  - **no parameter** Default value of **5** minutes.
  - **ignore-time *period*** Value ranges from **1 to 60**.
- **IGNORE\_COUNT** Number of temporary shutdowns required to trigger a permanent shutdown.
  - **no parameter** Default value of **5**.
  - **ignore-count *episodes*** Ranges from **1 to 20**.
- **RESET** Period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - **no parameter** Default value of **5** minutes.
  - **reset-time *r\_period*** Ranges from **1 to 60**.

## Example

This command defines an LSA limit of **8000** and other parameters.

```
switch(config-router-ospf)# max-lsa 8000 40 ignore-time 6 ignore-count 3 reset-time 20
switch(config-router-ospf)#{/pre>
```

---

### 15.2.5.35 max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

#### Parameters

All parameters can be placed in any order.

- **EXTERNAL** Advertised metric value. Values include:
  - **no parameter** Default value of **1**.
  - **external-lsa** Range: **1 to 16777215**. Default value is **0xFF0000**.
- **STUB** Advertised metric type. Values include:
  - **no parameter** Default value of **2**.
  - **include-stub**
- **STARTUP** Limit scope of LSAs. Values include:
  - **no parameter**
  - **on-startup**
  - **on-startup wait-for-bgp**
  - **on-startup** Range: **5 to 86400**.
- **wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** Advertised metric value. Values include:
  - **no parameter**
  - **summary-lsa**
  - **summary-lsa** Range: **1 to 16777215**.

#### Example

This command configures OSPF to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf) # max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf) #
```

### 15.2.5.36 network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area.

The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from ***running-config***.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
network ipv4_subnet area area_id
no network ipv4_subnet area area_id
default network ipv4_subnet area area_id
```

#### Parameters

- ***ipv4\_subnet*** IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask. The ***running-config*** stores value in CIDR notation.
- ***area\_id*** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. The ***running-config*** stores value in dotted decimal notation.

#### Example

These equivalent commands each assign the subnet **10.1.10.0/24** to area **0**.

```
switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)# network 10.1.10.0/24 area 0
switch(config-router-ospf) #
```

---

### 15.2.5.37 no area (OSPFv2)

The `no area` command removes the corresponding `area` command from the *running-config*:

- `no/default area not-so-stubby lsa type-7 convert type-5` commands remove the `translate type7 always` parameter without changing the area type.
- `no/default area nssa`, `no/default area stub`, and `no/default area stub no-summary` commands restore the areas type to `normal`.
- The `no/default area default-information-originate` command removes all area commands for the specified area from *running-config*.
- The `no/default area` command removes all area commands for the specified area from the *running-config*.
- The `no/default area` command removes all area commands for the specified area from the *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
no area area_id [TYPE]
default area area_id [TYPE]
```

#### Parameters

- `area_id` area number.
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always `normal`.
  - The *running-config* stores value in dotted decimal notation.
- `TYPE` Area type. Values include:
  - `nssa`
  - `nssa translate type7 always`
  - `stub`
  - `stub no-summary`

#### Examples

- These commands remove area **1** from the running configuration.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no area 1
switch(config-router-ospf)#{/pre>
```

- These commands remove area **10.92.148.17** as an NSSA.

```
switch(config-router-ospf)# no area 10.92.148.17 nssa
switch(config-router-ospf)#{/pre>
```

### 15.2.5.38 packet

This describes packet types that the feature is applied on.

#### Command Mode

```
system-feature-source-profile (config-hw-tcam-profile-profile-feature)
```

#### Command Syntax

```
packet packet header tokens forwarding [bridged | routed | mpls][multicast][decap]
```

#### Parameters

- **packet header tokens** The packet header is described as a series of CLI packet header tokens after the **packet** token. It starts from the outer most header after Ethernet. For example, a regular IPv4 packet is **packet ipv4** and a VXLAN packet is **packet ipv4 VXLAN eth ipv4**.
- **forwarding** The **forwarding** token indicates the forwarding type of the packet.
  - **bridged**
  - **routed**
  - **mpls**
    - **multicast** Indicates if the packet is a multicast packet.
    - **decap** Indicates if the packet is decapsulated after a tunnel.

#### Guidelines

On DCS-7200, DCS-7280R/R2 or DCS-7500R/R2, enabling OSPF routes over GRE tunnels requires the system TCAM profile to have “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. This can be achieved by creating a user defined TCAM profile.

The user defined TCAM profile may be created either manually from scratch or by copying from an existing TCAM profile. The system TCAM profile must have the feature **tunnel ipv4** for OSPFv2 over GRE tunnel interfaces to work. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

To create a user defined TCAM profile.

```
(config)# hardware tcam
(config-hw-tcam)# profile profilename copy default
(config-hw-tcam-profile-profile)# feature tunnel ipv4 copy system-feature-source-profile
```

The following steps are optional if the feature is added by copying from system-feature-source-profile.

- Set the packet types for the feature as follows to match GRE tunneled ipv4 routed unicast and multicast packets.

```
(config-hw-tcam-profile-profile-feature)# packet ipv4 non-VXLAN forwarding routed decap
(config-hw-tcam-profile-profile-feature)# packet ipv4 non-VXLAN forwarding routed
 multicast decap
```

- Specify the qualifiers to match on.

```
(config-hw-tcam-profile-profile-feature)# key field inner-dst-ip inner-ip-protocol
 inner-14-dst-port inner-14-src-port inner-ttl
```

- Set the key size limit to **160**.

```
(config-hw-tcam-profile-profile-feature)# key size limit 160
```

---

```
(config-hw-tcam-profile-profile-feature) # exit
```

It maybe necessary to disassociate some features which are not applicable to GRE encapsulated packets from the GRE TCAM program to make room for the **tunnel ipv4** feature.

#### Related Commands

- [system profile](#)
- [interface Tunnel](#)
- [show hardware tcam profile](#)

### 15.2.5.39 passive-interface default (OSPFv2)

The **passive-interface default** command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The **passive-interface (OSPFv2)** configures the OSPFv2 active-passive status for a specific interface:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in ***running-config***.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in ***running-config***.

The **no passive-interface** and **default passive-interface** commands configures all interfaces as OSPFv2 active by default by removing the **passive-interface default** statement from ***running-config***.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
passive-interface default
no passive-interface default
default passive-interface default
```

#### Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all **passive-interface** statements from the ***running-config***.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface default
switch(config-router-ospf) #
```

- This command configures the default interface setting as OSPFv2 active. This command also removes all **no passive-interface** statements from the ***running-config***.

```
switch(config-router-ospf)# no passive-interface default
switch(config-router-ospf) #
```

#### 15.2.5.40 passive-interface (OSPFv2)

The **passive-interface** command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the [passive-interface default \(OSPFv2\)](#) command:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in the **running-config**.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in the **running-config**.

The **no passive-interface** command enables OSPFv2 on the specified interface range. The **default passive-interface** command sets the interface to the default interface activity setting by removing the corresponding **passive-interface** or **no passive-interface** statement from the **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

#### Parameters

- **INTERFACE\_NAME** Interface to be configured. Options include:
  - **ethernet e\_range**
  - **port-channel p\_range**
  - **vlan v\_range**
  - **VXLAN vx\_range**

#### Examples

- These commands configure Ethernet interfaces **2** through **5** as passive interfaces.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface ethernet 2-5
switch(config-router-ospf) #
```

- This command configures VLAN interfaces **50-54, 61, 68**, and **102-120** as passive interfaces.

```
switch(config-router-ospf)# passive-interface vlan 50-54,61,68,102-120
switch(config-router-ospf) #
```

- This command configures **vlan 2** as an active interface.

```
switch(config-router-ospf)# no passive-interface vlan 2
switch(config-router-ospf) #
```

#### 15.2.5.41 point-to-point routes (OSPFv2)

The **point-to-point routes** command enables the switch to maintain a local Routing Information Base (RIB) to store information it learns from its neighbors.

The **no point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **point-to-point routes** command from the **running-config**.

##### Command Mode

Router-OSPF Configuration

##### Command Syntax

```
point-to-point routes
no point-to-point routes
default point-to-point routes
```

##### Examples

- This command configures the switch to optimize the local RIB by not including point-to-point routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no point-to-point routes
switch(config-router-ospf)#{
```

- This command configures the switch to include point-to-point routes.

```
switch(config-router-ospf)# point-to-point routes
switch(config-router-ospf)#{
```

---

#### 15.2.5.42 redistribute (OSPFv2)

The **redistribute** command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from the **running-config**, disabling route redistribution for the specified route type.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE [ROUTE_MAP]
default redistribute ROUTE_TYPE [ROUTE_MAP]
```

#### Parameters

- **ROUTE\_TYPE** Source from which routes are redistributed. Options include:
  - **connected** routes that are established when IPv4 is enabled on an interface.
  - **BGP** routes from a BGP domain.
  - **RIP** routes from a RIP domain.
  - **static** IP static routes.
- **ROUTE\_MAP** Route map that determines the routes that are redistributed. Options include:
  - **no parameter**
  - **route-map map\_name**

#### Examples

- The **redistribute static** command starts the advertising of static routes as OSPFv2 external routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# redistribute static
switch(config-router-ospf)#{/pre>
```

- The **no redistribute bgp** command stops the advertising of BGP routes as OSPFv2 external routes.

```
switch(config-router-ospf)# no redistribute bgp
switch(config-router-ospf)#{/pre>
```

#### 15.2.5.43 redistribute ospf

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

##### Command Mode

Config-router-bgp

##### Command Syntax

```
redistribute ospf [include [leaked] | match [external | internal | nssa-external] | route-map word]
no redistribute ospf [match [external | internal | nssa-external]
default redistribute ospf [match [external | internal | nssa-external]
```

##### Parameters

- **include** Include following routes while redistributing.
  - **leaked** Include leaked routes of this protocol while redistributing.
- **match** Routes learned by the OSPF protocol.
  - **external** OSPF routes learned from external sources.
  - **internal** OSPF routes learned from internal sources.
  - **nssa-external** OSPF routes learned from external NSSA sources.
- **route-map** Name a router map.
  - **word** Route map name.

##### Example

Use the following commands to redistribute OSPFv2 routes into the BGP domain.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute OSPF
switch(config-router-bgp) #
```

---

#### 15.2.5.44 redistribute ospf instance

The **redistribute ospf instance** command redistributes either the non-leaked routes, or both leaked and non-leaked routes. The **exit** command returns the switch to the **global** configuration mode.

##### Command Mode

Router-OSPF Configuration

##### Command Syntax

```
redistribute ospf instance [OPTIONS]
```

##### Parameters

- **include** Include leaked routes.
  - **leaked** OSPF leaked routes.
- **match** Routes learned by the OSPF protocol.
  - **external** OSPF routes learned from external sources.
  - **internal** OSPF routes learned from internal sources.
  - **nssa-external** OSPF routes learned from external NSSA sources.

##### Examples

- This command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
```

- This command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance include leaked match internal
```

#### 15.2.5.45 router ospf

The **router ospf** command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The **exit** command returns the switch to the **global** configuration mode.

The **show ip ospf** command displays the process ID of the OSPFv2 instances configured on the switch.

The **no router ospf** and **default router ospf** commands delete the specified OSPFv2 instance.

The **router-ospf** configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **router-ospf** configuration mode does not affect **running-config**. The **exit** command returns the switch to the **global** configuration mode.

Refer to the Router-OSPFv2 Configuration Mode for a list of commands available in **router-ospf** configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

##### Parameters

- **process\_id** OSPFv2 process ID. Values range from **1 to 65535**.
- **VRF\_INSTANCE**
  - **no parameter** Configures the default VRF instance.
  - **vrf vrf\_name** Configures the vrf\_name instance.

##### Examples

- This command creates an OSPFv2 instance with process ID **145** in the main VRF.

```
switch(config)# router ospf 145
switch(config-router-ospf) #
```

- This command deletes the specified OSPFv2 instance.

```
switch(config)# no router ospf 145
switch(config) #
```

#### 15.2.5.46 router-id (OSPFv2)

The **router-id** command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from the **running-config**; the switch uses the loopback or highest address as the router ID.

##### Command Mode

Router-OSPF Configuration

##### Command Syntax

```
router-id [identifier]
no router-id [identifier]
default router-id [identifier]
```

##### Parameters

**identifier** Value ranges from **0.0.0.0** to **255.255.255.255**.

##### Example

This command assigns **10.5.4.2** as the router ID for the OSPFv2 instance.

```
switch(config)# router ospf 6
switch(config-router-ospf)# router-id 10.5.4.2
switch(config-router-ospf)#{/pre>
```

### 15.2.5.47 show hardware tcam profile

Use the **show hardware tcam profile** command to verify that the user-defined-tcam profile is applied correctly without errors on the DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 platforms.

This command is applicable the following platforms:

- DCS-7280E
- DCS-7280R
- DCS-7280R2
- DCS-7020R
- DCS-7500E
- DCS-7500R
- DCS-7500R2

#### Command Mode

EXEC

#### Command Syntax

```
show hardware tcam profile [profile] detail
```

#### Parameters

- **tcam** Specifies the TCAM information.
- **profile *profile*** Specifies the TCAM profile information.
- **detail** Displays detailed tcam profile information.

#### Example

This example displays the detailed tcam profile information for profile named ***newprofile1***.

```
(config-hw-tcam) # show hardware tcam profile newprofile1 detail
Profile newprofile1 [FixedSystem]
 Feature mpls

 Key size 160
 Actions drop, redirect, set-ecn
 Packet type ipv4 mpls ipv4 forwarding mpls decap
 ipv4 mpls ipv6 forwarding mpls decap
 mpls ipv4 forwarding mpls
 mpls ipv6 forwarding mpls
 mpls non-ip forwarding mpls

 Feature acl vlan ipv6

 Key size 320
 Key fields dst-ipv6, ipv6-next-header, 14-dst-port, 14-src-port,
 src-ipv6-high, src-ipv6-low, tcp-control
 Actions count, drop, mirror, redirect
 Packet type ipv6 forwarding routed
 ...
```

---

#### 15.2.5.48 show ip ospf border-routers

The **show ip ospf border-routers** command displays the internal OSPFv2 routing table entries to Area Border Routers (ABRs) and Autonomous System Boundary Routers (ASBRs) for each of the OSPFv2 areas.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf border-routers [VRF_INSTANCE]
```

##### Parameters

**VRF\_INSTANCE** Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf\_name** displays information from the specified VRF.

##### Example

This command displays the ABRs and ASBRs.

```
switch# show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

Router ID Area Type
10.17.0.1 0.0.0.0 ASBR switch>
```

### 15.2.5.49 show ip ospf database database-summary

The `show ip ospf database database-summary` command displays the number of link state advertisements in the OSPFv2 database.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - **no parameter**
  - **process\_id**
  - **process\_id area\_id**
  - **process\_id** input range: **1 to 65535**.
  - **area\_id** input range: **0 to 4294967295** or **0.0.0.0 to 255.255.255.255**.

#### Example

This command displays the LSDB content summary for area **0**.

```
switch# show ip ospf 1 0 database database-summary
LSA Type Count
Router 18
Network 21
Summary Net 59
Summary ASBR 4
Type-7 Ext 0
Opaque Area 0
Type-5 Ext 4238
Opaque AS 0
Total 4340
```

---

### 15.2.5.50 show ip ospf database <link state list>

The **show ip ospf database <link state list>** command displays the OSPFv2 link state advertisements that originate on a specified switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [AREA] database[ROUTER] [VRF_INSTANCE]
```

#### Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - **no parameter**
  - **process\_id**
  - **process\_id area\_id**
  - **process\_id** value ranges from **1 to 65535**.
  - **area\_id** is entered in decimal or dotted decimal notation.
- **ROUTER** Router or switch for which the command provides data. Options include:
  - **no parameter**
  - **adv-router [a.b.c.d]**
  - **self-originate**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays OSPFv2 LSAs that originate at the router with a router ID of **10.26.0.31**.

```
switch# show ip ospf database adv-router 10.26.0.31
OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)
10.26.0.3110.26.0.319180x80002b4a0x13153

TypeLink IDADV RouterAgeSeq# Checksum
```

### 15.2.5.51 show ip ospf database <link-state details>

The `show ip ospf database` command displays details of the specified link state advertisements.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

#### Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - **no parameter**
  - **process\_id**
  - **process\_id area\_id**
  - **process\_id** input range: **1 to 65535**.
  - **area\_id** input range: **0 to 4294967295** or **0.0.0.0 to 255.255.255.255**.
- **LINKSTATE\_TYPE** Link state types. Parameter options include:
  - **detail** Displays all link states.
  - **router**
  - **network**
  - **summary**
  - **asbr-summary**
  - **external**
  - **nssa-external**
  - **opaque-link**
  - **opaque-area**
  - **opaque-as**
- **linkstate\_id** Network segment described by the LSA (dotted decimal notation).  
Value depends on the LSA type.
- **ROUTER** Router or switch for which the command provides data. Options include:
  - **no parameter**
  - **adv-router [a.b.c.d]**
  - **self-originate**
- **VRF\_INSTANCE** Parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Examples

- This command displays the router link states contained in the area **2** LSDB.

```
switch# show ip ospf 1 2 database router
OSPF Router with ID(10.168.103.1) (Process ID 1) (VRF default)
Router Link States (Area 0.0.0.2)
```

```

### 15.2.5.52 show ip ospf interface brief

The **show ip ospf interface brief** command displays a summary of OSPFv2 information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]
```

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - **no parameter**
  - **1 to 65535**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Related Command

[show ip ospf interface](#)

#### Example

This command displays a summary of interface information for the switch.

```
switch# show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1
Vlan210.0.0.210.168.2.1/2410BDR1
Vlan310.0.0.310.168.3.1/2410DR0 switch>
```

---

### 15.2.5.53 show ip ospf interface

The `show ip ospf interface` command displays interface information that is related to OSPFv2.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME][VRF_INSTANCE]
```

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - **no parameter**
  - **1 to 65535**
- **INTERFACE\_NAME** Interface type and number. Values include:
  - **no parameter**
  - **ethernet e\_num**
  - **loopback l\_num**
  - **port-channel p\_num**
  - **vlan v\_num**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Related Command

[show ip ospf interface brief](#)

#### Example

This command displays complete OSPFv2 information for **vlan 1**.

```
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
```

### 15.2.5.54 show ip ospf lsa-log

The **show ip ospf lsa-log** command displays log entries when LSA update messages are sent or received for OSPF.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

#### Parameters

**PROCESS\_ID** OSPFv2 process ID. Values include:

- ***no parameter***
- ***1 to 65535***

#### Example

This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch# show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000 msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
switch#
```

---

### 15.2.5.55 show ip ospf neighbor adjacency-changes

The **show ip ospf neighbor adjacency-changes** command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf neighbor [INTERFACE_NAME][NEIGHBOR] adjacency-changes [VRF_INSTANCE]
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Values include:
  - **no parameter**
  - **ethernet e\_num**
  - **loopback l\_num**
  - **port-channel p\_num**
  - **vlan v\_num**
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - **no parameter**
  - **ipv4\_addr**
  - **host\_name**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays the adjacency changes to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 adjacency-changes
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not
list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
```

### 15.2.5.56 show ip ospf neighbor state

The **show ip ospf neighbor state** command displays the state information on OSPF neighbors on a per-interface basis.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

#### Parameters

- **STATE\_NAME** Output filtered by the devices OSPF state. Options include valid OSPF states:
  - **2-ways**
  - **attempt**
  - **down**
  - **exch-start**
  - **exchange**
  - **full**
  - **graceful-restart**
  - **init**
  - **loading**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays OSPF information for neighboring routers that are fully adjacent.

| switch# show ip ospf neighbor state full |         |     |              |           |               |            |
|------------------------------------------|---------|-----|--------------|-----------|---------------|------------|
| Neighbor ID                              | VRF     | Pri | State        | Dead Time | Address       | Interface  |
| Test1                                    | default | 1   | FULL/BDR     | 00:00:35  | 10.17.254.105 | Vlan3912   |
| Test2                                    | default | 1   | FULL/BDR     | 00:00:36  | 10.17.254.29  | Vlan3910   |
| Test3                                    | default | 1   | FULL/DR      | 00:00:35  | 10.25.0.1     | Vlan101    |
| Test4                                    | default | 1   | FULL/DROTHER | 00:00:36  | 10.17.254.67  | Vlan3908   |
| Test5                                    | default | 1   | FULL/DROTHER | 00:00:36  | 10.17.254.68  | Vlan3908   |
| Test6                                    | default | 1   | FULL/BDR     | 00:00:32  | 10.17.254.66  | Vlan3908   |
| Test7                                    | default | 1   | FULL/DROTHER | 00:00:34  | 10.17.36.4    | Vlan3036   |
| Test8                                    | default | 1   | FULL/BDR     | 00:00:35  | 10.17.36.3    | Vlan3036   |
| Test9                                    | default | 1   | FULL/DROTHER | 00:00:31  | 10.17.254.13  | Vlan3902   |
| Test10                                   | default | 1   | FULL/BDR     | 00:00:37  | 10.17.254.11  | Vlan3902   |
| Test11                                   | default | 1   | FULL/DROTHER | 00:00:33  | 10.17.254.163 | Vlan3925   |
| Test12                                   | default | 1   | FULL/DR      | 00:00:37  | 10.17.254.161 | Vlan3925   |
| Test13                                   | default | 1   | FULL/DROTHER | 00:00:31  | 10.17.254.154 | Vlan3923   |
| Test14                                   | default | 1   | FULL/BDR     | 00:00:39  | 10.17.254.156 | Vlan3923   |
| Test15                                   | default | 1   | FULL/DROTHER | 00:00:33  | 10.17.254.35  | Vlan3911   |
| Test16                                   | default | 1   | FULL/DR      | 00:00:34  | 10.17.254.33  | Vlan3911   |
| Test17                                   | default | 1   | FULL/DR      | 00:00:36  | 10.17.254.138 | Ethernet12 |
| Test18                                   | default | 1   | FULL/DR      | 00:00:37  | 10.17.254.2   | Vlan3901   |

---

### 15.2.5.57 show ip ospf neighbor summary

The **show ip ospf neighbor summary** command displays a single line of summary information for each OSPFv2 neighbor.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]
```

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - **no parameter**
  - **1 to 65535**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch# show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
```

### 15.2.5.58 show ip ospf neighbor

The `show ip ospf neighbor` command displays OSPFv2 neighbor information for specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] neighbor [INTERFACE_NAME] [NEIGHBOR] [DATA] [VRF_INSTANCE]
```

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - **no parameter**
  - **1 to 65535**
- **INTERFACE\_NAME** Interface type and number. Values include:
  - **no parameter**
  - **ethernet e\_num**
  - **loopback l\_num**
  - **port-channel p\_num**
  - **vlan v\_num**
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - **no parameter**
  - **ipv4\_addr**
- **DATA** Type of information the command displays. Values include:
  - **no parameter**
  - **detail**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** displays information from all VRFs, or from context-active VRF if set.
  - **vrf vrf\_name** displays information from the specified VRF.

#### Examples

- This command displays the switch's neighbors.

```
switch# show ip ospf neighbor
Neighbor IDVRF PriStateDead TimeAddressInterface
10.168.104.2 default1 FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.2 default8 FULL/BDR00:00:3110.168.2.2Vlan2
```

- This command displays details about the neighbors to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 000:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34
```

---

### 15.2.5.59 show ip ospf request queue

The **show ip ospf request queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) requested by a router.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf request queue [VRF_INSTANCE]
```

#### Parameters

**VRF\_INSTANCE** Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays an LSA request list.

```
switch# show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
Type LS ID ADV RTR Seq No Age Checksum
```

### 15.2.5.60 show ip ospf retransmission queue

The **show ip ospf retransmission queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) waiting to be re-sent.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf retransmission queue [VRF_INSTANCE]
```

#### Parameters

**VRF\_INSTANCE** Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf\_name** displays information from the specified VRF.

#### Example

This command displays an empty retransmission list.

```
switch# show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
```

---

### 15.2.5.61 show ip ospf spf-log

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

#### Parameters

**PROCESS\_ID** OSPFv2 process ID. Values include:

- **no parameter**
- **1 to 65535**

#### Example

This command displays the SPF information for OSPF.

```
switch# show ip ospf spf-log
OSPF Process 172.26.0.22
When Duration(msec)
13:01:34 1.482
13:01:29 1.547
13:01:24 1.893
13:00:50 1.459
13:00:45 1.473
13:00:40 2.603
11:01:49 1.561
11:01:40 1.463
11:01:35 1.467
11:01:30 1.434
11:00:54 1.456
11:00:49 1.472
11:00:44 1.582
15:01:49 1.575
15:01:44 1.470
15:01:39 1.679
15:01:34 1.601
15:00:57 1.454
15:00:52 1.446
15:00:47 1.603
```

### 15.2.5.62 show ip ospf

The **show ip ospf** command displays OSPFv2 routing information

#### Command Mode

EXEC

#### Command Syntax

**show ip ospf [PROCESS\_ID][VRF\_INSTANCE]**

#### Parameters

- **PROCESS\_ID** OSPFv2 process ID. Values include:
  - **no parameter**
  - **1 to 65535**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter** configures the default VRF instance.
  - **vrf vrf\_name** configures the **vrf\_name** instance.

#### Example

This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch# show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msec
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

### 15.2.5.63 show line system dom thresholds

The **show line system dom thresholds** command reports DOM information reported by the OSFP-LS module. This includes standard fields such as temperature and voltage. In addition to standard DOM fields, the OSFP-LS also monitors the laser temperature for each of its amplifiers. The reported RX power reflects the total RX power seen on that path. TX bias current monitoring is not supported on these modules and should be ignored.

#### Command Mode

EXEC

#### Command Syntax

```
show line system [[port RANGE] dom thresholds]
```

#### Example

This command displays the DOM information reported by the OSFP-LS module.

| switch# show line system port 10 dom thresholds            |                                                                                                                                                |        |                      |                     |                    |                     |

### 15.2.5.64 show line system status

The **show line system status** command displays module status. The OSFP-LS is compliant to the Common Management Interface Specification (CMIS), and implements various CMIS-defined status flags. Data path 1 reflects the outgoing booster path and data path 2 reflects the incoming pre-amp path.

#### Command Mode

EXEC

#### Command Syntax

**show line system [port RANGE] status**

#### Example

This command displays the displays module status.

|                          | Current State | Changes | Last Change |

| TX bias high warn          | ok     | 0 | never       |
| TX bias low alarm          | ok     | 0 | never       |
| TX bias low warn           | ok     | 0 | never       |
| RX power high alarm        | ok     | 0 | never       |
| RX power high warn         | ok     | 0 | never       |
| RX power low alarm         | ok     | 2 | 0:16:35 ago |
| RX power low warn          | ok     | 2 | 0:16:35 ago |

Some lines of output do not apply to the OSFP-LS modules (For example, **Operational speed**, **RX CDR LOL**). These lines of output should be ignored. The fields of interest are **Module state**, **Data path 1 state**, and **Data path 2 state**. Under normal operating conditions, **Module state** will read ready and the **Data path state** fields will read either **initialized** or **activated**. Initialized means that the module is ready to operate but is receiving no signal to amplify. Activated means that the amplifier is active.

### 15.2.5.65 shutdown (OSPFv2)

The **shutdown** command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the **shutdown (OSPFv2)** command.

The **no shutdown** and **default shutdown** commands enable the OSPFv2 instance by removing the **shutdown** statement from the OSPF block in *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
shutdown
no shutdown
default shutdown
```

#### Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config)# router ospf 6
switch(config-router-ospf)# shutdown
switch(config-router-ospf) #
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)# no shutdown
switch(config-router-ospf) #
```

---

### 15.2.5.66 summary-address

The **summary-address** command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The **default summary-address** and **no summary-address** commands delete the current **summary-address** configurations.

#### Command Mode

Router Configuration Mode

#### Command Syntax

```
summary-address {ip_address subnet_mask | ip_prefix} [attribute_map WORD | not_advertise | tag]
default summary-address {ip_address summary_mask | ip_prefix}
no summary-address {ip_address summary_mask | ip_prefix}
```

#### Parameters

- **ip\_address subnet\_mask** IPv4 subnet in dotted decimal notation.
- **ip\_prefix** IPv4 subnet in CIDR notation.
- **attribute\_map WORD** allows using a route-map to set the attributes to be advertised in the LSA. Options include:
  - set metric
  - set metric-type
  - set tag
- **not\_advertise** suppresses the advertisement of contributing external prefixes by the router.
- **tag** allows setting the tag in the advertised external LSA. The tag value ranges from **0 to 4294967295**. The default value is **0**.

#### Guidelines

This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

#### Restriction

Only OSPF redistributed routes are aggregated.

## Example

This command advertises an external LSA for **50.0.0.0/16** prefix if at least one BGP contributing route is present which falls in the subnet **50.0.0.0/16**.

**Note:** The **show** commands display aggregation of BGP prefixes **50.0.0.0/24** and **50.0.1.0/24** into one OSPF AS External LSA for **50.0.0.0/16** prefix. A route-map is to set metric and tag for the advertised LSA.

```

switch(config)# router ospf 5
switch(config-router-ospf)# redistribute bgp
switch(config-router-ospf)# summary-address 50.0.0.0/16 attribute-map BGP_AGGR
switch(config-router-ospf)# exit
switch(config)# show ip route bgp

### 15.2.5.67 system profile

Use the **system profile** command to apply the user defined TCAM profile to the system.

#### Command Mode

hardware tcam mode

#### Command Syntax

**system profile *profilename***

#### Parameter

***profilename*** Name of the selected system profile.

#### Example

```
(config-hw-tcam) # system profile profilename
```

---

### 15.2.5.68 timers lsa rx min interval (OSPFv2)

The **timers lsa rx min interval** command sets the minimum interval for acceptance of identical Link State Advertisements (LSAs) from OSPFv2 neighbors.

The **no timers lsa rx min interval** and **default timers lsa rx min interval** commands restore the minimum interval to the default of **1** second by removing the **timers lsa rx min interval** command from the **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers lsa rx min interval lsa_time
no timers lsa rx min interval
default timers lsa rx min interval
```

#### Parameter

***lsa\_time*** Minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is **1000 (1 second)**.

#### Example

This command sets the minimum LSA arrival interval to **10** milliseconds.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers lsa rx min interval 10
switch(config-router-ospf)#{/pre}
```

### 15.2.5.69 timers lsa tx delay initial (OSPFv2)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPF link-state advertisement generation.

The `no timers lsa tx delay initial` and `default timers throttle lsa all` commands restore the defaults by removing the `timers lsa tx delay initial` command from the *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers lsa tx delay initial [initial_delay | min_hold | max_wait]
no timers lsa tx delay initial
default timers lsa tx delay initial
```

#### Parameters

- ***initial\_delay*** Value ranges from **0 to 600000** (ms). Default is **1000**.
- ***min\_hold*** Value ranges from **0 to 600000** (ms). Default is **5000**.
- ***max\_wait*** Value ranges from **0 to 600000** (ms). Default is **5000**.

#### Example

This command sets the rate-limiting values for OSPF link-state advertisement to **10** milliseconds.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers lsa tx delay initial 10
switch(config-router-ospf)#{/pre>
```

### 15.2.5.70 timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The **timers spf delay initial** command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- Initial delay: how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.
- Hold interval: this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- Maximum interval: the maximum time the switch will wait after a topology change before performing an SPF calculation.

The **no timers spf delay initial** and **default timers spf delay initial** commands restore the default OSPFv2 SPF calculation intervals by removing the **timers spf delay initial** command from the **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers spf delay initial [initial_delay | hold_interval | max_interval]
no timers spf
default timers spf
```

#### Parameters

- initial\_delay** Initial delay between a topology change and SPF calculation. Value ranges from **0 to 65535000** (ms). Default is **0** (ms).
- hold\_interval** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from **0 to 65535000** (ms). Default is **5000** (ms).
- max\_interval** Maximum hold interval before the switch will perform an SPF calculation. Value ranges from **0 to 65535000** (ms). Default is **5000** (ms).

#### Example

These commands set the SPF timers on the switch.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers spf 5 100 20000
switch(config-router-ospf)#{/pre}
```

### 15.2.5.71 tunnel routes

Use the **tunnel routes** command or the **default** form of the command to enable OSPFv2 routes over GRE tunnels. The tunnel routes are enabled, by default. Use the **no** form of the command to disable the tunnel routes.

#### Command Mode

Router OSPF configuration (config-router-ospf)

#### Command Syntax

```
tunnel routes
no tunnel routes
default tunnel routes
```

#### Examples

- To enable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# tunnel routes
switch(config-router-ospf)#{/pre>
```

- To disable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no tunnel routes
switch(config-router-ospf)#{/pre>
```

- To enable the default OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6
switch(config-router-ospf)# default tunnel routes
switch(config-router-ospf)#{/pre>
```

---

## 15.3 Open Shortest Path First – Version 3

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by *RFC 5340*.

This chapter contains the following sections.

- [OSPFv3 Introduction](#)
- [OSPFv3 Conceptual Overview](#)
- [Configuring OSPFv3](#)
- [OSPFv3 Configuration Examples](#)
- [OSPFv3 Commands](#)

### 15.3.1 OSPFv3 Introduction

OSPFv3 is based on OSPFv2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)

The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

### 15.3.2 OSPFv3 Conceptual Overview

This section contains the following topics:

- [Storing Link States](#)
- [Topology](#)
- [Link Updates](#)
- [OSPFv3 Security](#)

- Flood Pacing
- OSPFv3 BFD Sessions for Adjacencies in any State
- Support for OSPFv3 dn-bit-ignore

### 15.3.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol in which links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv3 packet communicating a router's topology to other routers. The Link State Database (LSDB) stores an area's topology database and comprises LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

### 15.3.2.2 Topology

An Autonomous System (AS) is the IP domain within which a dynamic protocol controls traffic routing. In OSPFv3, an AS comprises areas that define the LSDB computation boundaries—all routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

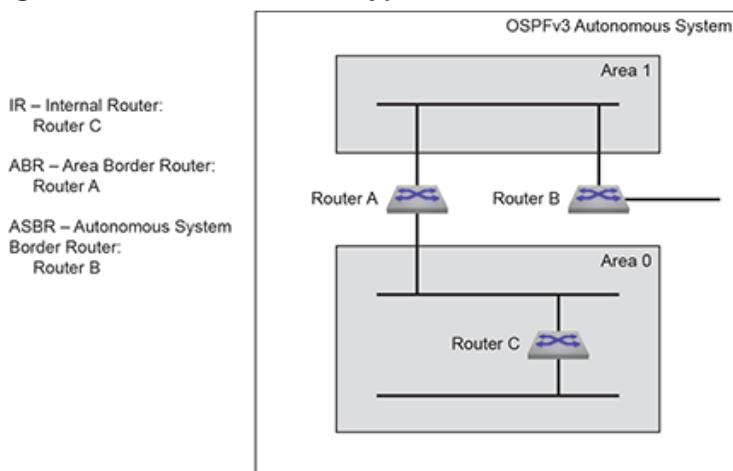

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other autonomous systems commit to carrying data to the IP space on the route.

OSPFv3 defines these routers:

- **Internal Router (IR):** a router with interfaces in a single area. All IRs in an area maintain identical LSDBs.
- **Area Border Router (ABR):** a router with interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- **Autonomous System Boundary Router (ASBR):** a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.

[OSPFv3 Router Types](#) displays the OSPFv3 router types.

**Figure 15-6: OSPFv3 Router Types**

OSPFv3 areas are assigned a number between **0** and **4,294,967,295**. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated area **0**, that connects to all other areas. The backbone receives routing information from all areas and distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

### 15.3.2.3 Link Updates

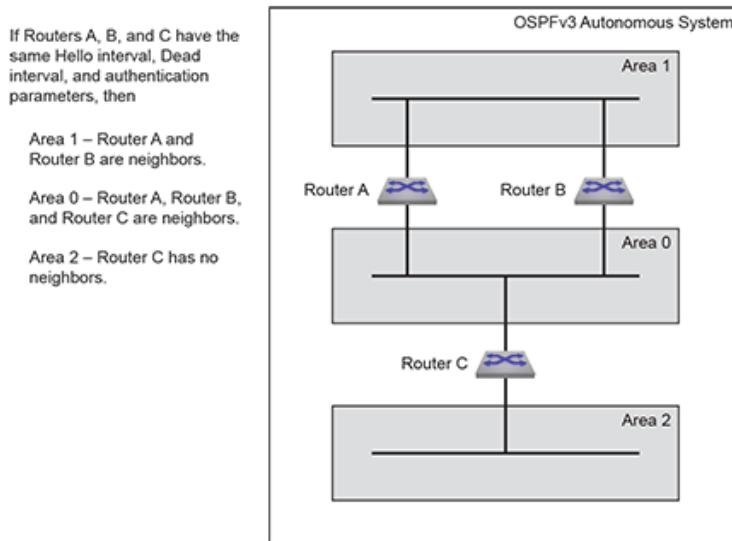

Routers periodically send hello packets to advertise status and establish neighbors. A routers hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- Share a common network segment.
- Are in the same area.
- Have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

[OSPFv3 Neighbors](#) illustrates OSPFv3 neighbors.

**Figure 15-7: OSPFv3 Neighbors**

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces, preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When an LSA changes a router's LSDB, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstra's algorithm to calculate the shortest path to all known destinations based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

#### 15.3.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication, and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has a Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

**Note:** On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.

##### 15.3.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the system inserts the HMAC-MD5 or SHA algorithm hash in the IPsec header and sends the packet over the wire for peer authentication.

While receiving OSPFv3 packets, the system verifies the computed hash with the one in the IPsec header and discards OSPFv3 packets if it fails.

##### 15.3.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with a security payload are discarded.

OSPFv3 encryption uses the Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES) algorithms. 3DES uses a **192** bit key, whereas the AES key length varies by **128**, **192**, and **256** bits.

#### 15.3.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay.
- It helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs.
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding.

**Note:** A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.

---

### 15.3.2.6 OSPFv3 BFD Sessions for Adjacencies in any State

BFD sessions are only established for OSPFv3 adjacencies that are in the FULL state. In a LAN environment, this results in BFD sessions not being established for OSPFv3 adjacencies with DR Other neighbors.

This feature provides configuration that enables the establishment of BFD sessions for OSPFv3 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv3 adjacencies with DR Other neighbors.

### 15.3.2.7 Support for OSPFv3 dn-bit-ignore

The OSPFv3 **dn-bit-ignore** command enables or disables the inclusion of LSAs with a Down (DN) bit set in SPF calculations. The DN Bit provides a loop prevention mechanism when configuring OSPF as a CE - PE IGP protocol.

The IEEE RFC *RFC6565* explains the DN-bit usage in OSPFv3. OSPFv3 honors the DN-bit in **type-3**, **type-5**, or **type-7** LSAs in non-default VRFs. SPF calculations do not include the LSAs and subsequently do not install them in the routing table. Using the **dn-bit-ignore** command changes this behavior. Arista Networks recommends understanding the entire topology before configuring the **dn-bit-ignore** command, as it can lead to forwarding loops on the network.

## 15.3.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- [Configuring an OSPFv3 Instance](#)
- [Configuring OSPFv3 Areas](#)
- [Configuring Interfaces for OSPFv3](#)
- [Enabling OSPFv3](#)
- [Configuring OSPFv3 Security](#)
- [Configuring OSPFv3 Flood Pacing](#)
- [Configuring OSPFv3 dn-bit-ignore](#)
- [Displaying OSPFv3 Status](#)

### 15.3.3.1 Configuring an OSPFv3 Instance

#### 15.3.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. The switch must be in router-OSPFv3 configuration mode to execute OSPFv3 configuration commands. The **ipv6 router ospf** command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the **ipv6 router ospf** command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the **ipv6 router ospf** command must specify its process ID (and VRF, if not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The **show ipv6 ospf** command displays information about OSPFv3 instances, including their process IDs.

## Example

This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance with a process ID of 9.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#[/pre]
```

### 15.3.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

**Note:** A router ID is required to run OSPF, and Arista recommends setting the router ID manually for the following reasons:

- 1. If there are no IPv4 addresses configured on the switch, a manually configured router ID is required.
- 2. The router ID also does not change if the interface status or IP address changes, which can cause confusion if the ID is selected automatically.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **router-id (OSPFv3)** command configures the router ID for an OSPFv3 instance.

## Example

This command assigns **15.1.1.1** as the OSPFv3 router ID.

```
switch(config-router-ospf3)# router-id 15.1.1.1
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 router-id 15.1.1.1
switch(config-router-ospf3)#[/pre]
```

### 15.3.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands control the OSPFv3 instance's behavior.

#### Logging Adjacency Changes

The **log-adjacency-changes (OSPFv3)** command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

#### Examples

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.

```
switch(config-router-ospf3) # log-adjacency-changes
switch(config-router-ospf3) #
```

- This command configures the switch to log all OSPFv3 link-state changes.

```
switch(config-router-ospf3) # log-adjacency-changes detail
switch(config-router-ospf3) #
```

## Intra-Area Distance

The **distance ospf intra-area (OSPFv3)** command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is **10**.

### Example

This command configures an administrative distance of **90** for OSPFv3 intra-area routes.

```
switch(config-router-ospf3) # distance ospf intra-area 90
switch(config-router-ospf3) # show active
ipv6 router ospf 9
 distance ospf intra-area 90
switch(config-router-ospf3) #
```

## Passive Interfaces

The **passive-interface (OSPFv3)** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, others may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The **no passive-interface** command re-enables OSPFv3 processing on the specified interface.

### Examples

- This command configures **vlan 200** as a passive interface.

```
switch(config-router-ospf3) # passive-interface vlan 200
switch(config-router-ospf3) # show active
ipv6 router ospf 9
 passive-interface Vlan200
switch(config-router-ospf3) #
```

- This command configures **vlan 200** as an active interface.

```
switch(config-router-ospf3) # no passive-interface vlan 200
switch(config-router-ospf3) # show active
ipv6 router ospf 9
switch(config-router-ospf3) #
```

## Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes established when enabling IPv6 on an interface.

### Example

The **redistribute (OSPFv3) connected** command converts connected routes to OSPFv3 external routes.

```
switch(config-router-ospf3)# redistribute connected
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 redistribute connected
switch(config-router-ospf3) #
```

## Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

### Example

The **redistribute (OSPFv3) static** command converts static routes to OSPFv3 external routes.

```
switch(config-router-ospf3)# redistribute static
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 redistribute static
switch(config-router-ospf3) #
```

## 15.3.3.2 Configuring OSPFv3 Areas

Area commands configure OSPFv3 areas. The switch must be in router-OSPFv3 configuration mode to run area commands, as described in [Entering OSPFv3 Configuration Mode](#).

Areas are assigned a 32-bit number expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

### 15.3.3.2.1 Configuring the Area Type

The **no area (OSPFv3)** command specifies the area type. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area **0**) is a normal area.
- **Stub area:** Area where external routes are not advertised. External routes are reached through a default summary route (**0.0.0.0**) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

### Example

These commands configure area **200** as an NSSA area and **300** as a stub area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 200 nssa
switch(config-router-ospf3)# area 300 stub
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 area 0.0.0.200
 area 0.0.1.44 stub
switch(config-router-ospf3) #
```

### 15.3.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

#### Default Summary Route Cost

The **area default-cost (OSPFv3)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to **10**.

#### Example

This command configures a cost of **25** for the default summary route in area **0.0.1.194 (450)**.

```
switch(config-router-ospf3)# area 450 default-cost 25
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 area 0.0.1.194 default-cost 25
```

#### Area Stub

The **area stub (OSPFv3)** command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (**0.0.0.0**). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

#### Examples

- This command configures area **45** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3) #
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3) #
```

#### Area Range

The **area range (OSPFv3)** command is used by OSPFv3 Area Border Routers (ABRs) to consolidate or summarize routes, configure a cost setting for those routes, and suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

#### Examples

- These commands consolidate and summarize routes at an area boundary **1**.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3) #
```

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64 not-advertise
switch(config-router-ospf3)#

```

### 15.3.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

#### 15.3.3.3.1 Assigning an Interface to an Area

The **ipv6 ospf area** command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent **ipv6 ospf area** commands that designate a different area on an interface replace any existing command for the interface.

##### Example

These commands enable OSPFv3 instance **9** on **interface vlan 200** and associate area **0** to the interface.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 ospf 9 area 0
switch(config-if-Vl200)# show active
interface Vlan200
 ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#

```

#### 15.3.3.3.2 Configuring Intervals

Interval configuration commands determine the OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.

##### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbor's dead interval.

The **ospfv3 hello-interval** command configures the hello interval for the configuration mode interface. The default is **10** seconds.

##### Example

These commands configure a hello interval of **45** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 hello-interval 45
switch(config-if-Vl200)# show active
interface Vlan200
 ospfv3 hello-interval 45
switch(config-if-Vl200)#

```

## Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. Configure identical dead intervals on all OSPFv3 neighbors. They must be longer than the hello interval of any neighbor.

The [ospfv3 dead-interval](#) command configures the dead interval for the configuration mode interface. The default is **40** seconds.

### Example

This command configures a dead interval of **75** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 dead-interval 75
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 dead-interval 75
switch(config-if-V1200)#

```

## Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. If they do not receive an acknowledgment, they will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The [ospfv3 ipv6 retransmit-interval](#) command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is **5** seconds.

### Example

This command configures a retransmission interval of **25** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 ipv6 retransmit-interval 25
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 ipv6 retransmit-interval 25
switch(config-if-V1200)#

```

## Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The [ospfv3 transmit-delay](#) command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

### Example

This command configures a transmission delay of **10** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 transmit-delay 10
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 transmit-delay 10
switch(config-if-V1200)#

```

### 15.3.3.3.3 Configuring Interface Parameters

#### Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the interface's bandwidth. The **ospfv3 cost** command configures the OSPFv3 cost for the configuration mode interface. The default cost is **10**.

#### Example

This command configures a cost of **50** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 cost 50
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 cost 50
switch(config-if-V1200) #
```

#### Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of **0** cannot be elected as a DR or BDR.

The **ospfv3 priority** command configures router priority for the configuration mode interface. The default priority is **1**.

#### Example

This command configures a router priority of **128** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 priority 128
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 priority 128
switch(config-if-V1200) #
```

### 15.3.3.4 Enabling OSPFv3

#### 15.3.3.4.1 IP Routing

OSPFv3 requires enabling IPv6 unicast routing on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

#### Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.

```
switch(config)# ipv6 router ospf 9
! IPv6 routing not enabled
switch(config-router-ospf3) #
```

- This command enables IP routing on the switch.

```
switch(config)# ipv6 unicast-routing
```

#### 15.3.3.4.2 Disabling OSPFv3

The **shutdown (OSPFv3)** disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the **ipv6 ospf area** statement for the corresponding interface.

The **no shutdown** command resumes OSPFv3 activity.

#### Examples

- This command disables OSPFv3 activity on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# shutdown
switch(config-router-ospf3)# show active
 ipv6 router ospf 9
 shutdown
switch(config-router-ospf3) #
```

- This command resumes OSPFv3 activity on the switch.

```
switch(config-router-ospf3)# no shutdown
switch(config-router-ospf3)# show active
 ipv6 router ospf 9
switch(config-router-ospf3) #
```

#### 15.3.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area, an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP).

When configuring OSPFv3 security on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

##### 15.3.3.5.1 Configuring OSPFv3 Authentication

###### Configuring OSPFv3 Authentication for Areas

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

###### Example

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81A
DD961241D8E4169D411
switch(config-router-ospf3)# show active
 ipv6 router ospf 9
 area 0.0.0.0 authentication ipsec spi 34 md5 7 1cNpcrQ11czqdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/
 XOWG/Iap5Q==
switch(config-router-ospf3) #
```

###### Configuring OSPFv3 Authentication for Interfaces

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

###### Example

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
 ospfv3 authentication ipsec spi 3456 md5 7 1xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#

```

### 15.3.3.5.2 Configuring OSPFv3 Encryption

#### Configuring OSPFv3 Encryption for Areas

The **area encryption ipsec spi** command configures OSPFv3 security on an area.

#### Example

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
1cNpcrQllczqdvKAzKLTyVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#

```

#### Configuring OSPFv3 Encryption for Interfaces

The **ospfv3 encryption ipsec spi** command configures OSPFv3 security on an interface.

#### Example

This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
2fd4e1c67a2d28fcfd849ee1bb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
 ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
1VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#

```

### 15.3.3.6 Configuring OSPFv3 Flood Pacing

You can configure flood pacing for global OSPFv3 instances and address families. The **timers pacing flood** command configures OSPFv3 flood pacing.

#### Examples

- This command configures OSPFv3 flood pacing timer to **50** ms in the global OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# timers pacing flood 50
switch(config-router-ospf3)# show ipv6 ospf
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msec

```

```

Initial LSA throttle delay 1000 msec
Minimum hold time for LSA throttle 5000 msec
Maximum wait time for LSA throttle 5000 msec
Interface flood pacing timer 50 msec
It has 0 fully adjacent neighbors
Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
Number of LSAs 1
Initial SPF schedule delay 0 msec
Minimum hold time between two consecutive SPFs 5000 msec
Current hold time between two consecutive SPFs 5000 msec
Maximum wait time between two consecutive SPFs 5000 msec
SPF algorithm last executed 21d19h ago
No scheduled SPF
Adjacency exchange-start threshold is 20
Maximum number of next-hops supported in ECMP is 32
Number of backbone neighbors is 0
Graceful-restart is not configured
Graceful-restart-helper mode is enabled
Area 0.0.0
 Number of interface in this area is 0
 It is a normal area
 SPF algorithm executed 2 times

```

- This command configures OSPFv3 flood pacing timer to **50** ms for ipv4 address family.

```

switch(config)# router ospfv3
switch(config-router-ospfv3)# address-family ipv4
switch(config-router-ospfv3-af)# timers pacing flood 50
switch(config-router-ospfv3-af)# show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msec
 Initial LSA throttle delay 1000 msec
 Minimum hold time for LSA throttle 5000 msec
 Maximum wait time for LSA throttle 5000 msec
 Interface flood pacing timer 50 msec
 It has 0 fully adjacent neighbors
 Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
 Number of LSAs 1
 Initial SPF schedule delay 0 msec
 Minimum hold time between two consecutive SPFs 5000 msec
 Current hold time between two consecutive SPFs 5000 msec
 Maximum wait time between two consecutive SPFs 5000 msec
 SPF algorithm last executed 00:01:05 ago
 No scheduled SPF
 Adjacency exchange-start threshold is 20
 Maximum number of next-hops supported in ECMP is 32
 Number of backbone neighbors is 0
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
 Area 0.0.0
 Number of interface in this area is 0
 It is a normal area
 SPF algorithm executed 2 times

```

### 15.3.3.7 Configuring OSPV3 dn-bit-ignore

#### OSPFv3

Use the command **dn-bit-ignore** to include type-3/5/7 LSAs to set the DN-bit in the SPF calculation.

The commands **dn-bit-ignore** or **default dn-bit-ignore** revert the behavior back to default. Use this command in the **ipv6 router ospf vrf** configuration mode and the **router ospfv3 vrf** configuration mode. The default VRF does not support this command.

### router ospfv3

The **dn-bit-ignore** command in the **router ospfv3 vrf** configuration mode disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# router ospfv3 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

### ipv6 router ospf

The **dn-bit-ignore** command in the **ipv6 router ospf vrf** configuration mode disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# ipv6 router ospf 1 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

## 15.3.3.8 Displaying OSPFv3 Status

This section describes OSPFv3 **show** commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

### 15.3.3.8.1 OSPFv3 Summary

The **show ipv6 ospf** command displays general OSPFv3 configuration information, operational statistics, and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

#### Example

This command displays OSPFv3 routing process information.

```
switch(config-router-ospfv3)# show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msec
 Initial LSA throttle delay 1000 msec
 Minimum hold time for LSA throttle 5000 msec
 Maximum wait time for LSA throttle 5000 msec
 Interface flood pacing timer 50 msec
 It has 0 fully adjacent neighbors
 ...
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
```

### 15.3.3.8.2 Viewing OSPFv3 on the Interfaces

The **show ipv6 ospf interface** command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of all interfaces or a specified interface. You can configure the command to display complete information or a summary.

#### Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch# show ipv6 ospf interface
Ethernet17 is up
 Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
```

```

Designated Router is 10.37.0.37
Backup Designated Router is 10.37.0.23
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
Vlan31 is up
 Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
 Designated Router is 10.37.0.22
 Backup Designated Router is 10.37.0.23
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1
Vlan32 is up
 Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State DR Other, Priority 1
 Designated Router is 10.37.0.11
 Backup Designated Router is 10.37.0.22
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 2 switch#

```

### 15.3.3.8.3 Viewing the OSPFv3 Database

The **show ipv6 ospf database <link state list>** command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the database's contents for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

#### Example

This command displays the OSPFv3 database of Link State Advertisements (LSAs).

```

switch# show ipv6 ospf database
Routing Process "ospf 9":

 AS Scope LSDB

 Type Link ID ADV Router Age Seq# Checksum
 AEX 0.0.0.5 10.37.0.37 15 0x80000005 0x00be82
 AEX 0.0.0.9 10.37.0.22 1747 0x8000002b 0x00df56
 AEX 0.0.0.3 10.37.0.46 599 0x8000002d 0x00651d

 Area 0.0.0.0 LSDB

 Type Link ID ADV Router Age Seq# Checksum
 RTR 0.0.0.0 10.37.0.32 234 0x80000031 0x00585a
 NTW 0.0.0.26 10.37.0.32 271 0x80000005 0x005609
 NAP 0.0.0.26 10.37.0.32 274 0x80000005 0x00964c

 Interface vlan3911 LSDB

 Type Link ID ADV Router Age Seq# Checksum
 LNK 0.0.0.38 10.37.0.22 267 0x80000005 0x00a45a
 LNK 0.0.0.23 10.37.0.23 270 0x8000002c 0x005b7e

 Interface vlan3902 LSDB

 Type Link ID ADV Router Age Seq# Checksum
 LNK 0.0.0.17 10.37.0.11 1535 0x8000002b 0x007120
 LNK 0.0.0.37 10.37.0.22 7 0x8000002b 0x00ce23
 LNK 0.0.0.22 10.37.0.23 250 0x8000002d 0x00c350 switch#

```

### 15.3.3.8.4 Viewing OSPFv3 Neighbors

The **show ipv6 ospf neighbor** command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all

areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The **adjacency-changes** option displays the interface's adjacency changes.

### Example

This command displays the switch's neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
 In area 0.0.0.0 interface et12
 DR is 10.37.0.37 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
 In area 0.0.0.0 interface vlan3911
 DR is 10.37.0.22 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
 In area 0.0.0.0 interface vlan3902
 DR is 10.37.0.11 BDR is 10.37.0.22
 Options is 0
 Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full

 DR is 10.37.0.22 BDR is 10.37.0.21
 Options is 0
 Dead timer is due in 39 seconds
switch#
```

### 15.3.3.8.5 Viewing OSPFv3 Routes

The **show ipv6 routes** command provides an OSPFv3 option.

### Example

This command displays the switch's OSPFv3 routes.

```
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate
O fd7a:3279:81a4:1112::/64 [150/11]
 via fe80::21c:41ff:fe00:d120, Ethernet12
O fd7a:3279:81a4:1114::/64 [150/11]
 via fe80::21c:41ff:fe00:d120, Ethernet12
O fd7a:3279:81a4:1124::/64 [10/20]
 via fe80::21c:41ff:fe01:5fe1, Vlan3901
 via fe80::21c:41ff:fe01:5fe1, Vlan3902
 via fe80::21c:41ff:fe01:5fe1, Vlan3908
O fd7a:3279:81a4:1a00::25/128 [150/11]
 via fe80::21c:41ff:fe00:d120, Ethernet12
O fd7a:3279:81a4:1a00::28/128 [150/11]
 via fd7a:3279:81a4:fe40::5, Vlan3908
```

### 15.3.3.8.6 Viewing OSPFv3 dn-bit-ignore

The **show running-config** command verifies whether the **dn-bit-ignore** command is configured.

## 15.3.4 OSPFv3 Configuration Examples

This section describes the commands required to configure three OSPFv3 topologies.

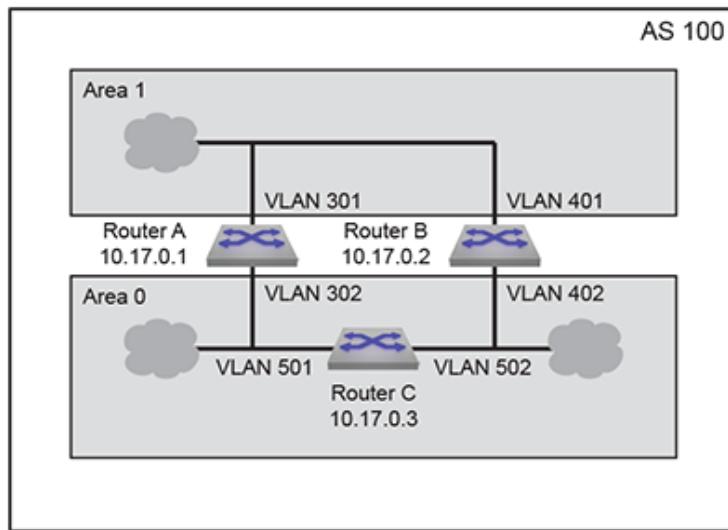

#### 15.3.4.1 OSPFv3 Configuration Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

##### 15.3.4.1.1 Example 1 Topology

[OSPFv3 Example 1](#) displays the Example 1 topology. Two ABRs, **Router A** and **Router B**, connect Area 0 and Area 1. **Router C** is an internal router connecting two links in Area 0. Area 0 is normal; area 1 is stub.

**Figure 15-8: OSPFv3 Example 1**

#### Area 1 Configuration

Area 1 contains links to ABRs **Router A** and **Router B**.

- **Router A** is accessed through **VLAN 301**.
- **Router B** is accessed through **VLAN 401**.
- Designated Router (DR): **Router A**.
- Backup Designated Router (BDR): **Router B**.
- Each router defines an interface cost of **10**.
- Router priority is not specified for either router on area 1.

#### Area 0 ABR Configuration

Area 0 contains links to ABRs **Router A** and **Router B**.

- **Router A** is accessed through **VLAN 302**.
- **Router B** is accessed through **VLAN 402**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router A**.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.
- Router priority is specified such that **Router B** will be elected as the Designated Router.

## Area 0 IR Configuration

Area **0** contains two links to an internal router.

- **Router C** is accessed through **VLAN 501** and **VLAN 502**.
- **VLAN 501** is configured as follows:
  - Interface cost of **20**.
  - Retransmit-interval of **10**.
  - Transmit-delay of **2**.
- **VLAN 502** is configured as follows:
  - Interface cost of **20**.
  - Dead interval of **80** seconds.

### 15.3.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

#### 1. Configure the areas and router IDs.

##### a. Router A OSPFv3 instance configuration:

```
switch-A(config) # ipv6 router ospf 100
switch-A(config-router-ospfv3) # area 1 stub
switch-A(config-router-ospfv3) # router-id 10.17.0.1
```

##### b. Router B OSPFv3 instance configuration:

```
switch-B(config) # ipv6 router ospf 100
switch-B(config-router-ospfv3) # area 1 stub
switch-B(config-router-ospfv3) # router-id 10.17.0.2
```

##### c. Router C OSPFv3 instance configuration: interfaces:

```
switch-C(config) # ipv6 router ospf 100
switch-C(config-router-ospfv3) # router-id 10.17.0.3
```

#### 2. Configure the interface OSPFv3 area and transmission parameters.

##### a. **Router A** interfaces:

```
switch-A(config) # interface vlan 301
switch-A(config-if-V1301) # ipv6 ospf 100 area 1
switch-A(config-if-V1301) # ospfv3 cost 10
switch-A(config-if-V1301) # ospfv3 priority 6
switch-A(config-if-V1301) # exit
switch-A(config) # interface vlan 302
switch-A(config-if-V1302) # ipv6 ospf 100 area 0
switch-A(config-if-V1302) # ospfv3 cost 20
switch-A(config-if-V1302) # ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-V1302) # ospfv3 transmit-delay 2
switch-A(config-if-V1302) # ospfv3 priority 4
```

##### b. **Router B** interfaces:

```
switch-B(config) # interface vlan 401
switch-B(config-if-V1401) # ipv6 ospf 100 area 1
switch-B(config-if-V1401) # ospfv3 cost 10
switch-B(config-if-V1401) # ospfv3 priority 4
switch-B(config-if-V1401) # exit
switch-B(config) # interface vlan 402
switch-B(config-if-V1402) # ipv6 ospf 100 area 0
switch-B(config-if-V1402) # ospfv3 cost 20
```

```
switch-B(config-if-V1402) # ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-V1402) # ospfv3 transmit-delay 2
switch-B(config-if-V1402) # ospfv3 priority 6
```

c. ***Router C*** interfaces:

```
switch-C(config) # interface vlan 501
switch-C(config-if-Vl501) # ipv6 ospf 100 area 0
switch-C(config-if-Vl501) # ospfv3 cost 20
switch-C(config-if-Vl501) # ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501) # ospfv3 transmit-delay 2
switch-C(config-if-Vl501) # exit
switch-C(config) # interface vlan 502
switch-C(config-if-Vl502) # ipv6 ospf 100 area 0
switch-C(config-if-Vl502) # ospfv3 cost 20
switch-C(config-if-Vl502) # ospfv3 dead-interval 80
```

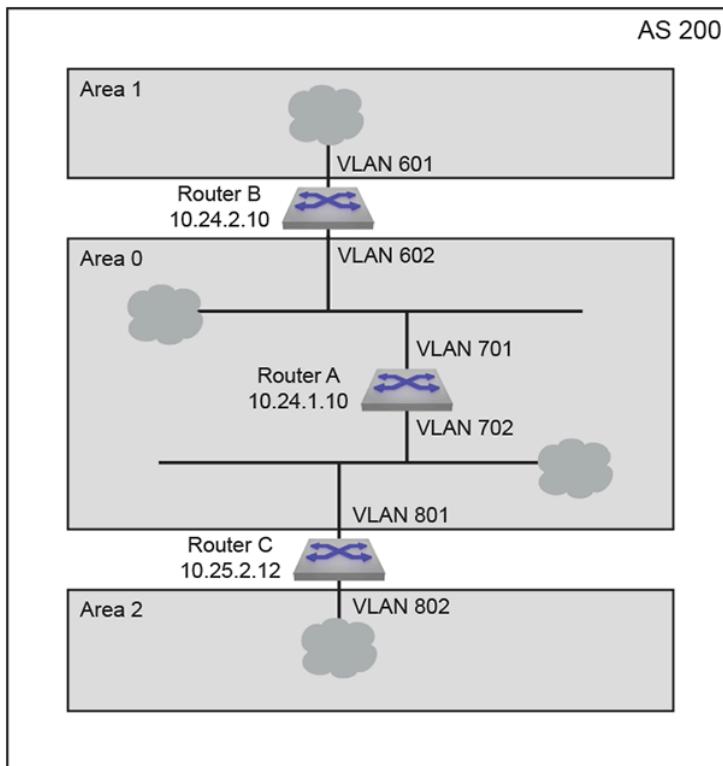

### **15.3.4.2 OSPFv3 Configuration Example 2**

The AS in Example 2 contains three areas. Area 0 connects to the other areas through different routers and contains an internal router connecting two links. Area 0 is normal; the other areas are stub areas.

#### **15.3.4.2.1 Example 2 Topology**

**OSPFv3 Example 2** displays the Example 2 topology. One ABR (**Router B**) connects area **0** and area **1**; another ABR (**Router C**) connects area **0** and area **2**. **Router A** is an internal router connecting two links in area **0**.

**Figure 15-9: OSPFv3 Example 2**

## Area 1 Configuration

Area **1** contains one link that is accessed by **Router B**.

- **Router B** is accessed through **VLAN 601**.
- The router defines a interface cost of **10**.

## Area 2 Configuration

Area **2** contains one link that is accessed by **Router C**.

- **Router C** is accessed through **VLAN 802**.
- The router defines a interface cost of **20**.

## Area 0 ABR Configuration

One ABR **Router B** link connects area **1** to area **0**. One ABR **Router C** link connects area **0** to area **2**.

- **Router B** is accessed through **VLAN 602**
- **Router C** is accessed through **VLAN 801**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router C**.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.

## Area 0 IR Configuration

Area **0** contains links connected by an internal router.

- Router A is accessed through **vlan 701** and **vlan 702**.
- The **vlan 701** link is configured as follows:
  - Interface cost of **10**.
- The **vlan 702** link is configured as follows:
  - Interface cost of **20**.
  - Retransmit-interval of **10**.
  - Transmit-delay of **2**.

### 15.3.4.2.2 Example 2 Code

1. Configure the areas and router IDs.
  - a. Router A OSPFv3 instance configuration:

```
switch-A(config) # ipv6 router ospf 200
switch-A(config-router-ospfv3) # router-id 10.24.1.10
```

- b. Router B OSPFv3 instance configuration:

```
switch-B(config) # ipv6 router ospf 200
switch-B(config-router-ospfv3) # area 1 stub
switch-B(config-router-ospfv3) # router-id 10.24.2.10
```

---

c. Router C OSPFv3 instance configuration:

```
switch-C(config) # ipv6 router ospf 200
switch-C(config-router-ospfv3) # area 1 stub
switch-C(config-router-ospfv3) # router-id 10.25.2.12
```

2. Configure the interface OSPFv3 area and transmission parameters.

a. **Router A** interfaces:

```
switch-A(config) # interface vlan 701
switch-A(config-if-V1701) # ipv6 ospf 200 area 0
switch-A(config-if-V1701) # ospfv3 cost 10
switch-A(config-if-V1701) # exit
switch-A(config) # interface vlan 702
switch-A(config-if-V1702) # ipv6 ospf 200 area 0
switch-A(config-if-V1702) # ospfv3 cost 20
switch-A(config-if-V1702) # ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-V1702) # ospfv3 transmit-delay 2
```

b. **Router B** interfaces:

```
switch-B(config) # interface vlan 601
switch-B(config-if-V1601) # ospfv3 200 area 1
switch-B(config-if-V1601) # ospfv3 cost 10
switch-B(config-if-V1601) # exit
switch-B(config) # interface vlan 602
switch-B(config-if-V1602) # ospfv3 200 area 0
switch-B(config-if-V1602) # ospfv3 cost 20
switch-B(config-if-V1602) # ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-V1602) # ospfv3 transmit-delay 2
switch-B(config-if-V1602) # ospfv3 priority 6
```

c. **Router C** interfaces:

```
switch-C(config) # interface vlan 801
switch-C(config-if-V1801) # ospfv3 200 area 0
switch-C(config-if-V1801) # ospfv3 cost 20
switch-C(config-if-V1801) # ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-V1801) # ospfv3 transmit-delay 2
switch-C(config-if-V1801) # exit
switch-C(config) # interface vlan 802
switch-C(config-if-V1802) # ospfv3 200 area 2
switch-C(config-if-V1802) # ospfv3 cost 20
switch-C(config-if-V1802) # ospfv3 dead-interval 80
```

#### 15.3.4.3 OSPFv3 Configuration Example 3

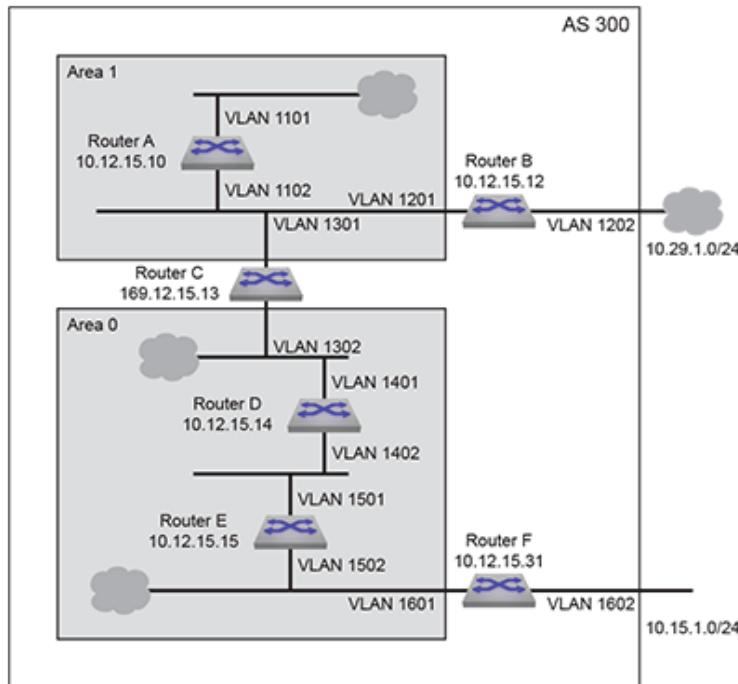

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.

##### 15.3.4.3.1 Example 3 Topology

[OSPFv3 Example 3](#) displays the Example 3 topology. One ABR connects area **0** and area **1**. **Router C** is an ABR connecting the areas. **Router A** is an internal router connecting two links in area **1**. **Router D** and

**Router E** are internal routers connecting links in area **0**. **Router B** and **Router F** are ASBRs that connect static routes outside the AS to area **1** and area **0**, respectively.

Figure 15-10: OSPFv3 Example 3

### Area 0 ABR Configuration

ABR **Router C** connects one area **0** link to an area **1** link.

- **Router C** is accessed through **VLAN 1302**.
- All interface OSPFv3 parameters are set to their default values.

### Area 0 IR Configuration

Area **0** contains two internal routers, each of which connects two of the three links in the area.

- **Router D** is accessed through **VLAN 1401** and **VLAN 1402**.
- **Router E** is accessed through **VLAN 1501** and **VLAN 1502**.
- All interface OSPFv3 parameters are set to their default values.

### Area 0 ASBR Configuration

ASBR **Router F** connects one area **0** link to an external link.

- **Router F** is accessed through **VLAN 1601**.
- **Router F** connects to the external AS through **VLAN 1602**.
- All interface OSPFv3 parameters are set to their default values.

### Area 1 ABR Configuration

ABR **Router C** connects one area **0** link to an area **1** link.

- **Router C** is accessed by area **1** through **VLAN 1301**.
- **Router C** is accessed by area **0** through **VLAN 1302**.

- 
- All interface OSPFv3 parameters are set to their default values.

### Area 1 IR Configuration

Area 1 contains one internal router that connects two links in the area.

- **Router A** is accessed through **VLAN 1101** and **VLAN 1102**.
- All interface OSPFv3 parameters are set to their default values.

### Area 1 ASBR Configuration

ASBR **Router B** connects one area 1 link to an external link.

- **Router B** is access through **VLAN 1201**.
- **Router B** connects to the external AS through **VLAN 1202**.
- All interface OSPFv3 parameters are set to their default values.

#### 15.3.4.3.2 Example 3 Code

1. Configure the areas and router IDs.

- a. **Router A** OSPFv3 instance configuration:

```
switch-A(config) # ipv6 router ospf 300
switch-A(config-router-ospfv3) # router-id 10.12.15.10
switch-A(config-router-ospfv3) # area 1 stub
```

- b. **Router B** OSPFv3 instance configuration:

```
switch-B(config) # ipv6 router ospf 300
switch-B(config-router-ospfv3) # router-id 10.12.15.12
switch-B(config-router-ospfv3) # area 1 stub
```

- c. **Router C** OSPFv3 instance configuration:

```
switch-C(config) # ipv6 router ospf 300
switch-C(config-router-ospfv3) # router-id 10.12.15.13
switch-C(config-router-ospfv3) # area 1 stub
```

- d. **Router D** OSPFv3 instance configuration:

```
switch-D(config) # ipv6 router ospf 300
switch-D(config-router-ospfv3) # router-id 10.12.15.14
```

- e. **Router E** OSPFv3 instance configuration:

```
switch-E(config) # ipv6 router ospf 300
switch-E(config-router-ospfv3) # router-id 10.12.15.15
```

- f. **Router F** OSPFv3 instance configuration:

```
switch-F(config) # ipv6 router ospf 300
switch-F(config-router-ospfv3) # router-id 10.12.15.31
```

2. Configure the interfaces.

- a. **Router A** interfaces:

```
switch-A(config) # interface vlan 1101
switch-A(config-if-Vl1101) # ospfv3 300 area 1
```

```
switch-A(config-if-V11101) # exit
switch-A(config) # interface vlan 1102
switch-A(config-if-V11102) # ospfv3 300 area 1
```

b. **Router B** interfaces:

```
switch-B(config) # interface vlan 1201
switch-B(config-if-V11201) # ospfv3 300 area 1
switch-B(config-if-V11201) # exit
```

c. **Router C** interfaces:

```
switch-C(config) # interface vlan 1301
switch-C(config-if-V11301) # ospfv3 300 area 1
switch-C(config-if-V11301) # exit
switch-C(config) # interface vlan 1302
switch-C(config-if-V11302) # ospfv3 300 area 0
```

d. **Router D** interfaces:

```
switch-D(config) # interface vlan 1401
switch-D(config-if-V11401) # ospfv3 300 area 0
switch-D(config-if-V11401) # exit
switch-D(config) # interface vlan 1402
switch-D(config-if-V11402) # ospfv3 300 area 0
```

e. **Router E** interfaces:

```
switch-E(config) # interface vlan 1501
switch-E(config-if-V11501) # ospfv3 300 area 0
switch-E(config-if-V11501) # exit
switch-E(config) # interface vlan 1502
switch-E(config-if-V11502) # ospfv3 300 area 0
```

f. **Router F** interfaces:

```
switch-F(config) # interface vlan 1601
switch-F(config-if-V11601) # ospfv3 300 area 0
switch-F(config-if-V11601) # exit
```

---

## 15.3.5 OSPFv3 Commands

### Global Configuration Mode

- clear ospfv3 ipv6 force-spf
- ipv6 router ospf

### Interface Configuration Mode

- ipv6 ospf area
- ospfv3 authentication ipsec spi
- ospfv3 cost
- ospfv3 dead-interval
- ospfv3 encryption ipsec spi
- ospfv3 hello-interval
- ospfv3 ipv6 retransmit-interval
- ospfv3 network
- ospfv3 priority
- ospfv3 transmit-delay

### Router-OSPFv3 Configuration Mode

- adjacency exchange-start threshold (OSPFv3)
- area authentication ipsec spi
- area default-cost (OSPFv3)
- area encryption ipsec spi
- area nssa (OSPFv3)
- area nssa default-information-originate (OSPFv3)
- area not-so-stubby lsa type-7 convert type-5 (OSPFv3)
- area range (OSPFv3)
- area stub (OSPFv3)
- default-information originate (OSPFv3)
- default-metric (OSPFv3)
- distance ospf intra-area (OSPFv3)
- log-adjacency-changes (OSPFv3)
- max-metric router-lsa (OSPFv3)
- maximum-paths (OSPFv3)
- no area (OSPFv3)
- passive-interface (OSPFv3)
- redistribute (OSPFv3)
- router-id (OSPFv3)
- shutdown (OSPFv3)
- timers
- timers lsa rx min interval (OSPFv3)
- timers lsa tx delay initial (OSPFv3)
- timers spf delay initial (OSPFv3)

### Display Commands

- show ipv6 ospf

- show ipv6 ospf border-routers
- show ipv6 ospf database
- show ipv6 ospf database<link-state details>
- show ipv6 ospf database <link state list>
- show ipv6 ospf database link
- show ipv6 ospf database link if-name
- show ipv6 ospf database link if-type
- show ipv6 ospf interface
- show ipv6 ospf lsa-log
- show ipv6 ospf neighbor
- show ipv6 ospf neighbor state
- show ipv6 ospf neighbor summary
- show ipv6 ospf spf-log
- show ospfv3

---

### 15.3.5.1 adjacency exchange-start threshold (OSPFv3)

The **adjacency exchange-start threshold** command sets the exchange-start options for an OSPF instance.

The **no adjacency exchange-start threshold** and **default adjacency exchange-start threshold** command resets the default by removing the corresponding **adjacency exchange-start threshold** command from the **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

#### Parameter

**peers** Value ranges from **1 - 4294967295**. Default value is **10**.

#### Example

This command sets the adjacency exchange start threshold to **156923**.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# adjacency exchange-start threshold 156923
switch(config-router-ospf3)#{
```

### 15.3.5.2 area authentication ipsec spi

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area.

The `default area authentication` and `no area authentication` commands delete the OSPFv3 authentication on an area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id authentication ipsec spi spi_value {md5|sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
no area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
default area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

#### Parameters

- **area *area\_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from **0 to 4294967295**.
- **spi *spi\_value*** configures the IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **0 *unencrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 *encrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- **KEY** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 *unencrypted\_passphrase*** configures an unencrypted key.
  - **7 *encrypted\_passphrase*** configures an encrypted key.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [ospfv3 authentication ipsec spi](#)
- [area encryption ipsec spi](#)

#### Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

#### Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

#### Examples

- This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
```

```
switch(config-router-ospf3) # area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81A
DD961241D8E4169D411
switch(config-router-ospf3) # show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 34 md5 7 1cNpcrQ11czqdvKAzKLTyVr6I7+R3niuWouDK
KYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3) #
```

- This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3) # area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
1Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3) # show active
ipv6 router ospf 9
area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3) #
```

- This command deletes the OSPFv3 authentication on an area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3) # show active
ipv6 router ospf 9
area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdvKAzKLTyVr6I7+R3niuWouDKKYC
FNs4/XOWG/Iap5Q==
area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3) #no area 0.0.0.0 authentication
switch(config-router-ospf3) #show active
ipv6 router ospf 9
area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdvKAzKLTyVr6I7+R3niuWouDKKYC
FNs4/XOWG/Iap5Q==
switch(config-router-ospf3) #
```

### 15.3.5.3 area default-cost (OSPFv3)

The `area default-cost` command sets the cost for the default summary routes sent into an area. When the `area default-cost` command is not configured for an area, the default-cost of that area is set to **10**.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to **10** by removing the corresponding `area default-cost` command from ***running-config***. The `no area (OSPFv3)` command removes all area commands for the specified area from ***running-config***, including the `area default-cost` command.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

#### Parameters

- ***area\_id*** area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. ***Running-config*** stores value in dotted decimal notation.
- ***def\_cost*** Values range from **1** to **65535**.

#### Example

These commands configure a cost of **15** for default summary routes that an ABR sends into area **100**.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 100 default 15
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 area 0.0.0.100 default-cost 15
switch(config-router-ospf3)#

```

---

#### 15.3.5.4 area encryption ipsec spi

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

The `default area encryption` and `no area encryption` commands delete the OSPFv3 security on an area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id encryption ipsec spi spi_value esp{3des-cbc|aes-128-cbc|aes-192-cbc|aes-256-cbc}{
0 unencrypted_key|7 encrypted_key} { md5|sha1} { 0 unencrypted_key| 7 encrypted_key| KEY}
area area_id encryption ipsec spi spi_value esp null{md5|sha1} { 0 unencrypted_key| 7
encrypted_key| KEY}
area area_id encryption ipsec spi spi_value esp{3des-cbc|aes-128-cbc|aes-192-cbc|aes-256-cbc |
null} {md5|sha1} { 0 unencrypted_key| 7 encrypted_key | LINE}
no area area_id encryption
default area area_id encryption
```

#### Parameters

- **area *area\_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from **0 to 4294967295**.
- **spi *spi\_value*** configures the value for IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- **0 *unencrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 *encrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- ***KEY*** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 *unencrypted\_passphrase*** configures an unencrypted key.
  - **7 *encrypted\_passphrase*** configures an encrypted key.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

#### Guidelines

**Passphrase** and **key** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase.

## Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

## Examples

- This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase
 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
1cNpcrQl1czqdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#

```

- This command deletes the OSPFv3 security on an area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
1cNpcrQl1czqdvKAzKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)# no area 0.0.0.0 encryption
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#

```

---

### 15.3.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The `area not-so-stubby lsa type-7 convert type-5` command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The `no area not-so-stubby lsa type-7 convert type-5` and `no area not-so-stubby lsa type-7 convert type-5` commands allow LSAs to be translated dynamically by removing the `no area not-so-stubby lsa type-7 convert type-5` command from the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
no area area_id not-so-stubby lsa type-7 convert type-5
default area area_id not-so-stubby lsa type-7 convert type-5
```

#### Parameters

##### *area\_id*

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
- The *running-config* stores value in dotted decimal notation.

#### Example

These commands configure the switch to always translate **Type-7** Link-State Advertisement (LSAs) to **Type-5** LSAs.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 3 not-so-stubby lsa type-7 convert type-5
switch(config-router-ospf)#{/pre}
```

### 15.3.5.6 area nssa (OSPFv3)

The **area nssa** command configures an OSPFv3 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from ***running-config***.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id nssa [TYPE]
no area area_id nssa [TYPE]
default area area_id nssa [TYPE]
```

#### Parameters

- ***area\_id***
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
  - The ***running-config*** stores value in dotted decimal notation.
- ***TYPE***
  - Values include:
    - **no parameter**.
    - **nssa-only**

#### Example

This command configures area **3** as a NSSA area.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 3 nssa nssa-only
switch(config-router-ospf3) #
```

### 15.3.5.7 area nssa default-information-originate (OSPFv3)

The `area nssa default-information-originate` command sets an area as an NSSA and the generation of a type 7 default LSA is created if a default route exists in the routing table.

The switch supports three area types:

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

The `no area` and `default area` commands remove the specified area from the OSPFv3 instance by deleting all `area` commands from the **running-config** for the specified area, including the [area default-cost \(OSPFv3\)](#) command.

The `no area stub` and `default area stub` commands configure the specified area as a normal area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
no area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
default area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

#### Parameters

All parameters except **area\_id** can be placed in any order.

- **area\_id.**
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
  - **Running-config** stores value in dotted decimal notation.
- **VALUE** Values include:
  - **no parameter.**
  - **metric 1-65535.**
- **TYPE** Values include:
  - **no parameter.**
  - **metric-type 1-2.**
- **EXCL** Values include:
  - **no parameter.**
  - **nssa-only.**

#### Examples

- These commands sets area **1** as NSSA only and generates a **type 7** default LSA if a default route exists in the routing table.

```
switch(config-router-ospf3)# area 3 nssa default-information-originate nssa-only
switch(config-router-ospf3)#

```

- These commands generates a **type 7** default route.

```
switch(config-router-ospf3)# area 3 nssa default-information-originate
```

```
switch(config-router-ospf3) #
```

### 15.3.5.8 area range (OSPFv3)

The `area range` command is used by OSPFv3 area border routers to summarize routes.

The `no area range` and `default area range` commands remove the area-range by deleting the corresponding `area range` command from the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

#### Parameters

- `area_id` 0 to 4294967295 or 0.0.0.0 to 255.255.255.255 .
- `net_addr`
- `ADVERTISE_SETTING` specifies the LSA advertising activity. Values include:
  - no parameter
  - advertise
  - not-advertise
- `COST_SETTING` Values include:
  - no parameter
  - `cost range_cost` Value ranges from 1 to 65535.

#### Examples

- These commands summarize routes at an area boundary 1.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3) #
```

- These commands modify the address range status to DoNotAdvertise.

```
switch(config)# ipv6 router ospf 1
switch(config-ospf6-router)# area 1 range 2001:0DB8:0:1::/64 not-advertise
switch(config-ospf6-router) #
```

### 15.3.5.9 area stub (OSPFv3)

The **area stub** command configures the area type of an OSPFv3 area.

Areas are **normal** by default.

The **no area stub** command configures the specified area as a normal area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id stub
no area area_id stub
default area area_id stub
```

#### Parameters

##### *area\_id*

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- The **running-config** stores value in dotted decimal notation.

#### Examples

- This command configures area **45** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3) #
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3) #
```

---

### 15.3.5.10 clear ospfv3 ipv6 force-spf

The **clear ospfv3 ipv6 force-spf** command starts the SPF algorithm without clearing the OSPF database.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ospfv3 ipv6 force-spf [VRF_INSTANCE]
```

#### Parameters

**VRF\_INSTANCE** Values include:

- **no parameter** Action is performed in the default VRF.
- **vrf vrf\_name** Action is performed in the specified VRF.

#### Example

This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config) # clear ospfv3 ipv6 force-spf
switch(config) #
```

### 15.3.5.11 default-information originate (OSPFv3)

The `default-information originate` command generates a default external route into an OSPF domain.

The `no default-information originate` and `default default-information originate` command removes the configuration from the the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
default-information originate [DURATION always][VALUE metric 1-65535][TYPE][metric-type 1-2]
[MAP route-map map_name]
```

```
no default-information originate
```

```
default default-information originate
```

#### Parameters

All parameters can be placed in any order.

- **DURATION** Values include:
  - **no parameter**.
  - **always**.
- **VALUE** Values include:
  - **no parameter**.
  - **metric 1-65535**.
- **TYPE** Values include:
  - **no parameter**.
  - **metric-type 1-2**.
- **MAP** Values include:
  - **no parameter**.
  - **route-map map\_name**.

#### Examples

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate always
switch(config-router-ospf3)# show active
ipv6 router ospf 1
 default-information originate always
```

- These commands configures OSPF area **1** as metric of **100** for the default route with an external metric type of **Type 1**.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate metric 100 metric-type 1
switch(config-router-ospf3)# show active
ipv6 router ospf 1
 default-information originate metric 100 metric-type 1
switch(config-router-ospf3)#

```

### 15.3.5.12 default-metric (OSPFv3)

The `default-metric` command sets default metric value for routes redistributed into the OSPFv3 domain.

The `no default-metric` and `default default-metric` commands restores the default metric to its default value of **10** by removing the `default-metric` command from the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
default-metric def_metric
```

```
no default-metric
```

```
default default-metric
```

#### Parameter

***def\_metric*** Values range from **1 to 65535**. Default value is **10**.

#### Example

These commands configure a default metric of **30** for routes redistributed into OSPFv3.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# default-metric 30
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 default-metric 30
switch(config-router-ospf3) #
```

---

### 15.3.5.13 **distance ospf intra-area (OSPFv3)**

The **distance ospf intra-area** command sets the administrative distance for routes in a single OSPFv3 area. The default is **110**.

The **no distance ospf intra-area** and **default distance ospf intra-area** commands remove the **distance ospf intra-area** command from the **running-config**, returning the OSPFv3 intra-area distance setting to the default value of **110**

#### **Command Mode**

Router-OSPFv3 Configuration

#### **Command Syntax**

```
distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area
```

#### **Parameter**

*distance* Values range from **1** to **255**. Default is **110**.

#### **Example**

This command configures a distance of **90** for all OSPFv3 intra-area routes on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# distance ospf intra-area 90
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 distance ospf intra-area 90
switch(config-router-ospf3)#

```

### 15.3.5.14 ipv6 ospf area

The `ipv6 ospf area` command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by `no area (OSPFv3)` commands in **router-OSPFv3** configuration mode.

The `no ipv6 ospf area` and `default ipv6 ospf area` commands disable OSPFv3 on the configuration mode interface by removing the corresponding `ipv6 ospf area` command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 ospf process_id [area area_id]
no ipv6 ospf process_id [area area_id]
default ipv6 ospf process_id [area area_id]
```

#### Parameters

- **process\_id** Values range from **1 to 65535**.
- **area\_id**.
  - Valid formats: integer **0** to **4294967295** or dotted decimal **0.0.0.0** to **255.255.255.255**.
  - **Running-config** stores value in dotted decimal notation.

#### Example

These commands enable OSPFv3 on VLAN interface **200** and associates area **0** to the interface.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ipv6 ospf 9 area 0
switch(config-if-V1200)# show active
interface Vlan200
 ipv6 ospf 9 area 0.0.0.0
switch(config-if-V1200) #
```

---

### 15.3.5.15 ipv6 router ospf

The **ipv6 router ospf** command places the switch in router-OSPFv3 configuration mode and creates and OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The **show ipv6 ospf** command displays the router ID of each OSPFv3 instance configured on the switch.

The **no ipv6 router ospf** and **default ipv6 router ospf** commands delete the OSPFv3 instance.

Refer to the [Router-OSPFv3 Configuration Mode](#) command for a list of commands available in router-OSPFv3 configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 router ospf process_id [VRF_INSTANCE vrf vrf_name]
no ipv6 router ospf process_id [VRF_INSTANCE vrf vrf_name]
default ipv6 router ospf process_id [VRF_INSTANCE vrf vrf_name]
```

#### Parameters

- ***process\_id*** Values range from **1 to 65535**.
- **VRF\_INSTANCE** Values include:
  - **no parameter** OSPF instance is in the default VRF.
  - **vrf *vrf\_name*** OSPF instance is the specified VRF.

#### Examples

- This command creates an OSPFv3 instance in the default VRF with process ID **9**.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#[/pre>
```

- This command deletes the OSPFv3 instance.

```
switch(config)# no ipv6 router ospf 9
switch(config)#[/pre>
```

### 15.3.5.16 log-adjacency-changes (OSPFv3)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from the **running-config**.

The default option (sending a message only when a neighbor goes up or down) is active when the **running-config** does not contain any form of the command. Entering the command in any form replaces the previous command state in the **running-config**.

The **no log-adjacency-changes** disables link state change Syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from the **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
log-adjacency-changes [INFO_LEVEL detail]
no log-adjacency-changes
default log-adjacency-changes
```

#### Parameters

**INFO\_LEVEL** Options include:

- **no parameter** Sends messages when a neighbor goes up or down.
- **detail** Sends messages for all neighbor state changes.

#### Example

This command configures the switch to send a Syslog message when a neighbor state changes.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# log-adjacency-changes
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 log-adjacency-changes
switch(config-router-ospf3)#

```

---

### 15.3.5.17 maximum-paths (OSPFv3)

The **maximum-paths** command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The **no maximum-paths** command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of **16** by removing the **maximum-paths** command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
maximum-paths paths
no maximum-paths
default maximum-paths
```

#### Parameters

**paths** Value range is platform dependent:

- **Arad**: Value ranges from **1 to 128**. Default value is **128**.
- **FM6000**: Value ranges from **1 to 32**. Default value is **32**.
- **PetraA**: Value ranges from **1 to 16**. Default value is **16**.
- **Trident**: Value ranges from **1 to 32**. Default value is **32**.
- **Trident II**: Value ranges from **1 to 128**. Default value is **128**.

#### Example

This command configures the maximum number of OSPFv3 parallel paths to **12**.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# maximum-paths 12
switch(config-router-ospf3) #
```

### 15.3.5.18 max-metric router-lsa (OSPFv3)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

#### Parameters

All parameters can be placed in any order.

- **EXTERNAL** Values include:
  - **no parameter** Default value of **1**.
  - **external-lsa** Range: **1 to 16777215**. The default value is **0xFF0000**.
- **STUB** Values include:
  - **no parameter** Default value of **2**.
  - **include-stub**.
- **STARTUP** Values include:
  - **no parameter**
  - **on-startup**
  - **on-startup wait-for-bgp**
  - **on-startup** Range: **5 to 86400**.
   
**wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** Values include:
  - **no parameter** Metric is set to the default value of **1**.
  - **summary-lsa**.
  - **summary-lsa** Range: **1 to 16777215**.

#### Example

This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf3)# max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf3)#{
```

---

### 15.3.5.19 no area (OSPFv3)

The **no area** command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the **no area** command include:

- **area**
- **nssa**
- **range**
- **stub**

Area settings can be removed individually; refer to the command description page of the desired command for details.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
no area area_id [TYPE]
default area area_id [TYPE]
```

#### Parameters

- ***area\_id*** area number.
  - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
  - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
  - The **running-config** stores value in dotted decimal notation.
- ***TYPE*** area type. Values include:
  - **nssa**.
  - **nssa translate type7 always**.
  - **stub**.
  - **stub no-summary**.

#### Example

This command remove the area **1** stub configuration.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# no area 1 stub
switch(config-router-ospf3)#[/pre>
```

### 15.3.5.20 ospfv3 transmit-delay

The `ospfv3 transmit-delay` command configures the transmission delay for OSPFv3 packets.

The `no ospfv3 transmit-delay` and `default ospfv3 transmit-delay` commands restore the default transmission delay of 1 second on the configuration mode interface by removing the corresponding `ospfv3 transmit-delay` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 transmit-delay trans
no ospfv3 transmit-delay
default ospfv3 transmit-delay
```

#### Parameter

*trans* Value ranges from **1 to 65535**; default is **1**.

#### Guideline

Arista devices also support the legacy `ipv6 ospf transmit-delay` command in certain software releases of the EOS.

#### Example

This command configures a transmission delay of **10** seconds for **VLAN 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 transmit-delay 10
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 transmit-delay 10
switch(config-if-V1200) #
```

### 15.3.5.21 ospfv3 authentication ipsec spi

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface.

The `default ospfv3 authentication` and `no ospfv3 authentication` commands delete the OSPFv3 authentication on an interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1}{0 unencrypted_key | 7 hidden_key | KEY}
ospfv3 authentication ipsec spi spi_value {md5 | sha1} passphrase{0 unencrypted_passphrase | 7
hidden_passphrase | LINE}
no ospfv3 authentication
default ospfv3 authentication
```

#### Parameters

- **spi *spi\_value*** configures IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **0 *unencrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 *encrypted\_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- **KEY** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 *unencrypted\_passphrase*** configures an unencrypted passphrase.
  - **7 *encrypted\_passphrase*** configures an encrypted passphrase.
  - ***LINE*** uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

#### Guidelines

**Passphrase** and **key** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase. Arista devices also support the legacy `ipv6 ospf authentication ipsec spi` command in certain software releases of the EOS.

#### Restriction

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

#### Examples

- This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D8E41
69D411
```

```

switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
 ospfv3 authentication ipsec spi 3456 md5 7 1xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#

```

- This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

```

switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 987 sha1 7 1VmUkWk6IL2S343bR3BbH0Rh
gvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
 ospfv3 authentication ipsec spi 987 sha1 7
1VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#

```

- This command deletes the OSPFv3 authentication on an interface.

```

switch(config)# interface ethernet 9
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
 ospfv3 authentication ipsec spi 3456 md5 7 1xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#no ospfv3 authentication
switch(config-if-Et9)#show active
interface Ethernet9
 no switchport
switch(config-if-Et9)#

```

---

### 15.3.5.22 ospfv3 cost

The **ospfv3 cost** command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is **10**.

The **no ospfv3 cost** and **default ospfv3 cost** commands restore the default cost of **10** for the configuration mode interface by removing the corresponding **ospfv3 cost** command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 cost interface_cost
```

```
no ospfv3 cost
```

```
default ospfv3 cost
```

#### Parameters

***interface\_cost*** Value ranges from **1 to 65535**; default is **10**.

#### Guideline

Arista devices also support the legacy **ipv6 ospf cost** command in certain software releases of the EOS.

#### Example

This command configures a cost of **50** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 cost 50
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 cost 50
switch(config-if-V1200)#

```

### 15.3.5.23 ospfv3 dead-interval

The `ospfv3 dead-interval` command sets the OSPFv3 dead interval.

The `no ospfv3 dead-interval` and `default ospfv3 dead-interval` commands restore the default dead interval of **40** seconds on the configuration mode interface by removing the corresponding `ospfv3 dead-interval` command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 dead-interval time
```

```
no ospfv3 dead-interval
```

```
default ospfv3 dead-interval
```

#### Parameter

***time*** Value ranges from **1 to 65535**; default is **40**.

#### Guideline

Arista devices also support the legacy `ipv6 ospf dead-interval` command in certain software releases of the EOS.

#### Example

This command configures a dead interval of **75** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 dead-interval 75
switch(config-if-Vl200)# show active
interface Vlan200
 ospfv3 dead-interval 75
switch(config-if-Vl200)#

```

---

#### 15.3.5.24 ospfv3 encryption ipsec spi

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.

The `default ospfv3 encryption` and `no ospfv3 encryption` commands delete the OSPFv3 security on an interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{0
unencrypted_key | 7 encrypted_key}{md5 | sha1}{0 unencrypted_key | 7 encrypted_key | KEY}
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-
cbc}{0 unencrypted_key | 7 encrypted_key}{md5 | sha1} passphrase {0 unencrypted_passphrase | 7
encrypted_passphrase | LINE}
ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1}{0 unencrypted_key | 7 encrypted_key |
KEY}
ospfv3 encryption ipsec spi spi_value esp {md5 | sha1} passphrase {0 unencrypted_passphrase | 7
encrypted_passphrase | LINE}
default ospfv3 encryption
no ospfv3 encryption
```

#### Parameters

- **spi *spi\_value*** configures the value for IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- **0 unencrypted\_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- **7 encrypted\_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **KEY** configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 unencrypted\_passphrase** configures an unencrypted passphrase.
  - **7 encrypted\_passphrase** configures an encrypted passphrase.
  - **LINE** uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [area encryption ipsec spi](#)
- [ospfv3 authentication ipsec spi](#)

#### Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase. Arista devices also support the legacy **ipv6 ospf encryption ipsec spi** command in certain software releases of the EOS.

## Restrictions

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

## Examples

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and **SHA1** algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
 2fd4e1c67a2d28fcfed849ee1bb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
1VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9) #
```

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and **MD5** hash algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
 1VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
1VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9) #
```

- This command deletes the OSPFv3 security on an interface.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# show active
interface Ethernet9
 no switchport
ospfv3 encryption ipsec spi 3456 md5 7 1xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx10+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#no ospfv3 encryption
switch(config-if-Et9)#show active
interface Ethernet9
 no switchport
switch(config-if-Et9) #
```

---

### 15.3.5.25 ospfv3 hello-interval

The `ospfv3 hello-interval` command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbors dead interval.

The `no ospfv3 hello-interval` and `default ospfv3 hello-interval` commands restore the default hello interval of **10** seconds on the configuration mode interface by removing the `ospfv3 hello-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 hello-interval time
no ospfv3 hello-interval
default ospfv3 hello-interval
```

#### Parameter

***time*** Values range from **1 to 65535**; default is **10**.

#### Guideline

Arista devices also support the legacy `ipv6 ospf hello-interval` command in certain software releases of the EOS.

#### Example

This command configures a hello interval of **45** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 hello-interval 45
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 hello-interval 45
switch(config-if-V1200)#

```

### 15.3.5.26 ospfv3 ipv6 retransmit-interval

The `ospfv3 ipv6 retransmit-interval` command configures the link state advertisement retransmission interval.

The `no ospfv3 ipv6 retransmit-interval` and `default ospfv3 ipv6 retransmit-interval` commands restore the default retransmission interval of **5** seconds on the configuration mode interface by removing the corresponding `ospfv3 ipv6 retransmit-interval` command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 ipv6 retransmit-interval period
no ospfv3 ipv6 retransmit-interval
default ospfv3 ipv6 retransmit-interval
```

#### Parameter

***period*** Value ranges from **1 to 65535**; default is **5**.

#### Example

This command configures a retransmission interval of **25** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)# show active
interface Vlan200
 ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#

```

---

### 15.3.5.27 ospfv3 network

The **ospfv3 network** command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The **no ospfv3 network** and **default ospfv3 network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ospfv3 network** command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 network point-to-point
```

```
no ospfv3 network
```

```
default ospfv3 network
```

#### Guideline

Arista devices also support the legacy **ipv6 ospf network** command in certain software releases of the EOS.

#### Examples

- This command configures **interface vlan 200** as a point-to-point link.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 network point-to-point
switch(config-if-Vl200)# show active
interface Vlan200
 ospfv3 network point-to-point
switch(config-if-Vl200)#

```

- This command restores **interface ethernet 10** as a broadcast link.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no ospfv3 network
switch(config-if-Vl200)# show active
interface Vlan200
switch(config-if-Vl200)#

```

### 15.3.5.28 ospfv3 priority

The `ospfv3 priority` command configures the OSPFv3 router priority.

The `no ospfv3 priority` and `default ospfv3 priority` commands restore the default priority (1) on the interface by removing the corresponding `ospfv3 priority` command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

`ospfv3 priority priority_level`

`no ospfv3 priority`

`default ospfv3 priority`

#### Parameter

***priority\_level*** Settings range from **0 to 255**.

#### Guideline

Arista devices also support the legacy `ipv6 ospf priority` command in certain software releases of the EOS.

#### Example

This command configures a router priority of **128** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-V1200)# ospfv3 priority 128
switch(config-if-V1200)# show active
interface Vlan200
 ospfv3 priority 128
switch(config-if-V1200)#

```

---

### 15.3.5.29 passive-interface (OSPFv3)

The **passive-interface** command disables OSPF on an interface range. All interfaces are active by default.

The **no passive-interface** and **default passive-interface** commands enable OSPFv3 on the specified interface range by removing the corresponding **passive-interface** statements from the **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

#### Parameters

- **INTERFACE\_NAME** Options include:
  - **ethernet e\_range**
  - **loopback l\_range**
  - **management m\_range**
  - **port-channel p\_range**
  - **vlan v\_range**
  - **VXLAN vx\_range**
  - **default**

Valid **e\_range**, **l\_range**, **m\_range**, **p\_range** **v\_range**, and **vx\_range** formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

This command configures VLAN interfaces **101** through **103** as passive interfaces.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# passive-interface vlan 101-103
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 passive-interface Vlan101
 passive-interface Vlan102
 passive-interface Vlan103
switch(config-router-ospf3)#

```

### 15.3.5.30 redistribute (OSPFv3)

The **redistribute** command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from the **running-config**, disabling route redistribution for the specified route type.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
redistribute ROUTE_TYPE ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

#### Parameters

- **ROUTE\_TYPE** Options include:
  - **BGP**
  - **connected**
  - **static**
- **ROUTE\_MAP** Options include:
  - **route-map map\_name**

#### Example

The **redistribute static** command starts the advertising of static routes as OSPFv3 external routes.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# redistribute static
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 redistribute connected
 redistribute static
switch(config-router-ospf3)#

```

### 15.3.5.31 router-id (OSPFv3)

The **router-id** command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address.
3. The highest IP address present on the device.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from the **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
router-id identifier
no router-id
default router-id
```

#### Parameters

***identifier*** Value ranges from **0.0.0.0 to 255.255.255.255** (dotted decimal notation).

#### Example

This command assigns **10.10.1.4** as the router ID for the OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# router-id 10.10.1.4
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 router-id 15.10.1.4
switch(config-router-ospf3) #
```

### 15.3.5.32 show ipv6 ospf border-routers

The **show ipv6 ospf border-routers** command displays the OSPF routing table entries.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf border-routers [VRF_INSTANCE vrf vrf_name]
```

#### Parameters

- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf vrf\_name** Displays information for the specified VRF.

#### Example

This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch# show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
 Router 10.37.0.32 area 0.0.0.0 ASBR
 Router 10.37.0.18 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.0 ASBR ABR
 Router 10.37.0.31 area 0.0.0.0 ASBR ABR
 Router 10.37.0.58 area 0.0.0.0 ASBR
 Router 10.37.0.37 area 0.0.0.0 ASBR
 Router 10.37.0.22 area 0.0.0.2 ASBR ABR
 Router 10.37.0.31 area 0.0.0.2 ASBR ABR
```

---

### 15.3.5.33 show ipv6 ospf database link if-name

The **show ipv6 ospf database link** command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link if-name [[INTF_ID][LS_ID][ROUTER][DATA_LEVEL]]
```

#### Parameters

- **INTF\_ID** Options include:
  - **ethernet e\_range** Ethernet interface list.
  - **loopback l\_range** Loopback interface list.
  - **management m\_range** Management interface list.
  - **port-channel p\_range** Channel group interface list.
  - **vlan v\_range** VLAN interface list.
  - **VXLAN vx\_range** VXLAN interface list.
- Valid **range** formats include number, range, or comma-delimited list of numbers and ranges.
- **LS\_ID** Options include:
  - **no parameter**
  - **A.B.C.D**
- **ROUTER** Options include:
  - **no parameter**
  - **adv-router a.b.c.d**
  - **self-originate**
- **DATA\_LEVEL** Options include:
  - **no parameter**
  - **detail**

#### Example

This command displays information for **ethernet 4/1** link state advertisements.

```
switch# show ipv6 ospf database link if-name ethernet 4/1
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,
 LNK - Link, NAP - Intra Area Prefix,
 NSA - Not So Stubby Area, NTW - Network,
 RTR - Router

Routing Process "ospf 1":
```

### 15.3.5.34 show ipv6 ospf database link if-type

The **show ipv6 ospf database link** command displays information of the link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link if-type [INTF_TYPE][LS_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- **INTF\_TYPE**
  - **broadcast**
  - **nbma**
  - **p2mp**
  - **p2p**
- **LS\_ID** Options include:
  - **no parameter**
  - **A.B.C.D**
- **ROUTER** Options include:
  - **no parameter**
  - **adv-router a.b.c.d**
  - **self-originate**
- **DATA\_LEVEL** Options include:
  - **no parameter**
  - **detail**

#### Example

This command displays LSA information for the interfaces configured for broadcast transmissions.

```
switch# show ipv6 ospf database link if-type broadcast
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,
 LNK - Link, NAP - Intra Area Prefix,
 NSA - Not So Stubby Area, NTW - Network,
 RTR - Router

Routing Process "ospf 1":

### 15.3.5.35 show ipv6 ospf database <link state list>

The **show ipv6 ospf database** command displays the OSPF link state advertisements that originate on a switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database [FILTER][LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- **FILTER** Filters the output of the command by specifying areas. Options include:
  - **no parameter**
  - **area A.B.C.D**
  - **area backbone**
  - **as**
  - **as external**
- **LINKSTATE\_ID** Options include:
  - **no parameter**
  - **A.B.C.D**
- **ROUTER** Options include:
  - **no parameter**
  - **adv-router a.b.c.d**
  - **self-originate**
- **DATA\_LEVEL** Options include:
  - **no parameter**
  - **detail**

#### Example

This command displays the OSPFv3 database of link state advertisements.

```
switch# show ipv6 ospf database 10.26.0.23
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,

### 15.3.5.36 show ipv6 ospf database link

The **show ipv6 ospf database link** command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link [LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- **LINKSTATE\_ID** Options include:
  - no parameter
  - *A.B.C.D*
- **ROUTER** Options include:
  - no parameter
  - **adv-router *a.b.c.d***
  - **self-originate**
- **DATA\_LEVEL** Options include:
  - no parameter
  - **detail**

#### Example

This command displays information about the Open Shortest Path First (OSPF).

```
switch# show ipv6 ospf database link
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,
 LINK - Link, NAP - Intra Area Prefix,
 NSA - Not So Stubby Area, NTW - Network,
 RTR - Router

Routing Process "ospf 9":
```

---

### 15.3.5.37 show ipv6 ospf database

The **show ipv6 ospf database** command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database [VRF_INSTANCE vrf vrf_name]
```

#### Parameters

- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf *vrf\_name*** Displays information for the specified VRF.

#### Example

This command displays OSPF database information for VRF blue.

```
switch# show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,
 LNK - Link, NAP - Intra Area Prefix,
 NSA - Not So Stubby Area, NTW - Network,
 RTR - Router
Routing Process "ospf 9", VRF blue
AS Scope LSDB
```

### 15.3.5.38 show ipv6 ospf database <link-state details>

The `show ipv6 ospf database <link-state details>` command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database [FILTER][LINK_TYPE][LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- **FILTER** Filters the output of the command by specifying areas. Options include:
  - **area A.B.C.D**
  - **area backbone**
- **LINK\_TYPE** Parameter options include:
  - **router**
  - **network**
  - **inter-area-prefix**
  - **inter-area-router**
  - **intra-area-prefix**
  - **nssa**
- **LINKSTATE\_ID** Options include:
  - **no parameter**
  - **A.B.C.D**
- **ROUTER** Options include:
  - **no parameter**
  - **adv-router a.b.c.d**
  - **self-originate**
- **DATA\_LEVEL** Options include:
  - **no parameter**
  - **detail**

#### Example

This command displays the OSPF database summary.

```
switch# show ipv6 ospf database detail
Codes: AEX - AS External, GRC - Grace,
 IAP - Inter Area Prefix, IAR - Inter Area Router,
 LNK - Link, NAP - Intra Area Prefix,
 NSA - Not So Stubby Area, NTW - Network,
 RTR - Router

### 15.3.5.39 show ipv6 ospf interface

The **show ipv6 ospf interface** command displays OSPFv3 information on interfaces where OSPFv3 is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf interface [VRF_INSTANCE]
```

#### Parameters

- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf vrf\_name** Displays information for the specified VRF.

#### Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch# show ipv6 ospf interface
Ethernet17 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
 Designated Router is 10.37.0.37
 Backup Designated Router is 10.37.0.23
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1
 Options are R E V6
Vlan31 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State Backup DR, Priority 1
 Designated Router is 10.37.0.22
 Backup Designated Router is 10.37.0.23
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 1
 Options are R E V6
Vlan32 is up
 Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
 Network Type Broadcast, Cost 10
 Transmit Delay is 1 sec, State DR Other, Priority 1
 Designated Router is 10.37.0.11
 Backup Designated Router is 10.37.0.22
 Timer intervals configured, Hello 10, Dead 40, Retransmit 5
 Neighbor Count is 2
 Options are R E V6
```

#### 15.3.5.40 show ipv6 ospf lsa-log

The `show ipv6 ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPFv3.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf [PROCESS_ID] lsa-log [VRF_INSTANCE]
```

##### Parameters

- **PROCESS\_ID** OSPFv3 process ID. Values include:
  - **no parameter** Displays information for all process IDs.
  - **1 to 65535** Displays information for the specified process ID.
- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf vrf\_name** Displays information for the specified VRF.

##### Example

This command displays log entries when LSA update messages are sent or received for OSPFv3.

```
switch# show ipv6 ospf lsa-log
OSPF3 Process 3.3.3.3, VRF default, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000
msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
```

---

#### 15.3.5.41 show ipv6 ospf neighbor state

The **show ipv6 ospf neighbor state** command displays the state information on OSPF neighbors on a per-interface basis.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

##### Parameters

- **STATE\_NAME** Values include:
  - **2-ways**
  - **attempt**
  - **down**
  - **exch-start**
  - **exchange**
  - **full**
  - **restart**
  - **init**
  - **loading**
- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf vrf\_name** Displays information for the specified VRF.

##### Example

This command displays OSPF information for neighboring devices that are adjacent.

```
switch# show ipv6 ospf neighbor state full
Routing Process "ospf 3":
```

#### 15.3.5.42 show ipv6 ospf neighbor summary

The **show ipv6 ospf neighbor summary** command displays a single line of state information for each OSPFv3 neighbor.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf neighbor summary [VRF_INSTANCE]
```

##### Parameters

**VRF\_INSTANCE** Values include:

- **no parameter** Displays information for all VRFs.
- **vrf vrf\_name** Displays information for the specified VRF.

##### Example

This command shows the summary information for the OSPFv3 neighbors.

```
switch# show ipv6 ospf neighbor summary
Routing Process "ospf 1":
 3 neighbors are in state Down
 3 neighbors are in state Full
 5 neighbors are in state Init
 0 neighbors are in state Loading
 0 neighbors are in state Attempt
 3 neighbors are in state Restarting
 0 neighbors are in state Exchange
 3 neighbors are in state 2 Ways
 0 neighbors are in state Exch Start
```

---

#### 15.3.5.43 show ipv6 ospf neighbor

The **show ipv6 ospf neighbor** command displays OSPFv3 neighbor information.

##### Command Mode

EXEC

##### Command Syntax

**show ipv6 ospf neighbor [VRF\_INSTANCE]**

##### Parameters

**VRF\_INSTANCE** Values include:

- **no parameter** Displays information for all VRFs.
- **vrf vrf\_name** Displays information for the specified VRF.

##### Example

This command displays the switch's neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface et12
 DR is 10.37.0.37 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 37 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface vlan3911
 DR is 10.37.0.22 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 31 seconds
Neighbor 10.37.0.11 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface vlan3902
 DR is 10.37.0.11 BDR is 10.37.0.22
 Options is 0
 Dead timer is due in 33 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface vlan3902
 DR is 10.37.0.11 BDR is 10.37.0.22
 Options is 0
 Dead timer is due in 31 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface vlan3923
 DR is 10.37.0.22 BDR is 10.37.0.46
 Options is 0
 Dead timer is due in 31 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.0 interface vlan3908
 DR is 10.37.0.22 BDR is 10.37.0.21
 Options is 0
 Dead timer is due in 39 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
 In area 0.0.0.2 interface vlan3992
 DR is 10.37.0.22 BDR is 10.37.0.23
 Options is 0
 Dead timer is due in 39 seconds
```

#### 15.3.5.44 show ipv6 ospf spf-log

The `show ipv6 ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf [PROCESS_ID] spf-log [VRF_INSTANCE]
```

##### Parameters

- **PROCESS\_ID** OSPFv3 process ID. Values include:
  - **no parameter** Displays information for all process IDs.
  - **1 to 65535** Displays information for the specified process ID.
- **VRF\_INSTANCE** Values include:
  - **no parameter** Displays information for all VRFs.
  - **vrf vrf\_name** Displays information for the specified VRF.

##### Example

This command displays the SPF information for OSPFv3 in all VRFs.

```
switch# show ipv6 ospf spf-log
OSPF3 Process 172.26.0.22, VRF default
TIME EVENT REASON
04:54:52.070 SPF ran for 0.70 ms
04:54:52.070 Scheduled after 0 ms Router LSA generation
04:54:39.151 SPF ran for 0.71 ms
04:54:39.151 Scheduled after 0 ms Router LSA generation
04:54:12.071 SPF ran for 0.56 ms
04:54:12.070 Scheduled after 0 ms Router LSA generation
04:54:04.153 SPF ran for 0.29 ms
04:53:59.153 Scheduled after 4999 ms Router LSA generation
04:53:59.153 SPF ran for 0.25 ms
04:53:59.151 Scheduled after 0 ms Router LSA generation
04:53:33.081 SPF ran for 0.3 ms
04:53:33.081 Scheduled after 0 ms ECMP max nexthop cfg change
```

---

#### 15.3.5.45 show ipv6 ospf

The `show ipv6 ospf` command displays information about OSPFv3 routing.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf [access-list | border-routers | database | interface | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf] Process ID
```

##### Parameters

- **no parameters** displays the complete configuration of OSPFv3 address family and routing process.
- **access-list** displays the information of configured OSPFv3 access-list. Options include:
  - **no parameters** displays the information of all configured OSPFv3 access lists.
  - **WORD** displays the information of the specified access list.
  - **summary** displays the summary of all configured access lists.
- **border-routers** displays the information of configured OSPFv3 border and boundary routers. Options include:
  - **no parameters** displays the information of all configured OSPFv3 borders and boundary routers.
  - **vrf** displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- **database** displays the summary of database. Options include:
  - **no parameters** displays the complete summary of database.
  - **ipv4** displays the database information of link state ID.
  - **adv-router** displays the database information of advertising router link states.
  - **area** displays the database information filtered by area scope LSAs.
  - **as** displays the database information filtered by AS scope LSAs.
  - **database-summary** displays the count of LSAs in OSPFv3 database.
  - **detail** displays the detailed information of LSA.
  - **link** displays the database information filtered by link scoped LSAs.
  - **self-originate** displays the database information of self-originated link states.
  - **vrf** displays the VRF information in OSPFv3 database.
- **interface** displays the information of OSPFv3 interfaces. Options include:
  - **no parameters** displays the information of all OSPFv3 interfaces.
  - **Ethernet eth\_num** displays the information of the specified Ethernet interface. The value ranges from **1 to 24**.
  - **Loopback lb\_num** displays the information of the specified loop back interface. The value ranges from **0 to 1000**.
  - **Port-Channel pc\_num** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from **1-1000** and **1-2000, 1-4094** respectively.
  - **Tunnel t\_num** displays the information of the specified tunnel. The value ranges from **0 to 255**.
  - **Vlan vlan\_num** displays the information of the specified VLAN interface. The value ranges from **1 to 4094**.
  - **vrf vrf\_name** displays the information of the specified VRF.
- **lsa-log** displays the log entries of OSPFv3 LSA updates.

- **neighbor** displays the list of OSPFv3 neighbors.
- **request-list** displays the list of all OSPFv3 LSAs requested by a router.
- **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.
- **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- **vrf vrf\_name** displays the information of specified VRF.
- **Process ID** displays the OSPFv3 configuration of the specified process ID. The value ranges from **1 to 65535**.

## Examples

- This command displays OSPFv3 routing information for all VRFs.

```
switch# show ipv6 ospf
Routing Process "ospfv3 0" with ID 11.1.11.1 and Instance 0 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msecs
 Initial LSA throttle delay 1000 msecs
 Minimum hold time for LSA throttle 5000 msecs
 Maximum wait time for LSA throttle 5000 msecs
 It has 0 fully adjacent neighbors
 Number of areas in this router is 0. 0 normal, 0 stub, 0 nssa
 Number of LSAs 0
 Initial SPF schedule delay 0 msecs
 Minimum hold time between two consecutive SPFs 5000 msecs
 Current hold time between two consecutive SPFs 5000 msecs
 Maximum wait time between two consecutive SPFs 5000 msecs
 SPF algorithm last executed 00:07:13 ago
 No scheduled SPF
 Adjacency exchange-start threshold is 20
 Maximum number of next-hops supported in ECMP is 32
 Number of backbone neighbors is 0
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
```

- This command displays the log entries of OSPFv3 LSA updates.

```
switch# show ipv6 ospf lsa-log
[22:11:02] type RTR: 0.0.0.0 [13.13.13.13], event 2, backoff restarted, new hold value 1000 msecs
[21:31:02] type RTR: 0.0.0.0 [13.13.13.13], event 2, backoff restarted, new hold value 1000 msecs
[20:56:22] type RTR: 0.0.0.0 [13.13.13.13], event 2, backoff restarted, new hold value 1000 msecs

```

---

#### 15.3.5.46 show ospfv3

The `show ospfv3` command displays the OSPFv3 configuration of OSPFv3 address family and routing process.

##### Command Mode

EXEC

##### Command Syntax

```
show ospfv3 [access-list | border-routers | database | interface | ipv4 | ipv6 | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf]
```

##### Parameters

- **no parameters** displays the complete configuration of OSPFv3 address family and routing process.
- **access-list** displays the information of configured OSPFv3 access-list. Options include:
  - **no parameters** displays the information of all configured OSPFv3 access lists.
  - **WORD** displays the information of the specified access list.
  - **summary** displays the summary of all configured access lists.
- **border-routers** displays the information of configured OSPFv3 border and boundary routers. Options include:
  - **no parameters** displays the information of all configured OSPFv3 borders and boundary routers.
  - **vrf** displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- **database** displays the summary of database. Options include:
  - **no parameters** displays the complete summary of database.
  - **ipv4** displays the database information of link state ID.
  - **adv-router** displays the database information of advertising router link states.
  - **area** displays the database information filtered by area scope LSAs.
  - **as** displays the database information filtered by AS scope LSAs.
  - **database-summary** displays the count of LSAs in OSPFv3 database.
  - **detail** displays the detailed information of LSA.
  - **link** displays the database information filtered by link scoped LSAs.
  - **self-originate** displays the database information of self-originated link states.
  - **vrf** displays the VRF information in OSPFv3 database.
- **interface** displays the information of OSPFv3 interfaces. Options include:
  - **no parameters** displays the information of all OSPFv3 interfaces.
  - **Ethernet eth\_num** displays the information of the specified Ethernet interface. The value ranges from **1 to 24**.
  - **Loopback lb\_num** displays the information of the specified loop back interface. The value ranges from **0 to 1000**.
  - **Port-Channel pc\_num** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from **1-1000** and **1-2000**, **1-4094** respectively.
  - **Tunnel t\_num** displays the information of the specified tunnel. The value ranges from **0 to 255**.
  - **Vlan vlan\_num** displays the information of the specified VLAN interface. The value ranges from **1 to 4094**.
  - **vrf vrf\_name** displays the information of the specified VRF.

- **ipv4** displays the IPv4 address family information.
- **ipv6** displays the IPv6 address family information.
- **lsa-log** displays the log entries of OSPFv3 LSA updates.
- **neighbor** displays the list of OSPFv3 neighbors.
- **request-list** displays the list of all OSPFv3 LSAs requested by a router.
- **retransmission-list** displays the list of all OSPFv3 LSAs waiting to be re-sent.
- **spf-log** displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- **vrf vrf\_name** displays the information of specified VRF.

## Examples

- This command displays the complete configuration of OSPFv3 address family and routing process.

```
switch# show ospfv3
OSPFv3 address-family ipv6
Routing Process "ospfv3" with ID 13.13.13.13 and Instance 0 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msecs
 Initial LSA throttle delay 1000 msecs
 Minimum hold time for LSA throttle 5000 msecs
 Maximum wait time for LSA throttle 5000 msecs
 Interface flood pacing timer 50 msecs
 It has 0 fully adjacent neighbors
 Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
 Number of LSAs 1
 Initial SPF schedule delay 0 msecs
 Minimum hold time between two consecutive SPFs 5000 msecs
 Current hold time between two consecutive SPFs 5000 msecs
 Maximum wait time between two consecutive SPFs 5000 msecs
 SPF algorithm last executed 3d23h ago
 No scheduled SPF
 Adjacency exchange-start threshold is 20
 Maximum number of next-hops supported in ECMP is 32
 Number of backbone neighbors is 0
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
 Area 0.0.0.0
 Number of interface in this area is 0
 It is a normal area
 SPF algorithm executed 2 times
```

- This command displays the count of LSAs in OSPFv3 database.

```
switch# show ospfv3 database database-summary
OSPFv3 address-family ipv4
Routing Process "ospfv3" Instance 64 VRF default

 LSA Type Count
 Router 1
 Network 0
 Inter Area Prefix 0
 Inter Area Router 0
 Summary Asex 0
 Nssa 0
 Link 0
 Intra Area Prefix 0
 Grace 0
 Total 1

OSPFv3 address-family ipv6
Routing Process "ospfv3" Instance 0 VRF default

 LSA Type Count
 Router 0
 Network 0
 Inter Area Prefix 0
 Inter Area Router 0
 Summary Asex 0
 Nssa 0
 Link 0
```

---

```
Intra Area Prefix 0
Grace 0
Total 0

ro301.02:05:02(config-router-ospfv3-af) #
```

- This command displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 SPF.

```
switch# show ospfv3 spf-log
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64, VRF default
TIME EVENT REASON
02:00:13.495 SPF ran for 0.064 ms
02:00:13.335 Scheduled after 0.000 ms Router LSA generation
01:59:55.499 SPF ran for 0.061 ms
01:59:54.604 Scheduled after 0.000 ms ECMP max nexthop cfg change
OSPFv3 address-family ipv6
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 0, VRF default
TIME EVENT REASON
02:00:13.495 SPF ran for 0.064 ms
02:00:13.335 Scheduled after 0.000 ms OSPF3 re-initialisation
01:59:55.499 SPF ran for 0.089 ms
01:59:54.603 Scheduled after 0.000 ms ECMP max nexthop cfg change
ro301.02:04:06(config-router-ospfv3-af) #
```

#### 15.3.5.47 shutdown (OSPFv3)

The **shutdown** command disables OSPFv3 on the switch.

OSPFv3 is disabled by default on individual interfaces and enabled through [ipv6 ospf area](#) commands.

The **no shutdown** and **default shutdown** commands enable the OSPFv3 instance by removing the **shutdown** statement from the OSPFv3 block in ***running-config***.

##### Command Mode

Router-OSPFv3 Configuration

##### Command Syntax

```
shutdown
no shutdown
default shutdown
```

##### Example

This command disables OSPFv3 activity on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# shutdown
switch(config-router-ospf3)# show active
ipv6 router ospf 9
 shutdown
switch(config-router-ospf3)#{
```

---

#### 15.3.5.48 timers lsa rx min interval (OSPFv3)

The **timers lsa rx min interval** command sets the minimum interval for accepting identical Link-State Advertisements (LSAs) from OSPFv3 neighbors.

The **no timers lsa rx min interval** and **default timers lsa rx min interval** commands restore the minimum interval to the default value of one second by removing the **timers lsa rx min interval** command from the **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

#### Command Syntax

```
timers lsa rx min interval lsa_time
no timers lsa rx min interval
default timers lsa rx min interval
```

#### Parameter

***lsa\_time*** Minimum time (in milliseconds) after which the switch accepts an identical LSA from OSPFv3 neighbors. Value ranges from **0 to 600000** (ms). Default value is **1000** milliseconds (**1** second).

#### Example

This command sets the minimum LSA arrival interval to **10** milliseconds.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# timers lsa rx min interval 10
switch(config-router-ospfv3)#{
```

### 15.3.5.49 timers lsa tx delay initial (OSPFv3)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPFv3 Link-State Advertisement (LSA) generation.

The `no timers lsa tx delay initial` and `default timers lsa tx delay initial` commands restore the default LSA rate-limiting values by removing the `timers lsa tx delay initial` command from the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

#### Command Syntax

```
timers lsa tx delay initial [initial_delay]||[min_hold]||[max_wait]
no timers lsa tx delay initial
default timers lsa tx delay initial
```

#### Parameters

- ***initial\_delay*** Initial delay in milliseconds to generate the first instance of LSAs. Value ranges from **0 to 600000** (ms). The default value is **1000** ms.
- ***min\_hold*** Minimum hold interval availed in milliseconds between the generation of same LSA. Value ranges from **1 to 600000** (ms). The default interval is **5000** ms.
- ***max\_wait*** Maximum hold interval availed in milliseconds between the generation of same LSA. Value ranges from **1 to 600000** (ms). The default interval is **5000** ms.

#### Example

These commands set the LSA transmission timers on the switch.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)#timers lsa tx delay initial 5 100 20000
switch(config-router-ospfv3)#{
```

### 15.3.5.50 timers spf delay initial (OSPFv3)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals of SPF calculations in a switch. The command sets three values:

- **Initial delay:** Initial wait by a switch to calculate SPF after a topology change in a network that has been stable throughout the hold interval. Because a topology change often requires several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch calculates SPF. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the initial delay period has expired and no other change is made to the throttle timers.
- **Hold interval:** This is an additional wait timer that reduces the frequency of SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur when the hold interval expires. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- **Maximum interval:** The maximum wait time of a switch after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv3 SPF calculation intervals by removing the `timers spf delay initial` command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

#### Command Syntax

```
timers spf delay initial [initial_delay][[hold_interval]][[max_interval]]
no timers spf
default timers spf
```

#### Parameters

- **initial\_delay** Initial delay between a topology change and SPF calculation. Value ranges from **0 to 65535000** (ms). The default value is **0** ms.
- **hold\_interval** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from **0 to 65535000** (ms). The default value is **5000** ms.
- **max\_interval** The maximum hold interval before a switch calculates SPF. Value ranges from **0 to 65535000** (ms). The default value is **5000** ms.

#### Example

These commands set the SPF timers on the switch.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# timers spf delay initial 5 100 20000
```

```
switch(config-router-ospfv3) #
```

### 15.3.5.51 timers

The **timers** command configures the minimum interval between the transmission of consecutive LS update packets in a network.

The **no timers** and **default timers** commands set the configured timer value to its default.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
timers {ls|out-delay|pacing|throttle}
no timers {ls|out-delay|pacing|throttle}
deault timers {ls|out-delay|pacing|throttle}
```

#### Parameters

- **ls** configures threshold for the retransmission of LSA. Option includes:
  - **arrival** configures the OSPF LSA arrival timer.
- **out-delay** configures the delay to flood router LSA in milliseconds. Option includes:
  - **out-delay\_time** minimum interval in milliseconds between accepting the same LSAs. The value ranges from **0 to 65000** milliseconds. The default value is **0**.
- **pacing** configures the OSPF packet pacing. Option includes:
  - **flood** configures the OSPF flood pacing.
- **throttle** configures OSPF throttle timers. Options include:
  - **ls** configures threshold for the retransmission of LSA.
  - **spf** configures the time between SPF calculations.

#### Examples

- This command configures OSPFv3 flood pacing timer to **50** ms in the global OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# timers pacing flood 50
switch(config-router-ospf3)# show ospfv3
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msecs
 Initial LSA throttle delay 1000 msecs
 Minimum hold time for LSA throttle 5000 msecs
 Maximum wait time for LSA throttle 5000 msecs
 Interface flood pacing timer 50 msecs
 It has 0 fully adjacent neighbors
 Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
 Number of LSAs 1
 Initial SPF schedule delay 0 msecs
 Minimum hold time between two consecutive SPFs 5000 msecs
 Current hold time between two consecutive SPFs 5000 msecs
 Maximum wait time between two consecutive SPFs 5000 msecs
 SPF algorithm last executed 21d19h ago
 No scheduled SPF
 Adjacency exchange-start threshold is 20
 Maximum number of next-hops supported in ECMP is 32
 Number of backbone neighbors is 0
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
 Area 0.0.0.0
```

```
Number of interface in this area is 0
It is a normal area
SPF algorithm executed 2 times
```

- This command configures the OSPFv3 flood pacing timer to **50** ms in IPv4 address family.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# address-family ipv4
switch(config-router-ospfv3-af)# timers pacing flood 50
switch(config-router-ospfv3-af)# show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
 FIPS mode disabled
 It is not an autonomous system boundary router and is not an area border router
 Minimum LSA arrival interval 1000 msecs
 Initial LSA throttle delay 1000 msecs
 Minimum hold time for LSA throttle 5000 msecs
 Maximum wait time for LSA throttle 5000 msecs
 Interface flood pacing timer 50 msecs
 It has 0 fully adjacent neighbors
 Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
 Number of LSAs 1
 Initial SPF schedule delay 0 msecs
 Minimum hold time between two consecutive SPFs 5000 msecs
 Current hold time between two consecutive SPFs 5000 msecs
 Maximum wait time between two consecutive SPFs 5000 msecs
 SPF algorithm last executed 00:10:38 ago
 No scheduled SPF
 Adjacency exchange-start threshold is 20
 Maximum number of next-hops supported in ECMP is 32
 Number of backbone neighbors is 0
 Graceful-restart is not configured
 Graceful-restart-helper mode is enabled
Area 0.0.0.0
 Number of interface in this area is 0
 It is a normal area
 SPF algorithm executed 2 times
```

---

## 15.4 IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

- [IS-IS Introduction](#)
- [IS-IS Segment Routing](#)
- [IS-IS Graceful Restart](#)
- [IS-IS Dynamic Flooding](#)
- [Dynamic Link Delay using TWAMP Light](#)
- [IS-IS Configuration](#)
- [IS-IS Commands](#)

### 15.4.1 IS-IS Introduction

IS-IS is a link-state protocol, which uses the Shortest Path First (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an Interior Gateway Protocol (IGP), IS-IS runs inside an Autonomous System (AS).

To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface. Arista IS-IS support includes IS-IS segment routing and IS-IS graceful restart.

### 15.4.2 IS-IS Segment Routing

Segment Routing (SR) provides a mechanism to simplify the definition of end-to-end paths within IGP topologies by encoding paths as sequences of topological sub-paths, called segments. The IS-IS protocol advertises these segments in four different ways: node segments, prefix segments, proxy-node segments, and adjacency segments.

- **Node-SID** - Represents a node in an IGP topology. Uses an index or label associated with an IPv4 or IPv6 address on a loopback interface of a router.
- **Proxy Node-SID** - Associated with an IP(v6) address received from a router that does not support IS-IS SR.
- **Prefix-SID** - Represents an ECMP-aware shortest path to a prefix (or a node), as per the state of the IGP topology.
- **Adjacency Segments** - Represents a hop over a specific adjacency between two nodes in IGP.

#### 15.4.2.1 TI-LFA FRR using IS-IS Segment-Routing

Topology Independent Fast Reroute, or TI-LFA, uses IS-IS SR to build loop-free alternate paths along the post-convergence path. These loop-free alternates provide fast convergence in the range of sub-50 ms.

This section describes TI-LFA FRR using IS-IS SR, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [TI-LFA FRR using IS-IS Segment-Routing Configuration](#)
- [TI-LFA FRR using IS-IS SR Commands](#)
- [Limitations](#)

The (Point of Local Repair (PLR)- the router where TI-LFA is configured) PLR switches to these loop-free alternate backup paths in the event of a link down (link-protection) or BFD neighbor down (node-protection) event, protecting traffic destined to IS-IS SR node segments, adjacency segments, and anycast segments while the IGP converges and the post-convergence paths are computed. Anycast segment protection is restricted to those segments which are attached to prefixes with host mask (/32 for V4 address and /128 for v6 address).

**Note:** Unlike node segments, anycast segments do not have the 'N' flag set described in section [2.1.1.2 of RFC8667](#).

The following enhancements are available by release:

- **EOS Release 4.22.1F** adds support for TI-LFA backup paths that protect IS-IS SR labeled traffic corresponding to a node segment or adjacency segment on a transit router.
- **EOS Release 4.23.1F** adds support for TI-LFA backup paths that protect IS-IS SR tunnels.
- **EOS Release 4.24.1** adds support for protecting IS-IS SR labeled traffic corresponding to anycast segments.
- **EOS Release 4.24.2F** adds support for calculating TI-LFA backup paths that exclude the SRLG configured on the failing link.

Backup paths are only installed for IS-IS SR labeled routes and tunnels corresponding to node segments, adjacency segments, and anycast segments. When requesting node-protection, and no node-protecting LFAs are available, a link-protecting LFA is computed instead. TI-LFA FRR using IS-IS Segment-Routing is available with the multi-agent routing protocol model and the ribd routing protocol model.

Other traffic that resolves over IS-IS SR tunnels, such as LDP pseudowires, BGP LU tunnels, BGP IP routes, L2 EVPN, MPLS L3 VPN, and so on, are also protected by the TI-LFA tunnel that protects the resolving IS-IS SR tunnel.

#### 15.4.2.1.1 TI-LFA FRR using IS-IS Segment-Routing Configuration

The following configuration tasks can be performed by Topology Independent Fast Reroute (TI-LFA FRR) using IS-IS Segment-Routing.

- [Configuring Link or Node Protection on a Specific Interface](#)
- [Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments](#)
- [Making Locally-originated Adjacency Segments Backup Eligible](#)
- [Enabling SRLG Protection](#)
- [show ip route](#)

#### 15.4.2.1.2 TI-LFA FRR using IS-IS SR Commands

##### TI-LFA FRR using IS-IS SR Show Commands

- [show ip route](#)
- [show isis interface](#)
- [show isis local-convergence-delay](#)
- [show isis segment-routing prefix-segments](#)
- [show isis segment-routing adjacency-segments](#)
- [show isis segment-routing tunnel](#)
- [show isis ti-lfa path](#)
- [show isis ti-lfa tunnel](#)
- [show mpls lfib route](#)

- 
- [show tunnel fib](#)

#### 15.4.2.1.3 Limitations

- Backup paths are not computed for prefix segments that do not have a host mask (**/32** for v4 and **/128** for v6).
- When TI-LFA is configured, the number of anycast segments generated by a node cannot exceed **10**.
- Computing TI-LFA backup paths for proxy node segments is not supported.
- Backup paths are not computed for node segments corresponding to multi-homed prefixes. The multi-homing could be the result of them being anycast node segments, loopback interfaces on different routers advertising SIDs for the same prefix, node segments leaked between levels, and thus being seen as originated from multiple L1-L2 routers.
- Backup paths are only computed for segments that are non-ECMP.
- Only IS-IS interfaces that are using the point-to-point network type are eligible for protection.
- Link/node protection is only supported in the default VRF owing to the lack of non-default VRF support for IS-IS segment-routing.
- Backup paths are computed in the same IS-IS level topology as the primary path.
- Even with IS-IS GR configured, SSU, SSO, agent restart are not hitless events for IS-IS SR LFIB routes or tunnels being protected by backup paths.

### 15.4.3 IS-IS Graceful Restart

IS-IS Graceful Restart (GR) provides a mechanism to prevent routing protocol re-convergence during a processor switchover or device downtime. Normally, when a router restarts, all the neighboring routers associated with that router detect that the device went down and remove routes from that neighbor. When the router restarts, the session re-establishes, and data transfer continues. During the restart, the removal and re-insertion of routes cause data loss. Prevent data loss by configuring Graceful Restart on the device.

When using IS-IS as the Interior Gateway Protocol (IGP), the following EOS features require nonstop forwarding (NSF) and support for the Graceful Restart from IS-IS:

- Smart Software Upgrade (SSU).
- A planned Stateful SwitchOver (SSO) for maintenance reasons or an unplanned SSO due to failures on the active supervisor.
- RIB agent restart due to software failures.

With IS-IS Graceful Restart (GR) configured, a redundancy switchover from an active to a standby supervisor, or SSU, or restart of the IS-IS software, the RIB agent, should be a hitless event if the GR completes successfully. Neighboring routers continue to forward traffic to the restarting router, and traffic forwarding through the restarting router continues without loss. When GR successfully completes, the failure of a router should be completely transparent to network applications.

ISIS Graceful Restart (GR) is compatible with the following platforms:

- IS-IS GR with unplanned software restart supported on all platforms.
- IS-IS GR with SSO supported on modular dual-supervisor platforms.
- IS-IS GR with SSU supported on platforms that support SSU.

#### 15.4.4 IS-IS Dynamic Flooding

Dynamic Flooding allows IS-IS to scale to large, dense topologies such as Leaf-Spine topologies. In such topologies, legacy IS-IS can exhibit a congestive collapse due to the control plane load created by excessively redundant flooding.

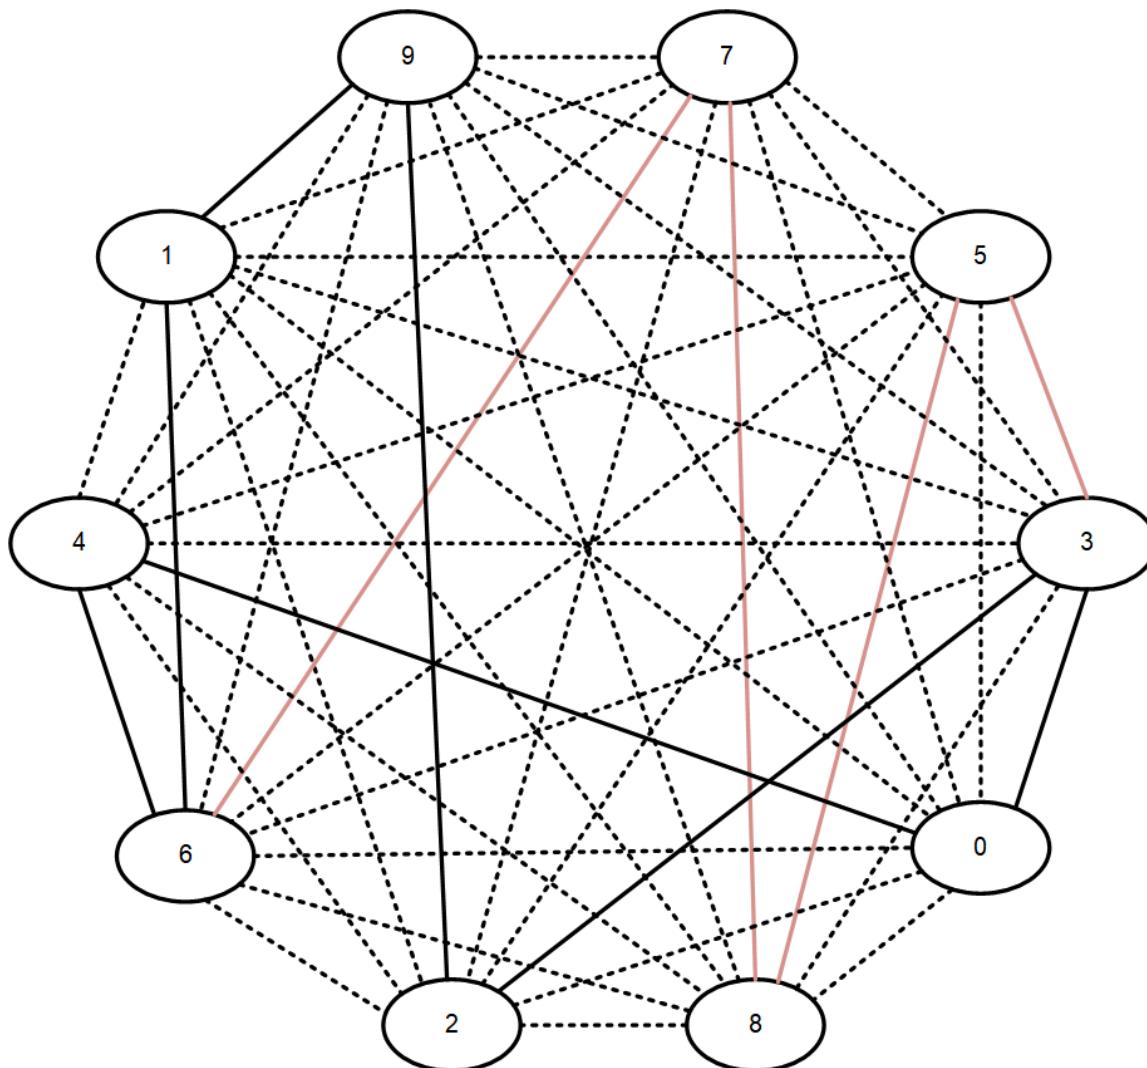

The concept in Dynamic Flooding is to dynamically compute a restricted topology for flooding (the **flooding topology**). Since this can be much smaller than the full physical topology, this can reduce the redundancy seen by each node, thereby reducing the control plane load and avoiding a congestive collapse.

To do this, first select one node within the IS-IS area as the **area leader**. Leverage the Designated Intermediate System (DIS) election algorithm for this, except instead of applying it to the neighbors on an interface, compute it across all of the nodes within the area.

The area leader is responsible for computing the flooding topology. This is distributed to the other nodes in the area through the Area System IDs TLV and the Flooding Path TLV.

All nodes within the area then flood only on the flooding topology.

**Figure 15-11: Flooding Topology**

A flooding topology on a dense graph. The flooding topology is shown by the solid lines. Dotted lines indicate non-flooding links.

---

In a dense topology, this can reduce the amount of flooding by an order of magnitude or more, with a resulting increase in scalability.

## 15.4.5 Dynamic Link Delay using TWAMP Light

### Overview of Link Delay using Two-Way Active Measurement Protocol (TWAMP)

EOS provides TWAMP support as a protocol used for active network performance monitoring. It measures the end-to-end performance of a network path by sending and receiving packets between two network devices. Previously, you could statically configure the minimum and maximum link delay, but with the addition of TWAMP, EOS supports dynamic measurement of link delay as described in [RFC8186](#) and provides it to the IS-IS FlexAlgo dynamically.

TWAMP Light provides two modes:

- **Active** - The device initiates sending probe packets and receives reflected packets with a timestamp to compute link-delay.
- **Reflector** - The device receives the probe packet, adds the timestamps, and sends it back.

The two modes operate independently, and the same interface can be in Active mode and Reflector mode simultaneously. To avoid conflict, configure different UDP ports for each mode.

IS-IS advertises the unidirectional link delay (the average delay), unidirectional min-max delay, and unidirectional delay variation measured by TWAMP Light. Only the unidirectional min-max delay advertises in Application Specific Link Attributes Sub-TLV (ASLA).

This feature only supports IPv4 probe packets, but EOS utilizes the measured link-delay values for IPv4 and IPv6 topologies in IS-IS multi-topology deployments.

### Platform Support

EOS supports this feature on the following platforms:

- 7500R3X
- 7800R3X
- DCS-7280XR3X

The platforms must have at least one Femtocell Access Point (FAP) with the Revision of **Q2c2TX**. To verify the FAP revision, use the following command:

| switch#show platform fap         |          |           |          |
|----------------------------------|----------|-----------|----------|
| Switches currently in the system |          |           |          |
| Name                             | Type     | Device    | Revision |
| Fap0                             | Jericho2 | Jericho2c | Q2c2tA1  |

## 15.4.6 IS-IS Configuration

These sections describe IS-IS configuration tasks:

- [Enabling IS-IS](#)
- [Configuring IS-IS Optional Global Parameters](#)
- [Configuring Optional IS-IS Interface Parameters](#)
- [Configuring IS-IS Segment Routing](#)

#### 15.4.6.1 Enabling IS-IS

To enable IS-IS, each of the following tasks must be performed.

- [Enabling IS-IS Globally and Specifying an IS-IS Instance](#)
- [Configuring the Network Entity Title \(NET\)](#)
- [Setting the Address Family Configuration](#)
- [Enabling IS-IS on a Specified Interface](#)

##### 15.4.6.1.1 Enabling IS-IS Globally and Specifying an IS-IS Instance

The switch supports only one IS-IS routing instance per VRF. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The `router isis` command places the switch in router IS-IS configuration mode.

#### Example

These commands create an IS-IS routing instance named Osiris in the default VRF and place the switch in IS-IS configuration mode for that instance.

```
switch(config) # router isis Osiris
switch(config-router-isis) #
```

##### 15.4.6.1.2 Configuring the Network Entity Title (NET)

After creating an IS-IS routing instance, configure the Network Entity Title (NET) with the `net` command. The NET defines the IS-IS area address and the system ID of the device.

#### Example

These commands configure the NET by specifying the IS-IS area address and the system ID of the device.

```
switch(config) # router isis Osiris
switch(config-router-isis) # net 49.0001.1010.1040.1030.00
```

##### 15.4.6.1.3 Setting the Address Family Configuration

The `address-family` command enables the address families that IS-IS will route and places the switch in the configuration mode for that address family. The address families supported are IPv4 unicast and IPv6 unicast.

#### Example

---

These commands enable and enter the address family mode for IPv4 unicast.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)#{
```

#### 15.4.6.1.4 Enabling IS-IS on a Specified Interface

After enabling IS-IS globally, enable it on an interface with the **isis enable** command.

##### Example

These commands enable IS-IS on **interface ethernet 4**.

```
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)#isis enable Osiris
```

#### 15.4.6.2 Configuring IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters may be configured.

- [Setting the Router Type](#)
- [Configuring Redistribution of Connected or Static Non-ISIS Routes](#)
- [Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1 or Level-2](#)
- [Configuring Redistribution of BGP Routes into ISIS](#)
- [Setting the Overload Bit](#)
- [Configuring IS-IS MD5 Authentication](#)
- [Setting the SPF Interval](#)
- [Configuring IS-IS Segment Routing Global Adjacency-SID](#)
- [Enabling Logging for Peer Changes](#)
- [Setting the IS-IS hostname](#)
- [Configuring IS-IS Multi-Topology](#)

##### 15.4.6.2.1 Setting the Router Type

The **is-type** command sets the routing level for an IS-IS instance.

##### Example

These commands specify Level-2 for the IS-IS instance.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-2
switch(config-router-isis)#{
```

##### 15.4.6.2.2 Configuring Redistribution of Connected or Static Non-ISIS Routes

The **redistribute (IS-IS)** command configures redistribution of connected or static non-ISIS routes.

##### Example

These commands redistribute connected routes into the IS-IS domain.

```
switch(config)# router isis Osiris
```

```
switch(config-router-isis)# redistribute connected
switch(config-router-isis)#

```

### 15.4.6.2.3 Configuring Redistribution of Connected or Static Non-ISIS Routes into Level-1 or Level-2

Non-ISIS routes can be exported into Level-1, Level-2, or both using a route map. By default, the routes are exported only to Level-2; to export to Level-1 or to both levels, configure the route map using the [set isis level](#) command. The Level-1 or Level-2 routes can also be filtered using the route maps match statement. The route map is then used when redistributing routes in ISIS with the [redistribute \(IS-IS\)](#) command.

Use the [show isis database detail](#) command to make sure that the route shows up in the exported level.

#### Examples

- The following commands configure a route map called **rm** to set the IS-IS level to Level-1, then use it to redistribute connected routes.

```
switch(config)# route-map rm
switch(config-route-map-rm)# set isis level level-1
switch(config-route-map-rm)# router isis osiris
switch(config-router-isis)# redistribute connected route-map rm
switch(config-router-isis)#

```

- The following command displays IS-IS database information and confirms that the level has been set to Level-1.

```
switch# show isis database detail
ISIS Instance: inst1 VRF: default
 ISIS Level 1 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1111.1111.1001.00-00 10 63306 751 L2 <>
 NLPID: 0xCC(IPv4) 0x8E(IPv6)
 Area address: 49.0001
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 15.4.6.2.4 Configuring Redistribution of BGP Routes into ISIS

The [redistribute bgp route-map](#) command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The [no redistribute bgp](#) and [default redistribute bgp](#) commands disable BGP route redistribution from the specified domain by removing the [redistribute bgp](#) statement from [running-config](#).

The command is available in both [router IS-IS](#) configuration mode and the [address-family](#) submode. The command is rejected if configured in both modes at the same time. Issuing the [no](#) or [default](#) command in [router IS-IS](#) configuration mode has no effect on redistribution configured in the [address-family](#) submode.

**Note:** If the command is configured in an [address-family](#) submode, it only redistributes routes from that address family. If it is configured in router-ISIS mode, it applies to all enabled address families.

#### Examples

- These commands redistribute IPv4 BGP routes from the route map called **bgp-to-isis-v4** into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v4
switch(config-router-isis-af)#

```

- These commands redistribute all BGP routes from the route map ***bgp-to-isis*** into ISIS.

```
switch(config)# router isis 1
switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

#### 15.4.6.2.5 Setting the Overload Bit

The overload bit is set in link state packets (LSPs) to signal that the switch is not available for forwarding transit traffic (for instance, during startup or when the switch is being taken down for maintenance). To set the overload bit manually, use the **set-overload-bit** command without the **on-startup** option. To configure the switch to set the overload bit after a reboot, allowing routing protocols to converge before the switch is used for forwarding traffic, use the **set-overload-bit** command with the **on-startup** option. The overload bit will remain set for the interval specified after startup.

 **Note:** When using the **on-startup** option, the overload bit will remain set in LSPs until the IS-IS agent has been up for the configured interval. If the configured **on-startup** time is less than the actual IS-IS agent uptime, the command will be applied immediately.

In scenarios when Border Gateway Protocol (BGP) routes are resolved using an Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, the IGP will consider the transit router as an optimal path again. After rebooting, the transit router will blackhole traffic until the transit router learns the external destination reachability information via BGP.

#### Examples

- These commands configure the switch to set the overload bit in LSPs sent for **120** seconds after startup.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup 120
switch(config-router-isis)#
```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup wait-for-bgp
switch(config-router-isis)# set-overload-bit on-startup wait-for-bgp timeout 750
switch(config-router-isis)#
```

#### 15.4.6.2.6 Configuring IS-IS MD5 Authentication

To configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated, use the **authentication mode** and **authentication key** commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the **isis authentication mode** and **isis authentication key** commands on the interface.

Two forms of authentication are supported by the IS-IS routing protocol: Clear-text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear-text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network. Arista recommends using the MD5 authentication.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello

PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area-wide and domain-wide authentication can be specified for L1 and L2 routers respectively.

## Examples

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication mode md5
switch(config-router-isis)# authentication key secret
switch(config-router-isis)#{/pre}

```

- These commands configure authentication on the interface causing IS-IS hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
switch(config-if-Et3/6)#{/pre}

```

To maximize interoperability, Arista recommends using the same key in both interface mode and in the **router isis** mode.

### 15.4.6.2.7 Setting the SPF Interval

The SPF timer interval defines the maximum interval between two successive SPF calculations. IS-IS runs SPF calculations following a change in the network topology or the link-state database. The [spf-interval](#) command defines the following intervals:

- Maximum wait interval:** The maximum time a switch will wait before running an SPF after a topology change.
- Initial wait interval:** In a network that has been stable throughout the hold interval, this interval defines the initial wait time of a switch for performing an SPF calculation after a topology change. As several link-state updates must be sent after a topology change, the initial wait interval allows the network to settle before a switch computes an SPF. If the topology changes during an initial wait interval, an SPF is calculated after the initial wait interval expires and no further changes are made to throttle timers.
- Hold time:** This interval delays SPF calculations during network instability. If the topology changes during a hold time, an SPF is computed when the hold time expires. Subsequent hold intervals are doubled up to the configured maximum wait interval for continuous topology changes. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF is computed after the initial wait interval.

**Note:** EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

## Example

This command configures maximum wait interval, initial wait interval, and hold time to **10** seconds, **2000** ms, and **1000** ms respectively.

```
switch(config)# router isis inst1
switch(config-router-isis)# spf-interval 10 2000 1000
```

### 15.4.6.2.8 Configuring IS-IS Segment Routing Global Adjacency-SID

IS-IS Segment Routing (SR) supports global adjacency SIDs for point-to-point interfaces. The adjacency SID is configured as an index using the adjacency-segment command.

Global adjacency segments are represented using an index instead of actual MPLS labels. The index is an offset into the Segment Routing Global Block (SRGB) advertised by a router, resulting in an MPLS label. The default value of SRGB in EOS is Base: **900000** and Size: **65536**.

The same index may be used to configure multiple interfaces so that MPLS forms an ECMP group, and the same index may be applied to IPv4 and IPv6 adjacencies.

#### Example

In this example, the global adjacency is configured on a point-to-point interface ethernet **Et1**, with an index value **10**.

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 10 global
```

#### Displaying Adjacency SID Information

The command **show isis segment-routing adjacency-segments** displays the global adjacency SID value and other related information.

#### Examples

- In this example an interface is configured as follows:

```
interface ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
switch# show isis segment-routing adjacency-segments

System ID: 1000.0000.0002 Instance: isis1
SR supported Data-plane: MPLS SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
 L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P -
Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
-----+-----+-----+-----+-----+-----+-----+-----+
Adj IP Address Local Intf SID SID Source Flags Type
-----+-----+-----+-----+-----+-----+-----+-----+
1.1.1.2 Et1 1 Configured F:0 B:0 V:0 L:0 S:0 P2P L1
fe80::1:ff:fe65:0 Et1 2 Configured F:1 B:0 V:0 L:0 S:0 P2P L1

Received Global Adjacency Segments
-----+-----+-----+-----+-----+-----+
SID Originator Neighbor Flags
-----+-----+-----+-----+-----+
0 rtrmpls1 1000.0000.0002 F:0 B:0 V:0 L:0 S:0
```

### 15.4.6.2.9 Enabling Logging for Peer Changes

The [log-adjacency-changes \(IS-IS\)](#) command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

#### Example

These commands configure the switch to send a Syslog message when a neighbor goes up or down.

```
switch(config)# router isis Osiris
switch(config-router-isis)# log-adjacency-changes
switch(config-router-isis)#{/pre}

```

### 15.4.6.2.10 Setting the IS-IS hostname

The [is-hostname](#) command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, Syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there's a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to de-configure an assigned hostname for IS-IS using the [no is-hostname](#) command. When the IS-IS hostname is removed, the switch goes back to using the switch's hostname as the IS-IS hostname.

#### Examples

- These commands configure the IS-IS hostname to the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# is-hostname ihost1
switch(config-router-isis)#{/pre}

```

- These commands unconfigure the IS-IS hostname of the symbolic name ***ishost1*** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# no is-hostname ihost1
switch(config-router-isis)#{/pre}

```

### 15.4.6.2.11 Configuring IS-IS Multi-Topology

The [multi-topology](#) command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly, the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The [isis ipv6 metric](#) command configures the IPv6 metric.

The [isis multi-topology](#) command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case

---

of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

### Examples

- These commands configure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# multi-topology
switch(config-router-isis-af)#+
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# no multi-topology
switch(config-router-isis-af)#+
```

- These commands configure the IPv6 metric.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis ipv6 metric 30
switch(config-if-Et5/6)#+
```

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# isis multi-topology address-family ipv4 unicast
switch(config-if-Et1)#+
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# isis multi-topology address-family ipv6 unicast
switch(config-if-Et1)#+
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# no isis multi-topology address-family unicast
switch(config-if-Et1)#+
```

#### 15.4.6.3 Configuring Optional IS-IS Interface Parameters

After globally enabling IS-IS, the following parameters may be configured on individual interfaces.

- Setting the Hello Packet Interval
- Configuring the Hello Multiplier for the Interface
- Configuring the IS-IS Metric
- Setting the LSP Transmission Interval
- Setting the IS-IS Priority
- Configuring an Interface as Passive
- Configuring BFD support for IS-IS for IPv4

#### 15.4.6.3.1 Setting the Hello Packet Interval

The **isis hello-interval** command sets the time interval between the hello packets that maintain an IS-IS adjacency.

##### Example

These commands configure a hello interval of **60** seconds for **interface ethernet 4**.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# isis hello-interval 60
switch(config-if-Et4)#[/pre]

```

#### 15.4.6.3.2 Configuring the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The **isis hello-multiplier** command calculates the hold time announced in hello packets by multiplying this number with the configured **isis hello-interval**.

##### Example

- These commands configure a hello multiplier of **5** for **interface ethernet 4**.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# isis hello-interval 60
switch(config-if-Et4)# isis hello-multiplier 5
switch(config-if-Et4)#[/pre]

```

#### 15.4.6.3.3 Configuring the IS-IS Metric

The **isis metric** command sets the cost for sending information over a specific interface. At present only wide metrics are supported.

##### Example

These commands configure a metric cost of **30** for sending information over **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis metric 30
switch(config-if-Et5)#[/pre]

```

#### 15.4.6.3.4 Setting the LSP Transmission Interval

The **isis lsp tx interval** command configures the minimum interval between successive LSP transmissions on an interface.

##### Example

This command sets the LSP transmission interval on interface **interface ethernet 5** to **50** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis lsp tx interval 50
switch(config-if-Et5)#[/pre]

```

### 15.4.6.3.5 Setting the IS-IS Priority

The [isis priority](#) command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority on the LAN will become the DIS.

#### Example

These commands configure a device priority of **60** on interface **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis priority 60
switch(config-if-Et5)#{/pre>
```

### 15.4.6.3.6 Configuring an Interface as Passive

A passive IS-IS interface does not send or receive IS-IS packets and will not form adjacencies, but is still included in LSP advertisements, making its IP address visible to the IS-IS domain. To configure an IS-IS interface as passive, use the [isis passive](#) command in interface configuration mode or the [passive \(IS-IS\)](#) command in router IS-IS configuration mode.

#### Examples

- These commands configure **interface ethernet 10** as a passive interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis passive
switch(config-if-Et10)#{/pre>
```

- These commands also configure **interface ethernet 10** as a passive interface.

```
switch(config)# router isis Osiris
switch(config-routerisis)# passive ethernet 10
switch(config-routerisis)#{/pre>
```

### 15.4.6.3.7 Configuring BFD support for IS-IS for IPv4

The [isis bfd](#) and [bfd all-interfaces](#) commands configure Bidirectional Forwarding Detection (BFD). BFD is supported for both IS-IS IPv4 and IPv6 routes.

#### Examples

- These commands enable BFD (for the IPv4 address family) for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all interfaces.

```
switch(config)# router isis 1
switch(config-routerisis)# address-family ipv4
switch(config-router-af)# bfd all-interfaces
switch(config-router-af)#{/pre>
```

- These commands enable BFD on an IS-IS interface.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#{/pre>
```

### 15.4.6.4 Configuring IS-IS Segment Routing

Global IS-IS Segment Routing (IS-IS SR) commands are accessed in Segment-Routing MPLS mode, under the router IS-IS configuration mode. Interface-specific IS-IS SR commands are accessed in interface configuration mode.

#### 15.4.6.4.1 Starting the MPLS Agent

The Routing Information Base (RIB) or IS-IS agent provides IS-IS segment routing, but the actual installation of LFIB entries pertaining to SR information provided by IS-IS is handled by the MPLS agent in EOS, which is disabled by default. To enable the MPLS agent, use the following commands.

**Note:** IP(v6) routing must be enabled as a prerequisite.

#### Example

The following commands enable IP routing and the MPLS agent on the switch.

```
switch(config)# ip routing
switch(config)# mpls ip
switch(config) #
```

#### 15.4.6.4.2 Enabling IS-IS SR

By default, IS-IS SR is disabled. You must enable it explicitly by issuing the **no** form of the [shutdown \(IS-IS SR\)](#) command in Segment-Routing MPLS configuration mode.

#### Example

The following commands enable IS-IS SR.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# no shutdown
switch(config-router-isis-sr-mpls) #
```

#### 15.4.6.4.3 Disabling IS-IS Segment Routing

To administratively disable IS-IS SR, issue the [shutdown \(IS-IS SR\)](#) command in Segment-Routing MPLS configuration mode. To disable **isis sr** and delete all **isis sr** configuration, issue the [segment-routing mpls](#) command in **router isis** configuration mode.

#### Examples

- The following commands administratively disable **router isis**.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# shutdown
switch(config-router-isis-sr-mpls) #
```

- The following commands disable **router isis** and delete all **router isis** configuration.

```
switch(config)# router isis instance1
switch(config-router-isis)# no segment-routing mpls
switch(config-router-isis) #
```

#### 15.4.6.4.4 SRGB (Segment Routing Global Range)

The global segments such as Prefix-SID, Node-SID, Proxy-node-SID are represented using indices of actual MPLS labels. These indices are offset on the SRGB advertised by a router to derive the respective MPLS label. The default value of SRGB in EOS is Base: **900000**, Size: **65536**. In other words, the labels that any global segment could represent is between **900000-965535**. The MPLS label range is categorized and reserved into pools based on the applications using these labels. The default values of label ranges in these pools are:

- Dynamic Global Range--(**100000**) (**262144**)
- IS-IS SR Global Range -- (**900000**) (**65536**)
- Static Global Range -- (**16**) (**99984**)

**Note:** SRGB can be configured to fit in different MPLS ranges as long as it does not fall under an MPLS range already assigned for usage by other applications.

#### Example

```
switch(config)# mpls label range isis-sr 900000 65536
```

#### 15.4.6.4.5 IS-IS Maximum LSP Size

The IS-IS maximum LSP size provides the ability to configure the maximum LSP size that the IS-IS protocol accepts and sends. The default value of LSP size is **9000**. The **lsp size maximum** command configures maximum size of an LSP that is sent or received. The default LSP maximum size is **9000**. The minimum value is **512**.

#### Example

```
switch(config)# lsp size maximum 400
```

The **no lsp size maximum** and **default lsp size maximum** commands remove the specified **lsp size maximum** command from *running-config*.

```
switch(config)# no lsp size maximum
```

```
switch(config)# default lsp size maximum
```

#### 15.4.6.4.6 Configuring the Node-SID

Node segments are indices associated with routers within an IS-IS SR domain by associating node segments with prefix mask length **/32** (IPV4) or **/128** (IPV6) addresses. Node segments are carried as sub-TLVs (type-length-value) in IP reachability TLVs for the prefixes with the associated segments. Node segments can also be represented by an absolute label and validated against the default or user-specific SRGB advertised by a router. An Absolute Node-SID has a label range of **16 - 1048575**.

A node segment label or Absolute Node SID represents a global segment validated based on the ISIS-SR global block, such as an SRGB range configured with the **mpls label range isis-sr base range**. Node

segment label or Absolute Node SID advertise as an index and bases the in-label on the local SRGB range and the out-label on the peer SRGB range.

Configure node segments on IS-IS enabled Loop-back interface(s) as shown in the example.

## Examples

- Use the following commands to associate a node-segment with an IPv4 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/32
switch(config-if-Lo1)# node-segment ipv4 index 5
```

- Use the following commands to associate a node-segment with an IPv6 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ipv6 add 2000::24/128
switch(config-if-Lo1)# node-segment ipv6 index 5
```

- The following example displays a warning in the CLI when no configured /32 or /128 address on the interface.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/24
switch(config-if-Lo1)# node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command configures an absolute label for a node-segment.

```
switch(config-if-Lo1)# node-segment ipv4 label 900123
```

- The following example displays a Node-SID with an absolute label.

```
switch(config-if-Lo1)# show node-segment ipv4 label 900123
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)# no node-segment ipv4 index 1
```

Node segments can be configured with either an **explicit-null** or **no-php** flag as well as a specific algorithm. The following example shows how to add the two flag parameters:

```
switch(config-if-Lo1)# node-segment ipv4 index 1 ?
 explicit-null Set Explicit Null flag
 flex-algo Flexible algorithm
 no-php Set No-PHP flag

switch(config-if-Lo1)# node-segment ipv4 index 1 explicit-null
switch(config-if-Lo1)# node-segment ipv6 index 2 no-php
switch(config-if-Lo1)# node-segment ipv4 index 3 flex-algo Algo-128

switch(config-if-Lo1)# show active
interface Loopback1
ip address 31.1.1.1/32
ipv6 address 2000::24/128
node-segment ipv4 index 1 explicit-null
node-segment ipv4 index 3 flex-algo Algo-128
node-segment ipv6 index 2 no-php
```

**Note:** A node segment configured with **flex-algo** only becomes active when you enable Traffic Engineering and the IS-IS segment participates in the specified **flex-algo**.

The CLI returns a warning if no /32 or /128 IPv4 addresses exist on the interface, but accepts the configuration anyway.

```
switch(config-if-Lo2)# ip address 33.2.2.1/24
switch(config-if-Lo2)# node-segment ipv4 index 33
! /32 IPv4 address is not configured on the interface
switch(config-if-Lo2)# show active
interface Loopback2
 ip address 33.2.2.1/24
 node-segment ipv4 index 33

switch(config-if-Lo2)# node-segment ipv6 index 34
! /128 IPv6 address is not configured on the interface
switch(config-if-Lo2)# show active
interface Loopback2
 ip address 33.2.2.1/24
 node-segment ipv4 index 33
 node-segment ipv6 index 34

switch(config-if-Lo2)# ip address 33.2.2.1/24
switch(config-if-Lo2)# node-segment ipv4 label 96123
! /32 IPv4 address is not configured on the interface
switch(config-if-Lo2)# show active
interface Loopback2
 ip address 33.2.2.1/24
 node-segment ipv4 label 61234

switch(config-if-Lo2)# node-segment ipv6 label 64321
! /128 IPv6 address is not configured on the interface
switch(config-if-Lo2)# show active
interface Loopback2
 ip address 33.2.2.1/24
 node-segment ipv4 index 33
 node-segment ipv6 index 34
```

Remove node segments from IS-IS using the **no** parameter under the **node-segment** parameter for an interface.

```
switch(config-if-Lo2)# no node-segment ipv4 index 33
```

```
switch(config-if-Lo2)# no node-segment ipv4 label 900123
```

#### 15.4.6.4.7 Configuring Prefix-SIDs

A router originating an IP reachability TLV associates Prefix segments with any IS-IS. These segments are carried as sub-TLVs in IP Reachability TLVs of the prefixes with which these segments are associated. Prefix segments are configured under segment-routing MPLS configuration mode in IS-IS.

**Note:** The configured prefix segment becomes effective, only if, the prefix for which a prefix-SID configured becomes a part of IS-IS by enabling IS-IS on interfaces, or by redistribution from other protocols etc.

#### Example

Use the following commands to associate a prefix segment with an IPv4 address with index value of **50**.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 1.1.1.0/24 index 50
```

#### 15.4.6.4.8 Configuring Proxy-Node SIDs

Node segments represent a device (node) by attaching a segment (index) with a /32, /128 prefix which generally is configured on a loopback interface. For routers that do not support segment routing, you must assign node identifiers on such routers. In this instance, a router that supports IS-IS SR to proxy by configuring a proxy-node-SID for an IS-IS prefix originating from the router that does not support IS-IS SR.

##### Example

A proxy-node SID associates a **/32** or a **/128** route with an SID.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# proxy-node-segment 1.1.1.0/32 index 50
```

In general, configure a proxy node segment on a router without the prefix that you want to associate with the proxy-node SID. You can also configure one for self-originated prefixes.

Configuring proxy-node-SIDs enables a router to send out a Binding-SID TLV with details pertaining to the prefix and SID.

 **Note:** A Binding-SID can carry a range of prefixes and an associated range of SIDs, but at present the EOS does not support the configuration of such ranges with one binding segment TLV in IS-IS SR. However, EOS does process ranges of prefixes and SIDs, if received from devices that support such configurations.

#### Attaching Flags to the Segmented Route

The default hop behavior of an Arista switch removes the top label if a neighbor node advertises reachability. Change this behavior for Proxy-Node segments using the **attached** parameter.

When routes redistribute from other domains into an IS-IS SR domain on a node, other nodes assume the prefixes directly connect to the node advertising reachability. This may not be the case and causes incorrect penultimate hop popping (PHP) behavior.

Using the **attached** flag corrects the behavior, and setting the flag on a proxy-node segment directly connected to the node advertising reachability. Verify the **attached** flag configuration using the **show isis segment-routing prefix-segments** command.

```
switch(config-router-isis-sr-mpls)# show isis segment-routing prefix-segments
System ID: 0000.0000.5555 Instance: 'inst1'
SR supported Data-plane: MPLS SR Router ID: 5.5.5.5
Node: 5 Proxy-Node: 3 Prefix: 0 Total Segments: 8
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
E: Explicit-NUL, `V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2, ! - SR-unreachable,
- Some IS-IS next-hops are SR-unreachable
Prefix SID Type Flags System ID Level Protection Algorithm
----- -----
* 5.5.5.5/32 5 Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0 A:0 0000.0000.5555 L2 unprotected
SPF
* 6.6.6.6/32 6 Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0 A:0 0000.0000.5555 L2 unprotected
SPF
* 44.44.44.44/32 44 Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0 A:1 0000.0000.5555 L2 unprotected
SPF
```

Configure a second parameter, **attached-flag inspect** and enable it on all nodes. When set, the behavior defaults to no-php, the penultimate hop swaps or forwards the label, for all proxy node segments without the **attached** set.

```
switch(config)# router isis inst1
switch(config-router-isis)# segment-routing mpls
```

```
switch(config-router-isis-sr-mpls) # proxy-node-segment attached-flag inspect
```

The resulting configuration has the following behavior:

- **pop** action for **44.44.44.44/32** on penultimate node R3.
- **swap** action for **5.5.5.5/32** and **6.6.6.6/32** without the **attached** flag on R3.
- **pop** action for **4.4.4.4/32** on R4 as the penultimate LDP hop.

### Configuration Considerations for the Attached Flag

- Use when configuring proxy node segments for prefixes advertised by any node in the IS-IS SR domain.
- Use when configuring a proxy node segment for a prefix residing on an IS-IS domain without SR.
- Do not use when configuring proxy node segments on a node not in the IS-IS domain.

### Handling Conflicts between Proxy-Node Segments and Other Types of Segments

By default, EOS does not allow conflicts between proxy-node segments and other types of segments such as Node or Prefix. To ignore conflicts, use the **conflict ignore** keyword when configuring proxy-nodes.

#### Example

The following configuration uses the **conflict ignore** keyword:

```
switch(config-router-isis-sr-mpls) #proxy-node-segment 1.0.14.1/32 index 200 range 10
conflict ignore
```

#### 15.4.6.4.9 Configuring Anycast-SID

An Anycast-SID is a prefix segment that identifies a set of routers and not a specific router. It enforces the ECMP-aware shortest-path forwarding towards the closest node of the anycast set.

An example of such an anycast group could be a set of routers A1, A2, A3, and A4 where at least one router of A1, A2, A3, and A4 advertises the prefix SID corresponding to the anycast address (which can be a prefix originating on all of A1, A2, A3 and A4 a loop-back address, maybe).

In general use case, all the routers of the anycast group would have the same prefix-SID configured for the anycast IP address present on them.

**Note:** That for Anycast-SID to work as expected, the SRGB on the members of the anycast group should be same.

#### 15.4.6.4.10 Configuring router-ID

A router that support IS-IS SR need to advertise its SR data-plane capability and the range of MPLS label values it uses for segment routing, this is advertised by inserting SR-Capability sub-TLV in the Router Capabilities TLV.

A Router Capability TLV is now sent in IS-IS LSPs when Segment routing is enabled and it is necessary for a Router Capability TLV to carry a router-ID. This router-ID could be configured in EOS under the segment routing MPLS configuration mode. If no router-ID is configured, the router automatically picks up the highest IPv4 address configured on the router for an router-ID.

#### 15.4.6.4.11 Configuring IS-IS Static Adjacency SID

Adjacency segments for IS-IS adjacencies are statically configured on the switch, so that these values are preserved even when the switch restarts. Static adjacency segments are configured per address family on any interface (including Port-Channel, VLANs and SVIs). They are configured and advertised as labels.

These are the few points to be considered while configuring the static adjacency SIDs:

- The same label can be configured on multiple interfaces so that MPLS can form ECMP, the same value can be applied to IPv4 and IPv6 adjacency.
- Static adjacency SID is applied only to p2p interface, and has local scope. When interface type changes to LAN, then dynamic adjacency SID is assigned.
- When Static adjacency SIDs are configured, then simply replace dynamic adjacency SIDs which are advertised to other routers and installed in the local LFIB.
- Static adjacency SID is applied regardless of Adjacency Segment Allocation Mode.
- When Static adjacency SID is disabled, then normal rules for dynamic adjacency SID is applied (it automatically applies a value based on Adjacency Segment Allocation Mode as described in IS-IS Segment Routing TOI document).

#### Example

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 50 global
```

They can be a label (local) or index (global) and we can assign multiple adjacency segments per link.

Where label-value must be within the SR Local Block (SRLB) that can be found in the output of **show mpls label range** command as shown.

| Start   | End     | Size   | Usage          |
|---------|---------|--------|----------------|
| <hr/>   |         |        |                |
| 0       | 15      | 16     | reserved       |
| 16      | 99999   | 99984  | static mpls    |
| 100000  | 362143  | 262144 | free (dynamic) |
| 362144  | 899999  | 537856 | unassigned     |
| 900000  | 965535  | 65536  | isis-sr        |
| 900000  | 965535  | 65536  | bgp-sr         |
| 965536  | 1031071 | 65536  | srlb           |
| 1031072 | 1036287 | 5216   | unassigned     |
| 1036288 | 1048575 | 12288  | l2evpn         |

#### 15.4.6.4.12 Configuring Adjacency Segment Label Range

Adjacency Segments are MPLS labels assigned to IS-IS adjacencies. These labels are shared with other routers in the domain by adding them in adjacency-SID sub-TLVs which are inserted in neighbor Reachability TLVs in IS-IS.

The MPLS labels (adjacency segments) are incrementally allocated to adjacencies, as the transition to Up state, from a adjacent set of MPLS labels pre-allocated by MPLS agent. This label range extends from **100000** to **116383** (base: **100000**, size: **16384**) by default. This could be changed by the following configuration:

#### Example

```
switch(config)# mpls label range dynamic 200000 131072
```

---

The dynamic label pool is shared between LDP and IS-IS SR Adjacency Segments.

#### 15.4.6.4.13 Configuring Adjacency Segment Allocation Mode

Adjacency Segments are allocated to all IS-IS adjacencies based on the IS-IS routers that have advertised IS-IS SR capability or to none of the adjacencies. The command adjacency-segment allocation is used to configure this under the **segment-routing mpls** configuration mode.

The default behavior is to allocate adjacency segments to adjacencies of SR supporting devices.

##### Example

```
switch(config-router-isis-sr-mpls) # adjacency-segment allocation sr-peer
```

#### 15.4.6.4.14 Adjacency Segment Persistence across Link Flaps

Adjacency segments are allocated to IS-IS adjacencies based on configured adjacency segment allocation mode mentioned above.

If an adjacency that has been allocated label L goes down, L is reserved for this adjacency for a duration of **3600** seconds from the time of the adjacency down event. Only the adjacency that owned this label before going down could reclaim label L in this duration.

#### 15.4.6.4.15 Troubleshooting IS-IS Segment Routing

- The **show tech-support ribd** command has a section starting with the string SR Book Keeper which has extensive information on state of IS-IS SR on the router.
- In-case, if IS-IS SR is configured but SR related TLVs/sub, but, TLVs are not being sent in IS-IS LSPs.
  - Ensure that MPLS has been enabled (MPLD IP) enabled.
  - Check if segment routing is administratively shut down.
  - A segment might have been configured for a prefix not yet being advertised in IS-IS.
- In case, if Adjacency Segments are not being advertised.
  - Check if the adjacency segment mode is correctly set.
  - Adjacency Mode is set to all SR supported interfaces (default setting) and the peer does not support SR.
- Generally, it is good to not have same prefix with different indices or same index with different prefixes. There are CLI prohibitions that ensure that a router is not sending out conflicting sets of prefixes and associated SIDs. As there is possibility of receiving conflicting prefix-segments from other devices, there are ways to resolve the following three types of conflicts: prefix+SID conflict, SID conflict and prefix conflict.
  - Prefix+SID Conflict: When there are two prefix segments which have both the prefix and SID have same values, the one from the higher system ID is chosen for LFIB processing.
  - Prefix Conflict: If the two prefix segments which have same Prefix are from two different system than the one from higher system ID is chosen. If they are originated from same system ID than we choose the prefix segment of smaller SID.
  - SID Conflict: If the two prefix segments which have same SID are from two different system than the one from higher system ID is chosen. If they are originated from same system than the one which is of smaller prefix length is chosen. If prefix length is also same than the one with smaller address is chosen.

For a given prefix, if both a proxy-node segment and prefix-SID are received, the prefix-SID advertised is preferred while the proxy-node segment is ignored.

The **show tech-support ribd** displays detail information about IS-IS SRs internal state, and more information on conflicts and chosen active segments could be found under the SR Book Keeper section of **show tech-support ribd** command as shown.

| Received Prefix Segments: |       |             |        |                |        |  |
|---------------------------|-------|-------------|--------|----------------|--------|--|
| Prefix                    | Value | Index/Label | Type   | SystemID       | spfgen |  |
| *1.0.3.0/24               | 3     | Index       | Prefix | 1111.1111.1002 | 0      |  |
| *1.0.5.1/32               | 0     | Index       | Node   | 1111.1111.1002 | 0      |  |
| *1.0.6.1/32               | 2     | Index       | Node   | 1111.1111.1003 | 39     |  |
| *1.0.7.1/32               | 14    | Index       | Node   | 1111.1111.1001 | 39     |  |
| #1.0.7.1/32               |       |             |        |                |        |  |

### 10 Index Proxy 1111.1111.1003 39

#### 15.4.6.5 Configuring Redistribution of DHCP for IS-IS Agent (IPv6)

The **redistribute dhcp** command redistributes DHCPv6 routes in IS-IS when using multi-agent routing protocol mode.

The **redistribute dhcp** command enables DHCP route redistribution in IS-IS when using the multi-agent routing protocol mode.

- These commands redistribute IPv6 DHCP routes into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6
switch(config-router-isis-af)# redistribute dhcp
switch(config-router-isis-af)#

```

- The following command shows the DHCPv6 routes distributed into IS-IS.

```
switch(config)# show isis database detail
IS-IS Instance: inst1 VRF: default
 IS-IS Level 1 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1111.1111.1001.00-00 10 19778 1101 L1 <>
 ...
 Reachability (MT-IPv6): 3ffe:701:ffff:101::10/128 Metric: 0 Type: 1 Up
 ...

```

#### 15.4.6.6 Disabling IS-IS

An IS-IS instance can be shut down globally or can be disabled on individual interfaces.

The [shutdown \(IS-IS\)](#) command shuts down an IS-IS instance globally.

##### Example

These commands disable IS-IS globally without modifying the IS-IS configuration.

```
switch(config)# router isis Osiris
switch(config-router-isis)# shutdown
switch(config-router-isis)#

```

The [no isis enable](#) command disables IS-IS on an interface.

## Example

These commands disable IS-IS on interface **interface ethernet 4**.

```
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)# no isis enable
```

### 15.4.6.7 Configuring IS-IS Graceful Restart (GR)

By default, IS-IS graceful restart is disabled. Use the graceful-restart command to configure graceful restart on an IS-IS router. By default IS-IS graceful-restart-helper functionality is enabled, and to disable it use no graceful-restart-helper command.

#### Examples

In this example IS-IS graceful restart is configured with t2 wait time of **30** seconds for **level-1** routes.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart t2 level-1 30
```

t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either Level-1 or Level-2 through the CLI. The default value is **30** seconds, and the allowed configuration range is **5** to **300** seconds.

#### Example

In this example an ISIS graceful restart is configured with restart-hold-time of **50** seconds.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart restart-hold-time 50
```

In case of a planned restart, the hold time advertised by the IS-IS router prior to restart should be greater than the time for which the router is expected to be offline. Otherwise, neighboring routers will bring down the adjacency before the restarting router has a chance to send a restart request in its hello packet, which may result in traffic loss.

In case of ASU2, the IS-IS router instance will advertise a hello hold time of **restart-hold-time** on those interfaces for which the configured hold time is less than **restart-hold-time**. This is done just before the router restarts.

**Note:** Once the router has restarted, the routers advertised hello hold time will depend on the hello-interval and hello-multiplier configuration on each interface as before. By default, the **restart-hold-time** is disabled.

For Graceful Restart to be successful, the hold time advertised by the router should be greater than the time it takes for Graceful Restart to complete. If the restarting router is DIS, hold time advertised is 1/3rd of the configured value (default is 9s). We recommend increasing the hold time for the DIS to a higher value before a planned restart; otherwise, it may result in traffic loss.

### 15.4.6.8 IS-IS Advertisement and Reachability of Interface Addresses

EOS advertises IS-IS passive and active interfaces, but in some cases, you want to control the Time-to-Live advertisement of interface addresses on the switch. Configure IS-IS to advertise only passive interfaces and control the LSP size by stopping the advertisement of active interfaces and reduce the IS-IS convergence time in complex networks.

EOS supports **advertise ip-reachability passive-only** to control the advertisement of IP Reachability TLVs. When enabled, IS-IS advertises IP Reachability for passive interfaces only.

### Configuring IS-IS Interface Advertisement and Reachability

Use the following command to advertise TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config) #router isis inst1
switch(config-router-isis) #advertise interface-address passive-only
```

Use the following command to advertise reachability TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config) #router isis inst1
switch(config-router-isis) #advertise ip-reachability passive-only
```

### Displaying IS-IS Interface Advertisement Information

Use the following command to display information about IS-IS Interface Advertisement:

```
switch#show running-config
...
router isis inst1
net 49.0001.1111.1111.1001.00
is-hostname A
is-type level-2
lsp purge origination-identification
log-adjacency-changes
advertise interface-address passive-only
advertise ip-reachability passive-only
!
address-family ipv4 unicast
...
```

#### 15.4.6.9 Configuring Dynamic IS-IS Link Delay using TWAMP

To implement minimum-delay and maximum-delay in the IS-IS FlexAlgo, configure a TWAMP sender profile, and select it when adding a traffic engineering configuration.

In addition to the basic IS-IS configuration, perform these additional tasks:

- Configure the IS-IS FlexoAlgo to use minimum-delay metrics.
- Bind the algorithm to the IS-IS configuration.
- Enable IS-IS and traffic engineering on the interfaces.

### Configuring TWAMP

To initiate TWAMP reflection on the network, use the following command to enter TWAMP or TWAMP Light configuration mode:

```
switch(config) #monitor twamp
switch(config-monitor-twamp) #twamp-light
switch(config-twamp-light) #
```

Configure the sender profile parameters as follows:

- measurement interval** - The sender sends probe packets during the configured interval window in seconds.

- **samples** - The number of packets sent during an interval window.
- **significance and offset** - The variables used to calculate normalized minimum delay in microseconds.

To actively send TWAMP Light probes, configure a sender profile with a measurement interval, 10 seconds, measurement samples 5, and significance 10 microseconds offset 5 microseconds using the following command:

```
switch(config-twamp-light)#sender profile MyTWAMPprofile
switch(config-twamp-light-sender-profile-MyTWAMPprofile)#measurement interval 10 seconds
switch(config-twamp-light-sender-profile-MyTWAMPprofile)#measurement samples 5
switch(config-twamp-light-sender-profile-MyTWAMPprofile)#significance 10 microseconds offset 5
microseconds
```

**Note:** The maximum effective sampling rate contains one (1) packet per second. The significance value must be larger than the offset value.

The ceiling function computes the ceiling values by adding the offset value to multiples of the significance value starting from a multiple of 0. For example, if you specify a significance of ten (10) and the offset as three (3), then the ceiling values compute as 3, 13, 23, 33, etc. The measured delay rounds up to the nearest ceiling value greater than the measure delay.

## Configuring UDP Ports for TWAMP

Configure the UDP ports for sending and reflecting TWAMP probes by setting the listen port, source port, and destination port. The reflector uses the listen port to listen for incoming packets. The sender uses the source port and destination port in probe packets.

Configure the ports using the following commands:

```
switch(config-twamp-light)#reflector defaults
switch(config-twamp-light-reflector-defaults)#listen port 51201
switch(config-twamp-light-reflector-defaults)#exit
switch(config-twamp-light)#sender defaults
switch(config-twamp-light-sender-defaults)#destination port 51201
switch(config-twamp-light-sender-defaults)#source port 51200
```

## Configuring Traffic Engineering for TWAMP

Configure traffic engineering for IGP (IS-IS) to use the dynamic unidirectional delay of the point-to-point links as measured by the TWAMP Light sender profile.

### Global Configuration

Activate the TWAMP sender profile globally using the following commands:

```
switch(config)#router traffic-engineering
switch(config-te)#twamp-light sender profile MyTWAMPprofile
```

### Per Interface Configuration

Activate the TWAMP sender profile on an interface using the following commands:

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#traffic-engineering twamp-light sender profile MyTWAMPprofile
```

## Configuring Measured Values for Traffic Engineering

Activate TWAMP measurements and use measured values for traffic engineering on an interface using the following command:

```
switch(config-if-Et3)#traffic-engineering min-delay dynamic twamp-light fallback value
microseconds/milliseconds
```

A **fallback** value must be configured on all IS-IS interfaces using dynamic delay measurement. IS-IS advertises this fallback value if TWAMP Light fails to compute the dynamic unidirectional minimum delay metric of a link.

## Displaying TWAMP Information

The **show monitor twamp-light** command displays the calculated one way and two way minimum delay. By default, all information displays for all peer IP addresses configured on the remote end of the IS-IS point-to-point links. You can also filter for a specific IP address.

```
switch#show monitor twamp-light
Unit: microseconds

IP Address Interface One Way Two Way
 Minimum Delay Minimum Delay

1.0.0.2 Ethernet17/1 2742 5482
1.0.0.3 Ethernet18/1 2772 5544
1.0.0.2
Unit: microseconds

IP Address Interface One Way Two Way
 Minimum Delay Minimum Delay

1.0.0.2 Ethernet17/1 2742 5482
```

Use the **show monitor twamp-light detail** to display detailed information about calculated results. By default, it displays information for all IP addresses configured on the remote end of the IS-IS point-to-point links or filter on a specific IP address.

```
switch#show monitor twamp-light detail ip 1.0.0.2 detail
IP address: 1.0.0.2
Interface: Ethernet17/1
Description: Interface Ethernet17/1
Sender profile name: defaultSender
Effective sampling rate: 1 packet every 1.0 second
Packets sent: 178
Packets received: 21

Unit: microseconds

Measurement Min Max Avg Variance

One-way delay 2742 236072 19822 4294967295
Two-way delay 5482 472132 39642 4294967295
```

### 15.4.6.10 TI-LFA FRR using IS-IS Segment-Routing Configuration

The following configuration tasks can be performed by Topology Independent Fast Reroute (TI-LFA FRR) using IS-IS Segment-Routing.

- Configuring Link or Node Protection on a Specific Interface
- Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments
- Making Locally-originated Adjacency Segments Backup Eligible
- Enabling SRLG Protection

- 
- [show ip route](#)

#### 15.4.6.10.1 Configuring Link or Node Protection on a Specific Interface

To enable link or node protection for node segments and Adjacency segments learned on a specific IS-IS interface, use the following command in the interface configuration mode.

```
switch(config-if-Et1)# [no|default] isis fast-reroute ti-lfa mode {link-protection|node-prot
ection|disabled} [level-1|level-2]
```

The interface TI-LFA configuration inherits the address-family sub-mode configuration by default.

On an L1-L2 router, the [**level-1|level-2**] optional keyword in both the router IS-IS address-family sub-mode and interface configuration mode CLIs is used to restrict protection to node segments and Adjacency segments learned through either Level-1 or Level-2 topologies only.

#### 15.4.6.10.2 Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

To configure a convergence delay only to LFIB routes that are being protected, the following command is used either in the router IS-IS mode or the **router isis address-family** sub-mode. A default of **10** seconds is used when using the command without an explicitly specified delay.

```
timers local-convergence-delay [delay_in_milliseconds] protected-prefixes
```

#### 15.4.6.10.3 Making Locally-originated Adjacency Segments Backup Eligible

The PLR computes backup paths for an adjacency segment only if the Adjacency SID sub-TLV has the B-flag (backup flag) set.

To set the B-flag in originated Adjacency SID sub-TLVs corresponding to adjacency segments dynamically allocated on the router, the following command is used in the **segment-routing mpls** sub-mode in the **router isis** mode.

```
adjacency-segment allocation [all-interfaces | sr-peers]
```

To set the B-flag in originated Adjacency SID sub-TLVs corresponding to adjacency segments statically configured on the router, the following command is used in the interface configuration mode.

```
adjacency-segment [ipv4 | ipv6] p2p [multiple][label label | index index] backup-eligible
```

**backup-eligible** is the newly introduced optional keyword in both the CLIs mentioned above that controls the setting of the B-flag in the Adjacency SID sub-TLV.

#### 15.4.6.10.4 Enabling SRLG Protection

To enable SRLG protection on all interfaces, use the **fast-reroute ti-lfa srlg** command. This command is used in addition to configuring link-protection or node-protection. If SRLG protection is enabled, the backup paths are computed after excluding all the links that share the same SRLG with the active link that is being used by all prefix segments and adjacency segments.

```
fast-reroute ti-lfa srlg [strict]
```

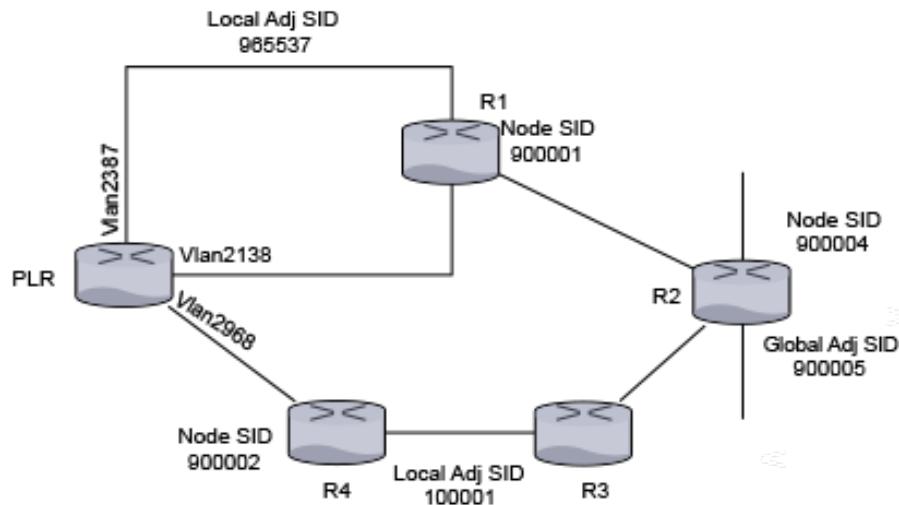

If the optional argument **strict** is configured, the backup path is only programmed if a backup path that excludes all the SRLGs configured on the primary interface. If the keyword is not provided and an SRLG excluding path is not available, TI-LFA programs the backup path that excluded the maximum number of SRLGs possible.

To selectively disable SRLG protection on an interface, use the **isis [ipv4|ipv6] fast-reroute ti-lfa srlg disabled** command. This is useful if SRLG protection is enabled globally for all interfaces but needs to be selectively disabled for a specific interface.

```
isis [ipv4 | ipv6] fast-reroute ti-lfa srlg disabled
```

## Sample Configuration

Figure 15-12: Sample Configuration

The above topology will be used to demonstrate the configuration and show command output.

The above topology is used to demonstrate the configuration and show command output. You will see the backup paths that the PLR computes to protect the node segments of R1 and R2, the global adjacency segment on R2, and the local adjacency segment on the **vlan 2387** on the PLR.

Here is a snippet of the configuration on the PLR.

```
switch(config)# interface vlan 2138
switch(config-if-Vl2138)# ip address 10.1.1.1/24
switch(config-if-Vl2138)# isis enable inst1
switch(config-if-Vl2138)# isis metric 11
switch(config-if-Vl2138)# isis network point-to-point

switch(config)# interface vlan2387
switch(config-if-Vl2387)# ip address 10.1.2.1/24
switch(config-if-Vl2387)# isis enable inst1
switch(config-if-Vl2387)# isis network point-to-point
switch(config-if-Vl2387)# adjacency-segment ipv4 p2p label 965537 backup-eligible

switch(config)# interface vlan2968
switch(config-if-Vl2968)# ip address 10.1.3.1/24
switch(config-if-Vl2968)# isis enable inst1
switch(config-if-Vl2968)# isis network point-to-point
switch(config-if-Vl2968)# isis fast-reroute ti-lfa mode disabled

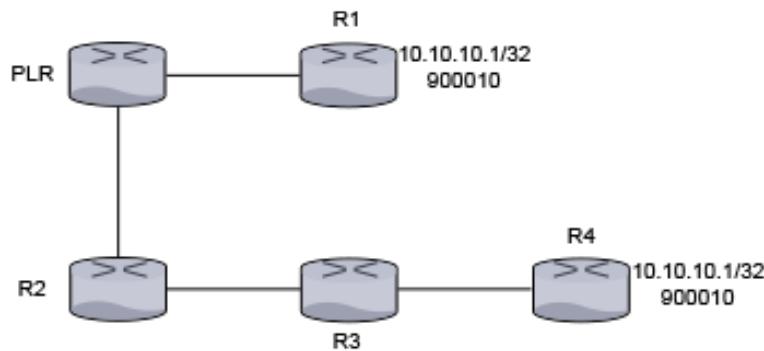

...
switch(config)# router isis inst1
switch(config-isis)# net 49.0001.1111.1111.1001.00
switch(config-isis)# router-id ipv4 252.252.1.252
switch(config-isis)# is-type level-2
switch(config-isis)# timers local-convergence-delay 5000 protected-prefixes
!
switch(config-isis)# address-family ipv4 unicast
switch(config-isis-af)# fast-reroute ti-lfa mode node-protection
!

switch(config-isis)# segment-routing mpls
switch(config-isis-sr-mpls)# no shutdown
switch(config-isis-sr-mpls)# adjacency-segment allocation sr-peers backup-eligible
!
end
```

The protection of anycast segments does not need any new configuration. The above configuration enables protection of anycast segments.

To demonstrate the protection of anycast segments consider the following topology.

**Figure 15-13: Topology Number 2**

R1 and R4 are originators of the host prefix 10.10.10.1/32 and advertise prefix segment 900010. Note that this should be configured as a prefix segment and not a node segment.

R1 and R4 are originators of the host prefix **10.10.10.1/32** and advertise prefix segment **900010**. This must be configured as a prefix segment and not a node segment.

R1 and R4's configuration should look similar to the following:

```

switch(config)# router isis inst1
switch(config-router-isis)# interface Loopback0
switch(config-if-Lo0)# ip address 10.10.10.1/32
switch(config-if-Lo0)# isis enable inst1
!
...
switch(config)# router isis inst1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 10.10.10.1/32 index 10
!
```

The prefix in the prefix-segment command must belong to an interface enabled with IS-IS or must be an active route in the RIB of another protocol redistributed into IS-IS.

When the link or node protection is configured on the PLR, then the primary path to the segment **900010** is PLR - R1 and the backup path is PLR - R2 - R3 - R4. In other words, the destination in the backup path is the segment originated by R4 as the segment originated by R1 and is not reachable when link PLR-R1 or the node R1 goes down.

#### 15.4.6.10.5 show ip route

When services like LDP pseudowires, BGP LU, L2 EVPN, or L3 MPLS VPN use IS-IS SR tunnels as an underlay, these services are automatically protected by TI-LFA tunnels that protect the IS-IS SR tunnels. The **show ip route** command displays the hierarchy of the overlay-underlay-TI-LFA tunnels.

```
switch# show ip route
B 2001:db8:3::/48 [200/0]
 via 2002::b00:301/128, IS-IS SR tunnel index 3, label 122697
 via TI-LFA tunnel index 5, label imp-null(3)
 via fe80::200:76ff:fe03:0, Ethernet26/1, label imp-null(3)
 backup via fe80::200:76ff:fe01:0, Ethernet30/1, label 900002 900003
```

#### 15.4.6.11 IS-IS Dynamic Flooding Configuration

Configure Dynamic flooding using the **lsp flooding dynamic** command under the **router config** mode. For example:

```
switch(config)# router isis Amun
switch(config-router-isis)# net 49.0000.0000.3333.00
switch(config-router-isis)# is-hostname ip3
switch(config-router-isis)# lsp flooding dynamic
```

Dynamic flooding should be enabled on all routers in the area. To enable Dynamic Flooding on all routers, use the following command:

```
lsp flooding dynamic [level-1 | level-2]
nolsp flooding dynamic [level-1 | level-2]
default lsp flooding dynamic [level-1 | level-2]
```

If necessary, the area leader election process can be tuned or disabled with the commands:

```
area leader [level-1 | level-2] priority 0-255 area leader [level-1 | level-2] disabled
no area leader [level-1 | level-2] priority 0-255 area leader [level-1 | level-2] disabled
default area leader [level-1 | level-2] priority 0-255 area leader [level-1 | level-2] disabled
```

#### 15.4.6.11.1 Limitations

On a sparse topology, Dynamic Flooding is not effective and only adds overhead. Leaf-spine and Clos networks are appropriate dense topologies.

#### 15.4.6.12 Relax Address-Family Check for IS-IS Adjacency

**Address-Family Check** for IS-IS creates the adjacency between devices with different address families. For example, a router supporting IPv4 and IPv6 is connected to a IPv4 only router, **Address-Family Check** is verified by comparing the NLPIID TLV ( Type #129 ) advertised in IIH hellos exchanged between peers. It is useful in following scenarios.

## Incrementally Enable IPv6 in an Existing IPv4 Network

Relaxing the **Address-Family Check** is useful to gradually add IPv6 support in an IPv4 network, without disturbing the IPv4 connectivity.

### IPv4 Controller Peering IPv4/v6 Dual Stack Router

A controller forms an IS-IS adjacency with a router and uses the IS-IS database for topology discovery. If the controller only supports IPv4 IS-IS or only IPv4 tunnels, to relax the **Address-Family Check** on the dual stack IPv4/v6 router for adjacency is useful in establishment.

### Disabling the Address-family Check

Under IS-IS instance, configure the following to disable the **Address-Family Check** during IIH processing.

```
switch(config-router-isis)# ?
 adjacency Configure parameters for adjacency formation
switch(config-router-isis)# adjacency?
 address-family Configure address-family related parameters for adjacency formation
switch(config-router-isis)# adjacency address-family?
 match Configure address-family match check related parameters for adjacency formation
switch(config-router-isis)# adjacency address-family match?
 disabled Relax address-family match check for bringing up adjacency
switch(config-router-isis)# adjacency address-family match disabled?
```

### Show Command

The **show isis neighbor detail** command displays address family details at each end of the adjacency.

```
switch# show isis neighbor detail
Instance VRF System Id Type Interface SNPA State Hold time Circuit Id
inst1 default 1111.1111.1002 L2 Vlan2116 P2P UP 24 06
 Area Address(es): 49.0001
 SNPA: P2P
 Router ID: 1.0.0.2
 Advertised Hold Time: 30
 State Changed: 00:04:18 ago at 2020-11-01 22:28:35
 IPv4 Interface Address: 1.0.0.2
 IPv6 Interface Address: none
 Interface name: Vlan2116
 Graceful Restart: Supported
 Segment Routing Enabled
 SRGB Base: 900000 Range: 65536
 Adjacency Label IPv4: 149152
 Supported Address Families: IPv4, IPv6
 Neighbor Supported Address Families: IPv4
```

The **show isis interface detail** command shows the details of supported protocols on the interface and the neighbors connected to it. The state of **Address-Family match check** is also displayed.

```
switch(config-router-isis)# show isis interface detail
IS-IS Instance: inst1 VRF: default
 Interface Vlan2116:
 Index: 35 SNPA: P2P
 MTU: 1497 Type: point-to-point

 Area Proxy Boundary is Disabled
 BFD IPv4 is Disabled
 BFD IPv6 is Disabled
 Hello Padding is Enabled
 Level 2:
 Metric: 10, Number of adjacencies: 1
 Link-ID: 23
 Authentication mode: None
 TI-LFA link protection is enabled for the following IPv4 segments: node segments, adjacency segments
 TI-LFA protection is disabled for IPv6
 Adjacency 1111.1111.1002:
```

```
State: UP, Level: 2 Type: Level 2 IS
Advertised Hold Time: 30
Neighbor Supported Address Families: IPv4
Address Family Match: Disabled
IPv4 Interface Address: 1.0.0.2
Areas:
49.0001
```

## Usage Guidelines

For IPv6 network upgrade, ensure the knob is incrementally configured on a contiguous section of the network, at any point the choice of routers for upgrade should not bisect the upgraded (supporting IPv4/v6) part of the network. All the routers bordering the upgraded network should always have the knob enabled.

When a proper set of router is established, the following steps are carried on each router.

1. Enable the CLI knob.
2. Enable IPv6 address family in the IS-IS instance.
3. Configure IPv6 on all the IS-IS interfaces.

### 15.4.6.13 IS-IS Advertisement and Reachability of Interface Addresses

EOS advertises IS-IS passive and active interfaces, but in some cases, you want to control the Time-to-Live advertisement of interface addresses on the switch. Configure IS-IS to advertise only passive interfaces and control the LSP size by stopping the advertisement of active interfaces and reduce the IS-IS convergence time in complex networks.

EOS supports **advertise ip-reachability passive-only** to control the advertisement of IP Reachability TLVs. When enabled, IS-IS advertises IP Reachability for passive interfaces only.

#### Configuring IS-IS Interface Advertisement and Reachability

Use the following command to advertise TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config)#router isis inst1
switch(config-router-isis)#advertise interface-address passive-only
```

Use the following command to advertise reachability TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config)#router isis inst1
switch(config-router-isis)#advertise ip-reachability passive-only
```

#### Displaying IS-IS Interface Advertisement Information

Use the following command to display information about IS-IS Interface Advertisement:

```
switch#show running-config
...
router isis inst1
net 49.0001.1111.1111.1001.00
is-hostname A
is-type level-2
lsp purge origination-identification
log-adjacency-changes
advertise interface-address passive-only
advertise ip-reachability passive-only
!
address-family ipv4 unicast
...
```

#### 15.4.6.14 Displaying IS-IS Information

The following sections describe display and verification of IS-IS settings and of peer and connection configuration:

- [Displaying the Link State Database](#)
- [Displaying the Interface Information for the IS-IS Instance](#)
- [Displaying IS-IS Neighbor Information](#)
- [Displaying IS-IS Instance Information](#)
- [Displaying IS-IS Segment Routing Information](#)
- [Displaying show isis local-convergence-delay](#)
- [Verifying IS-IS Graceful Restart \(GR\) Information](#)
- [IS-IS Dynamic Flooding Show Commands](#)

##### 15.4.6.14.1 Displaying the Link State Database

To display the link state database of IS-IS, use the [show isis database](#) command.

#### Example

This command displays the IS-IS link state database.

```
switch# show isis database
ISIS Instance: Osiris
 ISIS Level 2 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1212.1212.1212.00-00 4 714 1064 L2 <>
 1212.1212.1212.0a-00 1 57417 1064 L2 <>
 2222.2222.2222.00-00 6 15323 1116 L2 <>
 2727.2727.2727.00-00 10 15596 1050 L2 <>
 3030.3030.3030.00-00 12 62023 1104 L2 <>
 3030.3030.3030.c7-00 4 53510 1104 L2 <>
switch>
```

##### 15.4.6.14.2 Displaying the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the [show isis interface](#) command.

#### Example

This command displays IS-IS interface information.

```
switch# show isis interface
ISIS Instance: Osiris
 Interface Vlan20:
 Index: 59 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 2
 LAN-ID: 1212.1212.1212, Priority: 64
 DIS: 1212.1212.1212, DIS Priority: 64
 Interface Ethernet30:
 Index: 36 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 1
 LAN-ID: 3030.3030.3030, Priority: 64
```

```
DIS: 3030.3030.3030, DIS Priority: 64 switch>
```

#### 15.4.6.14.3 Displaying IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use [show isis neighbors](#).

##### Example

This command displays information for IS-IS neighbors that the device sees.

```
switch# show isis neighbor
Inst Id System Id Type Interface SNPA State Hold time
10 2222.2222.2222 L2 Vlan20 2:1:0:c:0:0 UP 30
10 1212.1212.1212 L2 Vlan20 2:1:0:d:0:0 UP 9
10 3030.3030.3030 L2 Ethernet30 2:1:0:b:0:0 UP 9 switch>
```

#### 15.4.6.14.4 Displaying IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the [show isis summary](#) command. The command is also used to verify the configured maximum wait interval, initial wait interval, and hold time of SPF timers in IS-IS instances. This command also displays values of the current SPF interval, last Level-1 SPF run, and last Level-2 SPF run.

##### Example

- This command displays general information about IS-IS instances.

```
switch# show isis summary
ISIS Instance: Osiris
 System ID: 1010.1040.1030, administratively enabled, attached
 Internal Preference: Level 1: 115, Level 2: 115
 External Preference: Level 1: 115, Level 2: 115
 IS-Type: Level 2, Number active interfaces: 1
 Routes IPv4 only
 Last Level 2 SPF run 2:32 minutes ago
 Area Addresses:
 10.0001
 level 2: number dis interfaces: 1, LSDB size: 1 switch>
```

- This command displays the SPF interval information about IS-IS instances.

```
switch(config-router-isis-af)# show isis summary

 IS-IS Instance: 1 VRF: default
 System ID: 0000.0000.0001, administratively enabled
 Multi Topology disabled, not attached
 IPv4 Preference: Level 1: 115, Level 2: 115
 IPv6 Preference: Level 1: 115, Level 2: 115
 IS-Type: Level 1 and 2, Number active interfaces: 0
 Routes both IPv4 and IPv6
 Max wait(s) Initial wait(ms) Hold interval(ms)
 LSP Generation Interval: 5 50 50
 SPF Interval: 2 1000 1000
 Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
 Last Level 1 SPF run 1 seconds ago
 Last Level 2 SPF run 1 seconds ago
 Authentication mode: Level 1: None, Level 2: None
 Graceful Restart: Disabled, Graceful Restart Helper: Enabled
 Area Addresses:
 49.0001
 level 1: number dis interfaces: 0, LSDB size: 1
 level 2: number dis interfaces: 0, LSDB size: 1
```

#### 15.4.6.14.5 Displaying IS-IS Segment Routing Information

IS-IS Segment Routing information is displayed using the following commands:

- `show isis database detail`
- `show isis segment-routing`
- `show isis segment-routing global-blocks`
- `show isis segment-routing prefix-segments`
- `show isis segment-routing adjacency-segments`
- `show mpls label ranges`
- `show mpls segment-routing bindings`
- `show mpls lfib route`
- 
- `show mpls lfib route <label value>`

##### **show isis database detail**

The `show isis database detail` command provides a view of LSPDB of different devices in the IS-IS domain. The output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

##### **Example**

```
switch# show isis database detail
ISIS Instance: inst1 VRF: default
 ISIS Level 2 Link State Database
 LSPID Seq Num Cksum Life IS Flags
 1111.1111.1001.00-00 10 63306 751 L2 <>
 NLPID: 0xCC(IPv4) 0x8E(IPv6)
 Area address: 49.0001
 Interface address: 1.0.7.1
 Interface address: 1.0.0.1
 Interface address: 2000:0:0:47::1
 Interface address: 2000:0:0:40::1

 SR Prefix-SID: 18 Flags: [] Algorithm: 0
```

##### **show isis segment-routing**

The `show isis segment-routing` command displays the summary information on IS-IS SR status.

##### **Example**

```
switch(config)# show isis segment-routing
System ID: 1111.1111.1002 Instance: inst1
```

```

SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
SR Global Block(SRGB): Base: 900000 Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
All Prefix Segments have : P:0 E:0 V:0 L:0
All Adjacency Segments have : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments : 2
Prefix-Segments : 2
Proxy-Node-Segments : 0
Adjacency Segments :

```

## About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field whereas the Router ID being advertised in the Router Capability is mentioned in the SR Router ID Field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```

switch(config-router-isis-sr-mpls)# show isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively shutdown

```

## show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

## Example

```

switch# show isis segment-routing global-blocks
System ID: 1111.1111.1002 Instance: inst1
SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
SR Global Block(SRGB): Base: 900000 Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId Base Size
----- -----
1111.1111.1002 900000 65536
1111.1111.1001 900000 65536

```

## show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

## Example

```
switch# show isis segment-routing prefix-segments
System ID: 1111.1111.1002 Instance: inst1
SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
 E: Explicit-NUL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
Prefix SID Type Flags SystemID Type
----- ---- ---- ---- ----- -----
1.0.7.1/32 2 Node R:0 N:1 P:0 E:0 V:0 L:0 1111.1111.1001 L1
* 1.0.8.1/32 4 Node R:0 N:1 P:0 E:0 V:0 L:0 1111.1111.1002 L2
1.0.11.0/24 10 Prefix R:1 N:0 P:0 E:0 V:0 L:0 1111.1111.1001 L2
* 1.0.12.0/24 12 Prefix R:1 N:0 P:0 E:0 V:0 L:0 1111.1111.1002 L2
1.0.15.1/32 18 Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0 1111.1111.1001 L2
1.0.16.1/32 20 Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0 1111.1111.1003 L2
```

## About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

### **show isis segment-routing prefix-segments self-originated**

The **show isis segment-routing prefix-segments self-originated** command output is identical to **show isis segment-routing prefix-segments** except, the fact that the former lists only self-originated prefix segments.

### **show isis segment-routing adjacency-segments**

The **show isis segment-routing adjacency-segments** displays list of all the adjacency segments that are being originated by IS-IS SR on a router.

## Example

```
switch# show isis segment-routing adjacency-segments
System ID: 1111.1111.1002 Instance: inst1
SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 1000000 Size: 16384
Adjacency Segment Count: 4
Adj IP-address Local Intf Label SID Source Flags Type
----- ---- ---- ---- --- ----- ---- -----
1.0.0.1 Vlan2472 100000 Dynamic F:0 B:0 V:1 L:1 S:0 LAN L2
1.0.1.2 Vlan2579 100001 Dynamic F:0 B:0 V:1 L:1 S:0 P2P L2
fe80::1:ff:fe01:0 Vlan2472 100002 Dynamic F:0 B:0 V:1 L:1 S:0 LAN L2
fe80::1:ff:fe02:0 Vlan2579 100003 Dynamic F:0 B:0 V:1 L:1 S:0 P2P L2
```

## About the Output

It consists allocation mode, MPLS label pool from which labels would be allocated to adjacencies, total count of adjacency segments allocated so far and the default flag values carried in all adj-SID sub-TLVs originating from this device.

The main section of the output lists all the adjacency segments allocated so far in six columns each pertaining to Adjacency IP address, local interface name, MPLS label value, SID source, flags in the sub-TLV and the

---

type of adj-SID respectively. The type of the adjacency segments depends on the IS-IS type of adjacency and the IS level.

### show mpls label ranges

The **show mpls label ranges** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

The isis-sr refers to the SRGB use-case in IS-IS, and isis (dynamic) refers to the label pool that is used for dynamic allocation of adjacency segments in IS-IS.

### Example

```
switch# show mpls label ranges
Start End Size Usage
-----+
0 15 16 reserved
16 99999 99984 static mpls
100000 116383 16384 isis (dynamic)
116384 362143 245760 free (dynamic)
362144 899999 537856 unassigned
900000 965535 65536 isis-sr
```

### show mpls segment-routing bindings

The **show mpls segment-routing bindings** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

### Example

```
switch# show mpls segment-routing bindings
1.0.7.1/32
Local binding: Label: 900002
Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
Local binding: Label: imp-null
Remote binding: Peer ID: 1111.1111.1001, Label: 900004
Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
Local binding: Label: 900006
Remote binding: Peer ID: 1111.1111.1001, Label: 900006
Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

### show mpls lfib route

The **show mpls lfib route** command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

### Example

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
 M - Mpls Via, P - Pseudowire Via,
 I - IP Lookup Via, V - Vlan Via,
 VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
 VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
 NG - Nexthop Group Via
Source Codes:
 S - Static MPLS Route, B2 - BGP L2 EVPN,
 B3 - BGP L3 VPN, R - RSVP,
 P - Pseudowire, L - LDP,
```

```

IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
BL - BGP LU, ST - SR TE Policy,
DE - Debug LFIB

IA 100000 [1]
 via M, 1.0.1.2, pop
 payload autoDecide, ttlMode uniform, apply egress-acl
 interface Vlan2930
IA 100001 [1]
 via M, fe80::200:eff:fe02:0, pop
 payload autoDecide, ttlMode uniform, apply egress-acl
 interface Vlan2930
IP 900008 [1]
 via M, 1.0.1.2, swap 900008
 payload autoDecide, ttlMode uniform, apply egress-acl
 interface Vlan2930
IP 900009 [1]
 via M, fe80::200:eff:fe02:0, swap 900009
 payload autoDecide, ttlMode uniform, apply egress-acl
 interface Vlan2930

```

### **show mpls lfib route <label value>**

The **show mpls lfib route <label value>** command provides information relevant to just the label value passed as an extension to the show command.

#### **Example**

```

switch# show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
M - Mpls Via, P - Pseudowire Via,
I - IP Lookup Via, V - Vlan Via,
VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
NG - Nexthop Group Via
Source Codes:
S - Static MPLS Route, B2 - BGP L2 EVPN,
B3 - BGP L3 VPN, R - RSVP,
P - Pseudowire, L - LDP,
IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
BL - BGP LU, ST - SR TE Policy,
DE - Debug LFIB
IP 900008 [1]
 via M, 1.0.1.2, swap 900008
 payload autoDecide, ttlMode uniform, apply egress-acl
 interface Vlan2930

```

#### **15.4.6.14.6 Displaying show isis local-convergence-delay**

The **show isis local-convergence-delay** command shows the current or last attempt at delaying the convergence of protected routes on a link down/BFD neighbor down event. If the timer aborts for some reason (such as a topology change causing a new SPF), the attempt fails.

```

switch# show isis local-convergence-delay

IS-IS Instance: inst1 VRF: default
System ID: 1111.1111.1001
IPv4 local convergence delay configured, 5000 msecs
IPv6 local convergence delay configured, 5000 msecs
Level 1 attempts 0, failures 0
Level 2 attempts 3, failures 1

Level 2 in progress due to LINK DOWN on Vlan2138

```

```

TI-LFA node protection is enabled for IPv4
IPv4 Routes delayed: 0
 Delay timer started at: 2019-07-25 23:16:33
 Delay timer expires in 2 secs
TI-LFA protection is disabled for IPv6

Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
TI-LFA node protection is enabled for IPv4
IPv4 Routes delayed: 3
 Delay timer started at: 2019-07-25 23:14:51
 Delay timer stopped at: 2019-07-25 23:14:56
TI-LFA protection is disabled for IPv6

```

The **detail** keyword also lists all the routes that have been delayed.

```

switch# show isis local-convergence-delay detail
...
Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
TI-LFA node protection is enabled for IPv4
IPv4 Routes delayed: 3
 Delay timer started at: 2019-07-25 23:14:51
 Delay timer stopped at: 2019-07-25 23:14:56
Delayed routes:
 10.0.7.1/32
 10.0.9.1/32
 10.0.10.1/32
TI-LFA protection is disabled for IPv6

```

#### 15.4.6.14.7 Verifying IS-IS Graceful Restart (GR) Information

GR State can be one of the following:

- Last Start/Restart was completed successfully.
- Last Start/Restart exited after t2 (level-1/level-2) expiry.
- Last Restart exited after t3 expiry.
- Start/Restart in progress.
- Graceful Restart was disabled during startup.

The following show commands are used to display the IS-IS graceful restart information.

- The **show isis graceful-restart vrf [vrf-name]** command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

#### Example

```

switch# show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
T1 : 3s
T2 (level-1) : 30s/20s remaining
T2 (level-2) : 30s/not running
T3 : not running

System ID Type Interface Restart Capable Status
is-hostname-1 L1L2 Ethernet1 Yes Running
is-hostname-2 L1 Ethernet2 Yes Restarting

```

- The **show isis summary vrf [vrf-name]** command displays the graceful restart state and helper configuration.

### Example

```
switch# show isis summary vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
...
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

- The **show isis neighbors detail vrf [vrf-name]** command displays the helpers view of a restarting router.

### Example

```
switch# show isis neighbors detail vrf default
Instance VRF System Id Type Interface SNPA State Hold time Circuit Id
1 default OT1 L1 Ethernet1 2:1:0:b 4:0:0 UP 29839 OT3.05
Area Address(es): 49.0001
SNPA: 2:1:0:b4:0:0
...
Graceful Restart: Supported, Status: Restarting (RR rcvd, RA sent, CSNP sent)
```

- The **show isis interface detail vrf [vrf-name]** command displays the graceful restart related stats for that interface.

### Example

```
switch# show isis interface detail vrf default
ISIS Instance: ISISQ VRF: default
Interface Ethernet1:
Index: 2 SNPA: P2P
...
Level 1:
Graceful Restart Status: RR sent, SA sent, RA rcvd, CSNP rcvd
```

## 15.4.6.14.8 IS-IS Dynamic Flooding Show Commands

Several show commands are available to monitor Dynamic Flooding. To see the flooding topology, use the **show isis dynamic flooding topology** command:

```
switch# show isis dynamic flooding topology
IS-IS Instance: Amun VRF: default
Level 1:
Path: ip6.00 ip4.00 ip2.00 ip1.00 ip3.00 ip5.00 ip6.00
```

This command displays a list of paths that describe the flooding topology. Each path is a list of nodes in the network.

To see which interfaces dynamic flooding will use, use the **show isis dynamic flooding interfaces** command:

```
switch# show isis dynamic flooding interfaces
IS-IS Instance: Amun VRF: default
Level 1:
Ethernet5
Ethernet4
```

This shows that the system is currently flooding only on **ethernet4** and **ethernet5**. Normally at least two interfaces are selected.

---

## 15.4.7 IS-IS Commands

### Global Configuration Commands

- [router isis](#)

### Clear Commands

- [clear isis database](#)
- [clear isis instance](#)
- [clear isis neighbor](#)

### Interface Configuration Commands

- [adjacency-segment](#)
- [adjacency-segment \(allocation\)](#)
- [adjacency-segment \(static\)](#)
- [area leader](#)
- [authentication key](#)
- [authentication mode](#)
- [bfd all-interfaces](#)
- [isis address-family fast-reroute ti-lfa srlg](#)
- [isis authentication key](#)
- [isis authentication mode](#)
- [isis bfd](#)
- [isis enable](#)
- [isis fast-reroute ti-lfa mode](#)
- [isis hello-interval](#)
- [isis hello-multiplier](#)
- [isis ipv6 metric](#)
- [isis lsp tx interval](#)
- [isis metric](#)
- [isis multi-topology](#)
- [isis network](#)
- [isis passive](#)
- [isis priority](#)

### Router IS-IS Configuration Mode (Includes Address-Family Mode)

- [address-family](#)
- [advertise interface-address passive-only](#)
- [advertise ip-reachability passive-only](#)
- [fast-reroute ti-lfa mode](#)
- [fast-reroute ti-lfa srlg](#)
- [graceful-restart \(IS-IS\)](#)
- [is-hostname](#)
- [is-type](#)
- [log-adjacency-changes \(IS-IS\)](#)
- [lsp dynamic flooding](#)
- [match isis level](#)

- multi-topology
- net
- passive (IS-IS)
- redistribute (IS-IS)
- redistribute bgp route-map
- set isis level
- set-overload-bit
- shutdown (IS-IS)
- spf-interval

### IS-IS Segment Routing Commands

- adjacency-segment (static)
- mpls label range
- node-segment
- prefix-segment
- proxy-node-segment
- proxy-node-segment mpls
- segment-routing mpls
- shutdown (IS-IS SR)

### TWAMP Commands

- monitor twamp

### Display Commands EXEC Mode

- show isis database
- show isis database detail
- show isis dynamic flooding
- show isis graceful-restart vrf
- show isis hostname
- show isis interface
- show isis local-convergence-delay
- show isis neighbors
- show isis network topology
- show isis segment-routing
- show isis segment-routing adjacency-segments
- show isis segment-routing global-blocks
- show isis segment-routing prefix-segments
- show isis segment-routing tunnel
- show isis summary
- show isis ti-lfa path
- show isis ti-lfa tunnel
- show monitor twamp-light counters
- show monitor twamp-light raw count
- show monitor twamp-light
- show mpls label ranges
- show mpls lfib route
- show mpls segment-routing bindings
- show tunnel fib

### 15.4.7.1 address-family

The **address-family** command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **no address-family** and **default address-family** commands delete the specified address-family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to the **isis** configuration mode.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
address-family [ipv4 | ipv6][MODE]
no address-family [ipv4 | ipv6][MODE]
default address-family [ipv4 | ipv6][MODE]
```

#### Parameters

- **address\_family** Options include:
  - **ipv4** IPv4 unicast.
  - **ipv6** IPv6 unicast.
- **MODE** Options include:
  - **no parameter** Defaults to unicast.
  - **unicast** All IPv4 or IPv6 addresses are active.

#### Examples

- These commands enter the **address family** mode for IPv4 unicast.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af) #
```

- To exit from the IPv4 IS-IS unicast **address family** configuration mode, enter the following command.

```
switch(config)# router isis Osiris
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af) # exit
switch(config-router-isis) #
```

---

### 15.4.7.2 adjacency-segment

Use the **adjacency-segment** command in the interface configuration mode to have the PLR computes backup paths for an adjacency segment only if the Adjacency SID sub-TLV has the B-flag (backup flag) set.

#### Command Mode

Interface configuration mode

#### Command Syntax

```
adjacency-segment [ipv4|ipv6] p2p [multiple][label label | indexindex] backup-eligible
no adjacency-segment [ipv4 | ipv6]p2p [multiple][label label|index index] backup-eligible
default adjacency-segment [ipv4 | ipv6]p2p multiple][label label|index index] backup-eligible
```

#### Parameters

- **ipv4** IPv4 related.
- **ipv6** IPv6 related.
- **p2p** P2P interface type.
- **multiple** Configure multiple Adj-SIDs.
- **label *label*** Label value to be assigned as Adj-SID for adjacency on this interface. ***label*** range **16 -1048575**.
- **index *index*** Prefix segment identifier. ***index*** range **0-65535**.
- **backup-eligible** Eligible for protection.

### 15.4.7.3 adjacency-segment (allocation)

The **adjacency-segment** command allocates adjacency segments to all IS-IS adjacencies, or only those adjacencies which are to IS-IS routers that have advertised IS-IS SR capability, or to none of the adjacencies.

#### Command Mode

Segment-Routing MPLS Configuration

#### Command Syntax

```
adjacency-segment allocation [all-interface |none | sr-peers]
```

#### Parameters

- **allocation** Allocation of Adjacency Segments.
- **all-interface** Allocates adjacency segments to all IS-IS adjacencies.
- **none** Disable automatic adjacency segment allocation.
- **sr-peers** Allocate adjacency segments to IS-IS adjacencies with SR peers.

#### Example

This command allocates the adjacency segment to an sr-peer.

```
switch(config-router-isis-sr-mpls)# adjacency-segment allocation sr-peer
```

---

#### 15.4.7.4 adjacency-segment (static)

The **adjacency-segment** command configures IS-IS adjacencies statically on the switch, so that these values are preserved even when the switch restarts. The no and the default form of the command places the switch back to the global configuration mode.

##### Command Mode

Interface Ethernet Configuration

##### Command Syntax

```
adjacency-segment ipv4 | ipv6 p2p [[label label-value]] [[index index-value global]]
```

##### Parameters

- **ipv4** IS-IS SR adjacency segment IPv4 interface configuration.
- **ipv6** IS-IS SR adjacency segment IPv6 interface configuration.
- **label *label-value*** Label value to be assigned as Adj-SID for adjacency on this interface. Value ranges from **16** to **1048575**.
- **index *label-value*** Index to be assigned as Adj-SID for adjacency on this interface. Value ranges from **0** to **65535**.
- **global** global adjacency SID.

##### Example

This command allocates the adjacency segment to an IPv4 p2p interface with a index value **50**.

```
switch(config-if-Et1)# adjacency-segment ipv4 p2p index 50 global
```

### 15.4.7.5 **advertise interface-address passive-only**

The **advertise interface-address passive-only** command configures IS-IS to advertise interface addresses for passive interfaces. The **no** disables the configuration.

#### **Configuration Mode**

Router IS-IS Configuration

#### **Command Syntax**

```
advertise interface-address passive-only
```

#### **Example**

Use the following command to advertise TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config)# router isis inst1
switch(config-router-isis)#advertise interface-address passive-only
```

---

#### 15.4.7.6 **advertise ip-reachability passive-only**

The **advertise ip-reachability passive-only** allows the configuration of advertising IS-IS IP reachability TLVs for passive and nonpassive interfaces. This reduces the size of the LSP by stopping the advertisement of IP reachability addresses for active interfaces and reduce IS-IS convergence time in complex networks. The **no** version of the command disables the feature.

##### **Configuration Mode**

Router IS-IS Configuration

##### **Command Syntax**

```
advertise ip-reachability passive-only
```

##### **Example**

Use the following command to advertise TLVs from only passive interfaces on IS-IS instance, *inst1*:

```
switch(config)#router isis inst1
switch(config-router-isis)#advertise ip-reachability passive-only
```

### 15.4.7.7 area leader

Use the **area leader** command to tune or disable the area leader election process.

#### Command Mode

Router configuration mode

#### Command Syntax

```
area leader [disabled | level-1 [disabled] | level-2 [disabled] | priority [num [level-1 | level-2]]]
no area leader
default area leader
```

#### Parameters

- **disabled** Disables becoming the are leader.
- **level-1** Configure at Level 1.
  - **disabled** Disables becoming the are leader.
- **level-2** Configure at Level 2.
  - **disabled** Disables becoming the are leader.
- **priority** Sets the area leader priority.
  - **level-1** Configure at Level 1.
  - **level-2** Configure at Level 2.

---

#### 15.4.7.8 authentication key

The **authentication key** command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication key** and **default authentication key** commands disables the authentication key for the IS-IS instance.

##### Command Mode

ISIS-Router Configuration

##### Command Syntax

```
authentication key [0 | 7] [LAYER_VALUE]
no authentication key [0 | 7] [LAYER_VALUE]
default authentication key [0 | 7] [LAYER_VALUE]
```

##### Parameters

**LAYER\_VALUE** layer value. Options include:

- **level-1**
- **level-2**

##### Example

These commands configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication key secret
switch(config-router-isis)#{
```

### 15.4.7.9 authentication mode

The **authentication mode** command configures authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

The **no authentication mode** and **default authentication mode** commands disables authentication for the IS-IS instance.

#### Command Mode

ISIS-Router Configuration

#### Command Syntax

```
authentication mode [md5 | text] [LAYER_VALUE]
no authentication mode [md5 | text] [LAYER_VALUE]
default authentication mode [md5 | text] [LAYER_VALUE]
```

#### Parameters

- **LAYER\_VALUE** Layer value. Options include:
  - **level-1**
  - **level-2**

#### Example

These commands configure authentication for the IS-IS instance causing LSPs, CSNPs, and PSNPs to be authenticated.

```
switch(config)# router isis 1
switch(config-router-isis)# authentication mode md5
switch(config-router-isis)#

```

---

#### 15.4.7.10 **bfd all-interfaces**

The **bfd all-interfaces** command enables Bidirectional Forwarding Detection (BFD) for all IS-IS-enabled interfaces in the IPv4 or IPv6 address family.

Use the [isis bfd](#) command to configure BFD on a specific interface.

#### Command Mode

Router-ISIS Address-Family Configuration

#### Command Syntax

```
bfd all-interfaces
```

#### Example

These commands enable BFD for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd all-interfaces
switch(config-router-af)#

```

### 15.4.7.11 clear isis database

The **clear isis database** command clears a specific LSP with a predefined LSP ID, or LSPs at a given level, or all LSPs in the database. Additionally, the command sends purge LSPs throughout the network to clear LSPs from all devices.

**Note:** Exercise caution while using this command since it can be disruptive to the network.

#### Command Mode

Privileged Exec

#### Command Syntax

```
clear isis [<INSTANCE>] database {LSPID | all | level-1 | level-2}
```

#### Parameters

- **<INSTANCE>** Clears all LSPs from a specific LSP instance.
- **LSPID** Clears an LSP based on the specific LSP ID.
- **all** Clears all LSPs from the LSP database.
- **level-1** Clears LSPs at level 1 only.
- **level-2** Clears LSPs at level 2 only.

#### Examples

- This command clears all LSPs for the specific LSP ID of **1111.1111.1002.00-00**.

```
switch(config)# clear isis database 1111.1111.1002.00-00
1 LSPs cleared on instance 1.
switch(config) #
```

- This command clears all LSPs from the LSP database.

```
switch(config)# clear isis database all
3 LSPs cleared on instance 1.
switch(config) #
```

- This command clears all LSPs from the level 1 LSP database.

```
switch(config)# clear isis database level-1
3 LSPs cleared on instance 1.
switch(config) #
```

- This command clears all LSPs from a specific LSP instance *instance2*.

```
switch(config)# clear isis instance2 database all
3 LSPs cleared on instance instance 2.
switch(config) #
```

---

### 15.4.7.12 clear isis instance

the **clear isis instance** clears an IS-IS instance or all instances.

#### Command Mode

Global

#### Command Syntax

```
clear isis instance vrf vrf_name
```

#### Parameters

**vrf *vrf\_name*** - Clears an IS-IS instance from a named VRF.

#### Example

Use the following command to clear an IS-IS instance:

```
switch# clear isis instance
IS-IS instance 1 cleared.
```

### 15.4.7.13 clear isis neighbor

The **clear isis neighbor** command clears IS-IS adjacencies that exist on an interface, or at a specific level, or the adjacencies formed with a given neighbor (either with a system ID or a hostname).

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear isis neighbor {Neighbor-ID | all | interface} [level-1 | level-2 | level-1-2]
```

#### Parameters

- **Neighbor-ID** Clears adjacencies based on the system ID or the hostname of a neighbor.
- **all** Clears all adjacencies.
- **interface** Clears adjacencies for a specific interface.
- **level-1** level 1 only.
- **level-1-2** level 1-2 point-to-point only.
- **level-2** level 2 only.

#### Examples

- This command clears IS-IS adjacencies with a neighbor **af86.3032.1a0f**.

```
switch# clear isis neighbor af86.3032.1a0f
2 neighbors cleared on instance 1 switch#
```

- This command clears all IS-IS adjacencies on an interface **et1**.

```
switch# clear isis neighbor interface et1
4 neighbors cleared on instance 1 switch#
```

- This command clears IS-IS adjacencies with a neighbor **af86.3032.1a0f** and on interface **et1**.

```
switch# clear isis neighbor af86.3032.1a0f interface et1
2 neighbors cleared on instance 1 switch#
```

- This command clears all IS-IS adjacencies at Level 1 and on interface **et1**.

```
switch# clear isis neighbor interface et1 level-1
2 neighbors cleared on instance 1 switch#
```

- This command clears Level 1-2 point-to-point adjacencies only.

```
switch# clear isis neighbor all level-1-2
0 neighbors cleared on instance 1 switch#
```

---

#### 15.4.7.14 fast-reroute ti-lfa mode

Use the **fast-reroute ti-lfa mode** to enable link or node protection for node segments and adjacency segments of a specific address-family learned on all IS-IS interfaces.

##### Command Mode

address-family sub-mode of the router isis mode (config-router-isis-af)

##### Command Syntax

```
fast-reroute ti-lfa mode [[[link-protection | node-protection][[level-1 | level-2]] | disabled]
```

##### Parameters

- **link-protection** Protects against the failure of the link.
- **node-protection** Protects against the failure of the neighbor mode.
- **level-1** Protects prefixes only in level-1.
- **level-2** Protects prefixes on in level-2. Disables the fast-reroute TI-LFA mode.

##### Guidelines

FRR using TI-LFA is disabled globally by default in the router IS-IS address-family sub-modes.

The interface TI-LFA configuration inherits the address-family sub-mode configuration by default.

### 15.4.7.15 fast-reroute ti-lfa srlg

Use the **fast reroute ti-lfa srlg** command to enable SRLG protection on all interfaces. This command is used in addition to configuring link-protection or node-protection. When SRLG protection is enabled, the backup paths are computed after excluding all the links that share the same SRLG with the active link that is being used by all prefix segments and adjacency segments.

#### Command Mode

IS-IS router address-family configuration mode

#### Command Syntax

```
fast-reroute ti-lfa srlg [strict]
```

#### Parameters

**strict** The backup path is only programmed if a backup path that excludes all the SRLGs configured on the primary interface.

---

### 15.4.7.16 graceful-restart (IS-IS)

The **graceful-restart** command configures IS-IS graceful-restart. The command provides options to configure the t2 time or the restart-hold-time.

t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either Level-1 or Level-2 routes.

restart-hold-time is the hold time advertised by the router to its neighbors before undergoing ASU2 fast reboot.

The **no graceful-restart** and **default graceful-restart** commands disables the IS-IS graceful-restart configuration from **running-config**.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
graceful-restart t2 | restart-hold-time value
no graceful-restart t2 | restart-hold-time value
default graceful-restart t2 | restart-hold-time value
```

#### Parameters

- **value** The time in seconds. Value ranges from **5** to **300** seconds.
- **restart-hold-time** Sets the hold time when restarting.
- **t2** Sets the LSP database sync wait time.

#### Examples

- In this example an ISIS graceful restart is configured with t2 wait time of **30** seconds for Level-1 routes.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart t2 level-1 30
```

- In this example an ISIS graceful restart is configured with restart-hold-time of **50** seconds.

```
switch(config)# router isis 1
switch(config-router-isis)# graceful-restart restart-hold-time 50
```

### 15.4.7.17 is-hostname

The **is-hostname** command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default, if a hostname is configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the **no is-hostname** command. When the IS-IS hostname is removed, the switch goes back to using the switch's hostname as the IS-IS hostname.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
is-hostname String
no is-hostname
```

#### Examples

- These commands configure the IS-IS hostname to the symbolic name **ishost1** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# is-hostname ishost1
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name **ishost1** for the IS-IS router.

```
switch(config)# router isis inst1
switch(config-router-isis)# no is-hostname ishost1
switch(config-router-isis)#
```

---

#### 15.4.7.18 isis authentication key

The **isis authentication key** command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables the authentication key for the IS-IS instance.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis authentication key [0 | 7] [LAYER_VALUE]
no isis authentication key [0 | 7] [LAYER_VALUE]
default isis authentication key [0 | 7] [LAYER_VALUE]
```

#### Parameters

**LAYER\_VALUE** Layer value. Options include:

- **level-1**
- **level-2**

#### Example

These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
switch(config-if-Et3/6) #
```

### 15.4.7.19 isis authentication mode

The **isis authentication mode** command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables authentication for the IS-IS instance.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis authentication mode [md5 | text][LAYER_VALUE]
no isis authentication mode [md5 | text][LAYER_VALUE]
default isis authentication mode [md5 | text][LAYER_VALUE]
```

#### Parameters

**LAYER\_VALUE** Layer value. Options include:

- **level-1**
- **level-2**

#### Example

These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)# interface Ethernet 3/6
switch(config-if-Et3/6)# isis authentication mode text
switch(config-if-Et3/6)# isis authentication key 7 cAm28+9a/xPi04o7hjd8Jw==
switch(config-if-Et3/6) #
```

---

#### 15.4.7.20 isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis bfd
no isis bfd
default isis bfd
```

#### Example

These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6) #
```

### 15.4.7.21 isis enable

The **isis enable** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

**isis enable *instance\_id***

**no isis enable**

**default isis enable**

#### Parameters

***instance\_id*** IS-IS instance name.

#### Examples

- These commands enable the IS-IS protocol on the **interface ethernet 4**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
switch(config-router-isis)# interface ethernet 4
switch(config-if-Eth4)# isis enable Osiris
```

- These commands disable the IS-IS protocol on the **interface ethernet 4**.

```
switch(config)# interface ethernet 4
switch(config-if-Eth4)# no isis enable
```

---

#### 15.4.7.22 isis fast-reroute ti-lfa mode

Use the **isis fast-reroute ti-lfa mode** command to enable link or node protection for node segments and adjacency segments learned on a specific IS-IS interface. By default, the interface TI-LFA configuration inherits the address-family sub-mode configuration.

The **no isis fast-reroute ti-lfa** and **default isis fast-reroute ti-lfa mode** commands disable link or node protection for node segments and adjacency segments learned on a specific IS-IS interface.

#### Command Mode

Router IS-IS Configuration Mode

#### Command Syntax

```
isis fast-reroute ti-lfa mode [link-protection | node-protection | disabled][[level-1 |
level-2]

no isis fast-reroute ti-lfa mode [link-protection | node-protection | level-1 |
level-2]

default isis fast-reroute ti-lfa mode [link-protection | node-protection | disabled]
[level-1 | level-2]
```

#### Parameters

- **link-protection** - Configures link-protection.
- **node-protection** - Configures node-protection.
- **disabled** - Disables protection over the link.
- **level-1** - Optional parameter in the **Router Is-Is Address-family** Configuration Mode - Restricts protection to node segments and adjacency segments learned through either Level-1 topologies only.
- **level-2** - Optional parameter in both the **Router Is-Is Address-family** Configuration Mode that restricts protection to node segments and adjacency segments learned through Level-2 topologies only.

#### Example

Use the following command to enable link protection on node segments for all interfaces on IS-IS, *network1* with an instance ID, 24 and address family *IPv4*:

```
switch(config)# router isis network1 instance-id 24
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# fast-reroute ti-lfa mode link-protection level 1
```

### 15.4.7.23 isis hello-interval

The **isis hello-interval** command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The **no isis hello-interval** and **default isis hello-interval** commands restore the default hello interval of **10** seconds on the configuration mode interface by removing the **isis hello-interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis hello-interval time
no isis hello-interval
default isis hello-interval
```

#### Parameters

**time** Values range from **1** to **300**; default is **10**.

#### Examples

- These commands configure a hello interval of **45** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# isis hello-interval 45
switch(config-if-Vl200)#End
```

- These commands remove the configured hello interval of **45** seconds from **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no isis hello-interval
switch(config-if-Vl200)#End
```

- These commands configure a hello interval of **60** seconds for **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis hello-interval 60
switch(config-if-Et5)#End
```

- These commands remove the configured hello interval of **60** seconds from **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis hello-interval
switch(config-if-Et5)#End
```

---

#### 15.4.7.24 isis hello-multiplier

The **isis hello-multiplier** command specifies the number of IS-IS hello packets missed by a neighbor before the adjacency is considered down.

The **no isis hello-multiplier** and **default isis hello-multiplier** commands restore the default hello interval of **3** on the configuration mode interface by removing the **isis hello-multiplier** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis hello-multiplier factor
no isis hello-multiplier
default isis hello-multiplier
```

#### Parameters

**factor** Values range from **3** to **100**; default is **3**.

#### Examples

- These commands configure a hello multiplier of **4** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# isis hello-multiplier 4
switch(config-if-Vl200)#End
```

- These commands remove the configured hello multiplier of **4** from **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# no isis hello-multiplier
switch(config-if-Vl200)#End
```

- These commands configure a hello multiplier of **45** for **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis hello-multiplier 45
switch(config-if-Et5)#End
```

- These commands remove the configured hello multiplier of **45** from **Interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis hello-multiplier
switch(config-if-Et5)#End
```

### 15.4.7.25 isis address-family fast-reroute ti-lfa srlg

Use the **isis address-family fast-reroute ti-lfa srlg** command to enable protection selectively on a specific interface. This command only enables Shared Risk Link Groups (SRLG) protection for prefix segments and adjacency segments enabled on the interface.

#### Command Mode

IIS-IS Configuration Mode

#### Command Syntax

```
isis [ipv4 | ipv6] unicast fast-reroute ti-lfa [mode | srlg] [strict | disabled]
no isis [ipv4 | ipv6] unicast fast-reroute ti-lfa [mode | srlg] [strict | disabled]
default isis [ipv4 | ipv6] unicast fast-reroute ti-lfa [mode | srlg] [strict | disabled]
```

#### Parameters

- **ipv4** - IS-IS IPv4 interface configuration.
- **ipv6** - IS-IS IPv6 interface configuration.
- **unicast** - Specify a unicast sub-address family.
- **fast-reroute** - Configures fast reroute.
- **ti-lfa** - Configures TI-LFA FRR.
- **srlg** - Excludes same SRLG links from backup path.
- **mode [disabled | link-protection | node-protection]** - Specify one of the following modes:
  - **disabled** - Disable protection over the link.
  - **link-protection** - Protect against failure of the link.
  - **node-protection** - Protect against the failure of the neighbor node.
- **strict** - The backup path is only programmed only if a backup path that excludes all the SRLGs configured on the primary interface. If **strict** is not provided and an SRLG excluding path is not available, TI-LFA programs the backup path that excluded the maximum number of SRLGs possible.
- **disabled** - Use to selectively disable SRLG protection on an interface. This is useful when SRLG protection is enabled globally for all interfaces but needs to be selectively disabled for a specific interface.

#### Example

Use the following command to enable SRLG in strict mode:

```
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# fast-reroute ti-lfa srlg strict
```

---

#### 15.4.7.26 isis ipv6 metric

The **isis ipv6 metric** command configures the IPv6 metric.

The **no isis ipv6 metric** and **default isis ipv6 metric** commands restore the default metric of 10 on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis ipv6 metric metric_value
```

```
no isis ipv6 metric
```

```
default isis ipv6 metric
```

#### Parameters

***metric\_value*** Values range from **1** to **16777214**; default is **10**.

#### Example

These commands configure the IPv6 metric.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis ipv6 metric 30
switch(config-if-Et5/6) #
```

### 15.4.7.27 isis lsp tx interval

The **isis lsp tx interval** command sets the interval at which IS-IS sends link-state information on the interface.

The **no isis lsp tx interval** and **default isis lsp tx interval** commands restores the default setting of **33** ms. by removing the **isis lsp tx interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

**isis lsp tx interval *period***

**no isis lsp tx interval**

**default isis lsp tx interval**

#### Parameters

**period** Value ranges from **1** through **3000**. Default interval is **33** ms.

#### Examples

- This command sets the LSP interval on interface **interface ethernet 5** to **600** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# isis lsp tx interval 600
switch(config-if-Et5)#

```

- This command removes the LSP interval on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no isis lsp tx interval
switch(config-if-Et5)#

```

---

#### 15.4.7.28 isis metric

The **isis metric** command sets cost for sending information over an interface.

The **no isis metric** and **default isis metric** commands restore the metric to its default value of **10** by removing the **isis metric** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis metric metric_cost
```

```
no isis metric
```

```
default isis metric
```

#### Parameters

**metric\_cost** Values range from **1** to **1677214**. Default value is **10**.

#### Examples

- These commands configure a metric cost of **30** for sending information over **interface ethernet 5**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# isis metric 30
switch(config-if-Et5)#

```

- These commands remove the configured metric cost of **30** from **interface ethernet 5**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# no isis metric
switch(config-if-Et5)#

```

### 15.4.7.29 isis multi-topology

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The **no isis multi-topology** and **default isis multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis multi-topology address-family ipv4 unicast
no isis multi-topology address-family ipv4 unicast
default isis multi-topology address-family ipv4 unicast
```

#### Examples

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis multi-topology address-family ipv4 unicast
switch(config-if-Et5/6)#[/pre]
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis multi-topology address-family ipv6 unicast
switch(config-if-Et5/6)#[/pre]
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# no isis multi-topology address-family unicast
switch(config-if-Et5/6)#[/pre]
```

---

### 15.4.7.30 isis network

The **isis network** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no isis network** and **default isis network** commands set the configuration mode interface as a broadcast link by removing the corresponding **isis network** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis network point-to-point
```

```
no isis network
```

```
default isis network
```

#### Examples

- These commands configure **interface ethernet 10** as a point-to-point link.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis network point-to-point
switch(config-if-Et10) #
```

- This command restores **interface ethernet 10** as a broadcast link.

```
switch(config-if-Et10)# no isis network
switch(config-if-Et10) #
```

### 15.4.7.31 isis passive

The **isis passive** command configures the configuration-mode interface as passive. The switch will continue to advertise the IP address in the LSP, but the interface will not send or receive IS-IS control packets.

The **no isis passive** command removes the passive configuration, allowing the interface to send and receive IS-IS control packets. The **default isis passive** command sets the interface to the default interface activity setting by removing the corresponding **isis passive** or **no isis passive** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis passive
```

```
no isis passive
```

```
default isis passive
```

#### Examples

- These commands configure **interface ethernet 10** as a passive interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# isis passive
switch(config-if-Et10) #
```

- These commands restore **interface ethernet 10** as an active interface.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# no isis passive
switch(config-if-Et10) #
```

### 15.4.7.32 isis priority

The **isis priority** command sets the IS-IS priority for the interface.

The default priority is **64**. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The **no isis priority** and **default isis priority** commands restore the default priority (**64**) on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis priority priority_level
```

```
no isis priority
```

```
default isis priority
```

#### Parameter

**priority\_level** Value ranges from **0** to **127**. Default value is **64**.

#### Examples

- These commands configure a IS-IS priority of **60** on **interface ethernet 5**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# isis priority 60
switch(config-if-Et5)#

```

- These commands restores the default IS-IS priority of **64** from **interface ethernet 5**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# interface ethernet 5
switch(config-if-Et5)# no isis priority
switch(config-if-Et5)#

```

- These commands configure the switch with a priority of **64** for **interface vlan 7**.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# isis priority 64
switch(config-if-Vl7)#

```

- These command restores the default IS-IS priority of **64** for **64**.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# no isis priority
switch(config-if-Vl7)#

```

### 15.4.7.33 is-type

The **is-type** command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

**is-type LAYER\_VALUE**

#### Parameters

- **LAYER\_VALUE** Layer value options include:

- **level-1**
- **level-1-2**
- **level-2**

#### Examples

- These commands configure Level 1-2 routing.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-1-2
switch(config-router-isis)#{/pre>
```

- These commands configure Level 2 routing.

```
switch(config)# router isis Osiris
switch(config-router-isis)# is-type level-2
switch(config-router-isis)#{/pre>
```

---

#### 15.4.7.34 log-adjacency-changes (IS-IS)

The **log-adjacency-changes** command sets the switch to send Syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when ***running-config*** does not contain any form of the command. Entering the command in any form replaces the previous command state in ***running-config***.

##### Command Mode

Router-ISIS Configuration

##### Command Syntax

```
log-adjacency-changes
no log-adjacency-changes
default log-adjacency-changes
```

##### Examples

- These commands configure the switch to send a Syslog message when a neighbor state changes.

```
switch(config)# router isis Osiris
switch(config-router-isis)# log-adjacency-changes
switch(config-router-isis)#{/pre>
```

- These commands configure not to log the peer changes.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no log-adjacency-changes
switch(config-router-isis)#{/pre>
```

### 15.4.7.35 lsp dynamic flooding

Use the **lsp flooding dynamic** command to configure dynamic flooding. Dynamic flooding must be enabled on all routers in the area. The **no** form of the command removes LSP dynamic flooding. LSP flooding dynamic is disabled by default.

#### Command Mode

Router configuration mode

#### Command Syntax

```
lsp flood dynamic [level-1 | level-2]
no lsp flood dynamic [level-1 | level-2]
default lsp flood dynamic [level-1 | level-2]
```

#### Parameters

- **level-1** Level 1 adjacencies.
- **level-2** Level 2 adjencencies.

#### Example

```
switch(config)# router isis Amun
switch(config-router-isis)# net 49.0000.0000.3333.00
switch(config-router-isis)# is-hostname ip3
switch(config-router-isis)# lsp flooding dynamic
```

---

#### 15.4.7.36 match isis level

The **match isis level** command configures a route map to match on ISIS level. It filters the Level-1 or Level-2 routes by using route maps match statement.

The **no match isis level** and **default match isis level** commands disables the match ISIS level configuration from *running-config*.

##### Command Mode

Route-map Configuration

##### Command Syntax

```
match isis level [level-1 | level-2]
no match isis level [level-1 | level-2]
default match isis level [level-1 | level-2]
```

##### Parameters

- **level-1** IS-IS level 1.
- **level-2** IS-IS level 2.

##### Example

These commands place the switch in **route-map** mode, and configures a route map to match isis level to Level-1.

```
switch(config)# route-map Test
switch(config-route-map-test)# match isis level level-1
```

#### 15.4.7.37 monitor twamp

The **monitor twamp twamp-light** command enters the TWAMP configuration mode and allows the configuration of TWAMP profiles to initiate TWAMP reflection on an IS-IS network. The **no twamp-light** command disables the feature.

##### Command Mode

TWAMP Configuration Mode

##### Command Syntax

```
monitor twamp twamp-light
```

##### Parameters

- **twamp-light** - Enter TWAMP configuration mode and configure TWAMP Light.

##### Example

Use the following command to enter the TWAMP configuration mode:

```
switch(config)#twamp
 switch(config-monitor-twamp)#twamp-light
 switch(config-twamp-light) #
```

---

#### 15.4.7.38 mpls label range

The **mpls label range** command derives the indices of the actual MPLS label on the SRGB advertised by the router. The default value of SRGB in EOS is Base: **900000**, Size: **65536**. In other words, the labels that any global segment could represent is between **900000-965535**.

##### Command Mode

Global Configuration

##### Command Syntax

```
mpls label range value
```

##### Parameters

**value** Specifies the Segment Routing global range.

- **dynamic** Specifies labels reserved for dynamic assignment. Default value is **(100000) (262144)**.
  - **IS-IS-sr** Specifies labels reserved for IS-IS SR global segment identifiers (SIDs). Default value is **(900000) (65536)**.
  - **static** Specifies labels reserved for static MPLS routes. Default value is **(16) (99984)**.

##### Example

The following command configures an IS-IS SR global range with a value of **(900000)**-- starting label range, **(65536)**--Numbers of labels to reserve.

```
switch(config)# mpls label range isis-sr 900000 65536
```

### 15.4.7.39 multi-topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **no multi-topology** and **default multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

#### Command Mode

Router IS-IS Address-Family Configuration

#### Command Syntax

```
multi-topology
no multi-topology
default multi-topology
```

#### Examples

- These commands configure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# multi-topology
switch(config-router-isis-af) #
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv6 unicast
switch(config-router-isis-af)# no multi-topology
switch(config-router-isis-af) #
```

---

#### 15.4.7.40 net

The **net** command configures the Network Entity Title of the IS-IS instance. By default, no NET is defined.

The **no net** and **default net** commands removes the NET from *running-config*.

#### Command Mode

Router-ISIS Configuration

#### Command Syntax

```
net mask_hex
```

```
no net
```

```
default net
```

#### Parameter

***mask\_hex*** Mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

#### Examples

- These commands specify the NET as **49.0001.1010.1040.1030.00**, in which the system ID is **1010.1040.1030**, area ID is **49.0001**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# net 49.0001.1010.1040.1030.00
switch(config-router-isis)#

```

- These commands remove NET **49.0001.1010.1040.1030.00** from *running-config*.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no net 49.0001.1010.1040.1030.00
switch(config-router-isis)#

```

#### 15.4.7.41 node-segment

The **node-segment** command associates the node segments with prefix mask length **/32** (IPV4) or **/128** (IPV6) addresses. The **node-segment** command must be issued on an IS-IS-enabled loop back interface.

##### Command Mode

Loop-back Interface Configuration

##### Command Syntax

```
node-segment [ipv4 | ipv6] index value
```

##### Parameters

- **ipv4** Specifies the IPv4 node configuration.
- **ipv6** Specifies the IPv6 node configuration.
- **index** Node segment identifier.
- **label** Absolute node segment label. A value between **16-1048575**
- **value** Index to be mapped with IP prefix. Value ranges from **0-65535**.

##### Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/32
switch(config-if-Lo1)# node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ipv6 add 2000::24/128
switch(config-if-Lo1)# node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a **/32** or **/128** address is not configured on the interface.

```
switch(config)# int loopback 1
switch(config-if-Lo1)# ip address 21.1.1.1/24
switch(config-if-Lo1)# node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command adds an absolute label, 900123, to a node segment.

```
switch(config-if-Lo1)#node-segment ipv4 label 900123
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)# no node-segment ipv4 index 1
```

---

#### 15.4.7.42 passive (IS-IS)

The **passive** command configures the specified IS-IS interface as passive. The switch will continue to advertise the IP address in the LSP, but the interface will not send or receive IS-IS control packets.

The **no passive** command removes the passive configuration, allowing the interface to send and receive IS-IS control packets. The **default passive** command sets the interface to the default interface activity setting by removing the corresponding **passive** or **no passive** statement from *running-config*.

#### Command Mode

Router-**IS-IS Configuration**

#### Command Syntax

```
passive INTERFACE_NAME
no passive INTERFACE_NAME
default passive INTERFACE_NAME
```

#### Parameters

**INTERFACE\_NAME** Options include:

- **ethernet e\_range** Ethernet interface list.
- **loopback l\_range** loopback interface list.
- **port-channel p\_range** channel group interface list.
- **vlan v\_range** VLAN interface list.

Valid **e\_range**, **l\_range**, **p\_range**, and **v\_range** formats include number, range, or comma-delimited list of numbers and ranges.

#### Examples

- These commands configure **interface ethernet 10** as a passive interface.

```
switch(config)# router isis Osiris
switch(config-router-isis)# passive ethernet 10
switch(config-router-isis)#

```

- These commands restore **interface ethernet 10** as an active IS-IS interface.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no passive ethernet 10
switch(config-router-isis)#

```

#### 15.4.7.43 prefix-segment

The **prefix-segment** command associates prefix segments with any IS-IS prefix a router is originating an IP Reachability TLV for.

##### Command Mode

Segment-Routing MPLS Configuration

##### Command Syntax

`prefix-segment ip-address index value`

##### Parameters

- ***ip-address*** It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- ***index*** Node segment identifier.
- ***value*** Index to be mapped with IP prefix. Value ranges from **0-65535**.

##### Example

The following commands are used to associate a prefix segment with an IPv4 address with index value of **50**.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls)# prefix-segment 1.1.1.0/24 index 50
```

---

#### 15.4.7.44 proxy-node-segment

The **proxy-node-segment** command configures a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

##### Command Mode

Segment-Routing MPLS Configuration

##### Command Syntax

```
proxy-node-segment ip-address index index_value range value conflict ignore
```

##### Parameters

- ***ip-address*** It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- ***index*** Node segment identifier.
- ***value*** Index to be mapped with IP prefix. Value ranges from **0-65535**.
- **conflict ignore** - Ignore conflicts between proxy-node segments and other segments.

##### Example

A proxy-node-segment associates a **/32** or a **/128** route with an SID as shown below.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#proxy-node-segment 1.1.1.0/32 index 50
```

#### 15.4.7.45 proxy-node-segment mpls

The **proxy-node-segment mpls** command allows the configuration of an MPLS route to forward traffic to the IGP next-hop for the loopback.

##### Command Mode

Segment-Routing MPLS Configuration

##### Command Syntax

```
proxy-node-segment mpls [fallback | pop | forward]
```

##### Parameters

- **fallback** - Specify the fallback entry if Segment Routing reachability becomes unavailable.
- **pop** - Specify to pop the top label.
- **forward** - Specify to forward the packet based on the IGP best path.

##### Example

Configure the proxy-node segment to forward MPLS traffic.

```
switch(config)# router general
switch(config-router-general)# segment-routing
switch(config-router-general-sr)# proxy-node-segment mpls fallback pop forward
```

#### 15.4.7.46 redistribute (IS-IS)

The **redistribute** command redistributes the specified types of routes into IS-IS.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** statement from **running-config**.

##### Command Mode

Router-ISIS Configuration

##### Command Syntax

```
redistribute ROUTE_TYPE
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

##### Parameters

**ROUTE\_TYPE** The route type for which routes are redistributed. These are the option to include.

- bgp redistribute BGP routes
- connected redistribute connected routes
- ospf redistribute OSPF routes
- ospfv3 redistribute OSPFv3 routes
- static redistribute static routes

##### Examples

- These commands redistribute connected routes into the IS-IS domain.

```
switch(config)# router isis Test
switch(config-router-isis)# redistribute connected
```

- These commands redistribute static routes into the IS-IS domain.

```
switch(config)# router isis Test
switch(config-router-isis)# redistribute static
```

- These commands redistribute the BGP routes into ISIS domain in the **address-family** mode.

```
Switch(config)# router isis 1
Switch(config-router-isis)# address-family ipv4
Switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v4
```

- These commands redistribute the BGP routes into ISIS domain in the **router-isis** mode.

```
Switch(config)# router isis 1
Switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

#### 15.4.7.47 redistribute bgp route-map

The `redistribute bgp route-map` command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The `no redistribute bgp` and `default redistribute bgp` commands disable BGP route redistribution from the specified domain by removing the `redistribute bgp` statement from *running-config*.

The command is available in both ***router isis*** configuration mode and the ***address-family*** submode. The command is rejected if configured in both modes at the same time. Issuing the `no` or `default` command in ***router isis*** configuration mode has no effect on redistribution configured in the ***address-family*** submode.

**Note:** If the command is configured in an ***address-family*** submode, it only redistributes routes from that address family. If it is configured in ***router-isis*** mode, it applies to all enabled address families.

#### Command Mode

Router-ISIS Configuration

Router-ISIS Address-Family Configuration

#### Command Syntax

```
redistribute bgp route-map map_name
no redistribute bgp
default redistribute ROUTE_TYPE
```

#### Parameter

***map\_name*** Route map to be used for redistribution of BGP routes.

#### Examples

- These commands redistribute IPv4 BGP routes from the route map called ***bgp-to-isis-v4*** into the ISIS domain.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-isis-af)# redistribute bgp route-map bgp-to-isis-v4
switch(config-router-isis-af)#

```

- These commands redistribute all BGP routes from the route map ***bgp-to-isis*** into ISIS.

```
switch(config)# router isis 1
switch(config-router-isis)# redistribute bgp route-map bgp-to-isis
```

#### 15.4.7.48 router isis

The **router isis** command places the switch in router ISIS configuration mode.

Router ISIS configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no router isis** command deletes the IS-IS instance.

The **exit** command returns the switch to **global** configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
router isis instance_name [VRF_INSTANCE]
no router isis instance_name
default router isis instance_name
```

##### Parameters

- ***instance\_name*** routing instance.
- **VRF\_INSTANCE**
  - **no parameter**
  - **vrf *vrf\_name***

##### Examples

- These commands places the switch in the **router isis** mode and creates an IS-IS routing instance named **Osiris**.

```
switch(config)# router isis Osiris
switch(config-router-isis)#
```

- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in **global** configuration mode.

```
switch(config)# router isis Osiris
% More than 1 ISIS instance is not supported
switch(config)#
```

- This command deletes the IS-IS instance.

```
switch(config)# no router isis Osiris
switch(config)#
```

#### 15.4.7.49 segment-routing mpls

The **segment-routing mpls** command places the switch in the ***segment-routing mpls*** configuration mode.

The **no segment-routing mpls** and **default segment-routing mpls** commands disable IS-IS SR and delete all IS-IS SR configurations.

##### Command Mode

Router IS-IS Configuration

##### Command Syntax

```
segment-routing mpls
no segment-routing mpls
default segment-routing mpls
```

##### Example

The following commands place the switch in ***segment-routing mpls*** configuration mode.

```
switch(config)# router isis instance1
switch(config-router-isis)# segment-routing mpls
switch(config-router-isis-sr-mpls) #
```

---

#### 15.4.7.50 set isis level

The **set isis level** command configures a route map to set ISIS level.

The **no set isis level** and **default set isis level** commands disables the set ISIS level configuration from ***running-config***.

#### Command Mode

Route-map Configuration

#### Command Syntax

```
set isis level [level-1 | level-2 | level-1-2]
no set isis level [level-1 | level-2 | level-1-2]
default set isis level [level-1 | level-2 | level-1-2]
```

#### Parameters

- **level-1** IS-IS level 1.
- **level-2** IS-IS level 2.
- **level-1-2** IS-IS level 1 and level 2.

#### Example

These commands place the switch in the ***route-map*** mode, and configures a route map to set isis level to **level-1**.

```
switch(config)# route-map Test
switch(config-route-map-test)# set isis level level-1
```

### 15.4.7.51 set-overload-bit

The **set-overload-bit** command sets the overload bit in link state packets (LSPs) to signal that the switch is not available for forwarding transit traffic (for instance, during startup or when the switch is being taken down for maintenance). To configure the switch to set the overload bit for a specified period after a reboot, use the **on-startup** option.

The **no set-overload-bit** and **default set-overload-bit** commands remove the corresponding **set-overload-bit** command from **running-config**.

**Note:** When using the **on-startup** option, the overload bit will remain set in LSPs until the IS-IS agent has been up for the configured interval.

#### Command Mode

Router-ISIS Configuration

#### Command Syntax

```
set-overload-bit [on-startup interval]
no set-overload-bit
default set-overload-bit
```

#### Parameters

- **on-startup** Configures the switch to set the overload bit in LSPs for a period of ***interval*** seconds after startup.
- ***interval*** The period in seconds for which the overload bit remains set after startup.

#### Examples

- These commands configure the switch to sets the overload bit for **120** seconds after startup.

```
switch(config)# router isis Osiris
switch(config-router-isis)# set-overload-bit on-startup 120
switch(config-router-isis)#
```

- These commands remove the configured overload bit of **120** seconds from the **running-config**.

```
switch(config)# router isis Osiris
switch(config-router-isis)# no set-overload-bit on-startup
switch(config-router-isis)#
```

### 15.4.7.52 show isis database

The **show isis database** command displays the link state database of IS-IS. The default command displays active routes and learned routes.

#### Command Mode

EXEC

#### Command Syntax

```
show isis database [INSTANCES][INFO_LEVEL]
show isis database [INFO_LEVEL] [VRF_INSTANCE]
```

#### Parameters

- **INSTANCES** Options include:
  - **no parameter**
  - **instance\_name**
- **INFO\_LEVEL** Options include:
  - **no parameter**
  - **detail**
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter**
  - **vrf vrf\_name**

#### Display Values

- **ISIS Instance**
- **LSPID**
- **Seq Num**
- **Cksum**
- **Life**
- **IS**

#### Examples

- This command displays general information about the link state database of IS-IS.

```
switch# show isis database

ISIS Instance: Osiris
 ISIS Level 2 Link State Database
 LSPID Seq Num Cksum Life IS Flags
1212.1212.1212.00-00 4 714 1064 L2 <>

---

#### 15.4.7.53 show isis database detail

The **show isis database detail** command displays a view of LSPDB of different devices in the IS-IS domain.

##### Command Mode

EXEC

##### Command Syntax

```
show isis database detail
```

##### Example

The command output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

```
switch# show isis database detail

ISIS Instance: inst1 VRF: default
 ISIS Level 2 Link State Database

### 15.4.7.54 show isis dynamic flooding

Use the **show isis dynamic flooding** command to monitor Dynamic Flooding.

#### Command Mode

EXEC

#### Command Syntax

```
show isis dynamic flooding [interfaces | level-1 | level-2 | nodes | paths | topology | interface]
```

#### Parameters

- **interfaces** Flooding interfaces
- **level-1** Level 1 adjencies only.
- **level-2** Level 2 adjencies only.
- **nodes** Nodes in the flooding topology.
- **paths** Paths in the flooding topology.
- **topology** Flooding topology.

#### Examples

- The command **show isis dynamic flooding nodes** shows the list of nodes in the area and the indices for the nodes.

```
switch# show isis dynamic flooding nodes
IS-IS Instance: Amun VRF: default
 Level 1 Nodes:
 Index Node ID
 0 ip6.00
 1 ip4.00
 2 ip2.00
 3 ip1.00
 4 ip3.00
 5 ip5.00
```

- The command **show isis dynamic flooding paths** shows the list of paths in the flooding topology using node indices.

```
switch# show isis dynamic flooding paths
IS-IS Instance: Amun VRF: default
 Level 1:
 Path: 0 1 2 3 4 5 0
```

- To view the flooding topology, use the **show isis dynamic flooding topology** command:

```
switch# show isis dynamic flooding topology
IS-IS Instance: Amun VRF: default
 Level 1:
 Path: ip6.00 ip4.00 ip2.00 ip1.00 ip3.00 ip5.00 ip6.00
```

- To view which interfaces dynamic flooding will use, use the **show isis dynamic flooding interfaces** command:

```
switch# show isis dynamic flooding interfaces
IS-IS Instance: Amun VRF: default
 Level 1:
 Ethernets5
 Ethernets4
```

---

#### 15.4.7.55 show isis graceful-restart vrf

The **show isis graceful-restart vrf** command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

##### Command Mode

EXEC

##### Command Syntax

```
show isis graceful-restart vrf vrf-name
```

##### Example

In this example the **show isis graceful-restart** command displays the output for the default vrf instance.

```
switch# show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
T1 : 3s
T2 (level-1) : 30s/20s remaining
T2 (level-2) : 30s/not running
T3 : not running

System ID Type Interface Restart Capable Status
is-hostname-1 L1L2 Ethernet1 Yes Running
is-hostname-2 L1 Ethernet2 Yes Restarting
```

#### 15.4.7.56 show isis hostname

The **show isis hostname** command displays mapping between the System ID and IS-IS hostname.

##### Command Mode

EXEC

##### Command Syntax

```
show isis hostname
```

##### Example

This command mapping between the System ID and IS-IS hostnames **host1** and **host2**.

```
switch# show isis hostname
ISIS Instance: 1 VRF: default
Level System ID Hostname
L1 1111.1111.1001 host1
L1 1111.1111.1002 host2
```

---

#### 15.4.7.57 show isis interface

The `show isis interface` command displays interface information for the IS-IS instance.

##### Command Mode

EXEC

##### Command Syntax

```
show isis interface [INSTANCES][INTERFACE_NAME][INFO_LEVEL]
show isis interface [INTERFACE_NAME] [INFO_LEVEL][VRF_INSTANCE]
```

##### Parameters

- **INSTANCES** Options include:
  - **no parameter**
  - *instance\_name*
- **INTERFACE\_NAME** Values include:
  - **no parameter** All interfaces.
  - **ethernet e\_num** Ethernet interface specified by *e\_num*.
  - **loopback l\_num** Loopback interface specified by *l\_num*.
  - **management m\_num** Management interface specified by *m\_num*.
  - **port-channel p\_num** Port channel interface specified by *p\_num*.
  - **vlan v\_num** VLAN interface specified by *v\_num*.
  - **VXLAN vx\_num** VXLAN interface specified by *vx\_num*.
- **INFO\_LEVEL** Options include:
  - **no parameter**
  - **detail**
- **VRF\_INSTANCE** specifies the VRF instance.
  - **no parameter**
  - **vrf vrf\_name**

##### Display Values

- **ISIS Instance**
- **System ID**
- **Index**
- **MTU**
- **Metric**
- **LAN-ID**
- **DIS**
- **Type**
- **Interface**
- **SNPA**
- **State**
- **Hold time**

##### Examples

- This command displays general IS-IS information for instance ***Osiris***.

```
switch# show isis interface

ISIS Instance: Osiris
 Interface Vlan20:
 Index: 59 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 2
 LAN-ID: 1212.1212.1212, Priority: 64
 DIS: 1212.1212.1212, DIS Priority: 64
 Interface Ethernet30:
 Index: 36 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 1
 LAN-ID: 3030.3030.3030, Priority: 64
 DIS: 3030.3030.3030, DIS Priority: 64
```

- This command displays detailed IS-IS information for instance ***Osiris***.

```
switch# show isis interface detail

ISIS Instance: Osiris
 Interface Vlan20:
 Index: 59 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 2
 LAN-ID: 1212.1212.1212, Priority: 64
 DIS: 1212.1212.1212, DIS Priority: 64
 Adjacency 2222.2222.2222:
 State: UP, Level: 2 Type: Level 2 IS
 Hold Time: 30, Supported Protocols: ipv4, ipv6
 SNPA: 2:1:0:c:0:0, Priority: 64
 IPv4 Interface Address: 10.1.1.3
 IPv6 Interface Address: fe80::1:ff:fe0c:0
 Areas:
 49.0001
 Adjacency 1212.1212.1212:
 State: UP, Level: 2 Type: Level 2 IS
 Hold Time: 9, Supported Protocols: ipv4, ipv6
 SNPA: 2:1:0:d:0:0, Priority: 64
 IPv4 Interface Address: 10.1.1.2
 IPv6 Interface Address: fe80::1:ff:fe0d:0
 Areas:
 49.0001
 Interface Ethernet30:
 Index: 36 SNPA: 0:1c:73:c:5:7f
 MTU: 1497 Type: broadcast
 Level 2:
 Metric: 10, Number of adjacencies: 1
 LAN-ID: 3030.3030.3030, Priority: 64
 DIS: 3030.3030.3030, DIS Priority: 64
 Adjacency 3030.3030.3030:
 State: UP, Level: 2 Type: Level 2 IS
 Hold Time: 9, Supported Protocols: ipv4, ipv6
 SNPA: 2:1:0:b:0:0, Priority: 64
 IPv4 Interface Address: 30.1.1.2
 IPv6 Interface Address: fe80::1:ff:fe0b:0
 Areas:
 49.0001
```

- This example displays the state of TI-LFA protection for IPv4/IPv6 prefixes learned on that IS-IS interface.

```
switch# show isis interface Vlan2387

IS-IS Instance: inst1 VRF: default

 Interface Vlan2387:
 Index: 36 SNPA: P2P
 MTU: 1497 Type: point-to-point
 BFD IPv4 is Disabled
 BFD IPv6 is Disabled
 Hello Padding is Enabled
```

---

```
Level 2:
Metric: 10, Number of adjacencies: 1
Link-ID: 24
Authentication mode: None
TI-LFA node protection with SRLG loose protection is enabled for the following IPv4
segments: node segments, adjacency segments
TI-LFA protection is disabled for IPv6
```

#### 15.4.7.58 show isis local-convergence-delay

The **show isis local-convergence-delay** command shows the current or last attempt at delaying the convergence of protected routes on a link down/BFD neighbor down event. If the timer aborts for some reason (such as a topology change causing a new SPF), the attempt fails.

#### Examples

```
switch# show isis local-convergence-delay

IS-IS Instance: inst1 VRF: default
 System ID: 1111.1111.1001
 IPv4 local convergence delay configured, 5000 msecs
 IPv6 local convergence delay configured, 5000 msecs
 Level 1 attempts 0, failures 0
 Level 2 attempts 3, failures 1

 Level 2 in progress due to LINK DOWN on Vlan2138
 TI-LFA node protection is enabled for IPv4
 IPv4 Routes delayed: 0
 Delay timer started at: 2019-07-25 23:16:33
 Delay timer expires in 2 secs
 TI-LFA protection is disabled for IPv6

 Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
 TI-LFA node protection is enabled for IPv4
 IPv4 Routes delayed: 3
 Delay timer started at: 2019-07-25 23:14:51
 Delay timer stopped at: 2019-07-25 23:14:56
 TI-LFA protection is disabled for IPv6
```

The **detail** keyword also lists all the routes that have been delayed.

```
switch# show isis local-convergence-delay detail
...
Level 2 last attempt due to LINK DOWN on Vlan2138, Succeeded
 TI-LFA node protection is enabled for IPv4
 IPv4 Routes delayed: 3
 Delay timer started at: 2019-07-25 23:14:51
 Delay timer stopped at: 2019-07-25 23:14:56
 Delayed routes:
 10.0.7.1/32
 10.0.9.1/32
 10.0.10.1/32
 TI-LFA protection is disabled for IPv6
```

---

### 15.4.7.59 show isis neighbors

The **show isis neighbors** command displays IS-IS neighbor information.

#### Command Mode

EXEC

#### Command Syntax

```
show isis neighbors [INSTANCES] [INFO_LEVEL]
show isis neighbor [INFO_LEVEL] [VRF_INSTANCE]
```

#### Parameters

- **INSTANCES** Options include:
  - no parameter
  - *instance\_name*
- **INFO\_LEVEL** Options include:
  - no parameter
  - detail
- **VRF\_INSTANCE** Specifies the VRF instance.
  - no parameter
  - vrf *vrf\_name*

#### Display Values

- Inst. ID
- System ID
- Type
- Interface
- SNPA
- State
- Hold time
- Area Address

#### Example

This command displays general information about the IS-IS neighbors.

```
switch(config)# show isis neighbors
Inst Id System Id Type Interface SNPA State Hold time
10 2222.2222.2222 L2 Vlan20 2:1:0:c:0:0 UP 30
10 1212.1212.1212 L2 Vlan20 2:1:0:d:0:0 UP 9
10 3030.3030.3030 L2 Ethernet30 2:1:0:b:0:0 UP 9
switch(config) #
```

### 15.4.7.60 show isis network topology

The **show isis network topology** command displays a list of all IS-IS devices that are reachable in the network.

#### Command Mode

EXEC

#### Command Syntax

```
show isis network topology
show isis INSTANCES network topology
show isis network topology VRF_INSTANCE
```

#### Parameters

- **INSTANCES** Options include:
  - **no parameter**
  - ***instance\_name***
- **VRF\_INSTANCE** Specifies the VRF instance.
  - **no parameter**
  - **vrf *vrf\_name***

#### Display Values

- **System Id**
- **Metric**
- **Next-Hop**
- **Interface**
- **SNPA**

#### Example

This command displays the list of all devices reachable in the network.

| System Id      | Metric | IA Metric | Next-Hop       | Interface | SNPA        |
|----------------|--------|-----------|----------------|-----------|-------------|
| 2222.2222.2222 | 10     | 0         | 2222.2222.2222 | Ethernet1 | P2P switch> |

### 15.4.7.61 show isis segment-routing adjacency-segments

The **show isis segment-routing adjacency-segments** command displays the global adjacency SID value and other related information.

#### Command Mode

EXEC

#### Command Syntax

```
show isis segment-routing adjacency-segments
```

#### Examples

- In this example the **show isis segment-routing adjacency-segments** command displays the output for the interface configured like this:

```
switch# interface Ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
switch# show isis segment-routing adjacency-segments

System ID: 1000.0000.0002 Instance: isis1
SR supported Data-plane: MPLS SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
 L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P -
Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
-----+-----+-----+-----+-----+-----+-----+-----+
Adj IP Address Local Intf SID SID Source Flags Type
-----+-----+-----+-----+-----+-----+-----+-----+
1.1.1.2 Ett1 1 Configured F:0 B:0 V:0 L:0 S:0 P2P L1
fe80::1:ff:fe65:0 Ett1 2 Configured F:1 B:0 V:0 L:0 S:0 P2P L1

Received Global Adjacency Segments
SID Originator Neighbor Flags
-----+-----+-----+-----+-----+-----+-----+
0 rtrmpls1 1000.0000.0002 F:0 B:0 V:0 L:0 S:0
```

- The following is the C-API output for the **show isis segment-routing adjacency-segments** command.

```
switch# show isis segment-routing adjacency-segments | json
{
 "vrfs": {
 "default": {
 "isisInstances": {
 "isis1": {
 "routerId": "1.1.1.4",
 "adjSidPoolSize": 16384,
 "receivedGlobalAdjacencySegments": [
 {
 "systemId": "1000.0000.0001",
 "hostname": "rtrmpls1",
 "sid": 0,
 "flags": {

```

- ```

switch# show isis segment-routing adjacency-segments
...
Locally Originated Adjacency Segments
Adj IP Address Local Intf SID Flags Protection
-----  -----
10.1.0.1 V12138 100001 F:0 B:1 V:1 L:1 S:0 node
10.1.0.2 V12968 100002 F:0 B:1 V:1 L:1 S:0 node with SRLG loose
10.1.0.3 V12387 965537 F:0 B:1 V:1 L:1 S:0 node with SRLG strict

Received Global Adjacency Segments
SID Originator Neighbor Flags Protection
-----  -----
5 1111.1111.1005 1111.1111.1004 F:0 B:1 V:0 L:0 S:0 node

```

15.4.7.62 show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

Command Mode

EXEC

Command Syntax

```
show isis segment-routing global-blocks
```

Example

```
switch# show isis segment-routing global-blocks
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS      SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000  Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId          Base          Size
-----
1111.1111.1002    900000       65536
1111.1111.1001    900000       65536
```

15.4.7.63 show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

Command Mode

EXEC

Command Syntax

```
show isis segment-routing prefix-segments
```

Example

```
switch# show isis segment-routing prefix-segments
System ID: 1111.1111.1002      Instance: inst1
SR supported Data-plane: MPLS      SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                    E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
          Prefix    SID     Type      Flags           SystemID      Type
-----+-----+-----+-----+-----+-----+-----+
        1.0.7.1/32   2     Node      R:0 N:1 P:0 E:0 V:0 L:0  1111.1111.1001  L1
* 1.0.8.1/32    4     Node      R:0 N:1 P:0 E:0 V:0 L:0  1111.1111.1002  L2
  1.0.11.0/24   10    Prefix     R:1 N:0 P:0 E:0 V:0 L:0  1111.1111.1001  L2
* 1.0.12.0/24   12    Prefix     R:1 N:0 P:0 E:0 V:0 L:0  1111.1111.1002  L2
  1.0.15.1/32   18   Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0  1111.1111.1001  L2
  1.0.16.1/32   20   Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0  1111.1111.1003  L2
```

```
switch# show isis segment-routing prefix-segments
...
  Prefix      SID  Type      System ID      Level  Protection
-----+-----+-----+-----+-----+-----+
* 10.1.1.1/32  0    Node     ...  1111.1111.1001  L2  unprotected
  10.1.1.2/32  1    Node     ...  1111.1111.1002  L2  node with SRLG loose
  10.1.1.3/32  4    Node     ...  1111.1111.1005  L2  node with SRLG strict
  10.1.1.4/32  10   Prefix   ...  1111.1111.1004  L1  node
```

About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

15.4.7.64 show isis segment-routing

The **show isis segment-routing** command displays the summary information on IS-IS SR status.

Command Mode

EXEC

Command Syntax

```
show isis segment-routing
```

Example

The command output displays the summary information on IS-IS SR status.

```
switch(config)# show isis segment-routing
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS       SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000   Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000    Size: 16384
All Prefix Segments have      : P:0 E:0 V:0 L:0
All Adjacency Segments have : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments      : 2
Prefix-Segments     : 2
Proxy-Node-Segments : 0
Adjacency Segments :
```

About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field, while the router ID being advertised in the Router Capability is mentioned in the SR Router ID field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)# show isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively shutdown.
```

15.4.7.65 show isis segment-routing tunnel

The **show isis segment-routing tunnel** command displays all the IS-IS SR tunnels. The field **TI-LFA tunnel index** displays the index of the TI-LFA tunnel protecting the SR tunnel. The same TI-LFA tunnel that protects the LFIB route also protects the corresponding IS-IS SR tunnel.

Example

```
switch# show isis segment-routing tunnel 10.0.10.1/32
Index   Endpoint        Nexthop      Interface    Labels      TI-LFA
          tunnel index
----- -----
4       10.0.10.1/32   10.0.0.2    Vlan2387    [900004]    0
```

15.4.7.66 show isis summary

The **show isis summary** command displays information about the configured IS-IS instances.

Command Mode

EXEC

Command Syntax

```
show isis summary  
show isis [INSTANCES] summary  
show isis summary VRF_INSTANCE
```

Parameters

- **INSTANCES** Options include:
 - no parameter
 - *instance_name*
- **VRF_INSTANCE** Specifies the VRF instance.
 - no parameter
 - vrf *vrf_name*

Display Values

- System ID
- IPv4 Preference
- IPv6 Preference
- IS-Types
- LSP Generation interval
- SPF Interval
- Current SPF Hold Interval
- IS-Types Run Time
- Area Addresses
- Designated Intermediate Systems (DIS) Interfaces
- Link State DataBase (LSDB) size

Display Status

- Multi Topology
- Authentication Mode
- Graceful Restart
- Graceful Restart Helper

Example

This command displays general information about the configured IS-IS instances.

```
switch(config-router-isis-af)# show isis summary  
  
IS-IS Instance: 1 VRF: default  
System ID: 0000.0000.0001, administratively enabled  
Multi Topology disabled, not attached  
IPv4 Preference: Level 1: 115, Level 2: 115  
IPv6 Preference: Level 1: 115, Level 2: 115  
IS-Type: Level 1 and 2, Number active interfaces: 0
```

```
Routes both IPv4 and IPv6
LSP size maximum: Level 1: 9000, Level 2: 9000
          Max wait(s) Initial wait(ms) Hold interval(ms)
LSP Generation Interval:      5           50           50
SPF Interval:                2           1000         1000
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
level 1: number dis interfaces: 0, LSDB size: 1
level 2: number dis interfaces: 0, LSDB size: 1
```

15.4.7.67 show isis ti-lfa path

The **show isis ti-lfa path** command displays the repair path with the list of all the system IDs from the P-node to the Q-node for every destination/constraint tuple. You will see that even though node protection is configured, a link protecting LFA is computed too. This is to fallback to link protecting LFAs if the node protecting LFA becomes unavailable.

Examples

```
switch# show isis ti-lfa path 1111.1111.1005
TI-LFA paths for IPv4 address family
Topo-id: Level-2
Destination      Constraint          Path
1111.1111.1005  exclude node 1111.1111.1002  1111.1111.1003
                  exclude Vlan2387           1111.1111.1004
                                         SRLG strict        1111.1111.1002
```

```
switch# show isis ti-lfa path 10.10.10.1/32
TI-LFA paths for IPv4 address family
Topo-id: Level-1
Destination      Constraint          Path
10.10.10.1/32   exclude Vlan2387    1111.1111.1002
                  exclude node 1111.1111.1004  1111.1111.1003
                                         SRLG strict        1111.1111.1002
```

15.4.7.68 show isis ti-lfa tunnel

The TI-LFA repair tunnels are just internal constructs that are shared by multiple LFIB routes that compute similar repair paths. The **show isis ti-lfa tunnel** command displays TI-LFA repair tunnels with the primary and backup via information.

Example

```
switch#show isis ti-lfa tunnel 1
Tunnel Index 1
  via 10.0.1.2, 'Vlan2968'
    label stack 3
  backup via 10.0.0.2, 'Vlan2387'
    label stack 900004 900002
```

15.4.7.69 show monitor twamp-light

The **show monitor twamp-light** displays calculated one way and two way minimum delay. By default, information displays for all peer IP addresses configured on the remote end of the IS-IS point-to-point links. The output can be filtered for a specific IP address.

Command Mode

EXEC

Command Syntax

```
show monitor twamp-light [ip ip_address] detail
```

Parameters

- **ip ip_address** - Specify an IP address to filter the output to an IP address.
- **detail** - Displays details about the TWAMP configuration.

Examples

- Use the **show monitor twamp** command to display TWAMP information.

```
switch#show monitor twamp-light
Unit: microseconds

IP Address      Interface          One Way           Two Way
                  Minimum Delay     Minimum Delay
-----
1.0.0.2          Ethernet17/1      2742             5482
1.0.0.3          Ethernet18/1      2772             5544
```

- Add an IP address to filter the TWAMP output to a specific IP address.

```
switch#show monitor twamp-light ip 1.0.0.2
Unit: microseconds

IP Address      Interface          One Way           Two Way
                  Minimum Delay     Minimum Delay
-----
1.0.0.2          Ethernet17/1      2742             5482
```

- Use the **show monitor twamp-light detail** command to display all information about the TWAMP configuration on IP address 1.0.0.2.

```
switch#show monitor twamp-light ip 1.0.0.2 detail
IP address: 1.0.0.2
Interface: Ethernet17/1
Description: Interface Ethernet17/1
Sender profile name: defaultSender
Effective sampling rate: 1 packet every 1.0 second
Packets sent: 178
Packets received: 21

Unit: microseconds

Measurement      Min      Max      Avg      Variance
-----
One-way delay    2742    236072   19822   4294967295
Two-way delay    5482    472132   39642   4294967295
```

15.4.7.70 show monitor twamp-light counters

The **show monitor twamp-light counters** displays packet counters for TWAMP reflection on the IS-IS network. The **clear monitor twamp-light counters** command clears the TWAMP packet counters.

Command Mode

EXEC

Command Syntax

```
show monitor twamp-light counters [sender | reflector | drop] detail
```

Parameters

- **sender**
- **reflector**
- **detail**

Examples

- Use the **show monitor twamp-light counters** to display all counters.

```
switch# show monitor twamp-light counters
Sender statistics
-----  

IP Address      Interface      Rx Pkts   Tx Pkts  

-----  

1.0.0.2        Ethernet17/1     21       223

Reflector statistics
-----  

IP Address      Interface      Rx Pkts   Tx Pkts  

-----  

1.0.0.2        Ethernet17/1     2         2

Dropped packets statistics
-----  

Interface      Rx Dropped Pkts  

-----  

Ethernet17/1          0
```

- Use the **show monitor twamp-light counters drop detail** to display detailed information about dropped packets.

```
switch#show monitor twamp-light counters drop detail
Interface: Ethernet17/1
Invalid TWAMP packet: 0
Packet too small: 0
Wrong dst port: 0
Internal error: 0
Wrong EtherType: 0
Unknown IP address: 0
Incorrect timestamps: 0
```

15.4.7.71 show monitor twamp-light raw count

The **show monitor twamp-light raw** displays probe packet information for TWAMP reflection on the IS-IS network. The probe packet information includes the packet received time, sequence number, and the delay calculated on this packet.

By default, the output displays statistics for all received packets but can be limited with the parameter, **raw count**.

Command Mode

EXEC

Command Syntax

```
show monitor twamp-light [ip | interface] raw count number
```

Parameters

- **ip *ip_address*** - Specify an IP address to display probe packet information.
- **interface *interface_name*** - Specify an interface to display probe packet information.
- **raw count *number*** - Specify the number of probe packets to display in the output.

Example

Use the **show monitor twamp-light ip 1.0.0.2 raw count 5** command to display five (5) probe packets on IP address, 1.0.0.2.

```
switch# show monitor twamp-light ip 1.0.0.2 raw count 5
Address: 1.0.0.2
Last RX interface: Ethernet17/1
Two-way delays (in microseconds):
Rx time                 Seqnum      Delay
-----
2024-05-15 01:44:45.814785    19        10120.5
2024-05-15 01:44:44.824825    18        21474.2
2024-05-15 01:44:43.828435    17        25934.5
2024-05-15 01:44:42.828052    16        26654.2
2024-05-15 01:44:41.811446    15        11387.4
```

15.4.7.72 show mpls label ranges

The **show mpls label ranges** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

Command Mode

EXEC

Command Syntax

```
show mpls label ranges
```

Example

```
switch# show mpls label ranges
Start      End      Size      Usage
-----
0          15       16        reserved
16         99999    99984    static mpls
100000    116383   16384    isis (dynamic)
116384    362143   245760   free (dynamic)
362144    899999   537856   unassigned
900000    965535   65536    isis-sr
```

15.4.7.73 show mpls lfib route

The **show mpls lfib route** command displays the LFIB information for a specified route or for all routes. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

Command Mode

EXEC

Command Syntax

```
show mpls lfib route [label_num]
```

Parameter

- ***label_num*** Displays only the LFIB information for the specified route. If no label number is specified, the command displays information for all LFIB routes.

Examples

- This command displays LFIB information for all routes.

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
    M - Mpls Via, P - Pseudowire Via,
    I - IP Lookup Via, V - Vlan Via,
    VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
    VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
    NG - Nexthop Group Via
Source Codes:
    S - Static MPLS Route, B2 - BGP L2 EVPN,
    B3 - BGP L3 VPN, R - RSVP,
    P - Pseudowire, L - LDP,
    IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
    IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
    BL - BGP LU, ST - SR TE Policy,
    DE - Debug LFIB
IA 100000 [1]
    via M, 1.0.1.2, pop
    payload autoDecide, ttlMode uniform, apply egress-acl
    interface Vlan2930
IA 100001 [1]
    via M, fe80::200:eff:fe02:0, pop
    payload autoDecide, ttlMode uniform, apply egress-acl
    interface Vlan2930
IP 900008 [1]
    via M, 1.0.1.2, swap 900008
    payload autoDecide, ttlMode uniform, apply egress-acl
    interface Vlan2930
IP 900009 [1]
    via M, fe80::200:eff:fe02:0, swap 900009
    payload autoDecide, ttlMode uniform, apply egress-acl
    interface Vlan2930
switch#
```

- This command displays LFIB information only for the route labeled **900008**.

```
switch# show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
    M - Mpls Via, P - Pseudowire Via,
    I - IP Lookup Via, V - Vlan Via,
    VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
    VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
    NG - Nexthop Group Via
Source Codes:
    S - Static MPLS Route, B2 - BGP L2 EVPN,
    B3 - BGP L3 VPN, R - RSVP,
```

```
P - Pseudowire, L - LDP,
IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
BL - BGP LU, ST - SR TE Policy,
DE - Debug LFIB
IP 900008 [1]
    via M, 1.0.1.2, swap 900008
    payload autoDecide, ttlMode uniform, apply egress-acl
    interface Vlan2930 switch#
```

15.4.7.74 show mpls segment-routing bindings

The **show mpls segment-routing bindings** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

Command Mode

EXEC

Command Syntax

```
show mpls segment-routing bindings
```

Example

```
switch# show mpls segment-routing bindings
1.0.7.1/32
  Local binding: Label: 900002
  Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
  Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
  Local binding: Label: imp-null
  Remote binding: Peer ID: 1111.1111.1001, Label: 900004
  Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
  Local binding: Label: 900006
  Remote binding: Peer ID: 1111.1111.1001, Label: 900006
  Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

15.4.7.75 show tunnel fib

The **show tunnel fib** command that displays tunnels programmed in the tunnel FIB also includes the TI-LFA tunnels along with protected IS-IS SR tunnels.

Examples

```
switch# show tunnel fib ti-lfa 1

Type 'TI-LFA', index 1, forwarding None
  via 10.0.1.2, 'Vlan2968'
    label stack 3
  backup via 10.0.0.2, 'Vlan2387'
    label stack 900004 900002
```

```
switch# show tunnel fib isis segment-routing

Type 'IS-IS SR', index 1, endpoint 2002::b00:201/128, forwarding Primary
  via TI-LFA tunnel index 3 label 3
    via fe80::200:76ff:fe01:0, 'Ethernet30/1' label 900002
    backup via fe80::200:76ff:fe03:0, 'Ethernet26/1' label 132769

Type 'IS-IS SR', index 2, endpoint 2002::b00:101/128, forwarding Primary
  via TI-LFA tunnel index 4 label 3
    via fe80::200:76ff:fe01:0, 'Ethernet30/1' label 3
    backup via fe80::200:76ff:fe03:0, 'Ethernet26/1' label 132769 900001
```

15.4.7.76 shutdown (IS-IS)

The **shutdown** command disables IS-IS on the switch without modifying the IS-IS configuration.

The **no shutdown** and **default shutdown** commands enable the IS-IS instance by removing the **shutdown** command from *running-config*.

Command Mode

Router-ISIS Configuration

Command Syntax

```
shutdown  
no shutdown  
default shutdown
```

Examples

- These commands disable IS-IS on the switch.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# shutdown  
switch(config-router-isis)#
```

- This command enables IS-IS on the switch.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# no shutdown  
switch(config-router-isis)#
```

15.4.7.77 shutdown (IS-IS SR)

The **shutdown** and **default shutdown** commands administratively disable IS-IS SR on the switch without modifying the IS-IS SR configuration.

The **no shutdown** command enables IS-IS SR.

Command Mode

Segment-Routing MPLS Configuration

Command Syntax

```
shutdown  
no shutdown  
default shutdown
```

Examples

- These commands administratively disable IS-IS SR on the switch but preserve the IS-IS SR configuration.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# segment-routing mpls  
switch(config-router-isis-sr-mpls)# shutdown  
switch(config-router-isis-sr-mpls)#
```

- This command enables IS-IS SR on the switch.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# segment-routing mpls  
switch(config-router-isis-sr-mpls)# no shutdown  
switch(config-router-isis-sr-mpls)#
```

15.4.7.78 spf-interval

The **spf-interval** command sets the Shortest Path First (SPF) timer that defines the interval between IS-IS path calculations. The default value is two seconds.

This command also configures the maximum wait interval between any two SPF runs, initial wait interval before executing the first SPF computation, and the hold time between the first and second SPF runs.

The **no spf-interval** and **default spf-interval** commands restore the default maximum IS-IS path calculation interval to two seconds by removing the **spf-interval** command from **running-config**.

For information about viewing SPF interval values, see [Displaying IS-IS Instance Information](#).

Command Mode

Router-ISIS Configuration

Command Syntax

```
spf-interval max-wait [initial-wait | hold-time]  
no spf-interval  
default spf-interval
```

Parameters

- **max-wait** Value ranges from **1** through **300** seconds. Default maximum wait interval is **2** seconds.
- **initial-wait** Value ranges from **1** through **300000** ms. Default initial wait interval is **1000** ms.
- **hold-time** Value ranges from **1** through **300000** ms. Default hold interval is **1000** ms.

Guidelines

EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

Examples

- This command configures the SPF maximum wait interval to **50** seconds.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# spf-interval 50
```

- This command configures maximum wait interval, initial wait interval, and hold time to **20** seconds, **10000** ms, and **5000** ms respectively.

```
switch(config)# router isis inst1  
switch(config-router-isis)# spf-interval 20 10000 5000
```

- This command reverts the SPF interval configuration to its default value.

```
switch(config)# router isis Osiris  
switch(config-router-isis)# no spf-interval
```

15.4.7.79 timers local-convergence-delay

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

Command Mode

IS-IS address-family sub-mode

Command Syntax

```
timers local-convergence-delay [delay_in_seconds] protected-prefixes
```

Parameters

- ***delay_in_seconds*** The convergence delay, in seconds. A default of 10 seconds is used when the command is used without an explicitly specified delay.
- **protected-prefixes** The prefix which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

15.5 Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) exchanges routing information among neighboring routers in different Autonomous Systems (AS). Arista switches use BGP version 4+, incorporating the multiprotocol extensions defined by **RFC 4760** so that BGP can carry both IPv4 and IPv6 routes simultaneously over a single BGP peering.

This section contains the following topics:

- [BGP Conceptual Overview](#)
- [Configuring BGP](#)
- [BGP IPv6 Link Local Peers Discovery](#)
- [BGP Examples](#)
- [BGP Commands](#)

Arista switches support these BGP functions:

- A single BGP instance.
- Simultaneous internal (iBGP) and external (eBGP) peering.
- Multiprotocol BGP, including IPv4-mapped IPv6 address next hops for IPv6 labeled-unicast routes.
- BGP Confederations.
- BGP Selective Route Download.
- BGP Route Reflection.

15.5.1 BGP Conceptual Overview

Using TCP sessions, the BGP protocol exchanges routing information among neighboring routers in different autonomous systems.

BGP neighbors (peers) communicate through a TCP session on port **179**. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (iBGP) peers operate within a single Autonomous System (AS). External BGP (eBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: The router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, and then transitions to the **Connect** state.
- **Connect**: The router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: The router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent**: The router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: The router waits for a keepalive message from its peer. The router waits for a keepalive message from its peer. If the message is received before a timeout expires, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.

- **Established:** Peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length, autonomous systems in the path, the next hop, and information that affects the receiving router's acceptance policy. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

15.5.1.1 Multiprotocol BGP

Multiprotocol BGP facilitates the advertisement of network routes and switch capabilities to neighbors from multiple address families over a single BGP peering. The switch supports IPv4 unicast and IPv6 unicast address families.

Neighbors negotiate an address family when establishing a connection. This address family, which identifies the following, forms the basis of the peer session:

- The set of network layer protocols to which the address carried in the Next Hop field must belong.
- The encoding format of the next-hop address.
- The semantics of Network Layer Reachability Information (NLRI).

15.5.1.2 BGP Confederations

BGP confederations divide an Autonomous System (AS) into subsystems (sub-ASs), each identified by a unique sub-AS number while appearing externally as a single AS.

15.5.1.3 QoS Control of Neighbor Discovery and ARP Packets

To prevent BGP sessions from being affected by dropped neighbor discovery and ARP packets, some Arista switches assign those packets to a higher-priority output queue when they are being software-forwarded. This action helps minimize hardware drops when competing with data plane packet traffic congestion.

15.5.1.4 Best-path Selection

Routing information received via the BGP protocol often contains multiple routes to the same destination. The BGP best-path selection algorithm determines which routes to install in the routing table.

BGP evaluates criteria in order. At each step, if a tie occurs for the best path BGP applies the next criterion. If a tie still exists at the end of the process, BGP installs the route it received from the peer with the lowest address.

When Equal Cost Multi-Path (ECMP) routing is enabled, the system may install multiple paths to a single destination in the IP routing table.

Route preferences can be shaped through configuration choices as described in [Configuring Best-path Selection](#).

15.5.1.5 BGP Convergence

BGP supports convergence, which waits for all peers to join and receive all the routes from other peers.

Before declaring convergence, BGP waits for IGP protocols to converge so that all IBGP sessions are established and routes learned over IBGP sessions are resolved via the IGP routes. BGP declares convergence when it has received route updates from all its peers and End-Of-RIB (EOR) markers from all the expected peers and IGP protocols have converged. You can avoid hardware updates or route advertisement churn during a switch reload or a BGP instance start using BGP convergence.

15.5.1.6 BGP Communities

A BGP community is a group of subnet address prefixes that share a common identifying attribute. Communities simplify routing policies by consolidating IP network spaces into logical entities BGP speakers can address to accept, prefer, and distribute routing information. BGP communities are defined by setting the community value within route maps. Community lists then reference one or more communities as follows:

- **Standard** community lists refer to communities by name or number.
- **Expanded** community lists reference communities using regular expressions.

15.5.1.7 BGP Graceful Shutdown Community

Autonomous System Boundary Routers (ASBRs) do not update all paths received from external BGP sessions and routers. They hide inefficient alternate paths and update only best paths in the routing table. BGP route policies are applied to all internal BGP sessions of ASBRs that support the graceful shutdown procedure.

As a part of maintenance mode, these route policies perform the following functionalities on routing advertisements:

- Match the graceful shutdown community with route map rules.
- Set the local preference attribute value of the paths that are tagged with the graceful shutdown community as **0**.

Refer to [Maintenance Mode](#) for detailed information on maintenance mode.

15.5.1.8 BGP Labeled-Unicast (LU) Path Nexthop Resolution over Tunnel RIB Entries

BGP Labeled-Unicast Protocol (BGP LU) path next-hop is enhanced to allow BGP in **ribd** mode to support resolution of BGP LU path next-hop over entries in the Tunnel RIB and fall-back to resolving over connected route when there is no entry in Tunnel RIB that provides a direct match for the BGP LU path next-hop. Previously, BGP in “ribd” mode allowed resolution of BGP Labeled-Unicast Protocol (BGP LU) path next-hop over only connected routes, resolution of the next-hop over IGP or static routes was not allowed since the next-hop router may not be in the MPLS forwarding path in which case the traffic will get dropped by the next-hop router (per IGP).

The following two use cases explain how BGP LU path next-hop resolution over tunnels would help in achieving desired or efficient traffic forwarding.

- [Egress Peer Engineering \(EPE\)](#)
- [Inter-AS Option C](#)

Egress Peer Engineering (EPE)

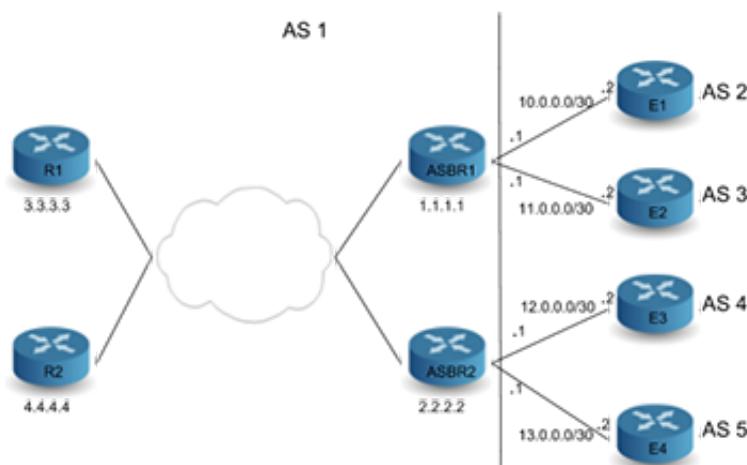

Egress Peer Engineering is a source-routing paradigm that provides ability to select an egress node/interface through which traffic goes out of an Autonomous System (AS). As shown in Figure 1 below R1, R2, ASBR1 & ASBR2 are in AS 1 and E1, E2, E3 & E4 are in different Ases. R1, R2, ASBR1 & ASBR2 could be connected each other directly or reachable to each other over an IGP (OSPF/ISIS) or MPLS tunnel. Let's assume

reachability of loop-back addresses 1.1.1.1, 2.2.2.2, 3.3.3.3 & 4.4.4.4 through LDP or Segment Routing (SR). There exists an iBGP Full Mesh between R1, R2, ASBR1 & ASBR2. eBGP session is present between ASBR1 & E1, ASBR1 & E2, ASBR2 & E3 and ASBR2 & E4. Consider following BGP updates are received on ASBR1:

Prefix **50.0.0.0/8** next-hop **10.0.0.2** as-path **2 100** from **E1**.

Prefix **50.0.0.0/8** next-hop **11.0.0.2** as-path **3 200 300** from **E2**.

BGP path from **E1** will be selected as best path due to shorter AS path length. **ASBR1** advertises this prefix to both **R1 & R2**. Any traffic destined to prefix **50.0.0.0/8** from **R1** will always be tunneled to **ASBR1** and then it will always be sent on an interface connected to **E1**. Traditional Destination based routing enforced by BGP policy and best path selection on the ASBRs may route traffic to a single AS as exit when a case can be made that for some prefixes an exit via some other AS may be preferable. BGP LU can be used here to perform traffic engineering or selecting Egress peer through which traffic should be forwarded.

A Centralized EPE Controller can be used to establish iBGP session with **R1** and **R2**. Let's assume Controller advertises BGP LU routes for **E2**, i.e., **11.0.0.2/32**, with next-hop set to loop-back IP address of **ASBR1**, that is, **1.1.1.1** and a label **111** to **R1 & R2**.

```

switch# show ip bgp 11.0.0.2/32
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 11.0.0.2/32
Paths: 1 available
  Local
    1.1.1.1 labels [111] from 100.100.100.1 (100.100.100.1)
      Origin IGP, metric 0, localpref 100, IGP metric 40, weight 0, received
      21:07:07 ago, valid, external, not installed
      Rx SAFI: Labels
      Tunnel RIB eligible
  
```

BGP LU path next-hop will get resolved over an ISIS SR tunnel present on **R1** and **R2** to reach **1.1.1.1**, loop-back IP address of **ASBR1**.

```

switch# show tunnel rib brief
  Endpoint   Tunnel Type Index(es)   Metric   Metric2 Preference   Preference2
  -----+-----+-----+-----+-----+-----+-----+-----+-----+
  1.1.1.1/32 IS-IS SR IPv4      5       40       0      115           0 switch#show bgp labeled-unicast tunnel
  Index   Endpoint      Nexthop/Tunnel Index Interface Labels Contributing Metric
  -----+-----+-----+-----+-----+-----+-----+-----+-----+
  1     11.0.0.2/32  IS-IS SR IPv4 (5)      -      [ 111 ]    Yes      0
  Metric 2 Pref Pref 2
  -----+-----+-----+-----+
  100    200    0 switch#show isis segment-routing tunnel
  Index   Endpoint      Nexthop      Interface      Labels
  -----+-----+-----+-----+-----+
  
```

```
5      1.1.1.1/32      6.6.6.6      Ethernet 5      [ 900001 ]
```

Controller or CLI can be used to install a static label route on **ASBR1** such that ingress label **111** have a forwarding action of “POP and forward” to next-hop (**11.0.0.2**) in MPLS forwarding table.

```
switch# show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 20 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
  M - Mpls Via, P - Pseudowire Via,
  I - IP Lookup Via, V - Vlan Via,
  VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
  VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
  NG - Nexthop Group Via
Source Codes:
  S - Static MPLS Route, B2 - BGP L2 EVPN,
  B3 - BGP L3 VPN, R - RSVP,
  P - Pseudowire, L - LDP,
  IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
  IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
  BL - BGP LU, ST - SR TE Policy,
  DE - Debug LFIB

S    111      [100]
        via M, 11.0.0.2, pop
        payload ipv4, apply egress-acl
        interface Ethernet 4
```

For prefixes to which traffic should be sent over interface connected **E2** controller will advertise a BGP route with next-hop being BGP LU prefix and higher local-preference compared to paths advertised by **ASBR1** and **ASBR2**, so that path received from controller will be preferred over paths coming from **ASBR1** and **ASBR2**.

```
switch# show ip bgp 50.0.0.0/8
BGP routing table information for VRF default
Router identifier 3.3.3.3, local AS number 1
BGP routing table entry for 50.0.0.0/8
Paths: 3 available
  Local
    11.0.0.2 from 100.100.100.1 (100.100.100.1)
      Origin IGP, metric 0, localpref 200, IGP metric 0, weight 0, received 00:00:15
      ago, valid, internal, best
      Rx SAIFI: Unicast
  2 100
    1.1.1.1 from 1.1.1.1 (1.1.1.1)
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:04:49
      ago, valid, internal
      Rx SAIFI: Unicast
  2 200 300
    2.2.2.2 from 2.2.2.2 (2.2.2.2)
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:30:38
      ago, valid, internal
      Rx SAIFI: Unicast
```

This results in pushing two labels on **R1**, top label is the label corresponding to ISIS SR tunnel to reach **ASBR1** and bottom label is the label that corresponds to egress interface. Similarly LU route for **12.0.0.2** or **13.0.0.2** can be advertised from controller to select egress peer between **E3** and **E4**. This approach provides Egress peer selection on an ingress router **R1/R2**.

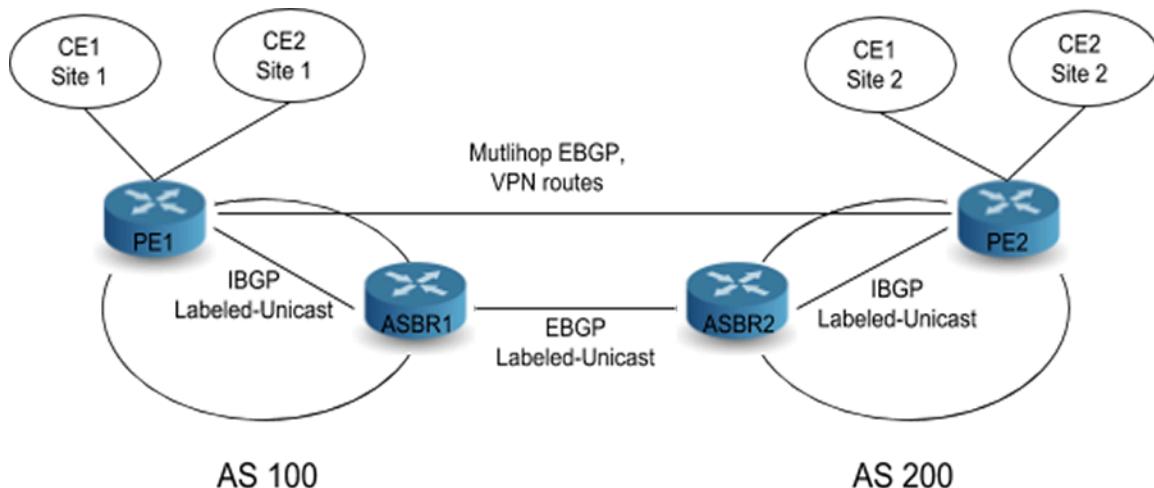

```
switch# show ip route 50.0.0.0/8
VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

B I      50.0.0.0/8 [200/0] via 11.0.0.2/32, BGP LU tunnel index 1
```

via 6.6.6.6, Ethernet 5, label 900001 111

Inter-AS Option C

Inter-AS Option C is an efficient and scalable MPLS IP VPN solution to provide connectivity between two sites of a customer connected to Provider Edge (PE) routers in different ASes. Following diagram shows a typical topology.

PE1 and **ASBR1** and **PE2** and **ASBR2** distribute loop-back addresses using an IBGP Labeled Unicast (LU) session. **ASBR2** advertises system addresses in **AS200** to **ASBR1** with next-hop as itself over EBGP LU session between them and installing Label swap entry of label sent to **ASBR1** (L2) to label received from **PE2** (L1) in MPLS forwarding table. **ASBR1** further propagates system addresses in **AS200** learned from **ASBR2** into **AS100** or to **PE1** using IBGP LU session with next-hop as itself and installing Label swap entry with label advertised to **PE1** (L3) to Label received from **ASBR2** (L2) in MPLS forwarding table. Similarly **ASBR1** sends system addresses in **AS100** to **ASBR2** over EBGP LU session, **ASBR2** forwards them into **AS200** or to **PE2** using IBGP LU session with itself as next-hop and this would trigger installing appropriate label swap actions into MPLS forwarding table. These advertisements results in the creation of a label switched path from **PE1** to **PE2**.

PE1 and **PE2** exchange VPN routes between each other using a Multi hop EBGP session with next-hop being their own loop-back/system addresses. This method eliminates the requirement of storing or sending/receiving VPN routes at ASBR routers. When PE and ASBR routers are non-adjacent, but in the same AS, then LDP or ISIS-SR can be used as a transport label signaling protocol and this would need resolving BGP LU path next-hop over LDP or ISIS-SR tunnel. An IP packet destined to an address in **CE1 site 2** is received on **PE1** from **CE1 site 1**. **PE1** would need to push 3 labels onto it. Bottom label corresponds to packet destination address in a particular VRF of **CE1 site 2** advertised by **PE2** to **PE1** over Multi hop EBGP session, Middle label belongs to **PE2** system address sent by **ASBR1** and top label corresponding to **ASBR1** system address assigned by transport label signaling protocol.

15.5.1.9 BGP Selective Route Download

BGP Selective Route Download allows the learning and advertising of BGP routes without installing them in hardware. The BGP routes are filtered before installation in hardware through the route map definition and routes that are filtered out are flagged as inactive in the Routing Information Base (RIB).

The route map used for filtering is applied only to BGP learned paths and not on locally originated routes, for example, BGP aggregate or redistributed routes. Also, because the BGP routes filtered by Selective Route Download are not active in the RIB, they are not used for recursive resolution, they are not redistributed into other protocols, and they do not contribute to BGP aggregates.

When BGP Selective Route Download is configured, the best path for peer advertisement is chosen based on the following aspects. If received BGP paths exist, then the best of them is advertised to BGP peers, else, the aggregate is preferred if configured and active. If neither BGP paths nor a BGP aggregate is available, then the RIB winner is advertised.

Note: The number of routes is limited based on the compute and memory resources available at runtime.

15.5.1.10 BGP Route Reflector

A BGP route reflector is a switch within an autonomous system that forwards route information learned from iBGP peers to other iBGP peers as an alternative to a full-mesh topology. When the switch is configured as a route reflector it can also be configured to preserve the BGP attributes of the reflected routes (next-hop, local preference, and metric) in its route advertisements regardless of outbound BGP policies.

15.5.1.11 BGP Nexthop Resolution RIBs: EVPN and IPV4/6 Labeled-Unicast Support

Adds the BGP Nexthop Resolution RIBs feature for EVPN and labeled-unicast address families.

BGP Nexthop Resolution RIBs: EVPN and IPV4/6 Labeled-Unicast Support adds support for user-configured BGP Nexthop Resolution RIB profiles for various BGP-based services such as IP unicast, L3 VPN, EVPN, etcetra. This feature allows an administrator to customize the next hop resolution semantics of BGP routes with an ordered list, or profile, of resolution RIB domains (for example, either tunnel or IP domain). This allows EOS to direct specific services over the specified RIB domains, overriding the default behavior. Further, this feature, through the use of user-defined tunnel RIBs, empowers an administrator to further select a subset of tunneling protocols for specific services.

Note: This feature is only available when running the multi-agent routing protocol model.

15.5.1.11.1 Support for Set Large Community List Limitations

Resolution of NLRI from (directly connected) eBGP Speakers

For IPv4 or IPv6 unicast NLRI received from eBGP, directly connected BGP sessions are resolved by only using connected routes, or **system-connected**, in the parlance of this feature. This feature does not change this behavior, nor will configuration of a non-default resolution profile affect this behavior.

Address Family Profile Restrictions

Certain BGP address families only support a subset of possible next-hop resolution profiles. This section documents such limitations.

| Address family | Restriction |
|---|---|
| IPv4/IPv6 unicast (non 6PE) | None. |
| IPv6 unicast 6PE | Only supports tunnel domains*. |
| IPv4/IPv6 unicast (eBGP directly connected) | Only supports system-connected; Not configurable. |
| IPv4/IPv6 VPN | Only supports tunnel domains* and system-connected. |
| IPv4/IPv6 LU | Only supports tunnel domains* and system-connected. |
| EVPN (MPLS) | Only supports tunnel domains* and system-connected. |
| EVPN (VXLAN) | Only supports IP domains+. |

* Tunnel domains refer to tunnel RIBs, e.g. system-colored-tunnel-rib, system-tunnel-rib, or user-defined tunnel RIBs.

+ IP domains are either of system-unicast-rib or system-connected.

15.5.1.12 BGP Logical OR of Multiple Community Lists in the Same Match Command

In the multi-agent routing protocol model, the BGP agent now supports matching community lists with a logical OR via the route map `match community or-results` command (same applies for extended and large communities with `match extcommunity` and `match large-community`).

Without the `or-results` portion of the command, the default is to compute the logical AND of all provided community lists. Before, one would need to merge existing community lists into one to do a logical OR:

Issue:

```
ip community-list COMMLIST1 permit 1:1
ip community-list COMMLIST2 permit 2:2

! No way to match "COMMLIST1" or "COMMLIST2" in a single
! route-map sequence
match community COMMLIST1 COMMLIST2
```

Workaround:

```
ip community-list standard mergedCommunityList permit 1:1
ip community-list standard mergedCommunityList permit 2:2

match community mergedCommunityList
```

15.5.1.12.1 Limitations

This feature is available only when configuring BGP in the multi-agent routing protocol model.

15.5.1.13 BGP Flowspec

The *EOS Release 4.21.3F* introduces support for BGP Flowspec, as defined in *RFC5575* and *RFC7674*. The typical use case is to filter or redirect DDoS traffic on edge routers.

BGP Flowspec rules are disseminated using a new BGP address family. The rules include both matching criteria used to match traffic, and actions to perform on the matching traffic. The rules are programmed into TCAM resources and applied on the ingress ports for which flowspec is enabled.

15.5.1.13.1 Release Updates

EOS Release 4.x enhancements:

- Added support for BGP Flowspec applied to SVI.
- BGP Flowspec releases TCAM banks as they are no longer needed to store matches. Previously, once TCAM banks allocated to BGP Flowspec, they never released.

EOS Release 4.22.0 Enhancements:

- Added support for redirect over MPLS or GRE Tunnels.
- Added support for traffic-rate action.

EOS Release 4.22.1 Enhancements:

Added support for hitless rule updates. This enhancement ensures that persistent filtering rules remain active while other filtering rules update, for example, a BGP Peer publishes or withdraws rules.

EOS Release 4.23.1 Enhancements:

- Added support for best-effort rule programming. When a switch receives more filtering rules from BGP neighbors than can fit within TCAM hardware, it programs the highest priority Flowspec rules up to the maximum TCAM available on a per-ASIC basis. The maximum TCAM available could either be the per-ASIC maximum free TCAM banks or the limit set by **feature flow-spec bank maximum tcam** in the hardware sub-configuration. (**LIMITATION** - the best-effort rule programming does not apply when Flowspec rules, after expansion into HW TCAM entries, occupy more than 24k 160b IPv4 or 320b IPv6 HW TCAM entries. In this case, programming fails, and no flowspec rules are programmed in hardware. This limitation is resolved in *EOS Release 4.24.2*).
- Added support for traffic-marking action. To enable traffic-marking action, the **feature flow-spec port (ipv4|ipv6)** command of the active TCAM profile must include action **set-dscp**.
- Added support for packet length (Type 10) component match on IPv4 packets. To enable matching on IPv4 packet length, the **feature flow-spec port ipv4** command of the active TCAM profile must include keyword **field ip-length**.

EOS Release 4.23.2 Enhancements:

- Added support for configuring BGP Flowspec in a non-default VRF. Only a single VRF is supported.
- Added support for packet length (Type 10) component match on IPv6 packets. To enable matching on IPv6 packet length, the **feature flow-spec port ipv6** command of the active TCAM profile must include the keyword **field ipv6-length**.

EOS Release 4.24.0 Enhancements:

Added support for configuring BGP Flowspec on subinterfaces. To enable subinterface support, the TCAM profile of the flow-spec feature must include **port qualifier size 3 bits** (see Flowspec TCAM Profile and Flowspec Policer TCAM Profile below).

EOS Release 4.24.1 Enhancements:

- Added support for BGP Flowspec in the DCS-7500R3 and DCS-7280R3 series.
- Added support for configuring BGP Flowspec in multiple VRFs.

EOS Release 4.24.2 Enhancements:

Removed *EOS Release 4.23.1* limitation to best effort programming.

EOS Release 4.25.2 Enhancements:

- Added support for BGP Flowspec applied to SVI.
- BGP Flowspec releases TCAM banks when no longer needed to store matches. Previously, once TCAM banks allocated to BGP Flowspec, they never released.

EOS Release 4.30.0F Enhancements

- Added support for below and above police counters.

EOS Release 4.30.1F Enhancements

- Added support for the source VRF override the configuration and apply flowspec rules received in a different VRF.

EOS Release 4.30.2F Enhancements

- Added support for displaying **per-match byte counters** in addition to packet counters in the output of `show flow-spec`.

EOS Release 4.31.1F Enhancements

- Added support for traffic-rate-packets policing action from *RFC8955*.

EOS Release 4.32.0F Enhancements

- Added support for Flowspec counter telemetry.

15.5.1.13.2 Limitations**BGP BGP FlowSpec Functionality**

- BGP BGP FlowSpec supports the following actions:
 - Drop
 - Redirect to a VRF
 - Redirect to a nexthop (https://tools.ietf.org/html/draft-simpson-idr-BGP_FlowSpec-redirect-02 and https://tools.ietf.org/html/draft-ietf-idr-BGP_FlowSpec-redirect-ip-02).
 - Redirect to an IPv6 nexthop (https://tools.ietf.org/html/draft-ietf-idr-BGP_FlowSpec-redirect-ip-02) supported only in EOS-4.22.0 or later.
 - Policer (*EOS Release 4.22.0 or later*)
 - Traffic-marking (*EOS Release 4.23.1 or later*)

To redirect to a nexthop, IP RIB must have a route to resolve the specified nexthop. When redirecting to a VRF, a default route for the VRF must be configured and traffic sent to the nexthop for the default route in this VRF.

- Prior to version *EOS Release 4.22.0*, to redirect to a nexthop or VRF, the resolving route cannot use the MPLS VPN or GRE tunnel, so the resolving route must have regular IP nexthop(s) for the redirect action. This limitation removed in *EOS Release 4.22.0*, except for the IPv6 GRE tunnels support for redirect action.
- All matching components described in *RFC 5575* supported, except for the following known caveats:
 - For TCP flags, the ECE, CWR, and NS flags not supported.
 - For fragment flags, only the ***Is a fragment (IsF)*** bit supported only for IPv4 packets. Combining source and destination ports and the Fragment flags in the same rule not supported.

-
- When enabling support for BGP FlowSpec policer, EOS disables the BGP FlowSpec counter feature due to a hardware limitation.
 - Beginning with *EOS Release 4.23.2*, the BGP FlowSpec address family can be configured in a non-default VRF. However, only a single VRF (default or non-default) may be used on *EOS Release 4.24.0* or earlier versions.
 - The additional BGP NLRI type (AFI=1, SAFI=134) which can be used to propagate traffic filtering information in a BGP/MPLS VPN environment not supported.
 - The validation procedure described in *RFC 5575* not supported. Any received BGP FlowSpec rules considered valid.
 - EOS Release 4.32.0F introduced support for BGP FlowSpec counter telemetry. BGP FlowSpec counters update periodically based on a specified interval. Currently, EOS supports an interval between 30 and 300 seconds. To enable BGP FlowSpec counter telemetry, use the following command:

```
flow-spec  
counters poll interval 30-300 seconds
```

BGP Limitations

- EOS does not support BGP FlowSpec rules for ECMP. If BGP FlowSpec receives the same rule from two peers and ECMP configured, only the actions received from the ECMP head apply.
- BGP Graceful Restart not supported.
- Policies applied on the BGP FlowSpec NLRI not supported. This means that prefix-list matching rules in a route-map do not match against BGP FlowSpec rules.
- BGP Additional Paths Send functionality not supported.

Platform Limitations

- BGP FlowSpec rules can only be applied to traffic received on ***routed Ethernet and Port-Channel*** interfaces in the initial release. Beginning with *EOS Release 4.24.0*, support for L3 subinterfaces added. Beginning with *EOS Release 4.25.0*, support for SVIs added. L2 interfaces not supported.
- Counters can either be reported for BGP FlowSpec or ACLs, but not both.
- With *EOS Release 4.24.1* and earlier versions, if the number of flow-spec rules exceed the available hardware TCAM resources, EOS removes all rules and logs a message.
- Reinstalling the entire set of BGP FlowSpec rules removes all existing rules from the hardware.

Scaling Limits

- that are supported in BGP FlowSpec depend on the match criteria of each rule. Assuming that BGP FlowSpec is the only TCAM feature enabled on the switch, it attempts to use all of the TCAM space available (24K entries per chip) in the forwarding chip. Simple BGP FlowSpec IPv4 rules map to one entry, allowing a max of 24K rules. Simple IPv6 rules each take two entries with a maximum of 12K rules.
- Some types of rules expand into multiple entries in the TCAM, for example, port ranges. Combining source and destination port ranges in a single rule multiplies the number of entries necessary to cover all combinations, which can quickly consume all of the TCAM space.
- The BGP FlowSpec and BGP FlowSpec Policer TCAM profiles support configuring the feature on up to seven VRFs starting with *EOS Release 4.24.1*. This scale can be adjusted with the number of bits in the feature's port qualifier size at the expense of removing other TCAM key fields.
- Make-before-break policer allocation affects scaling limits.

15.5.1.14 Support for Set Large Community List

EOS adds support to use large community lists in the set large community route map set clause.

The Support for Set Large Community List feature allows a large community list to be shared between a number of route maps. Changes to the large community list then affect all route-maps which use this list. This makes applying the same policy change to different inbound and outbound communication easier.

Properties of large communities and how to create large community lists are not be covered as those are described here.

15.5.1.14.1 Configuring Support for Set Large Community List

The following commands have been added to route map configuration:

```
set large-community large-community-list LIST1 [LIST2][additive | delete]
no set large-community large-community-list LIST1 [LIST2][additive | delete]
default set large-community large-community-list LIST1 [LIST2][additive | delete]
```

The following command replaces the large community value of the contents of the permit sequences of the specified large community list. It is possible to specify more than one large community list to the set clause. In this example, the community values in permit sequences in the lists are concatenated and applies in the set clause.

```
set large-community large-community-list LIST1 [LIST2]
no set large-community large-community-list LIST1 [LIST2]
default set large-community large-community-list LIST1 [LIST2]
```

The following command works similarly to the prior command, however, it does not replace communities already set on a route; it concatenates the community values with the values specified in the list. Duplicate communities are only shown once.

```
default set large-community large-community-list LIST1 [LIST2][additive]
set large-community large-community-list LIST1 [LIST2][additive]
no set large-community large-community-list LIST1 [LIST2][additive]
```

In the following command, the **delete** keyword is used. The **delete** keyword specifies that any large community values in the input matching any of the large community values (or large community value regular expressions) in the specified large community lists are removed.

```
default set large-community large-community-list LIST1 [LIST2][delete]
set large-community large-community-list LIST1 [LIST2][delete]
no set large-community large-community-list LIST1 [LIST2][delete]
```

Apply the following command to the concerned neighbour which large communities are to be sent, otherwise they are not sent.

```
neighbour x.x.x.x send-community large
```

15.5.1.14.2 Support for Set Large Community List Show Commands

Use the following command to show information about all of the configured route maps.

```
show route-map
```

This is an example output of the `show route-map` command.

```
switch# show route-map
route-map rm1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set large-community large-community-list lgl1 lgl2
```

15.5.1.14.3 Support for Set Large Community List Limitations

Resolution of NLRI from (directly connected) eBGP Speakers

For IPv4 or IPv6 unicast NLRI received from eBGP, directly connected BGP sessions are resolved by only using connected routes, or **system-connected**, in the parlance of this feature. This feature does not change this behavior, nor will configuration of a non-default resolution profile affect this behavior.

Address Family Profile Restrictions

Certain BGP address families only support a subset of possible next-hop resolution profiles. This section documents such limitations.

| Address family | Restriction |
|---|---|
| IPv4/IPv6 unicast (non 6PE) | None. |
| IPv6 unicast 6PE | Only supports tunnel domains*. |
| IPv4/IPv6 unicast (eBGP directly connected) | Only supports system-connected; Not configurable. |
| IPv4/IPv6 VPN | Only supports tunnel domains* and system-connected. |
| IPv4/IPv6 LU | Only supports tunnel domains* and system-connected. |
| EVPN (MPLS) | Only supports tunnel domains* and system-connected. |
| EVPN (VXLAN) | Only supports IP domains+. |

* Tunnel domains refer to tunnel RIBs, e.g. system-colored-tunnel-rib, system-tunnel-rib, or user-defined tunnel RIBs.

+ IP domains are either of system-unicast-rib or system-connected.

15.5.1.15 BGP Additional Paths Send Optimization

BGP Add-Path TX, or send, allows for a BGP speaker to advertise multiple paths (instead of a single best-path) for a prefix towards a peering BGP speaker. BGP Add-Path increases path diversity in a network. It restores fast traffic and has efficient link usage through multipathing. This can also be used as a monitoring solution for eligible paths to a monitoring or receiving Add-Path speaker.

Without Add-Path, a sending speaker only sends the best-path for a prefix and a receiving speaker collects all best-path announcements from its peers. The receiving speaker uses only the peer's address to identify the path.

With Add-Path, the sending speaker can potentially send multiple paths using distinct path-id's to a peer and the receiver can use to distinguish the multiple paths coming from the same sender.

15.5.1.16 Ordered Next Hops in FEC

In symmetric network topology, for the same Equal Cost Multi-Path (ECMP) route programmed at different devices in a switch layer, the various devices can program ECMP next-hops in the Forwarding Equivalence Class (FEC) for that route in varying orders. This could result in inconsistent hashing of traffic for those destination routes at the same layer of switches in the network and could be undesired behavior for certain classes of applications. Ordered FEC is an approach to order the next hops in the FEC of a route based on a network-wide device identifier for each next-hop resulting inconsistent ordering of next hops in the FEC for a route across all switches in a layer.

A BGP router-id can be used as a unique network-wide device identifier and BGP paths received from various peers for a BGP ECMP route can have their paths and subsequently, next-hops sorted based on the corresponding peer's router-id. Ordered Next Hops in the FEC feature would use the BGP router-id to achieve a consistent ordering of next hops in the FEC for a route. This feature is available with multi-agent routing protocol models.

EOS supports mixed IPv4 and IPv6 next hops in a network. An ECMP FEC may have an IPv4 primary route with a secondary IPv6 next hop or an IPv6 route with a secondary IPv4 next hop.

15.5.1.16.1 Configuring Ordered Next Hops in FEC

Use the following configuration commands to implement Ordered FEC solution for BGP routes.

- The BGP instance must be configured to order ECMP paths received for a BGP route deterministically using **bgp bestpath tie-break router-id** under **router bgp** configuration mode.

```
switch(config)# router bgp 100
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp)# bgp bestpath tie-break router-id
switch(config-router-bgp)#

```

Note: Other tie-break options available under **router bgp** configuration mode is not supported for Ordered Next Hops in FEC solution.

- The device must be configured to enforce ordering of next hops as determined by the protocol agents in the FEC programmed for the route using the **rib fib fec ecmp ordered** command under **router general** configuration mode.

```
switch(config)# router general
switch(config-router-general)# rib fib fec ecmp ordered
switch(config-router-general)#

```

15.5.1.16.2 Ordered FEC Show Commands

The **show ip route fec** command displays if the next-hops in the FEC of a route have been ordered. The output below indicate the show command output before enabling the Ordered FEC solution on the device, and after enabling it. The **show ip bgp** command output is also included to correlate next hop with corresponding router-id of the peer that the path was received from.

Example

```
switch# show ip bgp 1.0.16.0
BGP routing table information for VRF default
```

```

Router identifier 0.0.0.1, local AS number 1

```

15.5.1.16.3 Limitations

Ordered FEC is supported only for IPv4 and IPv6 BGP ECMP routes received with directly connected next hops.

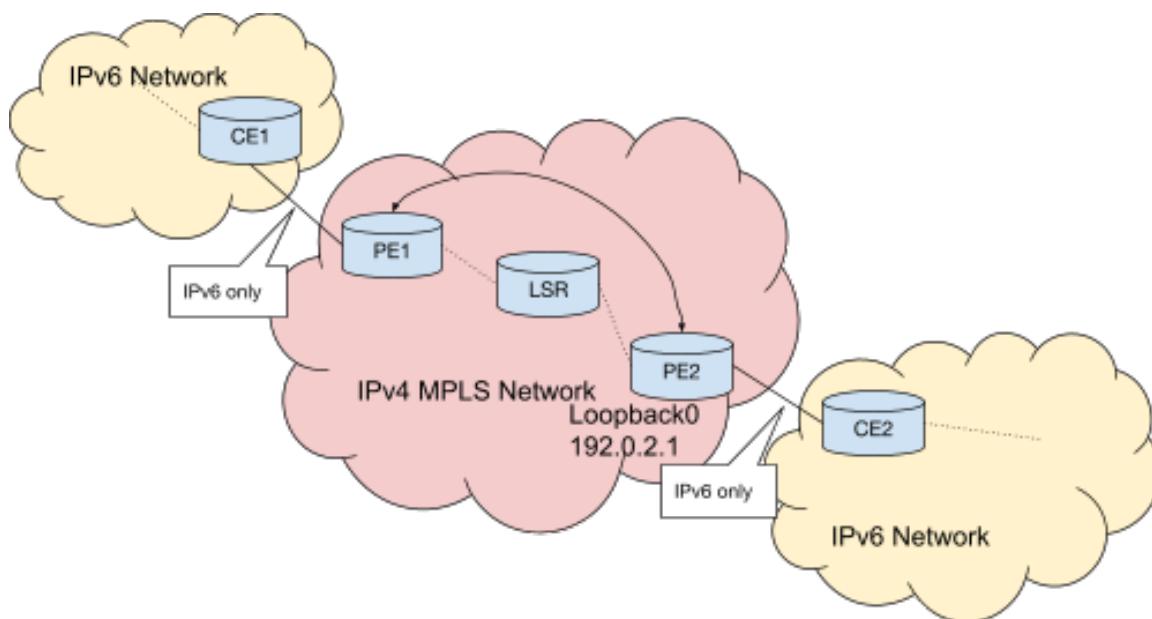

15.5.1.17 BGP IPv4-mapped IPv6 Address Next Hops for IPv6 Labeled-Unicast Routes

A BGP router in an IPv4 network may need to receive or send labeled-unicast routes to and from IPv6 networks. A receiving BGP router can be configured so that when it receives a next hop with an IPv4-mapped IPv6 address, the IPv4 address is used for resolving the next hop. Similarly, a sending BGP router can use the IPv4-mapped IPv6 address of its interface as the next hop. For example, this allows IPv6 labeled-unicast EPE bindings to be carried across an IPv4 MPLS network with a next hop corresponding to the border node's loopback IPv4-mapped IPv6 address. The iBGP peer receiving the IPv6 labeled-unicast EPE bindings resolves the IPv4-mapped IPv6 next hop over a IPv4 MPLS transport tunnel.

Example

In this example, a labeled-unicast path from a BGP router in one IPv6 network needs to cross an IPv4 MPLS network to a BGP router in another IPv6 network, as shown in the figure.

Figure 15-14: IPv4-mapped IPv6 address example

- Customer edge router CE2 advertises an IPv6 labeled-unicast route to provider edge router PE2.
- PE2 advertises to PE1 the IPv6 labeled-unicast route using the IPv4-mapped address of its loopback interface.
- PE1 receives the IPv6 labeled-unicast route, and uses the IPv4 address of the IPv4-mapped IPv6 address in order to resolve the next hop. It resolves to PE2 with an IPv4 multiprotocol label switching (MPLS) tunnel.
- PE1 advertises the IPv6 labeled-unicast route to CE1.

This allows a BGP speaker to send and receive IPv6 labeled-unicast paths with IPv4-mapped IPv6 next hops through the use of appropriate send-side policy and receive-side policy.

15.5.1.18 BGP Monitoring Protocol for a Multi-agent Model

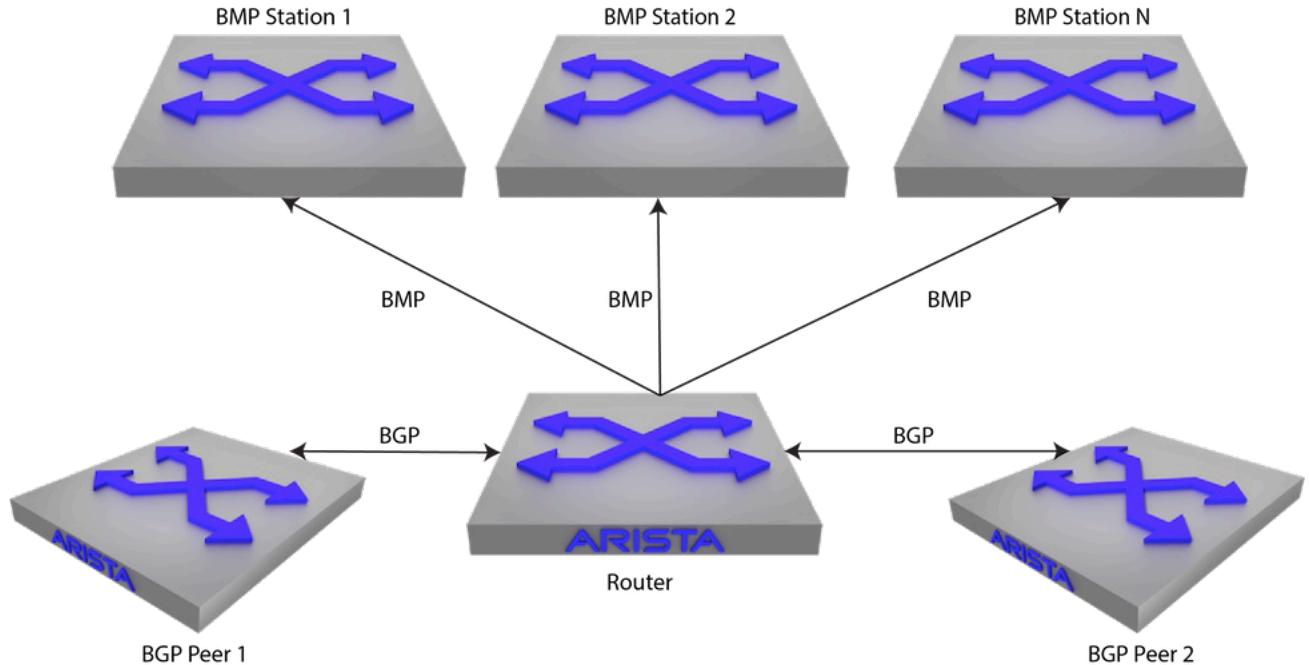

BGP Monitoring Protocol (BMP) allows a monitoring station to connect to a router and collect all BGP announcements received from the BGP peers of the router. BGP sends announcements to the monitoring station as BMP Route Monitoring messages generated from path information in the BGP internal tables on the router. A BMP speaker may choose to send either Adj-Rib-In routes or Loc-Rib routes, or both.

The router sends unidirectional BMP messages to the monitoring station and does not send monitoring messages from the monitoring station to the router. The router configuration controls the information sent to a monitoring station.

In addition to sending Route Monitoring messages, BMP also sends the following messages:

- **Initiation** - Sent at the beginning of a session and identifies the router.
- **Termination** - An optional message sent at the end of a session that contains the reason for closing the session.
- **Peer Up** - Indicates the BGP peer has an established state.
- **Peer Down** - Indicates the BGP peer transitioned to an unestablished state.

Figure 15-15: BGP Monitoring Protocol Overview

15.5.2.1 Configuring BGP Instances

15.5.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified Autonomous System (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in *RFC 4893*. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than **65535** with the well-known two-byte AS number **23456** (also called AS_TRANS), and encode the actual four-byte AS numbers using the **AS4_PATH** attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The **router bgp** command places the switch in the **router-BGP** configuration mode for creating a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

Example

This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS **50** if an instance was not previously created.

```
switch(config)# router bgp 50
switch(config-router-bgp) #
```

When a BGP instance exists, the **router bgp** command must include its autonomous system. Any attempt to create a second instance results in an error message.

Example

This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)# router bgp 100
% BGP is already running with AS number 50
switch(config)#+
```

15.5.2.1.2 Configuring BGP in a VRF

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the **vrf** command within router-BGP configuration mode to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is performed in the VRF submode of the router-BGP configuration mode. This submode is also where a Route Distinguisher (RD) is configured for a VRF on switches running Ethernet VPN (EVPN): use the [rd \(Router-BGP VRF and VNI Configuration Modes\)](#) command to configure an RD for a VRF.

Examples

- These commands place the switch in BGP VRF configuration mode for VRF **purple**. Commands issued in this mode override the global BGP configuration for the specified VRF instance.

```
switch(config)# router bgp 1
switch(config-router-bgp)# vrf purple
switch(config-router-bgp)#+
```

- These commands activate IPv6 address-family support for the IPv6 neighbor **2001:0DB8:8c01::1** in VRF **purple**.

```
switch(config-router-bgp-vrf-purple)# router-id 1.1.1.1
switch(config-router-bgp-vrf-purple)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp-vrf-purple)# address-family ipv6
switch(config-router-bgp-vrf-purple-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-vrf-purple-af)#+
```

- This command configures a route distinguisher for VRF **purple**.

```
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#+
```

15.5.2.1.3 Using RCF in BGP configuration

RCF functions support in EOS allows application of a BGP configuration to filter routes and update route attributes. RCF functions can be configured for inbound and outbound updates on BGP neighbors under the IPv4 unicast, IPv6 unicast, IPv4 labeled unicast, and IPv6 labeled unicast address families.

Examples

- These commands configure the switch in RCF functions for IPv4 application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# address-family ipv4
```

```
switch(config-router-bgp-af)# neighbor 192.168.0.1 rcf in INBOUND_POLICY()
switch(config-router-bgp-af)# neighbor 192.168.0.1 rcf out OUTBOUND_POLICY()
```

- These commands configure the switch in RCF functions for IPv6 unicast application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor 192.168.0.1 rcf in LU_INBOUND_POLICY()
switch(config-router-bgp-af-label)# neighbor 192.168.0.1 rcf out LU_OUTBOUND_POLICY()
```

- These commands configure RCF function with the redistribute configuration statement for connected and static routes.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# redistribute connected rcf CONNECTED_POLICY()
switch(config-router-bgp)# redistribute static rcf STATIC_POLICY()
```

- These commands configure RCF function on routes redistributed into BGP from IS-IS. Level 1, level 2, or both IS-IS level routes can be specified for RCF application.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# redistribute isis level-1 rcf ISIS_LEVEL_1_POLICY()
switch(config-router-bgp)# redistribute isis level-2 rcf ISIS_LEVEL_2_POLICY()
switch(config-router-bgp)# redistribute isis level-1-2 rcf ISIS_LEVEL_1_2_POLICY()
```

15.5.2.2 Configuring BGP Neighbors

15.5.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- Internal neighbors** are in the same autonomous system.
- External neighbors** are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- Static neighbors** are established by manually configuring the connection.
- Dynamic neighbors** are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

Static BGP Neighbors

The [neighbor remote-as](#) command connects the switch with a peer, establishing a static neighbor.

Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (for example, in an IPv6-only environment), configure an appropriate router ID using the [router-id \(BGP\)](#) command.

Examples

- These commands establish an internal BGP connection with the peer at **10.1.1.14**.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor 10.1.1.14 remote-as 50
switch(config-router-bgp) #
```

- These commands establish an external BGP connection with the peer at **192.168.2.5**.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor 192.168.2.5 remote-as 100
switch(config-router-bgp) #
```

Dynamic BGP Neighbors

The [bgp listen range](#) command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

Example

These commands create a peer group called “brazil” which accepts dynamic peering requests from the **192.168.2.0/24** subnet.

```
switch(config)# router bgp 50
switch(config-router-bgp)# bgp listen range 192.168.2.0/24 peer-group brazil remote-as 50
switch(config-router-bgp) #
```

Displaying Neighbor Connections

The [show ip bgp summary](#) and [show ip bgp neighbors](#) commands display neighbor connection status.

Example

This command indicates the connection state with the peer at **192.168.2.5** is **Estab** (established). The peer is an external neighbor because it is in AS **100** and the local server is in AS **50**.

```
switch# show ip bgp summary
BGP summary information for VRF default
BGP router identifier 192.168.104.2, local AS number 50
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS  MsgRcvd  MsgSent   InQ  OutQ  Up/Down State    PfxRcd PfxAcc
  192.168.2.5  4  100     198       281      0      0 03:11:31 Estab    12      12 switch#
```

Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the **default** form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the [neighbor peer group \(create\)](#) command, or by using the [bgp listen range](#) command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the [neighbor peer group \(neighbor assignment\)](#) command. The [neighbor peer group \(neighbor assignment\)](#) command removes a neighbor from a static peer group.

The [neighbor peer group \(create\)](#) command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.

Examples

- These commands create a peer group named **akron**.

```
switch(config)# router bgp 50
switch(config-router-bgp)# neighbor Akron peer group
switch(config-router-bgp) #
```

- This command adds the neighbors at **1.1.1.1** and **2.2.2.2** to peer group **akron**.

```
switch(config-router-bgp)# neighbor 1.1.1.1 peer group Akron
switch(config-router-bgp)# neighbor 2.2.2.2 peer group Akron
switch(config-router-bgp) #
```

- These commands configure the members of peer group **akron**, but cause the neighbor at **1.1.1.1** to use the system default value for out-delay.

```
switch(config-router-bgp)# neighbor Akron remote-as 109
switch(config-router-bgp)# neighbor Akron out-delay 101
switch(config-router-bgp)# neighbor Akron maximum-routes 12000
switch(config-router-bgp)# no neighbor 1.1.1.1 out-delay
switch(config-router-bgp) #
```

Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which makes a peer request to the switch. Members of dynamic peer group are configured in groups and not as individuals. A dynamic peer group name is used as a parameter to apply the configuration across all the members in the group. Neighbors joining the group inherit any settings already created for the group.

The [bgp listen range](#) command is used to create a dynamic peer group. This command identifies the BGP peering request from a range of IP address, and names the dynamic peer group to which those peers belong to. The [bgp listen range](#) command can be configured to accept a peering request from a single AS number or to accept peer request from the range of AS numbers. To accept the request from the range of AS numbers use the **peer filter** option in the command as shown. If the peer filter referred by the [bgp listen range](#) command does not exist, or if the filter exists but has no match commands, it will accept any AS number.

Note: When a listen range command is modified, any existing dynamic neighbor that is already established will get reset.

To delete a dynamic peer group, use the **no** or **default** form of the [bgp listen range](#) command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Examples

- These commands create a dynamic peer group called **brazil** in a single AS, which accepts peering requests from the **192.0.2.0/24** subnet the single AS is **5**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group brazil remote-as 5
switch(config-router-bgp)#

```

- These commands create a dynamic peer group called **brazil** in a range of ASNs, which accepts peering requests from the **192.0.2.0/24** subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group brazil peer-filter group-1
switch(config-router-bgp)#

```

- The **show ip bgp peer-group** command displays the source of a listen range's remote AS number definition as shown.

```
switch(config-router-bgp)# show ip bgp peer-group
BGP peer-group is brazil
  BGP version 4
  Listen-range subnets:
    VRF default:
      192.0.2.0/24, remote AS 5
      192.0.2.0/24, peer filter group1
switch(config-router-bgp)#

```

15.5.2.2.2 Peer Filter

A peer filter defines a set of rules to decide whether to accept or reject the incoming peer request based on the peer's attributes. The peer filter is defined using a sequence number and a match statement, and supports one new match statement for matching against a range of BGP AS numbers. A peer filter is defined in peer filter configuration mode as shown. The peer filter command supports only matching AS ranges. Unlike route maps, peer filters do not support sets, continuations or subroutines.

To delete a peer filter, use the **no peer filter** or **default peer filter** commands.

Examples

- These commands define a peer filter that accepts any AS number.

```
switch(config)# peer-filter group1
switch(config-peer-filter-group1)# 10 match as-range 1-4294967295 result accept
switch(config-peer-filter-group1)#

```

- These commands define a peer filter that accepts any AS number between **65000** and **65100** (inclusive) except **65008** and **65009**.

```
switch(config)# peer-filter group2
switch(config-peer-filter-group2)# 10 match as-range 65008-65009 result reject
switch(config-peer-filter-group2)# 20 match as-range 65000-651000 result accept
switch(config-peer-filter-group2)#

```

- These commands define a peer filter that accepts **3** specific remote AS numbers.

```
switch(config)# peer-filter group3
switch(config-peer-filter-group3)# 10 match as-range 65003 result accept
switch(config-peer-filter-group3)# 20 match as-range 65007 result accept
switch(config-peer-filter-group3)# 30 match as-range 65009 result accept
switch(config-peer-filter-group3)#

```

- The **show peer-filter** command displays the peer filter definition.

```
switch(config)# show ip bgp peer-group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
switch(config)#

```

15.5.2.2.3 Special Considerations for IPv6

BGP predates the use of IPv6, and BGP configuration assumes IPv4 connections by default. The following additional steps are used to configure IPv6 BGP neighbors.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the **router-id (BGP)** command.

Activating IPv6 Neighbors

By default, the switch does not negotiate or advertise IPv6 BGP routes. In order to establish a session with an IPv6 neighbor, it must be made active in the IPv6 address family. The **ipv6-unicast** option of the **bgp default** command causes the switch to send IPv6 capability messages and all network advertisements with IPv6 prefixes to all BGP neighbors. The **neighbor activate** command issued in IPv6 address family configuration mode does the same for a single BGP neighbor.

Examples

- These commands make all BGP neighbors active in the IPv6 address family.

```
switch(config)# router bgp 11
switch(config)# address-family ipv6
switch(config-router-bgp-af)# bgp default ipv6-unicast
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#

```

- These commands make the BGP neighbor at **2001:0DB8:8c01::1** active in the IPv6 address family.

```
switch(config)# router bgp 11
switch(config)# address-family ipv6
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#

```

Sending IPv4 NLRI over IPv6 Connections

The switch supports the exchange of IPv4 NLRI with IPv6 neighbors. To enable this feature for all IPv6 neighbors, use the **ipv4-unicast transport ipv6** option of the **bgp default** command in the **IPv4 address family** configuration mode. To enable it for a single IPv6 neighbor, use the **neighbor activate** command for that neighbor in the **IPv4 address family** configuration mode.

To send IPv4 NLRI to IPv6 neighbors, the IPv4 next-hop address must also be communicated. To explicitly configure an IPv4 next hop to send to a specific IPv6 neighbor, use the **neighbor local-v4-addr** command. In some network configurations, the switch can also be configured to automatically determine the best IPv4 next-hop address for an individual IPv6 neighbor or for all neighbors in the VRF using the **neighbor auto-local-addr** command.

Examples

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors, then configure the switch to automatically select a local IPv4 address to be sent in NLRLs to the IPv6 neighbors in a peer group called **indianapolis**.

```
switch(config)# router bgp 11
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# neighbor indianapolis auto-local-addr
switch(config-router-bgp) #
```

- These commands permit IPv4 NLRI transport with the IPv6 neighbor at **2001:0DB8:8c01::1** using a local IPv4 address of **10.7.5.11**.

```
switch(config)# router bgp 11
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 local-v4-addr 10.7.5.11
switch(config-router-bgp) #
```

15.5.2.2.4 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging KEEPALIVE, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (**hold time**) close the BGP session with that peer. Hold time is typically three times the period between scheduled KEEPALIVE messages. The default keepalive period is **60** seconds; default hold time is **180** seconds.

The [timers bgp](#) command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

Example

This command sets the keepalive period to **15** seconds and the hold time to **45** seconds.

```
switch(config-router-bgp)# timers bgp 15 45
switch(config-router-bgp) #
```

The [show ip bgp neighbors](#) command displays the hold time.

Example

This command indicates the BGP hold time is **45** seconds.

```
switch# show ip bgp neighbors 10.100.100.2
BGP neighbor is 10.100.100.2, remote AS 100
BGP version 4, remote router ID 192.168.100.13, VRF default
    Negotiated BGP version 4
    Last read 00:00:05, last write 00:00:05
    Hold time is 45, keepalive interval is 15 seconds      <= hold time
    Configured hold time is 45, keepalive interval is 15 seconds
    Connect timer is inactive
    Idle-restart timer is inactive
    BGP state is Established, up for 04:44:05
    Number of transitions to established: 11
    Last state was OpenConfirm
    Last event was RecvKeepAlive
    Last sent notification:Cease/administrative reset, Last time 04:44:09
    Last rcvd notification:Cease/peer de-configured, Last time 2d02h, First time 7d08h, Repeats 1
    Neighbor Capabilities:
        Multiprotocol IPv4 Unicast: advertised and received and negotiated
```

```
Four Octet ASN: advertised and received
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch#
```

15.5.2.2.5 Neighbor Route Configuration

Maximum Routes

The [neighbor maximum-routes](#) command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

Example

This command configures the switch to accept **15,000** routes from the peer at **192.168.18.24**.

```
switch(config-router-bgp) # neighbor 192.168.18.24 maximum-routes 15000
switch(config-router-bgp) #
```

Route Reflection

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers; they do not re-advertise iBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of iBGP messages when scaled. Alternatively, one or more routers can be configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through iBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The [neighbor route-reflector-client](#) command configures the switch to act as a route reflector and configures the specified neighbor as a client. The [bgp client-to-client reflection](#) command enables client-to-client reflection.

Cluster IDs When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple route reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to recognize updates from other cluster reflectors. The command configures the cluster ID in a cluster with multiple route reflectors.

Attribute Preservation Outbound BGP policies can rewrite the BGP attributes (next-hop, local preference and metric) of routes advertised by a route reflector. To configure the route reflector to preserve these attributes regardless of policy (unless those policies are included in a route map), use the [bgp route-reflector preserve-attributes](#) command. To include route attributes at all times (even contrary to policies included in route maps), use the always option of the command.

Client-to-client Reflection Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled using the [bgp client-to-client reflection](#) command.

Examples

- These commands configure the switch as a route reflector and the neighbor at **172.72.14.5** as one of its clients, set the cluster ID to **172.22.30.101**, and configure the reflector to preserve all BGP attributes of re-advertised routes.

```
switch(config-router-bgp)# neighbor 172.72.14.5 route-reflector-client
switch(config-router-bgp)# bgp cluster-id 172.22.30.101
switch(config-router-bgp)# bgp route-reflector preserve-attributes
switch(config-router-bgp)#

```

- This command displays the global BGP status for the default VRF, including route reflector configuration.

Note: The value of the “Attributes of reflected routes” can be **preserved** (reflected routes maintain attributes unless they are removed by an outbound BGP policy map), **always preserved** (reflected routes maintain BGP attributes regardless of all policies), or **not preserved** (reflected routes do not maintain their BGP attributes).

```
switch# show bgp instance
BGP instance information for VRF default
BGP Local AS: 64512, Router ID: 1.1.4.1
Total peers: 14
Configured peers: 14
UnConfigured peers: 0
Disabled peers: 4
Established peers: 9
Graceful restart helper mode enabled
Attributes of reflected routes are preserved
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged: yes, Time taken to converge: 00:05:44
    Outstanding EORs: 0, Outstanding Keepalives: 0
Convergence timeout: 00:10:00 switch#

```

Route Preference

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

Local preference is a metric that iBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the **LOCAL_PREF** field.

The **neighbor export-localpref** command specifies the **LOCAL_PREF** that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

Example

This command configures the switch to enter **200** in the **LOCAL_PREF** field of UPDATE packets it sends to the peer at **10.1.1.45**.

```
switch(config-router-bgp)# neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#

```

The **neighbor import-localpref** command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

Examples

- This command configures the switch to assign the local preference of **50** for routes advertised from the peer at **172.16.5.2**.

```
switch(config-router-bgp)# neighbor 172.16.5.2 import-localpref 50

```

```
switch(config-router-bgp) #
```

The [show ip bgp](#) command displays the **LOCAL_PREF** value for all listed routes.

- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 192.168.100.23, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e
- ECMP S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
Nexthop

      Network          Next Hop       Metric LocPref Weight   Path
* >Ec 10.10.20.0/24    192.168.31.3     0      400      0  64512 i switch#
```

Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the [graceful-restart-helper](#) command. Per-peer configuration takes precedence over the [global](#) configuration.

Examples

- This command disables graceful restart helper mode for all BGP peers.

```
switch(config-router-bgp) # no graceful-restart-helper
switch(config-router-bgp) #
```

- This command disables graceful restart helper mode for the neighbor at **192.168.32.5** regardless of global configuration.

```
switch(config-router-bgp) # no neighbor 192.168.32.5 graceful-restart-helper
switch(config-router-bgp) #
```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths are retained after the BGP session is re-established is **300** seconds by default, but can be configured using the [graceful-restart stalepath-time](#) command.

Example

This command configures BGP to discard stale paths from a restarting peer **500** seconds after the BGP session with that peer is re-established.

```
switch(config-router-bgp) # graceful-restart stalepath-time 500
switch(config-router-bgp) #
```

15.5.2.2.6 Filtering Routes

Filtering with Route Maps

Route maps are used in BGP to directly filter IPv4 unicast routes. The [neighbor route-map \(BGP\)](#) command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the [show ip bgp neighbors](#) command.

The redistribution of BGP unicast routes into multicast address families allows the network to take a different path for the multicast traffic. It allows redistribution of IPv4 unicast routes into the IPv4 multicast address family and IPv6 unicast routes into the IPv6 multicast address family.

The following command configures the redistribution of IPv4 unicast routes into IPv4 multicast address family in both default and non-default VRF.

```
switch(config-router-bgp) # address-family ipv4 multicast  
switch(config-router-bgp-af) # route input address-family ipv4 unicast rcf onePfx()
```

The following commands shows the two BGP unicast routes that are received by **bgptr1**.

```
bgptr1(config-router-multicast)# show bgp ipv4 unicast  
BGP routing table information for VRF default  
Router identifier 1.1.1.1, local AS number 100  
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP  
          S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast  
          % - Pending BGP convergence  
Origin codes: i - IGP, e - EGP, ? - incomplete  
RPKI Origin Validation codes: V - valid, I - invalid, U - unknown  
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop  
  
      Network           Next Hop         Metric   AIGP     LocPref  Weight  Path  
* > 10.10.10.1/32    1.1.1.2          0        -       100      0       200 i  
* > 10.10.20.1/32    1.1.1.2          0        -       100      0       200 i
```

The following command shows BGP IPv4 multicast output, when a RCF function filters **10.10.20.1/32**.

```
bgptr1# show bgp ipv4 multicast  
BGP routing table information for VRF default  
Router identifier 1.1.1.1, local AS number 100  
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP  
          S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast  
          % - Pending BGP convergence  
Origin codes: i - IGP, e - EGP, ? - incomplete  
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop  
  
      Network           Next Hop         Metric   AIGP     LocPref  Weight  Path  
* > 10.10.20.1/32    1.1.1.2          -        -       -        0       ?
```

Filtering with BGP Communities

Community values are assigned to a set of subnet prefixes through route map **set** commands. Route map **match** commands subsequently use community values to filter routes. The switch uses the following **ip community-list** commands to filter community routes into a BGP domain:

- [ip community-list](#) creates a community list by explicitly referencing one or more communities by name or number.
- [ip community-list regexp](#) creates a community list by referencing one or more communities by regular expression.
- [ip extcommunity-list](#) creates an extended community list to identify routes for VRFs or for Link BandWidth (LBW) by explicitly referencing extended communities by prefix and number.
- [ip extcommunity-list regexp](#) creates an extended community list to identify routes for VRFs or for Link BandWidth (LBW) by regular expression.

The BGP community attribute is a **32** bit value formatted as follows:

- an integer between **0** and **4294967040**.
- AA:NN, where AA is **65535** and NN specifies the community number (**0-65535**) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

Example

- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an **ip community-list** command to permit the routes into the BGP domain.

1. Compose the IP prefix list.

```
switch(config)# ip prefix-list PL_1 permit 10.1.2.5/24
switch(config)# ip prefix-list PL_1 permit 10.2.5.1/28
switch(config)#

```

2. Create a route map that matches the IP prefix list and sets the community value.

```
switch(config)# route-map MAP_1 permit
switch(config-route-map-MAP_1)# match ip address prefix-list PL_1
switch(config-route-map-MAP_1)# set community 500
switch(config-route-map-MAP_1)# exit
switch(config)#

```

3. Create a community list that references the community.

```
switch(config)# ip community-list CL_1 permit 500
switch(config)#

```

BGP extended communities identify routes for VRFs or for Link BandWidth (LBW). Extended community clauses utilize Route Target (RTt) and Site of Origin Options (SOO):

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

Filtering with AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the **ip as-path access-list** command, and are applied using a route map **match** clause with the name of the access list as a parameter.

Example

These commands create an AS path access list identifying routes which pass through AS **3**, create a route map which references the access list, assign the routes it filters to community **300**, and apply the route map to the neighbor at **192.68.14.5** to assign a community value of **300** to inbound routes received from that neighbor.

1. Create the AS path access list.

```
switch(config)# ip as-path access-list as_list3 permit _3
```

-
2. Create a route map that matches the AS path access list and sets the community value.

```
switch(config)# route-map MAP_3 permit
switch(config-route-map-MAP_3)# match as-path as_list3
switch(config-route-map-MAP_3)# set community 300
switch(config-route-map-MAP_3)# exit
```

3. Apply the route map to the neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.68.14.5 route-map MAP_3 in
switch(config-router-bgp) #
```

15.5.2.3 Configuring GTSM for BGP

The Generalized TTL Security Mechanism (GTSM) uses a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect BGP peering sessions from Denial-of-Service (DoS) attacks based on forged protocol packets.

An IP packet received from a BGP peer is discarded when its current TTL value is less than **(255-n)** where **n** is the configured maximum number of hops to the peer. Use the [neighbor ttl maximum-hops](#) command to configure the maximum hop count.

Note: IP packets to GTSM enabled BGP peers are sent with the configured TTL value of **255**.

15.5.2.4 Configuring Routes

15.5.2.4.1 Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The [network \(BGP\)](#) command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in [network](#) commands. For example, **192.0.2.4/24** is stored as **192.0.2.0/24**.

Example

This command configures the switch to advertise the **10.5.8.0/24** network.

```
switch(config-router-bgp) # network 10.5.8.0/24
switch(config-router-bgp) #
```

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The [bgp advertise-inactive](#) command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.

```
switch(config-router-bgp)# bgp advertise-inactive
switch(config-router-bgp)#{/pre}

```

- This command overrides inactive route advertisement for VRF ***purple***.

```
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# no bgp advertise-inactive
switch(config-router-bgp-vrf-purple)#{/pre}

```

15.5.2.4.1.1 Advertising ISIS Routes into BGP Network

The [redistribute \(BGP\)](#) command advertises the routes learned through IS-IS routes into the BGP network. It also allows the user to selectively advertise some routes and modify route attributes before advertising using route maps.

The command is available in both address-family mode and router BGP mode, but the command is rejected if configured in both address-family mode and router mode at the same time.

While redistributing IS-IS routes into BGP, the **Level-1** or **Level-2** keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The keyword is optional, and defaults to Level-2 when not configured.

Use the [show ipv6 bgp](#) command to verify that routes are advertised with correct attributes.

Note: If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

Examples

- These commands redistribute IS-IS routes into BGP in the **address-family** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# redistribute isis level-1 route-map isis-to-bgp-v4
switch(config-router-bgp-af)#{/pre}

```

- These commands redistribute IS-IS routes into BGP in the **router BGP** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute isis level-1 route-map isis-to-bgp
switch(config-router-bgp)#{/pre}

```

15.5.2.4.1.2 Advertising OSPF Routes into BGP Network

Routes learned through the OSPF protocol can be redistributed into the BGP domain and advertised by BGP. To redistribute OSPF routes into BGP, use the [redistribute \(BGP\)](#) command. By default, **redistribute ospf** will redistribute only internal OSPF routes into BGP; the command must be issued separately with additional parameters for each type of OSPF route that is to be redistributed.

Examples

- These commands redistribute internal OSPF routes into BGP.

```
switch(config)# router bgp 1
switch(config-router-bgp)#{/pre}

```

```
switch(config-router-bgp) #redistribute ospf  
switch(config-router-bgp) #
```

- These commands redistribute internal, external, and NSSA external OSPF routes into BGP.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# redistribute ospf internal  
switch(config-router-bgp)# redistribute ospf external  
switch(config-router-bgp)# redistribute ospf nssa-external  
switch(config-router-bgp) #
```

15.5.2.4.2 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the [aggregate-address](#) command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route becomes active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

Note: This behavior is observed only when the single-agent routing model (ribd) is run on the switch.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the [show ip route](#) command. Display normal BGP routes (and null aggregate routes) with the [show ip bgp](#) and [show ip route](#) commands.

Aggregation Options

The [aggregate-address](#) command provides the following aggregate route options:

- **AS_PATH attribute inclusion:** the **as-set** option controls the aggregate route's AS_PATH and ATOMIC_AGGREGATE attribute contents. AS_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

When the command includes **as-set**, the aggregate route's AS_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS_SET.

When the command does not include **as-set**, the aggregate route's ATOMIC_AGGREGATE attribute is set and the AS_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment:** the **attribute-map** option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression:** the **summary-only** option suppresses the advertisement of the contributor routes that comprise the aggregate.

- **Contributor filtering:** the **match-map** option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

Example

- These commands create an aggregate route (**10.16.48.0/20**) from four contributor routes (**10.16.48.0/23**, **10.16.50.0/23**, **10.16.52.0/23**, and **10.16.54.0/23**). The aggregate route includes the **AS_PATH** information from the contributor routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)# exit
switch(config)#

```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)# route-map map1 permit 10
switch(config-route-map-map1)# set local-preference 40
switch(config-route-map-map1)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 attribute-map map1
switch(config-router-bgp)# exit
switch(config)#

```

- These commands create an aggregate route and use a route map to allow only those contributors that match a specified prefix list included in the aggregate route.

```
switch(config)# route-map matchmap permit 10
switch(config-route-map-matchmap)# match ip address prefix-list aglist
switch(config-route-map-matchmap)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 1.1.0.0/16 summary-only match-map matchmap
switch(config-router-bgp)#

```

The **match-map** parameter in the **aggregate-address** command advertises the route(s) denied in match-map.

Note: The **match-map** parameter only takes effect when used with the **summary-only** parameter.

Identifying BGP Aggregate Contributors Match in Outbound Policy

When configured, this feature introduces the ability to match on the following parameters:

- Any BGP aggregate contributor, in the outbound route maps.
- A specific BGP aggregate contributor, in the outbound route maps.

The attributes that are currently supported for matching on BGP aggregate contributors are community, local-preference, prefix, next-hop,route-type.

Match Contributors to Any Aggregate

To match contributors to any BGP aggregate and set attributes (say communities) on said contributor, add an outbound policy with the clause:

```
switch(config-route-map-test)# match aggregate-role contributor
```

The **match aggregate-role contributor** clause only works with outbound policies.

Example

In this example, all the BGP contributor routes (to all aggregates) is assigned to the community **65536:100** as they are advertised to the neighbor **192.0.2.1**.

```
ip community-list BLUE permit 65536:100
!
route-map OUTBOUND_POLICY permit 10
match aggregate-role contributor
set community community-list BLUE
!
route-map OUTBOUND_POLICY permit 20
description "Permit the routes rejected by seq10"
!
router bgp 65536
aggregate-address 203.0.113.0/24
neighbor 192.0.2.1 route-map OUTBOUND_POLICY out
!
```

Match Contributors to Specific Aggregates

To match contributors which contribute only to a BGP aggregate with specific attributes (say communities) and set attributes (say communities again) on said contributor, add an outbound policy with the clause:

```
switch(config-route-map-test)# match aggregate-role contributor aggregate-attributes MATCH_AGG_COL  
OR
```

Define the **MATCH_**AGG_COLOR as below:

```
route-map MATCH_
```

AGG_COLOR
match community RED

Add an aggregate definition to explicitly set the desired attributes on the aggregate of interest:

```
route-map AGG_SET_COLOR
set community community-list RED
!
router bgp 65536
aggregate-address 203.0.113.0/24 attribute-map AGG_SET_COLOR
```

The route map referenced by the match **aggregate-role contributor aggregate-attributes** clause discards all set operations.

Example

- In this example the BGP contributor routes to the aggregate **203.0.113.0/24** (that has community **65536:200**), to be assigned the community **65536:100** when they are advertised outbound to the neighbor **192.0.2.1**.

```
ip community-list BLUE permit 65536:100
ip community-list RED permit 65536:200
!
route-map AGG_SET_COLOR
set community community-list RED
!
route-map MATCH_
```

AGG_COLOR
match community RED
!
route-map OUTBOUND_POLICY permit 10
match aggregate-role contributor aggregate-attributes MATCH_**AGG_COLOR**
set community community-list BLUE
!
route-map OUTBOUND_POLICY permit 20
description "Permit the routes rejected by seq10"
!
router bgp 65536
aggregate-address 203.0.113.0/24 attribute-map AGG_SET_COLOR
neighbor 192.0.2.1 route-map OUTBOUND_POLICY out
!

Invert-result Support

This match clause supports the invert-result modifier. When applied, invert-result inverts the result of the match clause to which it is applied.

The results for the following command would be:

```
switch(config-route-map-test)# match invert-result aggregate-role contributor aggregate-attributes
    MATCH_AGG_COLOR
```

1. match all routes that are not contributors to any aggregate.
2. match all routes that are contributors to aggregates where the aggregate doesn't match **MATCH_AGG_COLOR** (provided **MATCH_AGG_COLOR** is configured).
3. not match all routes that are contributors to aggregates where the aggregate matches **MATCH_AGG_COLOR** (provided **MATCH_AGG_COLOR** is configured).
4. not match all routes that are contributors to aggregates if **MATCH_AGG_COLOR** is not configured.

Related Command

[match \(route-map\)](#)

15.5.2.4.3 Customizing the BGP AS-Path Attribute

The BGP Replace AS-Path feature allows the user to customize the **AS_PATH** attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor. To configure the BGP Replace AS-Path feature, use the [set as-path match](#) and [set as-path prepend](#) commands.

To replace the **AS_PATH** attribute of routes received from a BGP neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the inbound direction.

To replace the **AS_PATH** attribute of routes that are advertised to a neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the outbound direction.

The Replace AS-Path feature works in conjunction with the AS-Path Prepend feature which is also used to modify the **AS_PATH** attribute. However, if both features are configured within the same route map, then the replace AS-Path feature takes precedence over the AS-Path Prepend.

Note: The BGP Replace AS-Path feature supports both eBGP and iBGP neighbors. The locally configured AS number is always prefixed to the AS-Path of routes advertised to the eBGP neighbors. This RFC behavior is retained in Arista's implementation of the Replace AS-Path feature as well.

BGP Replace AS-Path has the following limitations:

- Replacing the AS-Path should be used cautiously since it may impact BGP loop prevention.
- A few duplicated routes may be advertised and installed on a router after the original AS-Path of those routes are replaced. To fix this issue, it is always suggested to filter out such routes by prefix with BGP Community.

Example

This command replaces the AS-Path with the **none** option.

```
switch# show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
                                S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast, q -
Queued
```

```

* >   202.202.1.0/24    80.80.1.1      -       -       -     200 200 i switch#

```

The AS-path of matching prefixes are replaced with the locally configured AS 200.

15.5.2.4.4 Modifying the Local AS Value

The switch can replace its local AS number with a configured value when sending OPEN messages to a specified neighbor, allowing the switch to appear as a member of a different AS to that peer. In the case of a static peer, the neighbor must also be configured to recognize the modified AS in order for peering to occur. The additional configuration is unnecessary in the case of dynamic peers.

To configure a different local AS value for the switch, use the [neighbor local-as](#) command. To configure the peer to expect the altered ASN from the switch, use the [neighbor remote-as](#) command on the peer.

Example

These commands configure the switch to replace its local ASN in OPEN messages sent to the peer at **10.13.64.1** with **ASN 64500**, and configure the peer to expect that ASN in messages received from the switch.

Switch Configuration

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.13.64.1 local-as 64500 no-prepend
switch(config-router-bgp) #
```

Peer Configuration

```
peer(config)# router bgp 64502
peer(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
peer(config-router-bgp) #
```

15.5.2.4.5 AS-path Modifications for Split ASes

By default, BGP rejects routes that contain the local Autonomous System Number (ASN). Sometimes a single autonomous system is divided geographically or otherwise with one or more provider ASes in between. In these cases, a valid route can sometimes be dropped by a customer edge router because the local ASN appears in the AS-path of route advertisements that have traveled through one or more provider networks. To ensure that these routes are not dropped, the provider edge router can be configured to replace the customer AS with its own, or the customer edge router can be configured to ignore its local AS number in received routes.

Replacing Remote ASN in Outbound Route Announcements

To replace a remote ASN with the local ASN in BGP route announcements sent to a specified router, use the [neighbor as-path remote-as replace out](#) command.

Example

These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at **192.168.2.15** in BGP routes advertised to that neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.2.15 as-path remote-as replace out
switch(config-router-bgp) #
```

Ignoring Local ASN in Incoming Route Announcements

To accept BGP routes that include the local ASN in their AS-path attribute, use the [neighbor allowas-in](#) command.

Example

These commands configure the switch to accept routes from the BGP neighbor at **192.168.1.30** which contain the switch's ASN in their AS paths as many as **3** times.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 allowas-in
```

```
switch(config-router-bgp) #
```

15.5.2.5 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- **IPv4 address family:** switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as **IPv4 address family active**.
- **IPv6 address family:** switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as **IPv6 address family active**.

15.5.2.5.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses are configured through **bgp default** and **neighbor activate** commands.

- The **bgp default** command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The **neighbor activate** command specifies deviations from default address family activity level for a specified BGP neighbor address.

Default Neighbor Activation

The **bgp default** command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to **address family active** addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses:

- **bgp default ipv4-unicast:** all BGP neighbor addresses are IPv4 address family active (this is the switch default).
- **no bgp default ipv4-unicast:** no BGP neighbor addresses are IPv4 address family active.
- **bgp default ipv6-unicast:** all BGP neighbor addresses are IPv6 address family active.
- **no bgp default ipv6-unicast:** no BGP neighbor addresses are IPv6 address family active (this is the switch default).
- **bgp default ipv4-unicast transport ipv6:** all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRI.

Note: If it is necessary to exchange IPv4 NLRI over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command **bgp default**. For an individual neighbor, use the **neighbor activate** command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

Activating Individual Neighbor Addresses

The [address-family](#) command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The [**running-config**](#) displays **address family** commands in sub-blocks of the BGP configuration.

The [neighbor activate](#) command is available in each address family configuration mode and defines the configuration mode **address family** activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

- **neighbor activate** configures the address as active in the configuration mode **address family**.
- **no neighbor activate** configures the address as not active in the configuration mode **address family**.

The switch sends the following announcements to addresses that are active in an address family:

- **IPv4 address family**: IPv4 capability and all network routes with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network routes with IPv6 prefixes.

The [neighbor route-map \(BGP\)](#) command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration-mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

Network Route Advertising in Address Families

The [network \(BGP\)](#) command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command's execution.

- Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.
- Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.

Examples

- These commands instantiate BGP, configure three neighbors, and configure two network routes.

The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)# neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)# network 172.18.23.9/24
switch(config-router-bgp)# network 2001:0DB8:de29::/64
switch(config-router-bgp)#

```

- These commands instantiate BGP on the switch, set IPv4 default activity level (**not active**), set IPv6 default activity level (**active**), and configure three neighbor addresses and two network route prefixes.

IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

```
switch(config)# router bgp 10
switch(config-router-bgp)# bgp default ipv6-unicast
switch(config-router-bgp)# no bgp default ipv4-unicast
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15

```

```
switch(config-router-bgp) # neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp) # neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp) # network 172.18.23.9/24
switch(config-router-bgp) # network 2001:0DB8:de29::/64
switch(config-router-bgp) #
```

- These commands configure three neighbors, two network routes, and the default activity level for each address family (**not active**), and specify neighbor addresses for each address family that is active.

```
switch(config)# router bgp 11
switch(config-router-bgp)# neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)# neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)# neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)# network 172.18.23.9/24
switch(config-router-bgp)# network 2001:0DB8:de29::/64
switch(config-router-bgp)# no bgp default ipv4-unicast
switch(config-router-bgp)# no bgp default ipv6-unicast
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# neighbor 172.21.14.8 activate
switch(config-router-bgp-af)# neighbor 172.23.18.6 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#

```

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors.

```
switch(config)# router bgp 11
switch(config)# address-family ipv4
switch(config-router-bgp-af)# bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#

```

15.5.2.6 Configuring Best-path Selection

The best-path selection algorithm (described under [Best-Path Selection](#)) determines which of multiple paths to the same destination received by BGP will be added to the IP routing table. To shape route preferences and influence best-path selection, use the following commands in router-BGP configuration mode.

- **bgp always-compare-med** configures the switch to always consider the Multi-Exit Discriminator (MED) value when comparing paths (disabled by default).
 - **bgp bestpath as-path ignore** configures the switch to ignore the length of the Autonomous System (AS) path when comparing routes (disabled by default).
 - **bgp bestpath as-path multipath-relax** used in Equal-Pot Multi Path (ECMP configuration) and enabled by default; the **no** form of the command configures the switch to consider paths unequal if their AS paths have different contents.
 - **bgp bestpath ecmp-fast** the no form of this command causes the switch to ignore order of arrival in evaluating paths within an ECMP group.
 - **bgp bestpath med confed** causes comparison of Multi-Exit Discriminator (MED) values in routes originating within the same confederation as the switch and received from confederation peers (disabled by default).
 - **bgp bestpath med missing-as-worst** configures the switch to treat a missing MED as having the highest (least preferred) value (disabled by default). This command overrides the setting of the **bgp bestpath med confed** command.
 - **bgp bestpath tie-break cluster-list-length** configures the switch to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie in step 10 of the selection process (disabled by default).

- **bgp bestpath tie-break router-id** configures the switch to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie in step 10 (disabled by default).

15.5.2.6.1 Displaying Reasons for Best-path Selection

To see the reasons why certain routes were excluded by the best-path selection process, use the **detail** option of the **show ip bgp** command. Enter the prefix to which BGP has selected a best path, and the output will display all learned paths. Paths which were not selected as best will display the reason they were not selected after the label **not best**.

The reason will be listed as one of the following:

- **path weight**
- **local preference**
- **AS path length**
- **origin**
- **path MED**
- **eBGP path preferred**
- **IGP cost**
- **AS path details**
- **ECMP-Fast configured**
- **router ID**
- **originator ID**
- **router ID tie-break configured**
- **cluster list length**
- **cluster list length tie-break configured**
- **peer IP address**
- **path ID**
- **redistributed route exists**
- **unknown**
- **another route from the same AS is a better BGP route**
- **peer not ready**
- **unusable**

Example

This command displays the reasons why three routes to **172.16.0.0/24** were rejected by the best-path algorithm. The reason for rejection is preceded by the label **Not best**:

```
switch# show ip bgp 172.16.0.0/24 detail
BGP routing table information for VRF default
Router identifier 192.168.100.18, local AS number 64524
Route status: [a.b.c.d] - Route is queued for advertisement to peer.
BGP routing table entry for 204.1.47.220/30
Paths: 4 available
 64512 64550 65100
    192.168.14.2 from 192.168.14.2 (192.168.100.21)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
      external, ECMP head, ECMP, best, ECMP contributor
      Rx SAFI: Unicast
 64512 64550 65100
    192.168.24.2 from 192.168.24.2 (192.168.100.22)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
      external, ECMP, ECMP contributor
      Rx SAFI: Unicast
      Not best: ECMP-Fast configured
 64512 64550 65100
    192.168.34.2 from 192.168.34.2 (192.168.100.23)
      Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
      external, ECMP, ECMP contributor
```

```

Rx SAFI: Unicast
Not best: Redistributed route exists
64512 64550 65100
 192.168.44.2 from 192.168.44.2 (192.168.100.24)
    Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29 ago, valid,
external, ECMP, ECMP contributor
Rx SAFI: Unicast
Not best: eBGP path preferred
Not advertised to any peer switch#

```

15.5.2.7 Configuring BGP Convergence

To avoid hardware updates and route advertisement churn during switch reload or BGP instance start, BGP enters into the convergence state where it waits for all peers to join and receive all routes from all the peers.

BGP Convergence is bound by an upper value of convergence time (default value is **5 minutes**) and BGP declares convergence on expiry of convergence timer. At the end of convergence, BGP updates the routes in FIB and advertises to all the peers.

To configure BGP convergence and the different timeout features, use the following commands in router-BGP configuration mode.

- **update wait-for-convergence** enables the BGP convergence feature.
- **bgp convergence slow-peer time** configures the BGP convergence idle peer timeout value. The default timeout value is 90 seconds.
- **bgp convergence time** configures the BGP convergence timeout value. The default timeout value is 300 seconds.

Different Cases for Convergence with Default Timeout Configuration

- **Convergence Time < 90 seconds after the first peer has joined:** this is the best case when all the configured peers have joined and EORs have been received from all peers in less than **90** seconds after the first peer has joined.
- **Convergence Time = 90 seconds after the first peer has joined:** this is the case when one or more BGP peers have joined within **90** seconds and EORs have been received from all peers within **90** seconds, but there are still some configured peers which have not joined yet. In this case, the convergence is declared after slow-peer timeout is reached.
- **Convergence Time > 90 seconds after the first peer has joined:** this is the case when one or more BGP peers have joined after **90** seconds, but EORs have not been received from all peers. As soon as EORs are received from all peers which have joined during the first **90** seconds, the convergence is declared.
- **Convergence Time = 300 seconds after the first peer has joined:** this is the case when EOR is not received till **300** seconds from some of the peers that have joined during 90 seconds after the first peer has joined.

15.5.2.7.1 Displaying BGP Convergence Status

Use the **show bgp convergence** command to view information about the BGP convergence status, and to know if the convergence timer has started or not. The examples below show the command output at different points in the convergence process.

No Peers Have Joined

This is the output when no peers have joined before convergence.

```
switch(config-router-bgp) # show bgp convergence
```

```
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Pending Peers: 2
  Total Peers: 2
  Established Peers: 0
  Disabled Peers: 0
  Peers that have not converged yet:
    IPv4 peers:
      201.1.1.1 (Session : Connect)
      202.1.1.1 (Session : Connect)
    IPv6 peers:
      None
switch(config-router-bgp) #
```

First Peer Has Joined

This is the output when the first peer has joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP
convergence)
  Convergence timer running, will expire in 00:01:50
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer came up 00:00:13 ago
  All the expected peers are up: no
  All IGP protocols have converged: yes
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Pending Peers: 1
  Total Peers: 2
  Established Peers: 1
  Disabled Peers: 0
  Peers that have not converged yet:
    IPv4 peers:
      201.1.1.1 (Session : Active)
    IPv6 peers:
      None
switch#
```

Convergence Timeout Reached

This is the output when the convergence timeout value is reached.

```
switch(config-router-bgp) # show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
  Time taken to converge 00:02:30
  Pending Peers: 1
  Total Peers: 2
  Established Peers: 1
  Disabled Peers: 0
  Peers that did not converge before local bgp convergence:
    IPv4 peers:
      201.1.1.1 (Session : Active)
```

```
202.1.1.1 (Session : Established)
IPv6 peers:
None
switch(config-router-bgp) #
```

Converged State

This is the output during the converged state.

```
switch(config-router-bgp) # show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
None
IPv6 peers:
None
switch(config-router-bgp) #
```

15.5.2.8 Configuring BGP Graceful Shutdown Community

15.5.2.8.1 Creating a Route-Map Entry That Sets the Community for Graceful Shutdown

The [set community \(route-map\)](#) command specifies community attribute modifications to BGP routes.

Example

```
switch(config) # route-map map1
switch(config-route-map-map1) # set community GSHUT
switch(config) # exit
switch(config) #
```

15.5.2.8.2 Creating a Route-Map Entry with Matching Preferences on Graceful Shutdown Community

The [ip community-list](#) command creates and configures a BGP access list that is based on BGP communities.

The [match \(route-map\)](#) command creates a route map clause entry that specifies one route filtering condition.

Example

```
switch(config) # ip community-list gshut_list permit GSHUT
switch(config) # route-map map1
switch(config-route-map-map1) # match community gshut_list
switch(config-route-map-map1) # exit
switch(config) #
```

15.5.2.8.3 Validating the Route-Map

The `show route-map` command displays the contents of the specified route maps.

Example

```
switch# show route-map map1
route-map map1 permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT switch#
```

15.5.2.9 Configuring BGP Additional Paths Send

The `bgp additional-paths send mode/application` command is used in the BGP configuration mode to enable BGP additional paths.

The following examples show how to configure Add-Path TX at global, address family (AF) and neighbor for both default VRF and non-default VRF.

Add-Path TX at Global Level (AF and NeighborIndependent) for Default VRF

These commands configure all peers under the default VRF to be Add-Path capable at global level with different options for BGP router **65003**.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send limit 2

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send ecmp limit 2

switch(config)# router bgp 65003
switch(config-router-bgp)# bgp additional-paths send backup
```

Add-Path TX at Address-Family Level (neighbor independent) for Default VRF

These configure all peers under the default VRF to be Add-Path capable when exchanging IPv4 NLRI, under **address-family ipv4** for BGP router **65003**.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp additional-paths send limit 3

switch(config)# router bgp 65003
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp additional-paths send ecmp limit 3

switch(config)# router bgp 65003
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp additional-paths send backup
```

Add-Path TX at Neighbor Level for Default VRF

These configure a specific peer under the default VRF to be Add-Path capable for BGP router **65003** and neighbor **90.0.0.1**.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send limit

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send ecmp limit 4

switch(config)# router bgp 65003
switch(config-router-bgp)# neighbor 90.0.0.1 additional-paths send backup
```

Add-Path TX at Global Level (AF and Neighbor Independent) for Non-default VRF

These commands configure Add-Path TX at global level (AF and neighbor independent) for non-default VRF for BGP router **65003** and **Acme** VRF.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send limit 5

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send ecmp limit 5

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# bgp additional-paths send backup
```

Add-Path TX at Address-Family Level (neighbor Independent) for Non-default VRF

These configure all peers under the non-default VRF to be Add-Path capable under **address-family ipv4** for BGP router **65003** and **Acme** VRF.

```
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send limit 6

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
```

```

switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send ecmp limit 6
switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# address-family ipv4
switch(config-router-bgp-vrf-Acme-af)# bgp additional-paths send backup

```

Add-Path TX at Neighbor Level (AF Independent) for Non-default VRF

These configure a specific peer under the non-default VRF to be Add-Path capable for BGP router **65003**, neighbor **90.0.0.1** and **Acme** VRF.

```

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths send any

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths send limit 7

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths send ecmp

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths send ecmp limit 7

switch(config)# router bgp 65003
switch(config-router-bgp)# vrf Acme
switch(config-router-bgp-vrf-Acme)# neighbor 90.0.0.1 additional-paths send backup

```

15.5.2.10 Configuring BGP Selective Route Download

The [bgp route install-map](#) command is used in the BGP configuration mode to enable BGP Selective Route Download. BGP Selective Route Download can also be configured in an address family or VRF instance as shown in the following examples.

The following examples show how to configure a prefix list and route map, then apply BGP Selective Route Download to the map.

Examples

- These commands install BGP routes in the **10.0.0.0/24** and **20.0.0.0/24** ranges in the RIB (and thus in the hardware), but no other BGP routes.

```

switch(config)# ip prefix-list PFXL_ALLOW
switch(config-ip-pfx)# seq 1 permit 10.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)# seq 2 permit 20.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)# exit
switch(config-ip-pfx)#

```

- These commands configure the permit and deny rules for BGP routes.

```

switch(config)# route-map BGP_INSTALL_MAP permit 10
switch(config-route-map-BGP_INSTALL_MAP)# match ip address prefix-list PFXL_ALLOW
switch(config-route-map-BGP_INSTALL_MAP)# exit
switch(config)# route-map BGP_INSTALL_MAP deny 20
switch(config)#

```

- These commands configure Selective Route Download for the map **BGP_INSTALL_MAP**.

```

switch(config)# router bgp 100
switch(config-router-bgp)# bgp route install-map BGP_INSTALL_MAP

```

```
switch(config-router-bgp) #
```

The following examples show how to configure prefix lists individually for the IPv4 and IPv6 address families, then apply BGP Selective Route Download for these address families.

Examples

- These commands configure the IPv4 address family prefix list.

```
switch(config)# ip prefix-list V4_ALLOW
switch(config-ip-pfx)# route-map BGP_V4_MAP permit 10
switch(config-route-map-BGP_V4_MAP)# match ip address prefix-list V4_ALLOW
switch(config-route-map-BGP_V4_MAP)# route-map BGP_V4_MAP deny 20
switch(config-route-map-BGP_V4_MAP)# exit
switch(config-route-map-BGP_V4_MAP) #
```

- These commands configure the IPv6 address family prefix list.

```
switch(config)# ipv6 prefix-list V6_ALLOW
switch(config-ipv6-pfx)# route-map BGP_V6_MAP permit 10
switch(config-route-map-BGP_V6_MAP)# match ipv6 address prefix-list V6_ALLOW
switch(config-route-map-BGP_V6_MAP)# route-map BGP_V6_MAP deny 20
switch(config-route-map-BGP_V6_MAP)# exit
switch(config-route-map-BGP_V6_MAP) #
```

- These commands configure Selective Route Download individually for the two address families.

```
switch(config)# router bgp 200
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# bgp route install-map BGP_V4_MAP
switch(config-router-bgp-af)# exit
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# bgp route install-map BGP_V6_MAP
switch(config-router-bgp-af) #
```

15.5.2.10.1 Displaying BGP Selective Route Download Information

The [show ip bgp](#) command displays BGP RIB winning paths that are not installed in the RIB.

Example

The following command displays BGP routing table information for VRF default, showing winning paths that are not installed in the RIB.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop        Metric  LocPref  Weight  Path
* >   6.0.0.0/24      1.0.0.1         0       100      0      ?
* #   7.0.0.0/24      1.0.0.1         0       100      0      ?
switch#
```

The [show ip bgp](#) command with a specified prefix displays detailed information and the reason for the BGP RIB winning paths to that prefix not being installed in the RIB.

Example

The following command displays detailed information for the BGP routing table for VRF default.

```
switch# show ip bgp 7.0.0.0/24
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
BGP routing table entry for 7.0.0.0/24
  Paths: 1 available
    Local
      1.0.0.1 from 1.0.0.1 (1.0.0.1)
        Origin INCOMPLETE, metric 0, localpref 100, weight 0, valid, internal, not installed (denied by install-map)
switch#
```

The **show ip bgp installed** command displays the list of installed routes in the BGP RIB.

Example

The following command displays the list of installed routes in BGP routing table for VRF defaults.

```
switch# show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
  S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop          Metric LocPref Weight Path
* >   6.0.0.0/24       1.0.0.1           0     100      0      ?
switch#
```

The **show ip bgp not-installed** displays the list of non-installed routes in the RIB.

Example

The following command displays the list of non-installed routes in the BGP routing table for VRF default.

```
switch# show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
  S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop          Metric LocPref Weight Path
* #   7.0.0.0/24       1.0.0.1           0     100      0      ?
switch#
```

15.5.2.11 Configuring Nexthop Resolution

The configuration model for this feature involves configuring and applying **Nexthop Resolution RIB Profiles** on a per-address family basis. There are two ways a profile can be applied: (1) across an entire address-family, or (2) a granular, route-map based mechanism for specific routes within an address family. The per-address-family configuration is the simplest. It enables specification of a unique profile for all the routes in a given address family, such as IPV4 unicast, or EVPN. In contrast, the route-map approach leverages the matching criteria of route-map statements to apply profiles to individual routes within an address family.

Note: Note the support for each configuration and submode were released in a phased manner.

The general configuration model for the CLI is a new command under the BGP address-family submode:

```
switch(config-router-bgp-af) # next-hop resolution ribs(PROFILE|[route-map NAME])
```

The PROFILE option is a list of up to three (3) resolution domains. The NAME option is the name of a route-map. Notice the PROFILE and route-map NAME options are mutually exclusive. That is, a resolution profile can be specified either explicitly at the address family level, or on a per-route basis via a route-map.

To enable setting a profile using a route-map, this feature adds support for a new set statement in the route-map submode:

```
switch(config-route-map-NAME) # set next-hop resolution ribs PROFILE
```

You can combine this statement with existing match statements to select profiles based on the BGP path attributes of a route, or other properties.

As mentioned, the profile itself is a list of resolution domains:

```
PROFILE:=DOMAIN[DOMAIN[DOMAIN]]
```

Example configuration for EVPN MPLS, EVPN VXLAN and BGP Labeled-unicast:

```
switch(config) # router bgp id
switch(config-router-bgp) # address-family evpn
switch(config-router-bgp-af) # next-hop mpls resolution ribs PRIMARY-RIB [FALLBACK-RIB]
switch(config-router-bgp-af) # next-hop VXLAN resolution ribs IP-RIB
...
address-family ipv4 labeled-unicast
next-hop mpls resolution ribs PRIMARY-RIB [FALLBACK-RIB]
address-family ipv6 labeled-unicast
next-hop mpls resolution ribs PRIMARY-RIB [FALLBACK-RIB]
```

The **PRIMARY-RIB** and **FALLBACK-RIB** refers to either tunnel domain or IP RIB domain. EVPN VXLAN only supports IP-RIB domain.

Configure the tunnel domain as:

- **tunnel-rib <tunnel-rib-name>** where the **<tunnel-rib-name>** refers to either the system-tunnel-rib or the user defined tunnel rib.

The IP domain can be either:

- **system-unicast-rib**
- **system-connected**

The **system-unicast-rib** refers to complete IP RIB and the **system-connected** refers to just the connected routes.

Primary and secondary RIBs cannot come from the same domain (for example, both cannot be from the tunnel domain and both cannot be from the IP RIB domain). The **FALLBACK-RIB** is optional.

Nexthops will first attempt to resolve, using the primary rib. If the resolution fails, it attempts to resolve using the fallback rib (if that exists).

Example

```
router bgp <id>
address-family ipv4 labeled-unicast
next-hop resolution ribs tunnel-rib USER_TR system-unicast-rib
```

All the nexthops of the IPV4 labeled-unicast routes will first attempt to resolve, using the **tunnel rib** **USER_TR**. If the resolution fails, the nexthops attempt to resolve using the **complete unicast IP RIB**.

Each DOMAIN can be either a system or user-defined tunnel RIB or a unicast RIB. The available resolution domains, and their corresponding tokens, are tabulated below:

Table 79: Domains

| Domain | Token | Description |
|---------------------------|--|---|
| IP RIB | system-unicast-rib | The complete IP unicast RIB is available for next-hop resolution. |
| Connected routes (IP) | system-connected | Only connected routes are available for next-hop resolution. |
| System tunnel RIB | tunnel-rib system-tunnel-rib | All winning tunnels from all protocols are available for next-hop resolution. |
| System colored tunnel RIB | tunnel-rib colored system-colored-tunnel-rib | All winning, colored tunnels from all protocols are available for next-hop resolution. Only routes with an associated color can be resolved by the system colored tunnel RIB. |
| User-defined tunnel RIB | tunnel-rib NAME | All contributing tunnels to the tunnel RIB called NAME are available for next-hop resolution. |
| IP RIB of VPN Import VRF | vrf-unicast-rib | This token is limited to BGP L3VPNs. |

Now the profile configuration is available under select BGP address family submodes. For example:

```
switch(config) # router bgp num
switch(config-router-bgp) # address-family evpn
switch(config-router-bgp-af) # next-hop mpls resolution ribs PROFILE
    next-hop VXLAN resolution ribs PROFILE
    address-family ipv4
        next-hop resolution ribs ( PROFILE | route-map NAME )
    address-family ipv4 labeled-unicast
        next-hop resolution ribs PROFILE
    address-family ipv6
        next-hop resolution ribs ( PROFILE | route-map NAME )
        next-hop 6pe resolution ribs PROFILE
    address-family ipv6 labeled-unicast
        next-hop resolution ribs PROFILE
    address-family vpn-ipv4
        next-hop resolution ribs PROFILE
    address-family vpn-ipv6
        next-hop resolution ribs PROFILE
```

Note that a given address-family may restrict the possible profiles which can be configured, and may not support specifying a route-map. For example, the resolution profile for 6PE routes, configured via *next-hop 6pe resolution ribs PROFILE*, is constrained to only the tunnel domain. That is, the profile cannot specify either *system-unicast-rib* or *system-connected*. This is, of course, because it is meaningless to resolve a 6PE next-hop using either of those resolution domains.

15.5.2.11.1 Configuring BGP Attributes Ignore Received Lists

Configure BGP Attributes Ignore Received Lists using the **router bgp** command to enter the Router-BGP Configuration Mode. When adding the BGP attributes to the ignore list, EOS displays a warning message that in order to discard the BGP attributes from the existing BGP sessions, BGP must relearn the routes. Discard BGP attributes on an outbound route after applying inbound and outbound policies.

Adding BGP Attribute Ignore Received Lists

To add the feature to the default BGP configuration, use the following commands:

```
switch(config) #router bgp
switch(config-router-bgp) #neighbor default received attribute
    discard bgp_attributes
! To make this command effective for existing BGP sessions, clear all routes by
issuing "clear ip bgp"
```

Adding BGP Attributes Ignore Received Lists to BGP Neighbors or Peers

To add the feature to a neighbor or peer group, use the following commands:

```
switch(config) #router bgp
switch(config-router-bgp) #neighbor ip_address peer_group received attribute
    discard bgp_attributes
! To make this command effective for existing BGP sessions, clear all routes by
issuing "clear ip bgp"
```

Adding BGP Attributes Ignore Received Lists to a VRF

Configure BGP Attributes Ignore Received Lists on a VRF with the VRF configuration taking precedence over the global configuration.

For the global configuration, use the following commands:

```
switch(config) #router bgp
switch(config-router-bgp) #neighbor default received attribute discard 4-255
```

Use the following commands to configure a BGP Attribute Ignore Received List on VRF1 to ignore attributes 50 and 255 :

```
switch(config) #router bgp
switch(config-router-bgp) #vrf VRF1
switch(config-router-bgp-vrf-VRF1) #neighbor default received attribute discard
    50,255
! To make this command effective for existing BGP sessions, clear all routes by
issuing "clear ip bgp"
```

VRF1 discards only BGP attributes 50 and 255 and overrides the default configuration.

Use the following command to display the configuration:

```
router(config-router-bgp) #show active

router bgp 1

    router-id 0.0.0.1

        neighbor default received attribute discard 4-255

    vrf vrf1

        router-id 0.0.0.2

            neighbor default received attribute discard 50,255
```

The output displays the default configuration discarding BGP attributes 4 through 255 and VRF1 discards only BGP attributes 50 and 255.

Disabling BGP Attributes Ignore Received Lists on a VRF

Configure BGP Attributes Ignore Received on a VRF by VRF basis using the following commands to enable the feature by default and then disabling it on a specific VRF, **VRF1**.

```
router(config-router-bgp)#neighbor default received attribute discard 4-255
! To make this command effective for existing BGP sessions, clear all the
  routes by issuing "clear ip bgp *"
router(config-router-bgp-vrf-vrf1)#neighbor default received attribute discard
  disabled
! To make this command effective for existing BGP sessions, clear all the
  routes by issuing "clear ip bgp *"
```

Use the following command to display the configuration:

```
router(config-router-bgp)#show active

router bgp 1

  router-id 0.0.0.1

  neighbor default received attribute discard 4-255

  vrf vrf1

    router-id 0.0.0.2

    neighbor default received attribute discard disabled
```

The output displays the default configuration discarding BGP attributes 4 through 255, while VRF1 does not discard any BGP attributes.

15.5.2.11.2 Release Matrices

The following tables detail the release in which the possible configurations for this feature are available.

| Configuration | Release | | | | | |
|----------------------------------|--|---------|---------|---------|---------|------------------------------|
| | next-hop resolution ribs PROFILE command | | | | | |
| | 4.22.0F | 4.22.1F | 4.23.1F | 4.24.1F | 4.25.1F | Unsupported / Not Applicable |
| IPv4/IPv6 unicast (non 6PE) | X | | | | | |
| IPv6 unicast 6PE | X | | | | | |
| IPv4/IPv6 VPN (vrf-unicast-rib) | X | | | | | |
| IPv4/IPv6 VPN (full profile) | | X | | | | |
| EVPN (MPLS) | | | X | | | |
| EVPN (VXLAN) | | | X | | | |
| IPv4/IPv6 LU | | | X | | | |
| IPv4/IPv6 Multicast | | | | | | X |
| IPv4/IPv6 SR TE | | | | | | X |
| Flowspec | | | | | | X |
| Path Selection | | | | | | X |
| Link State | | | | | | X |
| RT Membership | | | | | | X |
| | PROFILE configuration | | | | | |
| Up to 2 resolution domains | X | | | | | |
| Up to 3 resolution domains | | | | X | | |
| system-colored-tunnel-rib | | | | X | | |
| | next-hop resolution ribs route-map NAME command | | | | | |
| IPv4/IPv6 unicast (non 6PE) | | | | | X | |
| IPv6 unicast 6PE | | | | | | X |
| IPv4/IPv6 VPN | | | | | | X |
| EVPN (MPLS) | | | | | | X |

| All other set statements | | | | | | X |
| sub-route-map | | | | | | X |

15.5.2.11.3 Default Resolution Profiles

Given the aforementioned configuration model, the default resolution profiles in EOS for each address-family can be expressed by the following:

| Address-family | Default profile |
|---|--|
| IPv4/IPv6 unicast (non 6PE) | tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-unicast-rib |
| IPv6 unicast 6PE | tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib |
| IPv4/IPv6 unicast (eBGP directly connected) | system-connected |
| IPv4/IPv6 VPN | tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-connected |
| IPv4/IPv6 LU | tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-connected |
| EVPN (MPLS) | tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-connected |
| EVPN (VXLAN) | system-unicast-rib |
| IPv4/IPv6 Multicast | <i>This is not supported. Multicast next-hops are first resolved in the MRIB. Failure to resolve in the MRIB results in a lookup in the unicast RIB.</i> |
| Flowspec | <i>These next hops are not resolved.</i> |

Note: Support for the **system-colored-tunnel-rib** was released in EOS Release 4.24.1F. For earlier releases, the defaults can be determined by omitting this resolution domain.

15.5.2.11.4 Semantics

When processing the next-hop of a route, the next-hop resolver attempts resolution by using the first domain in the route's resolution profile. If the resolution domain successfully resolves the next-hop, the resolver stops. If resolution fails, however, the resolver moves onto the next domain, if it exists, and tries again. This iterative process continues until the next-hop is either resolved, or the profile is exhausted. In the latter case, the next-hop is left unresolved.

To illustrate this, consider the following example. This resolution profile constrains the resolution of a BGP route to only the IP unicast RIB:

```
switch(config-router-bgp-af) # next-hop resolution ribs system-unicast-rib
```

When a next-hop is unresolvable in the IP unicast RIB, and there are no further resolution domains to try, then the next-hop is ultimately unresolved. In contrast, the following profile first attempts resolution

in the system colored tunnel RIB, then the system tunnel RIB, and finally attempts resolution using connected routes:

```
switch(config-router-bgp-af)# next-hop resolution ribs tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-connected
```

Therefore, only when a next-hop cannot be resolved by any of those domains will it be ultimately unresolved.

15.5.2.11.4. Route Map Semantics

This section describes semantics and limitations specific to the **next-hop resolution ribs route-map NAME** command.

The use of a route-map to select a custom resolution profile allows for per-route granularity rather than an entire BGP address-family. The next-hop resolution semantics of a next-hop whose profile is set using a route-map are the same as the per-address family configuration. However, unlike in the per-address family configuration model, a route-map makes it possible to leave the resolution profile for a next-hop unspecified. **A next-hop for which the resolution profile is unspecified is left unresolved.** The following example illustrates this as well as the recommended configuration.

The profile below constrains the resolution of a subset of IPV4 unicast routes to only the system tunnel RIB:

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
    match ip next-hop prefix-list SUBSET
    set next-hop resolution ribs tunnel-rib system-tunnel-rib

router bgp 64512
    address-family ipv4
        next-hop resolution ribs route-map TUNNEL_ONLY
```

Note, however, that the **TUNNEL_ONLY** route-map applies to *all IPV4 unicast routes*. Further, note that only routes whose next-hop value matches **SUBSET** will have a resolution profile set. **All other IPV4 unicast routes will have no resolution profile.** Any route without a resolution profile is left **unresolved**. This is often not intentional.

A more common use case is to allow the route's which do not match a given sequence to fallback to the system default resolution behavior. This can be achieved by adding a second sequence to the route-map with no match statements (matches all routes), and a single set statement which sets the default profile (see the [Default Resolution Profiles](#) section) for the given address family.

Example

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
    match ip next-hop prefix-list SUBSET
    set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map TUNNEL_ONLY permit 20
    set next-hop resolution ribs tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-tunnel-rib system-unicast-rib

router bgp 64512
    address-family ipv4
        next-hop resolution ribs route-map TUNNEL_ONLY
```

This feature provides an explicit token to automatically fallback to the default resolution profile of whichever address family the route-map is applied:

```
ip prefix-list SUBSET 192.0.2.1/32 192.0.2.2/32 192.0.2.3/32
route-map TUNNEL_ONLY permit 10
    match ip next-hop prefix-list SUBSET
    set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map TUNNEL_ONLY permit 20
```

```
set next-hop resolution ribs system-default
router bgp 64512
  address-family ipv4
    next-hop resolution ribs route-map TUNNEL_ONLY
```

15.5.2.11.5 BGP L3VPNs: Next-hop Resolution ribs vrf-unicast-rib

This subfeature affects both the profile used to resolve BGP VPN routes as well as the VRF in which the route resolution takes place. With this feature disabled, or prior to **EOS Release 4.22.0F**, imported VPN routes and is subject to the following restriction:

For each VPN route received from a neighbor, the route is imported (based on route-targets) and installed into the target VRF (import-vrf), **only if the nexthop of the route is resolvable via an MPLS tunnel in the default VRF**.

With this feature enabled, the above restriction is lifted, enabling a VPN route to be imported into the target VRF unconditionally. The plain IP unicast route is subsequently resolved using the unicast RIB of the target VRF.

Note: With this feature enabled, no attempt is made to resolve the VPN route over an MPLS tunnel (even if one exists) in the default VRF. Therefore, the VPN routes received from a neighbor remains inactive in the default VRF.

To enable this feature, use the domain token **vrf-unicast-rib** under the IPV4 / IPV6 address family submodes:

```
switch(config-router-bgp-af)# next-hop resolution ribs vrf-unicast-rib
```

15.5.2.11.5 Examples

To enable the **vrf-unicast-rib** feature:

```
router bgp 64512
  address-family vpn-ipv4
    next-hop resolution ribs vrf-unicast-rib
```

The following IPV4 VPN route has been received from a neighbor:

```
switch(config)# show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
                  S - Stale, c - Contributing to ECMP, b - backup
                  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Network          Next Hop      Metric  LocPref Weight Path
RD: 11.0.1.1:0  IPv4 prefix 50.1.1.0/24
                  42.42.42.42      -       1        0     100 200 i
```

The route is **inactive** in the default VRF.

Also, there is a VRF, **CUST-1**, where the VPN route (based on the route-targets) is imported. In the **CUST-1** VRF, the nexthop of the route is resolved via a static route to **42.42.42.42**. With this feature enabled, the VPN route is imported and installed in the VRF **CUST-1**:

```
switch(config)# show ip bgp vrf CUST-1
```

```
BGP routing table information for VRF CUST-1
Router identifier 11.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
          S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
          % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Network      Next Hop      Metric  LocPref Weight Path
* >      50.1.1.0/24      42.42.42.42      -       1        0     100 200 i
```

To confirm the route is installed in the **VRF CUST-1**, use the **show ip route** command:

```
switch(config)# show ip route vrf CUST-1
VRF: CUST-1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route
S      42.42.42.42/32 is directly connected, Null0
B I    50.1.1.0/24 is directly connected, Null0
```

The resolution profile used to resolve the next-hop can be seen using the **show rib next-hop** command. Note how the profile includes (only) the system-unicast-rib for **CUST-1**.

```
switch(config)# show rib next-hop ip vrf CUST-1 bgp detail
VRF: CUST-1, Protocol: bgp
Codes: * - Unresolved Next hop
       L - Part of a recursive route resolution loop
       A - Next hop not resolved in ARP/ND
11.0.1.1 [1 pref/0 metric] [ID: 18] type ipv4
  Resolution RIBs: system-unicast-rib
  via Null0, directly connected [ID 3]
```

15.5.2.11.6 Viewing the BGP Nexthop Resolution Status

The following existing show commands which have been enhanced for this feature:

- **show route-msp NAME**
- **show bgp instance [vrf NAME]**
- **show rib next-hop {ip | ipv6}[PROTOCOL] detail**

show route-map NAME

Use the **show route-map NAME** command to display the new set statement:

```
switch(config)# show route-map
route-map foo permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set next-hop resolution ribs tunnel-rib system-tunnel-rib
route-map foo permit 20
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set next-hop resolution ribs tunnel-rib colored system-colored-tunnel-rib tunnel-rib system-
tunnel-rib system-unicast-rib

switch(config)#show route-map | json
```

```
{
    "routeMaps": {
        "foo": {
            "entries": {
                "20": {
                    "setRules": {
                        "resolutionRibProfileConfig": {
                            "resolutionMethods": [
                                {
                                    "ribType": "tunnel",
                                    "colored": true,
                                    "name": "system-colored-tunnel-rib"
                                },
                                {
                                    "ribType": "tunnel",
                                    "name": "system-tunnel-rib"
                                },
                                {
                                    "ribType": "ip",
                                    "name": "system-unicast-rib"
                                }
                            ]
                        },
                        "subRouteMap": {
                            "name": "",
                            "invert": false
                        },
                        "filterType": "permit",
                        "matchRules": {},
                        "description": []
                    },
                    "10": {
                        "setRules": {
                            "resolutionRibProfileConfig": {
                                "resolutionMethods": [
                                    {
                                        "ribType": "tunnel",
                                        "name": "system-tunnel-rib"
                                    }
                                ]
                            },
                            "subRouteMap": {
                                "name": "",
                                "invert": false
                            },
                            "filterType": "permit",
                            "matchRules": {},
                            "description": []
                        }
                    }
                }
            }
        }
    }
},
```

show bgp instance [vrf NAME]

Use the **show bgp instance** command to inspect the configured profiles and route-maps for each address family. The display output has been extended to show the resolution ribs as seen below, done so in order to display the resolution ribs used for EVPN and BGP Labeled-unicast address families. The output displays the resolution rib profile configuration for the respective address families.

Example

```
switch(config-router-bgp)# show bgp instance
BGP instance information for VRF default
...
Address family IPv4 MplsLabel:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
  Target RIBs: Tunnel RIB
  Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected
```

```

...
Address family IPv6 MplsLabel:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
  Target RIBs: Tunnel RIB
    Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected
...
Address family L2VPN EVPN:
  Additional-paths installation is disabled
  Convergence based update synchronization is disabled
  VXLAN Resolution RIBs: system-unicast-rib
  Mpls Resolution RIBs: tunnel-rib system-tunnel-rib, system-connected

```

Use the `show rib next-hop ip bgp` command to display the per-via resolution profile.

`show rib-next-hop {ip,ipv6} [proto] detail`

Use the `show rib next-hop {ip | ipv6}[proto] detail` command to display which resolution profile is used to resolve each next-hop.

Example

```

switch#(config-router-bgp) # show rib next-hop ip bgp detail
VRF: default, Protocol: bgp
Codes: * - Unresolved Next hop
      L - Part of a recursive route resolution loop
      A - Next hop not resolved in ARP/ND
192.0.2.1 [110 pref/20 metric] [ID: 1] type ipv4
  Resolution RIBs: tunnel-rib colored system-colored-tunnel-rib, tunnel-rib system-tunnel-rib,
  system-unicast-rib
  via 198.51.100.1, Ethernet3 [ID: 10]
192.0.2.2 * [ID: 86]
  Resolution RIBs: No profile set for this next-hop
192.0.2.3 * [ID: 78]
  Resolution RIBs: tunnel-rib colored system-colored-tunnel-rib, tunnel-rib system-tunnel-rib,
  system-connected

```

Note how **192.0.2.2** has no profile set, and is therefore unresolved. This show command illustrates this clearly with the **No profile set for this next-hop** message.

15.5.2.11.7 User-defined Tunnel RIBs for NextHop Resolution

Currently, EOS generates a single system-defined tunnel RIB for the next-hop resolution.

When tunnels to the same destination address are learned from multiple protocols, a fixed preference that is associated with each protocol is used to determine the winning tunnel.

However, with the User-defined tunnel RIBs feature the user is allowed to create user-defined tunnel RIBs with:

- Control over which protocols may contribute to the tunnel RIB.
- The ability to override the preference for all tunnels from a protocol to achieve non-default ordering of tunnels.
- The option to use it in a context where the system-defined tunnel RIB does not suffice.

15.5.2.11.7. Configuring User-defined Tunnel RIBs

A new **tunnel-ribs** configuration mode allows the creation of user-defined tunnel RIBs. For example, the following configuration creates a tunnel RIB with tunnels learned from IS-IS SR and LDP only, with IS-IS SR tunnels being preferred over LDP:

```

switch(config)# tunnel-ribs
switch(config-tunnel-ribs)# tunnel-rib SR_OVER_LDP

```

```
switch(config-tunnel-rib-SR_OVER_LDP)# source-protocol isis segment-routing preference 10
switch(config-tunnel-rib-SR_OVER_LDP)# source-protocol ldp preference 20
```

When adding a source protocol in a user-defined tunnel RIB, the preference is optional. A lower preference value indicates a more preferred protocol. If the preference is not specified, the following system-defined preference values are used:

| Source Protocol | System-defined Preference |
|----------------------|---------------------------|
| Static | 15 |
| Nexthop group tunnel | 25 |
| RSVP LER | 45 |
| LDP | 55 |
| IS-IS SR | 65 |
| BGP-LU | 85 |

Modifying the system-tunnel-rib

The user can explicitly modify the default preferences for the **system-tunnel-rib** as well as user-defined RIBs:

```
switch(config)# tunnel-ribs
switch(config-tunnel-ribs)# tunnel-rib system-tunnel-rib
switch(config-tunnel-rib-system-tunnel-rib)#
  source-protocol Configure the tunnel source
-----
  comment      Up to 240 characters, comment for this mode
  default     Set a command to its defaults
  exit        Leave Configure mode
  no          Disable the command that follows
  show        Display details of switch operation
  !!
  Append to comment

switch(config-tunnel-rib-system-tunnel-rib)# source-protocol ?
  bgp         BGP tunnel
  isis        IS-IS tunnel
  ldp         LDP tunnel
  nexthop-group Nexthop group tunnel
  rsvp-ler    RSVP LER tunnel
  static      Static tunnel

switch(config-tunnel-rib-system-tunnel-rib)# source-protocol rsvp-ler preference 2
switch(config-tunnel-rib-system-tunnel-rib)# exit
switch(config-tunnel-ribs)# show active all
tunnel-ribs
  tunnel-rib system-tunnel-rib
    source-protocol static
    source-protocol isis segment-routing
    source-protocol bgp labeled-unicast
    source-protocol nexthop-group
    source-protocol rsvp-ler preference 2
    source-protocol ldp
```

15.5.2.11.7. Displaying Tunnel RIB Information

- Use the **show tunnel rib** to display the user defined RIB information:

```
switch# show tunnel rib SR_OVER_LDP brief
Tunnel RIB: SR_OVER_LDP
Endpoint      Tunnel Type   Index(es) Tunnel Preference IGP Preference IGP Metric
-----        -----
1.1.1.1/32    IS-IS SR IPv4 2           10            115           20
```

- Use the **show tunnel rib brief** command to display the system-defined tunnel RIB information.

```
switch# show tunnel rib brief
Tunnel RIB: system-tunnel-rib
Endpoint      Tunnel Type   Index(es) Tunnel Preference IGP Preference IGP Metric
-----        -----       -----      -----      -----      -----
1.1.1.1/32    LDP          1           55            1             0
```

- Use the **show active all** command to display the information about which source protocols contribute to the system-defined tunnel RIB.

```
switch(config)# tunnel-ribs
switch(config-tunnel-ribs)# tunnel-rib system-tunnel-rib
switch(config-tunnel-ribs)# show active all
tunnel-ribs
  tunnel-rib system-tunnel-rib
    source-protocol static
    source-protocol isis segment-routing
    source-protocol bgp labeled-unicast
    source-protocol nexthop-group
    source-protocol rsvp-ler
    source-protocol ldp
```

15.5.2.12 BGP Next Hop Resolution with IGP Distance

A core router with competing advertisements for the same prefixes from different Perimeter Edge (PE) routers should select the local Edge Router (ER) as the best path based on the IGP metric of resolving routes with competing advertisements. The switch supports utilizing the IGP distance in the route selection process when a BGP route has two or more levels of recursion.

Configuring BGP Next Hop Resolution with IGP Distance

Use the following commands to configure the BGP network with IGP Distance:

```
switch(config)# router bgp 100
switch(config-router-bgp)# next-hop resolution route igrp-nexthop-cost protocol
  bgp
switch(config-router-bgp) #
```

Displaying BGP Next Hop Resolution with IGP Distance Information

Use the following command to display the resolution details of BGP next hops:

```
switch# show ip bgp detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
BGP routing table entry for 1.1.1.0/24
  Paths: 1 available
    Local (Received from a RR-client)
      3.3.3.3 from 3.3.3.3 (3.3.3.3)
        Origin IGP, metric 0, localpref 100, IGP metric 20, weight 0, tag 0
        Received 00:02:02 ago, valid, internal, best
        Rx SAFI: Unicast
BGP routing table entry for 2.2.2.0/24
  Paths: 1 available
    Local (Received from a RR-client)
      4.4.4.4 from 4.4.4.4 (4.4.4.4)
        Origin IGP, metric 0, localpref 100, IGP metric 30, weight 0, tag 0
        Received 00:02:02 ago, valid, internal, best
        Rx SAFI: Unicast
BGP routing table entry for 10.0.0.0/24
  Paths: 2 available
    200 (Received from a RR-client)
      1.1.1.1 from 3.3.3.3 (3.3.3.3)
        Origin INCOMPLETE, metric 0, localpref 100, IGP metric 20, weight 0, tag 0
        Received 00:02:02 ago, valid, internal, best
```

```

Rx SAFI: Unicast
200 (Received from a RR-client)
  2.2.2.2 from 4.4.4.4 (4.4.4.4)
    Origin INCOMPLETE, metric 0, localpref 100, IGP metric 30, weight 0, tag 0
    Received 00:02:02 ago, valid, internal
Rx SAFI: Unicast

```

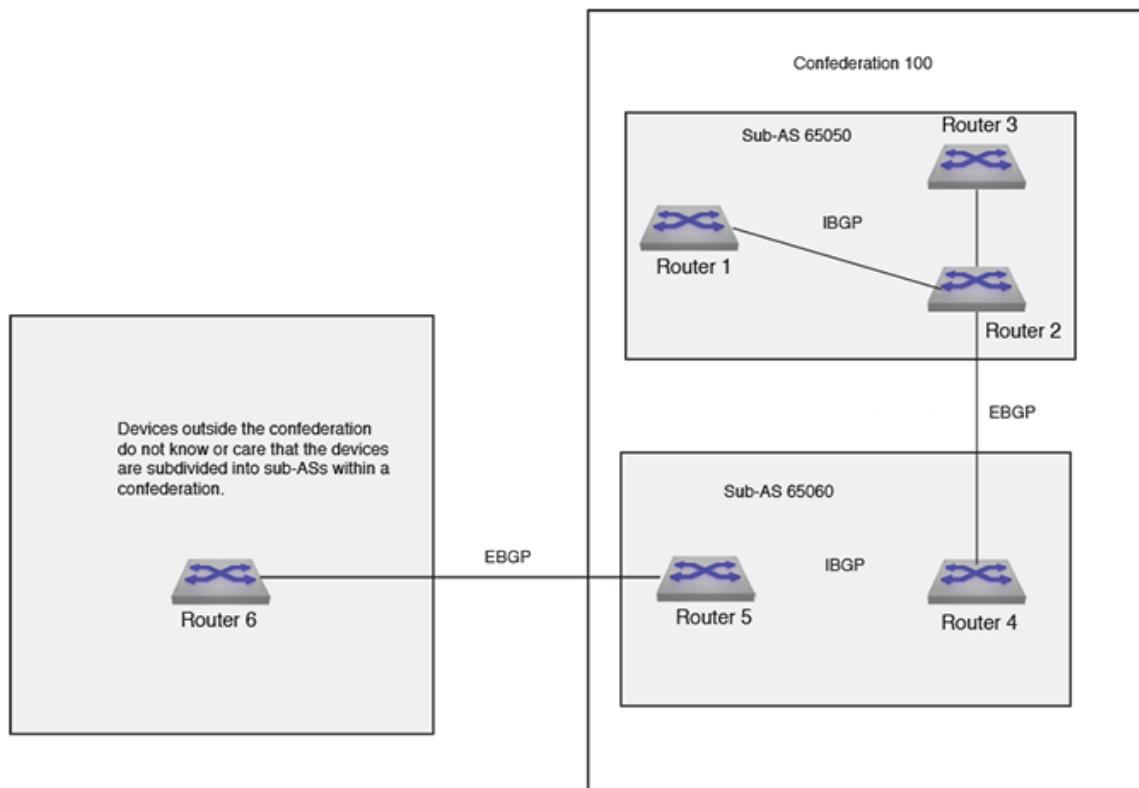

15.5.2.13 Configuring BGP Confederations

BGP confederations allow you to break an Autonomous System (AS) into multiple sub-ASs, and then to group the sub-ASs as a confederation. The sub-ASs exchange iBGP routing information (next-hop, local-preference and MED), but communicate via eBGP.

To configure a BGP confederation, complete the following tasks on each BGP device in the confederation.

- **Configure the local AS number:** the local AS number is the membership number in a sub-AS. BGP devices with the same local AS number are identified as members of the same sub-AS. BGP devices always use the local AS number when communicating with other BGP4 devices in the confederation.
- **Configure the confederation ID:** the confederation ID is the AS number for those BGP devices that are outside of the confederation. A BGP device outside the confederation is not aware that BGP devices are in multiple sub-ASs. The confederation ID must differ from the sub-AS numbers.
- **Configure the list of sub-AS numbers that are confederation members:** devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

Figure 15-16: BGP Confederation Example

Examples

- The `router bgp` command enables BGP and configures the router in sub-autonomous system **65050**. The `bgp confederation identifier` command specifies that confederation **65050** belongs to autonomous system **100**.

The neighbors from other autonomous systems within the confederation are treated as special eBGP peers when using the `bgp confederation peers` command.

```
switch(config)# router bgp 65050
switch(config-router-bgp)# bgp confederation identifier 100
switch(config-router-bgp)# bgp confederation peers 65060
switch(config-router-bgp)#{/pre>
```

- The Arista EOS will group the maximum ranges together. In this example, peers **65032** and **65036** are not included in BGP confederation **100**.

```
switch(config)# router bgp 65050
switch(config-router-bgp)# bgp confederation identifier 100
switch(config-router-bgp)# bgp confederation peers 65060
switch(config-router-bgp)# no bgp confederation peers 65032, 65036
switch(config-router-bgp)#{/pre>
```

15.5.2.14 Configuring BGP FlowSpec

Enable the BGP FlowSpec address family on a per-peer basis using the following commands:

Example

```
switch(config)# router bgp id
switch(config-router-bgp)# address-family flow-spec [ipv4 | ipv6]
switch(config-router-bgp-af)# neighbor address activate#{/pre>
```

Use the following command to explicitly enable BGP FlowSpec on an interface:

Example

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# flow-spec ipv4 ipv6#{/pre>
```

Currently, both IPv4 and IPv6 must be enabled together on the interface. A user-defined TCAM profile, a feature introduced in *EOS Release 4.20.5F*, must be configured for TCAM support for BGP FlowSpec.

Warning: Creating user-defined TCAM profile on the Arista switch could cause serious issues that impact traffic. Test the BGP FlowSpec policer with the profile in the example. If you need to add new features in the profile, work with Arista's TAC team to define and test the new profile before deploying it on your production switches.

The ACL counters and BGP FlowSpec counters cannot be enabled simultaneously. To enable reporting of counters for BGP FlowSpec rules, use the following configuration:

Example

```
switch(config)# no hardware counter feature acl in
switch(config)# hardware counter feature flow-spec in#{/pre>
```

EOS supports BGP FlowSpec counter telemetry, and BGP updates the BGP FlowSpec counters periodically for a configured specific interval. Configure a range from 30 to 300 seconds.

To add BGP FlowSpec telemetry with an interval of 60 seconds, add the following parameter to the BGP configuration:

```
switch(config-router-bgp-af) # flow-spec counters poll interval 60 seconds
```

Note: The output from the show command reflects any updates and then refreshes the BGP FlowSpec counters.

Enabling BGP Flowspec on Layer 2 (L2) Interfaces

Enable BGP Flowspec on Layer 2 interfaces using the following commands:

```
switch(config) # flow-spec
switch(config-flow-spec) # hardware persistent
switch(config-flow-spec) # exit
switch(config) # interface eth1.1
switch(config-if-Eth1.1) # flow-spec ipv4
```

Configure FlowSpec for IPv4 or IPv6 on a L2 interface. Also, configure the TCAM profile to include the packet type, **packet ipv4 forwarding bridged** and **packet ipv6 forwarding bridged**.

15.5.2.14.1 Displaying Flowspec Information

The BGP show commands have been enhanced to display the **flow-spec** content for both IPv4 and IPv6 address families:

Example

The **show bgp flow-spec ipv4 summary** command displays the count of flowspec rules received from each peer:

```
switch(config) # show bgp flow-spec ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 10
Neighbor Status Codes: m - Under maintenance
  Neighbor      V   AS     MsgRcvd    MsgSent   InQ  OutQ Up/Down State RulesRcd RulesAcc
  10.0.0.2      4   10        12          4       0    0 00:02:18 Estab   2         2
  10.0.1.2      4   10        6           4       0    0 00:02:18 Estab   0         0
```

The **show bgp flow-spec ipv4** displays a brief description of each flowspec rule, including the matching rule and actions. The matching rule uses a format:

dest prefix; src prefix; [component:condition] +

The component is abbreviated, for example, DP for destination port and IP for IP Protocol as shown in the following example. The detail of the show command will display the full component name.

The condition is expressed with logical operators. In the following example, **IP:=6|=17** matches any packets whose IP Protocol is 6 (TCP) or 17 (UDP). **DP:>1010&<1024** matches any packets whose destination port is greater than **1010** and less than **1024**.

Example

```
switch(config) # show bgp flow-spec ipv4
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
Rule status codes: # - not installed, M - received from multiple peers
```

| Matching Rule | Actions |
|---|---------|
| 10.2.3.0/24;* | Drop |
| 10.2.4.0/24;10.2.0.0/16;IP:=6 =17;DP:>1010&<1024; | Drop |

The **show bgp flow-spec detail** displays the full details of each flowspec rule including the peer(s) it was received from, BGP properties, and an expanded description of the matching rule:

Example

```
switch(config)# show bgp flow-spec ipv4 detail
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
BGP Flow Specification Matching Rule for 10.2.3.0/24;*;
  Rule identifier: 3882065752
    Matching Rule:
      Destination Prefix: 10.2.3.0/24
      Source Prefix: *
    Paths: 1 available
      Local
        from 10.0.0.2 (10.1.1.2)
          Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
          Actions: Drop
BGP Flow Specification Matching Rule for 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
  Rule identifier: 3882090640
    Matching Rule:
      Destination Prefix: 10.2.4.0/24
      Source Prefix: 10.2.0.0/16
      IP Protocol: =6 | =17
      Destination Port: >1010 & <1024
    Paths: 1 available
      Local
        from 10.0.0.2 (10.1.1.2)
          Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
          Actions: Drop
```

The **show flow-spec ipv4 summary** command displays an overall status of how many flowspec rules were received and how many were installed:

Example

```
switch(config)# show flow-spec ipv4 summary
Flow specification rules summary for VRF default
  Total number of rules: 2
  Number of installed rules: 2
```

The **show flow-spec ipv4** displays the installation status of the rule, and a counter of how many hits it has accumulated. This command also compiles the received flowspec rules into rules that can be programmed into the TCAM. For example, logical expressions on values such as the destination port are converted to ranges, as shown below:

Example

```
switch(config)# show flow-spec ipv4
Flow specification rules for VRF default
Applied on: Ethernet47/1
  Flow-spec rule: 10.2.3.0/24;*
    Rule identifier: 3882065752
    Matches:
      Destination prefix: 10.2.3.0/24
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
        Route via LDP tunnel index 4, MPLS label 100123
        Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 312 packets
  Flow-spec rule: 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
```

```

Rule identifier: 3882090640
Matches:
  Destination prefix: 10.2.4.0/24
  Source prefix: 10.2.0.0/16
  Next protocol: 17
    6
  Destination port: 1011-1023
Actions:
  Police: 80 Mbps (10 MBps)
  Redirect: VRF customer1
    Route via LDP tunnel index 4, MPLS label 100123
    Route via LDP tunnel index 1, MPLS label 116507
Status:
  Installed: yes
  Counter: 0 packets

```

Infeasible rules are detected and not programmed, and this status is reported using the **show flow-spec ipv4** command. Examples of the infeasible rules are:

- The **lt/gt/eq** operator is missing in the numerical opVal component.
- Co-existence of TCP flag component with ICMP type or code component in the same rule.
- Co-existence of port based component with ICMP type or code component in the same rule. For example, the default route in the specified VRF can be resolved over a GRE or MPLS tunnel. The following **show** command output verifies the resolution over the tunnel.

For redirect actions, additional information is displayed to show how it was resolved.

Example

```

Actions:
  Redirect: VRF customer1
    Route via LDP tunnel index 4, MPLS label 100123
    Route via LDP tunnel index 1, MPLS label 116507

```

The specified **nexthop** in the flow-spec **redirect** action can be resolved by the respective VRFs IP RIB over MPLS or GRE tunnel, as shown in the following example:

Example

```

Actions:
  Redirect: VRF default, fc00:91:91:91::91
    Route via Static Interface tunnel index 1

```

15.5.2.15 Configuring BGP Logical OR of Multiple Community Lists

Adding the **or-results** token to the **match community** command allows you to do a logical OR between all provided community lists:

```

match community or-results COMMLIST1 COMMLIST2
match extcommunity or-results EXTCOMMLIST1 EXTCOMMLIST2
match large-community or-results LARGECOMMLIST1 LARGECOMMLIST2

```

Full configuration example:

- Enable the Multi-agent mode.

```
switch(config)# service routing protocols model multi-agent
```

- Create community lists (extended and large communities are also compatible with **or-results**).

```
switch(config)# ip community-list COMMLIST1 permit 1:1
```

```
switch(config)# ip community-list COMMLIST2 permit 2:2
```

- Configure Route-map with **or-results**.

```
switch(config)# route-map IN-POLICY
switch(config-route-map-IN-POLICY)#match community or-results
COMMLIST1 COMMLIST2
```

15.5.2.15.1 Displaying BGP Logical OR Information

The **or-results** match clauses can be seen with the standard **show route-map** command, as shown in the following command display outputs.

```
switch# show route-map IN-POLICY
route-map IN-POLICY permit 10
  Description:
  Match clauses:
    match community or-results COMMLIST1 COMMLIST2
  SubRouteMap:
  Set clauses:
    set local-preference 500
route-map IN-POLICY permit 20
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
```

```
switch# show run | in 200.200.200.57
neighbor 200.200.200.57 remote-as 300
neighbor 200.200.200.57 update-source Loopback200
neighbor 200.200.200.57 ebgp-multipath
neighbor 200.200.200.57 route-map IN-POLICY in
neighbor 200.200.200.57 maximum-routes 0
```

```
switch# show ip bgp community 1:1
BGP routing table information for VRF default
Router identifier 220.220.220.51, local AS number 200
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -

Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
          S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
          % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop          Metric LocPref Weight  Path
* >   192.12.24.0/24     200.200.200.57    0      500      0    300 ?
* >   192.47.242.0/24    200.200.200.57    0      500      0    300 ?
```

15.5.2.16 Setting the BGP Missing Policy Action

To set the default policy behavior for BGP so that all routes can be denied or rejected, use the **bgp missing policy** command. Options control inbound and outbound directions independently. When the inbound direction is affected, currently installed routes from the peer are removed (and withdrawn from other attached peers). When the outbound direction is affected, currently exported routes to the peer are withdrawn. Setting the Missing Policy Action options back to its default/permit value re-applies the current inbound route-map policy processing to the set of routes received from the peer and export routes according to the configured outbound route-map. If soft-reconfiguration is disabled and the inbound direction is affected then the peer must re-send its routes (e.g. a manual “clear ip bgp” command is required).

Configuring the BGP Missing Policy Action

Permit is the default missing policy action when no/default are applied. Entering the ‘default’ form of the command in a non-default VRF will cause the non-default VRF to inherit the setting from the default VRF. Entering the **no** form of the command in a non-default VRF will cause the non-default VRF to be configured with the **permit** setting regardless of the default VRF setting.

The include keyword is optional, and only takes effect in the multi-agent protocol model.

The following configures the BGP missing policy action.

```
switch(config-router-bgp) # bgp missing-policy [include {prefix-list|sub-route-map}]
direction [in|out] action [permit|deny|deny-in-out]
switch(config-router-bgp) # [no|default] bgp missing-policy [include {prefix-list|sub-route-map}]
direction [in|out] action
```

Actions

For the actions, the **permit** and **deny** options inherit the direction of route denial from the direction, while the **deny-in-out** option specifically calls out denying routes in both directions.

- direction **in** action **permit**: allow all routes in the inbound direction when the inbound route-map is misconfigured (default).
- direction **out** action **permit**: allow all routes in the outbound direction when the outbound route-map is misconfigured (default).
- direction **in** action **deny**: deny all routes in the inbound direction when the inbound route-map is misconfigured.
- direction **out** action **deny**: deny all routes in the outbound direction when the outbound route-map is misconfigured.
- direction **in** action **deny-in-out**: deny all routes in both inbound/outbound directions when the inbound route-map is misconfigured.
- direction **out** action **deny-in-out**: deny all routes in both inbound/outbound directions when the outbound route-map is misconfigured.

The include keyword specifies that the policy constructs in the route map should also be examined. The options to the include keyword are.

- **sub-route-map**: examine the sub route map references if any are defined in a route map covered by a missing policy statement. If the sub route map statement – or any in a route map chain – makes a reference to a route map which does not exist, then the missing policy action will be applied.
- **prefix-list**: examine the prefix list references if any are defined in a route map covered by a missing policy statement. If the prefix-list statement – or any in the applied route map chain – makes a reference to a prefix list which does not exist, then the missing policy action will be applied.

Displaying BGP Missing Policy Action Configurations

The `show ip bgp neighbors` command displays the status of a peer which is currently in the missing policy/default deny state. The `Missing policy/default deny` lines would be omitted if the configuration option is disabled or the route-maps are configured correctly.

```
switch(config-router-bgp) # show ip bgp neighbors
BGP neighbor is 1.0.0.2, remote AS 200, external link
BGP version 4, remote router ID 0.0.1.1, VRF default
Negotiated BGP version 4
...Missing policy/default deny import action is active
Missing policy/default deny export action is active
Inbound route map is rml
Outbound route map is rm2
...
...
```

15.5.2.17 Configuring BGP Inbound Update Processing Delay

Apply an optional delay before processing inbound update messages from peers, and may be useful when routes from a peer depend on routes from another. The routes from the second peer must install before the routes from the first peer process, and applying the delay to the first peer allows the second peer to install the routes first. Configure the delay per peer and apply it to all address families negotiating with the peer. The delay timer starts when the peer becomes established, and routes from the peers with the delay process only after the time expires. EOS supports this feature on default and non-default VRFs on the network. The inbound delay does not apply to switch reloads or BGP agent restarts.

Configure the delay per peer and apply it to all address families negotiating with the peer. The delay timer starts when the peer becomes established, and routes from the peers with the delay process only after the time expires. EOS supports this feature on default and non-default VRFs on the network.

The inbound delay does not apply to switch reloads or BGP agent restarts.

Example

To configure the inbound update processing delay for 30 seconds on a peer group, `mybgp-peers`, use the following command:

```
switch(config) #router bgp
switch(config-router-bgp) #neighbor peer mybgp-peers rib-in delay 30 event peer-init
```

15.5.2.18 Configuring BGP IPv4-mapped IPv6 Address Next Hops for IPv6 Labeled-Unicast Routes

Receive-side Configuration

To configure BGP to translate IPv4-mapped IPv6 addresses to IPv4 addresses when receiving next hops in labeled-unicast routes, use the `neighbor next-hop resolution v4-mapped-v6 translation` command. With this configuration, when the switch receives an IPv4-mapped IPv6 address for the next hop of an IPv6 labeled-unicast route, it will translate it to an IPv4 address, which allows the next hop to be resolved in an IPv4 network. This command takes effect only if the multi-agent routing protocol model is running. It applies only to the default VRF.

Example

These commands enter BGP IPv6 Labeled-Unicast Address Family Configuration Mode for AS **64510** (creating the BGP instance if it does not exist) and enable the translation of IPv4-mapped IPv6 addresses to IPv4 addresses for neighbors in the **v6_pg** peer group.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor v6_pg next-hop resolution v4-mapped-v6 translation
switch(config-router-bgp-af-label)#+
```

Send-side Configuration

A BGP router advertising a route can provide the IPv4-mapped IPv6 address of one of its local interfaces, such as a loopback interface, as the next hop. This source interface is specified with the **neighbor next-hop-self** command. The interface must be configured with an IPv4 address for this to be effective.

This configuration does not enable next-hop-self. It simply specifies the interface to be provided if the router advertises itself as the next hop. The next-hop-self action can be enabled with the **neighbor next-hop-self** command, or by configuring Egress Peer Engineering (EPE) using the **neighbor default-originate** command, or by other methods.

Example

These commands enable the switch to advertise itself as a next hop for the peer at **2001:0db8::1**, and then configure the switch to use the IPv4 address of the **Loopback 0** interface for the next hop for the peer at **2001:0db8::1** if the route is IPv4-mapped IPv6.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# neighbor 2001:0db8::1 next-hop-self
switch(config-router-bgp)# neighbor 2001:0db8::1 next-hop-self v4-mapped-v6 source-interface
  Loopback 0
switch(config-router-bgp)#+
```

15.5.2.19 BGP Automatic Route Distinguisher

For BGP EVPN VXLAN fabrics, automatic route distinguisher (RD) generation simplifies the network configuration by automatically generating unique RD values based on the BGP Router ID and the VRF ID, eliminating manual RD configuration. EOS supports this configuration for the following address families:

- L2 EVPN VXLAN
- Virtual Private Wire Service (VPWS)
- VLAN
- VNI

Route Distinguisher Generation

According to [RFC4364](#), a route distinguisher (RD) consists of two fields, *type* and *value*. In the *type* field, the RFC defines three values: 0, 1, and 2 that use the following encoding types:

- **Type 0** - A 2-byte Administrator subfield plus a 4-byte Assigned Number subfield (<asn><nn>)
- **Type 1** - A 4-byte Administrator subfield plus a 2-byte Assigned Number subfield (<ip-addr><nn>)
- **Type 2** - A 4-byte Administrator subfield plus a 2-byte Assigned Number subfield (<asn4><nn>)

Autogeneration of RDs generates a Type 1 RD by using the router ID as the 4-byte administrator subfield and a 2-byte assigned number subfield from a configurable range.

Configuring BGP Automatic RDs

Configure the automatic RD in the BGP Router Configuration Mode using a range for the RD and the address family type:

```
switch(config) #router bgp asn
switch(config-router-bgp) #route-distinguisher
switch(config-route-distinguisher) #assignment auto range start_range end_range
?switch(config-route-distinguisher) #assignment auto address-family 12-evpn
```

EOS disables this feature by default. All address families within the L2 EVPN configuration share the same range.

15.5.2.20 Configuring BGP Monitoring Protocol

Enable BGP Monitoring Protocol (BMP) in the Router BGP Configuration Mode.

Enabling BMP Globally

Use the following commands to export BGP paths on the BGP router, **64512**, router ID, **1.0.0.1**, and VRF **purple** for BMP:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # router-id 1.0.0.1
switch(config-router-bgp) # bgp monitoring
switch(config-router-bgp) # vrf purple
switch(config-router-bgp-vrf-purple) # rd 530:12
```

The **bgp monitoring** command enables the export of BGP received paths and Loc-Rib routes on non-default VRFs. BMP only supports non-default VRFs with a route distinguisher (RD) configured in the BGP Router VRF Configuration Mode. The RD distinguishes peers with the same IP address but in different VRFs.

If the RD or router ID changes later, BMP sends **Peer Down** messages with the old RD value to all BGP peers in the VRF, and then sends **Peer Up** and Route Monitoring messages with the new RD value.

Disabling BMP for a Neighbor

Use the following commands to disable BMP on router **64512** with the router ID **1.0.1.1**:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # no neighbor 1.0.1.1 monitoring
```

VRF Filtering for Adj-Rib-In Export

With BMP and export for an address family (AFI/SAFI) enabled, the BGP router exports Adj-RIB-In information for all VRFs. Filter the VRFs exported by the BGP router using the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # vrf mgmt
switch(config-router-bgp-vrf-mgmt) # bgp received routes monitoring disabled
```

This prevents the BGP router from exporting the routes on VRF. Using the **no** or **default** version of the command reverts the configuration to the default behavior of exporting the Adj-RIB-Ins information.

Configuring a BMP Header Timestamp

Use the **monitoring timestamp** to set the timestamp in BMP Route Monitoring messages to zero (none) or to the Route Monitoring Message construction time. BMP uses the **send-time** as the default value.

Note: The **send-time** indicates the time of Route Monitoring messaging formation and may not be equal to the time that the BGP peer received BGP paths. Since many BGP paths may be packed together into a single Route Monitoring message, the BGP paths all share the same timestamp.

To configure the timestamp to **none**, use the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring timestamp none
```

Filtering Received Route Policies

By default, the pre-policy and the post-policy routes advertise to the monitoring station. Use the **no monitoring received routes** command disables either pre-policy or post-policy routes or both. Use the following commands to disable pre-policy routes:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # no monitoring received routes pre-policy
```

To enable exporting pre-policy and post-policy routes, use the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring received routes pre-policy post-policy
```

Statistics Reporting for BMP Stations

The following table lists the supported statistics counters for BMP:

Table 80: Supported Statics Counters

| Statistic Type | Description |
|----------------|---|
| 0 | Number of prefixes rejected by the inbound policy |
| 7 | Number of routes in Adj-RIBs-In |
| 9 | Number of routes in each AFI/SAFI Adj-RIB-In |

BMP disables statistics reporting by default. Use the following commands to turn on statistics reporting for a Monitoring Station:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring station S1
switch(config-router-bgp-monitoring-station-S1) # statistics
```

Once enabled on a monitoring station, the station begins receiving periodic SR announcements containing the supported statistics. The SR announcements generate periodically, every 30 seconds by default, whether or not any changes occur to the statistics. Configure the statistics reporting interval to 45 seconds using the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring statistics interval 45
```

Export BGP Received Paths of Address-Family

BMP supports exporting BGP received paths with a specific address family and exports IPv4 Unicast and IPv6 Unicast Adj-RIB-In paths by default. Enable or disable exporting BGP received paths with a specific address family. Use the following commands to specify IPv4 Unicast Adj-RIB-In paths:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring received routes address-family ipv4
    unicast
```

15.5.2.20.1 Configuring a BMP Monitoring Station

To export BGP received paths, configure a BMP Monitoring Station using the **monitoring station station_name** command. Specify a connection mode, the IP address of the station, and depending on the connection mode, the local or remote TCP port to establish a TCP connection to the station. Use one of the following connection modes:

- **Active** mode - The router initiates a TCP connection to the BMP Monitoring Station.
- **Passive** mode - The router listens for TCP connections from the BMP Monitoring Station which must initiate the connection.

Configuring a Passive Mode Connection

Use the following commands to configure a passive connection with a listening port, 5001:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring port 5001
```

For passive mode connections, configure an IP address for the BMP Monitoring Station:

```
switch(config)# router bgp 64512
switch#(config-router-bgp)# monitoring station S1
switch#(config-router-bgp-monitoring-station-S1)# connection mode passive
switch#(config-router-bgp-monitoring-station-S1)# connection address
    192.168.1.5
```

The connection address must match the source IP address used by the monitoring station to connect to the router. Since the monitoring stations does not send messages to the router, the IP address provides the only way to identify the station and match the correct configuration.

Configuring an Active Mode Connection

For active mode connections, configure the monitoring station IP address and port number:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station S1
switch(config-router-bgp-monitoring-station-S1)# connection mode active port
    5000
switch(config-router-bgp-monitoring-station-S1)# connection address 192.168.1.5
```

The monitoring station must listen for connections at the specified IP address and TCP port number.

Configuring a Monitoring Station on a Non-Default VRF

Use the following commands to configure a monitoring station, *Stn-2*, on a VRF, *mgmt*.

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station Stn-2
```

```
switch(config-router-bgp-monitoring-station-S1)# connection address 192.168.1.5
vrf mgmt
```

Configuring Monitoring Station Settings

The **description** parameter allows the addition of descriptive text for the monitoring station and displays that information in BMP station show commands.

Use the following commands to add a description, *monitoring remote network*, to the monitoring station, *Stn-2*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1)# description monitoring remote
network
```

Configuring Received Route Policy Filtering

Use the following commands to configure export policy filtering at the station level:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1)# no export-policy received
routes pre-policy
switch(config-router-bgp-monitoring-station-S1)# no export-policy received
routes post-policy
```

Shutting Down Monitoring Station TCP Sessions

Use the **shutdown** command to shut down TCP sessions to the monitoring station. The router stops initiating TCP connections to stations configured with an active mode connection. For stations configured with a passive mode connection, the router stops accepting TCP sessions from the station.

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1)# shutdown
```

Updating the Source for the TCP Session

Use the **update-source** command to select the source IP address sent by the router for the TCP session. The monitoring station must be able to reach the IP address. Use the following commands to update the source IP address to interface, *ethernet1/1*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1)# update-source interface
ethernet1/1
```

Configuring TCP Keepalive Probes

The **connection keepalive** command periodically checks the health of the TCP connection with the station. Since the router does not receive messages from the station, the router cannot detect when the station becomes unavailable due to power or link failure. Using a TCP keepalive probe allows the router to quickly detect the loss of a station connection. Configure a keepalive probe with 30 seconds of idletime, 30 seconds between TCP keepalive probes, and sending 100 probes before closing the connection:

```
switch(config)# router bgp 64512
```

```
switch(config-router-bgp) # monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1) # connection keepalive 30 30 100
```

Configuring TCP Authentication for TCP Sessions

For additional security, enable the TCP MD5 signature option for the TCP session with the station. The **authentication-key** command enables this option and configures the key used on the session. Use the following commands to configure a password, *mySecretID*, for TCP sessions:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring station Stn-2
switch(config-router-bgp-monitoring-station-S1) # authentication mySecretID
```

Exporting BGP Received Additional Paths (AddPath)

Use the following configuration for a BMP station (S1) to receive additional-paths advertisements, for example, NLRIIs containing addpath-ids. If any BGP peer has a configuration for additional-paths and can send addpath-id values with the required additional-paths visibility for that peer.

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring station S1
switch(config-router-bgp-monitoring-station-S1) # export-policy received routes
additional-paths
```

Exporting Local RIB

By default, BMP disables exporting Local RIB for all monitoring stations on all VRFs. Enable exporting the Local RIB per station or per VRF. You must configure the router ID for BGP and the RD for a non-default VRF. BMP exports IPv4 and IPv6 Unicast routes into the Local RIB including imported VPN routes. The following commands configure exporting of the Local RIB to a single station:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring station S1
switch(config-router-bgp-monitoring-station-S1) # export-policy bgp rib
bestpaths
```

To configure exporting of Local RIB to all monitoring stations, use the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring bgp rib bestpaths
```

Per monitoring station configuration overrides the global BGP configuration.

Use the following commands to enable the export of a specific BGP VRF, *Blue*, Local RIB:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # vrf Blue
switch(config-router-bgp-vrf-Blue) # bgp rib bestpaths monitoring
```

Per VRF configuration overrides the global VRF configuration.

15.5.2.20.2 Displaying BGP Monitoring Protocol Status

Use the **show bgp monitoring** command to display information about the BMP status on the switch:

```
switch# show bgp monitoring
BGP Monitoring status: enabled
BMP Timestamp mode: send-time
BMP Export policies: pre-policy, post-policy
VRFs filtered: vrf1, vrf2

Station - bmp_A
  Connection mode: active
  VRF: default
  Address: 192.0.2.1
  Port: 5000
  Connection: connected
  State: up
  Uptime: 00:09:17
  Station flap count: 0
```

The **show bgp monitoring summary** command displays a summary of the station names, status, and duration of activity:

```
switch# show bgp monitoring summary
BGP Monitoring status: enabled

Station Name Status Uptime
-----
bmp_A   connecting -
bmp_B   idle      -
bmp_C   up        00:11:46
```

The **show bgp monitoring station *station_name*** displays details about per-station configurations. Use the command to display information about station *bmp_B*:

```
switch# show bgp monitoring station bmp_B
Station - bmp_B
  Station export policies: pre-policy, post-policy
  Connection mode: unknown
  VRF: default
  Connection: disconnected
  State: idle
  Station flap count: 0
```

The **show bgp monitoring active** command displays information about stations receiving TCP connection requests from a BGP router:

```
switch# show bgp monitoring active
Active Station - bmp_C
VRF: default
Address: 192.0.2.1
Port: 5000
Retry interval: 30s
Connection: connected
Attempts: 4484
Successes: 1
Errors: 5
```

The **show bgp monitoring passive** command displays information about stations that the router listens for TCP connections:

```
switch# show bgp monitoring passive
IPv4 Passive Listener VRF - default
  Port 5000
  Status: Listening
  Stations:
    bmp_A: (198.51.100.100)
    bmp_B: (192.0.2.5)
  Accepted: 2
  Rejected: 5
IPv6 Passive Listener VRF - default
  Port 5000
  Status: Disabled
  Reason:
  Stations:
    bmp_A: (2001:DB8::800:1)
    bmp_B: (2001:DB8::900:2)
  Accepted: 4
  Rejected: 0
```

The **show bgp monitoring station *station_name* detail** command displays TCP statistics for a BMP monitoring station:

```
switch# show bgp monitoring station bmp_C detail
Station - bmp_C
  Connection mode: active
  VRF: default
  Address: 192.0.2.1
  Port: 5000
  Connection: connected
  State: up
  Uptime: 00:13:06
  Station flap count: 1
  TCP Socket Information:
    TCP state is ESTABLISHED
    Send-Q: 0/200
    Outgoing Maximum Segment Size (MSS): 1448
    Total Number of TCP retransmissions: 0
    Options:
      Timestamps enabled: yes
      Selective Acknowledgments enabled: yes
      Window Scale enabled: yes
      Explicit Congestion Notification (ECN) enabled: no
  Socket Statistics:
    Window Scale (wscale): 9,9
    Retransmission Timeout (rto): 204.0ms
    Round-trip Time (rtt/rtvar): 0.1ms/0.1ms
    Delayed Ack Timeout (ato): 0.0ms
    Congestion Window (cwnd): 10
    TCP Throughput: 864.48 Mbps
    Advertised Recv Window (rcv_space): 29200
```

15.5.2.21 BGP Operational Commands

15.5.2.21.1 Shutdown

The **shutdown (BGP)** command disables BGP operations without disrupting the BGP configuration. The **router bgp** command disables BGP and removes the BGP configuration.

The **shutdown (BGP)** command resumes BGP activity.

Examples

- This command disables BGP activity on the switch.

```
switch(config-router-bgp) # shutdown
switch(config-router-bgp) #
```

- This command resumes BGP activity on the switch.

```
switch(config-router-bgp) # no shutdown
switch(config-router-bgp) #
```

15.5.2.21.2 Clearing the Routing Table and Resetting BGP Sessions

When entered without parameters, the **clear ip bgp** command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

Followed by an asterisk (*), it clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer's IP address at the end of the command.

Example

This command removes all BGP learned routes from the routing table.

```
switch# clear ip bgp
! Peerings for all neighbors were hard reset switch#
```

15.5.3 BGP IPv6 Link Local Peers Discovery

BGP IPv6 Link Local Peers Discovery supports a dynamic configuration model to eliminate the need for the network administrator to assign and configure IPv6 addresses for BGP peering.

Leverage the following details to automatically establish BGP adjacency:

- IPv6 link local addresses are automatically generated by the system based on MAC addresses.
- IPv6 router advertisements are used to communicate these addresses among potential BGP peers.

BGP IPv6 Link Local Peers Discovery uses IPv6 router advertisement to discover the peers IPv6 link local address. Devices are required to have IPv6 routing enabled, and the interface used for peering must have an IPv6 link local address. The time taken to discover the peers IPv6 link local address is proportional to the time taken by the peer to send a router advertisement message. When bringing up BGP sessions based on router advertisements received, a flurry of router advertisements on the interfaces causes the Rib agent to do more work and potentially delays the discovery of BGP neighbors over those interfaces and the establishment of BGP sessions. Since these are link local addresses, the peers must be directly connected at Layer 3.

15.5.4 BGP Examples

This section shows example configurations and topologies for iBGP ([BGP Example 1](#)) and eBGP ([BGP Example 2](#)).

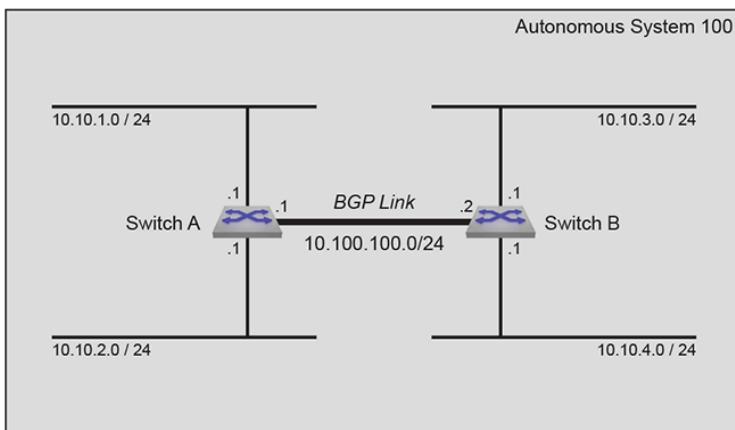

15.5.4.1 BGP Example 1

Example 1 features an internal BGP (iBGP) link that connects peers in AS 100.

15.5.4.1.1 BGP Example 1 Diagram

[Figure 15-17: BGP Example 1](#) displays an iBGP connection, linking neighbors within AS 100. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the **LOCAL_PREF** field is 150. In UPDATE packets sent by Switch B, the **LOCAL_PREF** field is 75.

Figure 15-17: BGP Example 1

15.5.4.1.2 BGP Example 1 Code

This code configures the Example 1 BGP instance on both switches.

- Configure the neighbor addresses.

- Specify the neighbor to **Switch A**.

```
switchA(config)# router bgp 100
switchA(config-router-bgp)# neighbor 10.100.100.2 remote-as 100
```

- Specify the neighbor to **Switch B**.

```
switchB(config)# router bgp 100
switchB(config-router-bgp)# neighbor 10.100.100.1 remote-as 100
```

- Configure the routes to be advertised.

- Advertise **Switch A's** routes.

```
switchA(config-router-bgp)# network 10.10.1.0/24
switchA(config-router-bgp)# network 10.10.2.0/24
```

- b. Advertise **Switch B's** routes.

```
switchB(config-router-bgp) # network 10.10.3.0/24
switchB(config-router-bgp) # network 10.10.4.0/24
```

- 3. Configure the **LOCAL_PREF**.

- a. Configure **LOCAL_PREF** on **Switch A**.

```
switchA(config-router-bgp) # neighbor 10.100.100.2 export-localpref 150
```

- b. Configure **LOCAL_PREF** on **Switch B**.

```
switchB(config-router-bgp) # neighbor 10.100.100.2 export-localpref 75
```

- 4. Modify the hold time and keepalive interval.

- a. Configure timers on **Switch A**.

```
switchA(config-router-bgp) # timer bgp 30 90
```

- b. Configure timers on **Switch B**.

```
switchB(config-router-bgp) # timer bgp 30 90
```

15.5.4.2 BGP Example 2

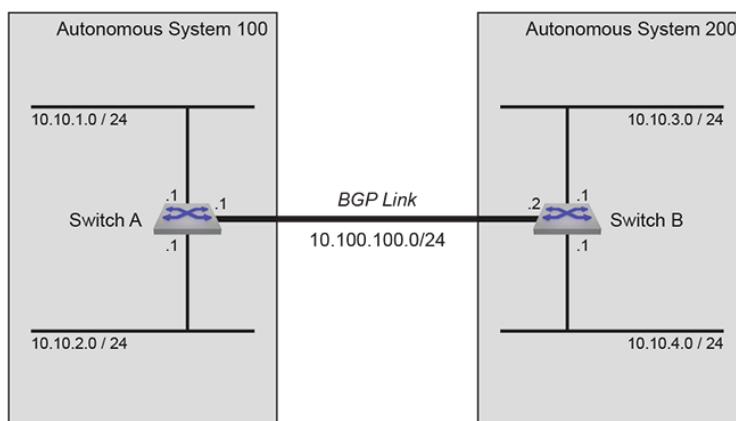

Example 2 creates an external BGP (eBGP) link that connects routers in AS **100** and AS **200**.

15.5.4.2.1 BGP Example 2 Diagram

[Figure 15-18: BGP Example 2](#) displays an eBGP connection, linking **Switch A** in AS **100** to **Switch B** in AS **200**. Each switch advertises two subnets.

Switch A assigns a local preference of **150** to networks advertised by **Switch B**. **Switch B** assigns a local preference of **75** to networks advertised by **Switch A**.

Figure 15-18: BGP Example 2

15.5.4.2.2 BGP Example 2 Code

This code configures the Example 2 BGP instance on both switches.

1. Configure the neighbor addresses.

- a. Specify the neighbor to **Switch A**.

```
switchA(config)# router bgp 100
switchA(config-router-bgp)# neighbor 10.100.100.2 remote-as 200
```

- b. Specify the neighbor to **Switch B**.

```
switchB(config)# router bgp 200
switchB(config-router-bgp)# neighbor 10.100.100.1 remote-as 100
```

2. Configure the routes to be advertised.

- a. Advertise **Switch A**'s routes.

```
switchA(config-router-bgp)# network 10.10.1.0/24
switchA(config-router-bgp)# network 10.10.2.0/24
```

- b. Advertise **Switch B**'s routes.

```
switchB(config-router-bgp)#network 10.10.3.0/24
switchB(config-router-bgp)#network 10.10.4.0/24
```

3. Configure the **LOCAL_PREF**.

- a. Configure **LOCAL_PREF** on **Switch A**.

```
switchA(config-router-bgp)# neighbor 10.100.100.2 import-localpref 150
```

- b. Configure **LOCAL_PREF** on **Switch B**.

```
switchB(config-router-bgp)# neighbor 10.100.100.2 import-localpref 75
```

4. Modify the hold time and keepalive interval.

- a. Configure timers on **Switch A**.

```
switchA(config-router-bgp)# timer bgp 30 90
```

- b. Configure timers on **Switch B**.

```
switchB(config-router-bgp)# timer bgp 30 90
```

15.5.5 BGP Commands

Global Configuration Commands

- ip as-path access-list
- ip as-path regex-mode
- ip community-list
- ip community-list regexp
- ip extcommunity-list
- ip extcommunity-list regexp
- ip large-community-list regexp
- router bgp

Router General Command

- rib fib fec ecmp ordered

Router-BGP Configuration Mode (Includes Address-Family Mode)

- address-family
- address-family flow-spec
- aggregate-address

15.5.5.1 address-family

The **address-family** command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. The address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **running-config** displays the **address-family** commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- **neighbor activate** configures the address as active in the configuration mode address family.
- **neighbor activate** configures the address as not active in the configuration mode address family.
- **neighbor default-originate** advertises a default route to the specified BGP neighbor.
- **neighbor route-map (BGP)** applies a route map to the specified BGP route.
- **network (BGP)** specifies a network for advertisement through UPDATE packets to BGP peers.

The **no address-family** and **default address-family** commands delete the specified address family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp [ipv4 | ipv6]
no bgp [ipv4 | ipv6]
default bgp [ipv4 | ipv6]
```

Parameters

- **ipv4** subsequent commands are applied to the IPv4 unicast address family.
- **ipv6** subsequent commands are applied to the IPv6 unicast address family.

Example

These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv6
switch(config-router-bgp-af)# neighbor 172.10.1.1 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp) #
```

15.5.5.2 address-family flow-spec

Use the **address-family flow-spec** command to filter or redirect DDoS traffic on edge routers. The **no** and **default** versions of the command removes the filter to redirect the DDoS traffic.

Command Mode

BGP router configuration mode (config-router-bgp)

Command Syntax

```
address-family flow-spec [ipv4 | ipv6]
no address-family flow-spec [ipv4 | ipv6]
default address-family flow-spec [ipv4 | ipv6]
```

Parameters

- **ipv4** IPv4 flow specifications.
- **ipv6** IPv6 flow specifications.

Example

The BGP Flowspec address family is enabled on a per-peer basis with:

```
switch(config)# router bgp id
switch(config-router-bgp)# address-family flow-spec [ipv4|ipv6]
switch(config-router-bgp-af)# neighbor address activate
```

15.5.5.3 aggregate-address

The **aggregate-address** command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

Note: Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS_PATH attribute inclusion:** the **as-set** option controls the aggregate route's **AS_PATH** and **ATOMIC_AGGREGATE** attribute contents. **AS_PATH** identifies the autonomous systems through which UPDATE message routing information passes. **ATOMIC_AGGREGATE** indicates that the route is an aggregate or summary of more specific routes.

When the command includes **as-set**, the aggregate route's **AS_SET** attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the **AS_SET**.

When the command does not include **as-set**, the aggregate route's **ATOMIC_AGGREGATE** attribute is set and the aggregate route **AS_PATH** will include the longest leading **PATH_SEQ** of the **AS_PATH** which is common to all contributor routes. For example, for the aggregate **1.0.0.0/16** with two contributors present, the **AS_PATH** for the aggregate is **100 200** as shown.

Aggregate

1.0.0.0/16 as-path ??

Contributors

1.0.1.0/24 as-path 100 200 400 500

1.0.2.0/24 as-path 100 200 300

- **Attribute assignment:** the **attribute-map** option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression:** the **summary-only** option suppresses the advertisement of the contributor routes that comprise the aggregate.
- **Contributor filtering:** the **match-map** option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The **no aggregate-address** and **default aggregate-address** commands remove the corresponding **aggregate-address** command from **running-config**.

Note: The configuration requires the **match-map** and the **summary-only** parameters to enforce the configuration.

Command Mode

Router-BGP Configuration

Command Syntax

```
aggregate-address AGGREGATE_NET [AS_SET][SUMMARY][ATTRIBUTE_MAP][MATCH_MAP]
no aggregate-address AGGREGATE_NET
default aggregate-address AGGREGATE_NET
```

Parameters

- **AGGREGATE_NET** aggregate route IP address. Options include:
 - **netv4_addr** IPv4 subnet address (CIDR or address-mask notation).
 - **netv6_addr** IPv6 subnet address (CIDR notation).
- **AS_SET** controls **AS_PATH** attribute values associated with aggregate route. Options include:
 - **no parameter** **ATOMIC_AGGREGATE** attribute is set. Route contains no **AS_PATH** data.
 - **as-set** route includes **AS_PATH** information from contributor routes as **AS_SET** attributes.
- **SUMMARY** controls advertisement of contributor routes. Options include:
 - **no parameter** contributor and aggregate routes are advertised.
 - **summary-only** contributor routes are not advertised.
- **ATTRIBUTE_MAP** controls attribute assignments to the aggregate route. Options include:
 - **no parameter** attribute values are not assigned to route.
 - **attribute-map map_name** assigns attribute values in set commands of the map's permit clauses. Deny clauses and match commands in permit clauses are ignored.
- **MATCH_MAP** filters contributors to the aggregate route. Options include:
 - **no parameter** no contributors are filtered.
 - **match-map map_name** filters contributor routes using the named match-map.

Examples

- These commands create an aggregate route (**10.16.48.0/20**) from the contributor routes **10.16.48.0/23**, **10.16.50.0/23**, **10.16.52.0/23**, and **10.16.54.0/23**. The aggregate route includes the **AS_PATH** information from the contributor routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)# exit
switch(config)#

```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)# route-map map1 permit 10
switch(config-route-map-map1)# set community 45
switch(config-route-map-map1)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 10.16.48.0/20 attribute-map map1
switch(config-router-bgp)# exit
switch(config)#

```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)# route-map matchmap permit 10
switch(config-route-map-matchmap)# match ip address prefix-list aglist
switch(config-route-map-matchmap)# exit
switch(config)# router bgp 1
switch(config-router-bgp)# aggregate-address 1.1.0.0/16 match-map matchmap
switch(config-router-bgp)#{
```

15.5.5.4 authentication-key

The **authentication-key** command adds security to the TCP session to the BMP monitoring station. Configure the same key on the BGP router and the BMP monitoring station. Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

authentication-key key

Parameters

- **key** - Specify the authentication key in one of the following formats:
 - **0** - Indicates an unencrypted key string follows.
 - **7** - Indicates that a hidden key follows.
 - **8a** - Indicates that an AES-256-GCM encrypted key follows.
 - **password** - Specify a password up to 80 characters.

Example

Use the following commands to specify an authentication-key as a password, *!ckCK!nfxH3!LsyBr3!*

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring bgp
switch(config-router-bgp) # monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E) # authentication-key !ckCK!nfxH3!LsyBr3!
```

15.5.5.5 bgp advertise-inactive

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The **bgp advertise-inactive** command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The **no bgp advertise-inactive** and **default bgp advertise-inactive** commands restore the default BGP behavior (advertising only active routes) by removing the corresponding bgp advertise-inactive command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp advertise-inactive  
no bgp advertise-inactive  
default bgp advertise-inactive
```

Example

These commands configure BGP to advertise inactive routes.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp advertise-inactive  
switch(config-router-bgp) #
```

15.5.5.6 bgp always-compare-med

The **bgp always-compare-med** command configures the switch to always consider Multi-Exit Discriminator (MED) values (also known as “metric”) in best-path selection. By default, this function is disabled, and MED values are compared only if two paths have the same neighbor AS.

When there are two or more links between autonomous systems, MED values may be set by a router in the originating AS to give preferences to certain routes. In comparing MED values, the lower value is preferred.

The **no bgp always-compare-med** and **default bgp always-compare-med** commands restore the default behavior of comparing MED values only on paths with the same neighbor AS.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp always-compare-med  
no bgp always-compare-med  
default bgp always-compare-med
```

Related Commands

- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure BGP to always consider MED values in best-path comparisons.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp always-compare-med  
switch(config-router-bgp) #
```

15.5.5.7 bgp bestpath as-path ignore

The **bgp bestpath as-path ignore** command configures BGP to ignore the length of the Autonomous System (AS) path when comparing routes. This behavior is disabled by default. Normally, the switch compares AS paths as the third step in the best-path selection process (see [Best-Path Selection](#)), preferring the route with the shorter AS path.

The **no bgp bestpath as-path ignore** and **default bgp bestpath as-path ignore** commands restore the default behavior of considering AS path length in route comparisons.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath as-path ignore  
no bgp bestpath as-path ignore  
default bgp bestpath as-path ignore
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure BGP to ignore AS path lengths when comparing routes.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp bestpath as-path ignore  
switch(config-router-bgp) #
```

15.5.5.8 bgp bestpath as-path multipath-relax

The **bgp bestpath as-path multipath-relax** command allows multiple eBGP routes to a destination to be considered equal in ECMP if their AS paths are the same length despite having different autonomous systems in those paths. The **no bgp bestpath as-path multipath-relax** command configures best-path selection to consider two paths *unequal* if their AS path contents are different, and prefers the first path received.

Multipath-relax is enabled by default. The **bgp bestpath as-path multipath-relax** and **default bgp bestpath as-path multipath-relax** commands restore the default behavior by removing the corresponding **no bgp bestpath as-path multipath-relax** command from *running-config*.

For BGP to support equal cost multipath (ECMP) routing, the [maximum-paths \(BGP\)](#) command must be issued in router-BGP configuration mode.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath as-path multipath-relax  
no bgp bestpath as-path multipath-relax  
default bgp bestpath as-path multipath-relax
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure BGP best-path selection to consider routes unequal if the contents of their AS paths differ.

```
switch(config) # router bgp 64500  
switch(config-router-bgp) # no bgp bestpath as-path multipath-relax  
switch(config-router-bgp) #
```

15.5.5.9 bgp bestpath d-path

The **bgp bestpath d-path** command configures BGP to use the domain path length in bestpath route selection.

The **no bgp bestpath d-path** and **default bgp bestpath d-path** commands restore the default behavior of considering the domain path length in the route selection process.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath d-path  
no bgp bestpath d-path  
default bgp bestpath d-path
```

Example

These commands configure BGP to use the domain path length in the route selection process.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp bestpath d-path  
switch(config-router-bgp) #
```

15.5.5.10 **bgp bestpath ecmp-fast**

By default, within an ECMP group the BGP best-path selection process prefers the active path (the first path received by the switch) unless a relevant tie-breaker is enabled. The **no bgp bestpath ecmp-fast** command causes the best-path selection process to ignore order of arrival and continue evaluating paths on other criteria.

The **bgp bestpath ecmp-fast** and **default bgp bestpath ecmp-fast** commands restore the default behavior by removing the corresponding **no bgp bestpath ecmp-fast** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath ecmp-fast  
no bgp bestpath ecmp-fast  
default bgp bestpath ecmp-fast
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure BGP to ignore order of arrival in best-path comparisons of paths within an ECMP group.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# no bgp bestpath ecmp-fast  
switch(config-router-bgp) #
```

15.5.5.11 bgp bestpath med confed

By default, paths originating within the same confederation as the switch and received from confederation peers do not have their Multi-Exit Discriminator (MED) values compared as part of the best-path selection process. The `bgp bestpath med confed` command causes comparison of MED values in such routes. To ensure that MED values are considered in the best-path selection process for all routes received, use the `bgp always-compare-med` command.

The `no bgp bestpath med confed` and `default bgp bestpath med confed` commands restore the default behavior by removing the corresponding `bgp bestpath ecmp-fast` command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath med confed [missing-as-worst]
no bgp bestpath med confed [missing-as-worst]
default bgp bestpath med confed [missing-as-worst]
```

Parameters

- **missing-as-worst** By default, best-path selection considers a missing MED value to be **0**, so paths with missing MED values is preferred. This option reverses the behavior in comparisons of routes originating within the same confederation as the switch, treating a missing MED as having the highest (least preferred) value.

Note: The `bgp bestpath med missing-as-worst` command controls how best-path selection treats missing MED values for all routes received, and, if configured, overrides the **missing-as-worst** option of this command.

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure the BGP best-path selection process to consider MED values in comparisons between routes originating within the same confederation as the switch.

```
switch(config)# router bgp 64500
switch(config-router-bgp)# bgp bestpath med confed
switch(config-router-bgp) #
```

15.5.5.12 bgp bestpath med missing-as-worst

By default, BGP best-path selection considers a missing MED value to be **0**, so paths with missing MED values will be preferred. The **bgp bestpath med missing-as-worst** command reverses the behavior, treating a missing MED as having the highest (least preferred) value.

The **no bgp bestpath med missing-as-worst** and **default bgp bestpath med missing-as-worst** commands restore the default behavior (giving preference to missing MED values) by removing the corresponding **bgp bestpath med missing-as-worst** command from *running-config*.

Note: This command overrides the **missing-as-worst** setting of the [bgp bestpath med confed](#) command.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath med missing-as-worst  
no bgp bestpath med missing-as-worst  
default bgp bestpath med missing-as-worst
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure the BGP best-path selection process to consider a missing MED value to be considered highest (least preferred) in MED comparisons for all routes received.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp bestpath med missing-as-worst  
switch(config-router-bgp) #
```

15.5.5.13 bgp bestpath tie-break cluster-list-length

The `bgp bestpath tie-break cluster-list-length` command causes the best-path selection process to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie in step **10**. The cluster list length is assumed to be **0** if the route does not carry a **CLUSTER_LIST** attribute.

The `no bgp bestpath tie-break cluster-list-length` and `default bgp bestpath tie-break cluster-list-length` commands restore the default behavior by removing the associated `bgp bestpath tie-break cluster-list-length` command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath tie-break cluster-list-length  
no bgp bestpath tie-break cluster-list-length  
default bgp bestpath tie-break cluster-list-length
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break router-id](#)

Example

These commands configure the BGP selection process to prefer the multipath route with the shortest **CLUSTER_LIST** length in case of a tie.

```
switch(config) # router bgp 64500  
switch(config-router-bgp) # bgp bestpath tie-break cluster-list-length  
switch(config-router-bgp) #
```

15.5.5.14 bgp bestpath tie-break router-id

The **bgp bestpath tie-break router-id** command causes the best-path selection process to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie in step 10. If the route is a reflected route (i.e., if it contains route reflector attributes), the process will use the **ORIGINATOR_ID** as the **ROUTER_ID** for comparison. This behavior is disabled by default.

The **no bgp bestpath tie-break router-id** and **default bgp bestpath tie-break router-id** commands restore the default behavior by removing the associated **bgp bestpath tie-break router-id** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp bestpath tie-break router-id  
no bgp bestpath tie-break router-id  
default bgp bestpath tie-break router-id
```

Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)

Example

These commands configure the best-path selection process to prefer the multipath route with the lowest **ROUTER_ID** in case of a tie.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)# bgp bestpath tie-break router-id  
switch(config-router-bgp) #
```

15.5.5.15 bgp client-to-client reflection

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The `no bgp client-to-client reflection` command disables client-to-client reflection.

The `bgp client-to-client reflection` and `default bgp client-to-client reflection` commands restore the default behavior by removing the `no bgp client-to-client reflection` command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp client-to-client reflection  
no bgp client-to-client reflection  
default bgp client-to-client reflection
```

Example

These commands disable client-to-client reflection on the switch.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# no bgp client-to-client reflection  
switch(config-router-bgp) #
```

15.5.5.16 bgp cluster-id

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster's other route reflectors.

The **bgp cluster-id** command configures the cluster ID in a cluster with multiple route reflectors.

The **no bgp cluster-id** and **default bgp cluster-id** commands remove the cluster ID by removing the corresponding **bgp cluster-id** command from **running-config**. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp cluster-id ID_NUM
no bgp cluster-id
default bgp cluster-id
```

Parameters

ID_NUM cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation).
Options include:

- **0.0.0.1** to **255.255.255.255** valid cluster ID number.
- **0.0.0.0** removes the cluster-ID from the switch. Equivalent to **no bgp cluster-id** command.

Example

This command sets the cluster ID for the switch to **172.22.30.101**.

```
switch(config) # router bgp 1
switch(config-router-bgp) # bgp cluster-id 172.22.30.101
switch(config-router-bgp) #
```

15.5.5.17 bgp confederation identifier

The **bgp confederation identifier** command configures the confederation identifier. Confederation can reduce the number of iBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

The **no bgp confederation identifier** and **default bgp confederation identifier** commands remove the **bgp confederation identifier** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp confederation identifier as_number
no bgp confederation identifier
default bgp confederation identifier
```

Parameter

as_number the ID of BGP AS confederation. Values range from **1** to **4294967295**.

Example

This command sets the BGP confederation identifier to **9**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp confederation identifier 9
switch(config-router-bgp) #
```

15.5.5.18 bgp confederation peers

The **bgp confederation peers** command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured using the [bgp confederation identifier](#) command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The **no bgp confederation peers** and **default bgp confederation peers** commands delete the specified sub-AS from the confederation by removing the corresponding **bgp confederation peers** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp confederation peers as_range  
no bgp confederation peers as_range  
default bgp confederation peers as_range
```

Parameter

as_range the sub-AS number. Formats include number (from **1** to **4294967295**), number range, or comma-delimited list of numbers and ranges.

Example

This command configures the confederation that contains AS **1000** and AS **1002**.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# bgp confederation peers 1000 1002  
switch(config-router-bgp) #
```

15.5.5.19 bgp convergence time

The **bgp convergence time** command configures the time BGP waits before declaring all BGP sessions as converged, whether or not a EOR message has been received.

The **no bgp convergence time** command removes the configured convergence timeout. The **default bgp convergence time** command sets the timeout value to the default value.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp convergence time timeout_range
```

```
no bgp convergence time
```

```
default bgp convergence time
```

Parameter

timeout_range the maximum time to wait for the BGP convergence. Values range from **1** to **3600** seconds. The default value is **300** seconds.

Example

This command configures a convergence time of **200** seconds to wait before establishing a session.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp convergence time 200
switch(config-router-bgp) #
```

15.5.5.20 bgp convergence slow-peer time

The **bgp convergence slow-peer time** command configures the idle peer time to wait for the slow peers to establish a session in a BGP convergence state.

The **no bgp convergence slow-peer time** command disables the inheritance of the configuration from the global BGP configuration mode. The **default bgp convergence slow-peer time** command sets the timeout value to the default value.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp convergence slow-peer time timeout
no bgp convergence slow-peer time
default bgp convergence slow-peer time
```

Parameter

timeout the maximum time to wait for the slow peers to establish a session connection. Values range from **1** to **3600** seconds. The default value is **90** seconds.

Example

This command configures an idle peer timeout of **40** seconds to wait before establishing a session.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp convergence slow-peer time 40
switch(config-router-bgp) #
```

15.5.5.21 bgp default

The **bgp default** command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- **ipv4 address family**: IPv4 capability and all network advertisements with IPv4 prefixes.
- **ipv6 address family**: IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- **bgp default ipv4-unicast**: all addresses are IPv4 address family active.
- **no bgp default ipv4-unicast**: all addresses are *not* IPv4 address family active.
- **bgp default ipv6-unicast**: all addresses are IPv6 address family active
- **no bgp default ipv6-unicast**: all addresses are *not* IPv6 address family active.
- **bgp default ipv4-unicast transport ipv6**: all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIIs.

 **Note:** If it is necessary to exchange IPv4 NLRIIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command **bgp default ipv4-unicast transport ipv6**. For an individual neighbor, use the **neighbor activate** command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

The activation state of an individual BGP neighbor address is configured by the **neighbor activate** command. The **neighbor activate** command overrides the address's default activation state for the address family configuration mode in which the command is issued:

- **neighbor activate**: the specified address is active.
- **no neighbor activate**: the specified address is *not* active.

The **default-default address family activation state** defines the address family activation level of all addresses configured as BGP neighbors when **running-config** does not contain any **bgp default** commands. The default state of the BGP default activation level varies by address family.

- **ipv4 address family**: all BGP addresses are IPv4 address family active.
- **ipv6 address family**: all BGP addresses are *not* IPv6 address family active.

The **default bgp default** command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- **default bgp ipv4-unicast** is equivalent to **bgp ipv4-unicast**.
- **default bgp ipv6-unicast** is equivalent to **no bgp ipv6-unicast**.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp default ADDRESS_FAMILY
no bgp default ADDRESS_FAMILY
default bgp default ADDRESS_FAMILY
```

Parameters

ADDRESS_FAMILY BGP address family. Options include:

- **ipv4-unicast** IPv4-unicast peering sessions.
- **ipv6-unicast** IPv6-unicast peering sessions.

Example

These commands configure the switch to configure all BGP neighbor addresses as IPv4 address-family active and IPv6 address-family active.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp default ipv4-unicast
switch(config-router-bgp)# bgp default ipv6-unicast
switch(config-router-bgp)# show active
router bgp 65533
    bgp log-neighbor-changes
    distance bgp 20 200 200
    neighbor 172.23.254.2 remote-as 65533
    neighbor 172.41.254.78 remote-as 65534
    neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
    neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
switch(config-router-bgp) #
```

The **show active** command does not display the **bgp default ipv4-unicast** command because it is the default setting for IPv4 peering sessions.

15.5.5.22 bgp enforce-first-as

The **bgp enforce-first-as** command causes a forced comparison of the first Autonomous System (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer Autonomous System Number (ASN). Updates from eBGP peers that do not include that ASN as the first item in the AS path (in the **AS_PATH** attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the **no** form of this command. To configure first-AS enforcement for an individual neighbor or peer group, use the [neighbor enforce-first-as](#) command.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp enforce-first-as  
default bgp enforce-first-as  
no bgp enforce-first-as
```

Example

This command configures BGP to enforce the first AS globally.

```
switch(config-router-bgp) # bgp enforce-first-as  
switch(config-router-bgp) #
```

15.5.5.23 bgp listen range

The **bgp listen range** command identifies the BGP peering request from a range of IPv4 or IPv6 address, and names the dynamic peer group to which those peers belong to. To create a static peer group, use the **neighbor peer group (create)** command.

The request can be from a single AS number or from a range of AS numbers configured. To accept the peering request from single ASN use the **remote-as** option, and to accept request from multiple ASNs use the **peer-filter** option.

Members of a dynamic peer group are configured in groups and not as individuals. Once a new peer group is created with a group name, the group name is then used as an argument by the following **neighbor** commands:

- [neighbor ebgp-multipath](#)
- [neighbor import-localpref](#)
- [neighbor maximum-routes](#)
- [neighbor route-map \(BGP\)](#)
- [neighbor timers](#)
- [neighbor update-source](#)

The **no bgp listen range** and **default bgp listen range** commands remove the dynamic peer group by deleting the corresponding command from **running-config**. To remove a static peer group, use the **no neighbor** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp listen range NET_ADDRESS [PEER-ID include router-id] peer-group group_name [remote-as as_number | peer-filter filter_name]
```

```
no bgp listen range NET_ADDRESS peer-group group_name
```

```
default bgp listen range NET_ADDRESS peer-group group_name
```

Parameters

- **NET_ADDRESS** IP address range. Options include:
 - **IPv4_subnet** IPv4 subnet (CIDR notation).
 - **IPv4_address mask subnet** IPv4 subnet (dotted decimal notation).
 - **IPv6_prefix** IPv6 subnet (dotted decimal notation).
- **PEER-ID** Additional specification for identifying a peer.
 - **include** Include following fields as part of peer identifier.
 - **router-id** Include router ID as part of peer identifier.
- **group_name** name of the peer group.
- **as_number** the autonomous system number, ranges from 1 to **4294967295**.
- **filter_name** name of the peer filter.

Examples

- These commands create a dynamic peer group called **brazil** in AS **5** which accepts peering requests from the **192.168.6.0/24** subnet.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.168.6.0/24 peer-group brazil remote-as 5
switch(config-router-bgp)#{/pre>
```

- These commands create a dynamic peer group called **brazil** in a range of AS numbers, which accepts peering requests from the **192.0.2.0/24** subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-group brazil peer-filter group-1
switch(config-router-bgp)#{/pre>
```

- These commands enable the same address peering.

```
switch(config)# router bgp 1
switch(config-router-bgp)# bgp listen range 192.0.2.0/24 peer-id include router-id peer-group
brazil peer-filter group-1{/pre>
```

15.5.5.24 bgp log-neighbor-changes

The **bgp log-neighbor-changes** command configures the switch to generate a log message when a BGP peer enters or exits the **established** state. This is the default behavior.

The **no bgp log-neighbor-changes** command disables the generation of these log messages. The **default bgp log-neighbor-changes** command enables the generation of these log messages.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp log-neighbor-changes  
no bgp log-neighbor-changes  
default bgp log-neighbor-changes
```

Example

These commands configure the switch to generate a message when a BGP peer enters or exits the **established** state.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# bgp log-neighbor-changes  
switch(config-router-bgp) #
```

15.5.5.25 bgp monitoring

The **bgp monitoring** command enters the Router BGP Monitoring Configuration Mode on the switch, and configures BGP Monitoring Protocol on the switch

Command Mode

Router-BGP Configuration Mode

Command Syntax

bgp monitoring

Example

Use the following command to enter Router BGP Monitoring Configuration Mode on the switch:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
```

15.5.5.26 bgp redistribute-internal (BGP)

The **bgp redistribute-internal** command enables the redistribution of iBGP routes into an Interior Gateway Protocol (IGP).

The **no bgp redistribute-internal** command disables route redistribution from the specified domain by removing the corresponding **bgp redistribute-internal** command from **running-config**. The **default bgp redistribute-internal** command enables the redistribution of iBGP routes into an IGP.

Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

Command Syntax

```
bgp redistribute internal  
no bgp redistribute internal  
default bgp redistribute internal
```

Example

This command redistributes internal BGP routes.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# bgp redistribute-internal  
switch(config-router-bgp) #
```

15.5.5.27 bgp rib bestpaths monitoring

The **bgp rib bestpaths monitoring** globally enables or disables exporting all Local Routing Information Bases (Loc_RIB) for all BGP VRFs in a BGP VRF configuration. By default, BGP exports all VRF Loc-RIBs to the stations configured to receive them.

Command Mode

Router-BGP-VRF Configuration

Command Syntax

```
bgp rib bestpaths monitoring [disabled]
```

Parameter

disabled - Disables the export to BGP VRFs.

Example

Use the following command to disable exporting Loc-RIB for VRF, *blue*, on BGP router, 64512:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# vrf blue
switch(config-router-bgp-vrf-blue)# bgp rib bestpaths monitoring disabled
```

15.5.5.28 bgp rib received routes monitoring disabled

The **bgp rib received routes monitoring disabled** allows filtering of Adjacency-RIB-In (Adj-RIB-In) exports for BGP Monitoring Protocol and prevents a VRF from exporting the Adj-RIB-In. Adj-RIB-In in BMP provides a view of the BGP routes received from neighbors before applying any local inbound policies.

Using the [**no** | **default**] changes the behavior back to the default behavior of exporting Adj-RIB-Ins from the VRF

Command Mode

Router BGP VRF Configuration

Command Syntax

```
bgp rib received routes monitoring disabled  
no bgp rib received routes monitoring disabled  
default bgp rib received routes monitoring disabled
```

Example

Use the following commands to disable exporting Adj-RIB-Ins from VRF, *blue*:

```
switch(config)# router bgp 64512  
switch(config-router-bgp)# vrf blue  
switch(config-router-bgp-vrf-blue)# bgp rib received routes monitoring disabled
```

15.5.5.29 bgp route install-map

The **bgp route install-map** command enables BGP Selective Route Download on the switch and allows the learning and advertising of the BGP routes without installing them in hardware.

The **no bgp route install-map** and **default bgp route install-map** commands delete the BGP Selective Route Download instance.

The **exit** command returns the switch to global configuration mode.

Command Mode

BGP Configuration

Command Syntax

`bgp route install-map map_name`

Parameter

map_name The name of the route map configured.

Example

These commands configure BGP Selective Route Download for **test_BGP** map.

```
switch(config)# router bgp 100
switch(config-router-bgp)# bgp route install-map test_BGP
switch(config-router-bgp) #
```

15.5.5.30 bgp route-reflector preserve-attributes

The **bgp route-reflector preserve-attributes** command configures the switch, when operating as a BGP route reflector, to preserve the BGP attributes of re-advertised routes. By default, BGP attribute preservation is disabled. When attribute preservation is enabled, the BGP attributes (next-hop, local preference, and metric) are preserved in the reflected routes regardless of outbound BGP policies, except when those policies are part of an outbound route map. To override outbound route maps, use the **always** keyword.

The **no bgp route-reflector preserve-attributes** and **default bgp route-reflector preserve-attributes** commands disable BGP attribute preservation.

Command Mode

Router-BGP Configuration

Command Syntax

```
bgp route-reflector preserve-attributes [always]  
no bgp route-reflector preserve-attributes  
default bgp route-reflector preserve-attributes
```

Parameter

always Always preserves route attributes, overwriting route map changes.

Related Command

[neighbor route-reflector-client](#)

Example

The following commands configure the switch as a route reflector and the neighbor at **10.5.2.1** as one of its clients, then configure the switch to preserve the BGP attributes of reflected routes unless overridden by an outbound route map policy.

```
switch(config)# router bgp 10  
switch(config-router-bgp)# neighbor 10.5.2.11 route-reflector-client  
switch(config-router-bgp)# bgp route-reflector preserve-attributes  
switch(config-router-bgp) #
```

15.5.5.31 clear bgp history

To clear all messages for a peer or group of peers, use the **clear bgp history** command.

Command Mode

Privileged EXEC

Command Syntax

```
clear bgp [PEER | PREFIX | peer-group PEER_GROUP] history [connect-failures] [vrf VRF]
```

Parameters

- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group PEER_GROUP** A peer group name.
- **connect-failures** Optional and will not affect the result.
- **vrf VRF** A VRF name. If it's not supplied, command will act upon VRF default.

If no peer, prefix, or peer-group is supplied, the **clear bgp history** command will clear the history for all peers in the specified VRF.

Related Command

[show bgp neighbors history](#)

Example

This example clears the BGP Peer group **Purple** history from **VRF_1**.

```
switch# clear bgp Purple history vrf VRF_1
```

15.5.5.32 clear ip bgp

The **clear ip bgp** command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - **ipv4_addr** the IPv4 peer with the specified IPv4 address.
 - **ipv6_addr** the IPv6 peer with the specified IPv6 address.
 - **intrf_ipv6_addr** the peer using the specified IPv6 link-local address.
 - **peer-group peer_grp_name** the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
 - **no parameters** performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
 - **soft** performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
 - **no parameters** resets inbound and outbound routes.
 - **in** resets inbound peer routes.
 - **out** resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf_name** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ip bgp counters](#)
- [clear ip bgp errors](#)
- [clear ip bgp neighbor](#)

Guidelines

Use the **clear ip bgp** command after changing any of the following BGP attributes:

- weights
- distribution lists

- timers
- administrative distance

Examples

- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp
! Peerings for all neighbors were hard reset switch#
```

- This command has the same behavior as the above **clear ip bgp** command.

```
switch# clear ip bgp *
! Peerings for all neighbors were hard reset switch#
```

15.5.5.33 clear ip bgp counters

The **clear ip bgp counters** command resets general statistics of peers. These statistics primarily consist of message-related counts.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip bgp [PEERS] counters [VRF_INSTANCES]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - **ipv4_addr** the IPv4 peer with the specified IPv4 address.
 - **ipv6_addr** the IPv6 peer with the specified IPv6 address.
 - **intrf_ipv6_addr** the peer using the specified IPv6 link-local address.
 - **peer-group peer_grp_name** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf_name** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ip bgp](#)
- [clear ip bgp errors](#)
- [clear ip bgp neighbor](#)

Example

This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp counters
! Counters for all neighbors were reset switch#
```

15.5.5.34 clear ip bgp errors

The **clear ip bgp errors** command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip bgp [PEERS] errors [VRF_INSTANCES]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - **ipv4_addr** the IPv4 peer with the specified IPv4 address.
 - **ipv6_addr** the IPv6 peer with the specified IPv6 address.
 - **intra_if_ipv6_addr** the peer using the specified IPv6 link-local address.
 - **peer-group peer_grp_name** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf_name** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ip bgp](#)
- [clear ip bgp counters](#)
- [clear ip bgp neighbor](#)

Example

This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp errors
! Errors for all neighbors were reset switch#
```

15.5.5.35 clear ip bgp neighbor

The **clear ip bgp neighbor** command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the [clear ipv6 bgp neighbor](#) command.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip bgp neighbor [*] [vrf vrf_name] [reason]
```

Parameters

* optional; all neighbors in the address family are cleared with or without this option

vrf vrf_name specifies a VRF instance for which IPv4 transport address family BGP neighbors will be cleared. If no VRF is specified, the command clears IPv4 BGP neighbors in the context-active VRF.

vrf all clears IPv4 BGP neighbors in all VRFs.

vrf default clears IPv4 BGP neighbors in the default VRF.

reason message includes the specified message string in the notification sent to neighbors. Maximum string length 250 characters.

Related Commands

- [clear ip bgp](#)
- [clear ip bgp counters](#)
- [clear ip bgp errors](#)

Examples

- This command clears all IPv4 BGP neighbors in the context-active VRF.

```
switch# clear ip bgp neighbor
! Peerings for all ipv4 neighbors were hard reset switch#
```

- This command clears all IPv4 BGP neighbors in VRF **purple**.

```
switch# clear ip bgp neighbor vrf purple
! Peerings for all ipv4 neighbors were hard reset switch#
```

15.5.5.36 clear ipv6 bgp

The `clear ipv6 bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
 - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
 - ***intf_ipv6_addr*** the peer using the specified IPv6 link-local address.
 - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
 - **no parameters** performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
 - **soft** performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
 - **no parameters** resets inbound and outbound routes.
 - **in** resets inbound peer routes.
 - **out** resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf *vrf_name*** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ipv6 bgp counters](#)
- [clear ipv6 bgp errors](#)
- [clear ipv6 bgp neighbor](#)

Guidelines

Use the `clear ipv6 bgp` command after changing any of the following BGP attributes:

- weights
- distribution lists

-
- timers
 - administrative distance

Examples

- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp
! Peerings for all neighbors were hard reset switch#
```

- This command has the same behavior as the above **clear ip bgp** command.

```
switch# clear ipv6 bgp *
! Peerings for all neighbors were hard reset switch#
```

15.5.5.37 clear ipv6 bgp counters

The **clear ipv6 bgp counters** command resets general statistics of peers. These statistics primarily consist of message-related counts.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 bgp [PEERS] counters [VRF_INSTANCES]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - ***ipv4_addr*** the IPv4 peer with the specified IPv4 address.
 - ***ipv6_addr*** the IPv6 peer with the specified IPv6 address.
 - ***intrf_ipv6_addr*** the peer using the specified IPv6 link-local address.
 - **peer-group *peer_grp_name*** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf *name*** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ipv6 bgp](#)
- [clear ipv6 bgp errors](#)
- [clear ipv6 bgp neighbor](#)

Example

This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp counters
! Counters for all neighbors were reset switch#
```

15.5.5.38 clear ipv6 bgp errors

The **clear ipv6 bgp errors** command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6s bgp [PEERS] errors [VRF_INSTANCES]
```

Parameters

- **PEERS** specifies targeted BGP peers. Options include:
 - **no parameters** all IPv4 and IPv6 peers.
 - ***** all IPv4 and IPv6 peers.
 - **ipv4_addr** the IPv4 peer with the specified IPv4 address.
 - **ipv6_addr** the IPv6 peer with the specified IPv6 address.
 - **intrf_ipv6_addr** the peer using the specified IPv6 link-local address.
 - **peer-group peer_grp_name** the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
 - **no parameters** resets matching peers in the context-active VRF.
 - **vrf_name** resets matching peers in the specified VRF.
 - **all** resets matching peers in all VRFs.
 - **default** resets matching peers in the default VRF.

Related Commands

- [clear ipv6 bgp](#)
- [clear ipv6 bgp counters](#)
- [clear ipv6 bgp neighbor](#)

Example

This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp errors
! Errors for all neighbors were reset switch#
```

15.5.5.39 clear ipv6 bgp neighbor

The **clear ipv6 bgp neighbor** command clears BGP neighbors belonging to the IPv6 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the [clear ip bgp neighbor](#) command.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 bgp neighbor [*] [vrf vrf_name] [reason message]
```

Parameters

* optional; all neighbors in the address family are cleared with or without this option

vrf vrf_name specifies a VRF instance for which IPv6 transport address family BGP neighbors will be cleared. If no VRF is specified, the command clears IPv6 BGP neighbors in the context-active VRF.

vrf all clears IPv6 BGP neighbors in all VRFs.

vrf default clears IPv6 BGP neighbors in the default VRF.

reason message includes the specified message string in the notification sent to neighbors. Maximum string length 250 characters.

Related Commands

- [clear ipv6 bgp](#)
- [clear ipv6 bgp counters](#)
- [clear ipv6 bgp errors](#)

Examples

- This command clears all IPv6 BGP neighbors in the context-active VRF.

```
switch# clear ipv6 bgp neighbor
! Peerings for all ipv6 neighbors were hard reset switch#
```

- This command clears all IPv6 BGP neighbors in VRF **purple** and adds a message to the notification.

```
switch# clear ipv6 bgp neighbor vrf purple reason going down for maintenance
! Peerings for all ipv6 neighbors were hard reset switch#
```

15.5.5.40 connection address

The **connection address** command configures an IP address on a BMP monitoring station. Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

connection address ip_address vrf vrf_name

Parameters

- **ip_address** - Specify a hostname, or an IPv4 or IPv6 address for the monitoring station.
- **vrf vrf_name** - Configure BMP on a non-default VRF.

Example

Use the following commands to add the IPv4 address, 172.16.21.25 to the BMP monitoring station, *bmp_E*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# connection address 172.16.21.25
```

15.5.5.41 connection keepalive

The **connection keepalive** command checks on the health of the TCP connection with the BMP monitoring station. Since the router does not receive messages from the monitoring station, the station may become unavailable due to a power or link failure. Using a TCP Keepalive probe allows the router to quickly detect monitoring station connection loss.

Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

```
connection keepalive [idletime seconds | probe-interval seconds | probe-count num]
```

Parameters

- **idletime seconds** - Specify the duration in seconds that no messages occur on the connection before sending a probe packet to test the connection. Use a value between 1 and 86400 seconds.
- **probe-interval seconds** - Specify an interval in seconds between TCP Keepalive Probes. Use a value between 1 and 3600 seconds.
- **probe-count num** - Specify the number of Keepalive Probes before closing the connection.

Example

Use the following commands to add the idletime *6000*, probe-interval *1800*, and the probe count *500* to the BMP monitoring station, *bmp_E*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# connection keepalive 6000 1800 500
```

15.5.5.42 connection mode

The **connection mode** command configures TCP connection parameters for a BMP monitoring station. Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

```
connection mode [[active port port_number] | [reconnect-timer timer_value] | [connection mode passive]]
```

Parameters

- **active port *port_number*** - Specify an active mode connection to allow the BGP router to initiate a TCP connection to the BMP monitoring station. *port_number* - Specify a TCP port that listens for connections to the BMP monitoring station.
- **reconnect-timer *timer_value*** - Configure the BGP monitoring session reconnect timer.
- **connection mode passive** - Specify a passive mode connection to allow the BGP router to listen for TCP connections from BMP monitoring stations.

Examples

- Use the following commands to configure a monitoring station, *bmp_D* with an active mode connection with port 5000:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_D
switch(config-router-bgp-monitoring-station-bmp_D)# connection mode active port 5000
```

- Use the following commands to configure a monitoring station, *bmp_E* with a passive mode connection:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# connection mode passive
```

15.5.5.43 description

The **description** command adds a description of the BMP monitoring station to display in the **show bgp station** output. Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

description text

Parameters

- **text** - Assign a description to the BGP monitoring station.

Example

Use the following commands to add the description, *remote office location Seattle* to the *bmp_E*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# description remote office location Seattle
```

15.5.5.44 distance bgp

The **distance bgp** command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from **1** to **255**; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of **255**.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external**: Best-path routes learned from a neighbor external to the autonomous system. Default distance is **200**.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is **200**.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is **200**.

The **no distance bgp** and **default distance bgp** commands restore the default administrative distances by removing the **distance bgp** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
distance bgp external_dist [INTERNAL_LOCAL]
```

```
no distance bgp
```

```
default distance bgp
```

Parameters

- **external_dist** distance assigned to external routes. Values range from **1** to **255**.
- **INTERNAL_LOCAL** distance assigned to internal and local routes. Values for both routes range from **1** to **255**. Options include:
 - **no** parameter the **external_dist** value is also assigned to internal and local routes.
 - **internal_dist local_dist** values assigned to internal and local routes.

Example

- This command assigns an administrative distance of **150** to external routes, **200** to internal, and **150** to local routes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# distance bgp 150 200 150
switch(config-router-bgp)#

```

15.5.5.45 dynamic peer max

The **dynamic peer max** command limits the number of dynamic BGP peers allowed on the switch.

The **no dynamic peer max** and **default dynamic peer max** commands restore the default limit of dynamic BGP peers by removing the **dynamic peer max** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
dynamic peer max maximum
```

```
no dynamic peer max
```

```
default dynamic peer max
```

Parameter

maximum the maximum number of dynamic BGP peers to be allowed on the switch. Values range from **1** to **1000**; default value is **100**.

Example

This command sets the maximum number of dynamic BGP peers allowed on the switch to **200**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# dynamic peer max 200
switch(config-router-bgp) #
```

15.5.5.46 export-policy received routes

The **export-policy** command configures the BMP monitoring station to receive additional paths advertisements from BGP peers.

Command Mode

Monitoring Station Configuration Mode

Command Syntax

```
export-policy received routes additional-paths [post-policy | pre-policy]
```

Parameters

- **additional-paths** - Specify per station status of parsing additional paths.
- **post-policy** - Export BGP routes after input policies applied.
- **pre-policy** - Export BGP routes before input policies applied.

Examples

- Use the following commands to receive additional paths on BMP monitoring station, *bmp_E*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# export-policy received
routes additional-paths
```

- Use the following commands to export routes after applying input policies on BMP monitoring station, *bmp_E*:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# export-policy received
routes post-policy
```

15.5.5.47 graceful-restart stalepath-time

The **graceful-restart stalepath-time** command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The **no graceful-restart stalepath-time** and **default graceful-restart stalepath-time** commands restore the default value of **300** seconds by deleting the **graceful-restart stalepath-time** statement from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
graceful-restart stalepath-time interval
no graceful-restart stalepath-time
default graceful-restart stalepath-time
```

Parameter

interval Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Values range from **1** to **3600** (**60** minutes). Default is **300**.

Example

These commands configure the stale path retention interval to **15** minutes.

```
switch(config)# router bgp 1
switch(config-router-bgp)# graceful-restart stalepath-time 900
switch(config-router-bgp) #
```

15.5.5.48 graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart helper is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the **neighbor graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding **no graceful-restart helper** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
graceful-restart helper long-lived  
no graceful-restart helper long-lived  
default graceful-restart helper long-lived
```

Parameter

long-lived Enables long lived graceful restart helper mode.

Example

These commands disable graceful restart helper mode on the switch.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# no graceful-restart-helper  
switch(config-router-bgp) #
```

15.5.5.49 ip as-path access-list

The `ip as-path access-list` command creates an access list to filter BGP route updates. If access list *list_name* does not exist, this command creates it. If it already exists, this command appends statements to the list.

The `no ip as-path access-list` and `default ip as-path access-list` commands delete the named access list.

Command Mode

Global Configuration

Command Syntax

```
ip as-path access-list list_name FILTER_TYPE regex ORIGIN
no ip as-path access-list list_name
default ip as-path access-list list_name
```

Parameters

- ***list_name*** the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
 - **permit** access is permitted.
 - **deny** access is denied.
- **regex** a regular expression describing the AS path being filtered. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
 - **no parameter** sets the origin to **any**.
 - **any** any BGP origin.
 - **egp** EGP origin.
 - **igp** IGP origin.
 - **incomplete** incomplete origin.

Example

These commands create an AS path access list named *list1* which allows all BGP routes except those originating in **AS 3**.

```
switch(config) # ip as-path access-list list1 deny _3$
switch(config) # ip as-path access-list list1 permit .*
switch(config) #
```

15.5.5.50 ip as-path regex-mode

The **ip as-path regex-mode** command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to **asn**, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to **string**, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is **asn**.

For example, **asn** mode returns as **false** and the **string** mode returns as **true** when searching for “**10**” in an AS path of **100 200**.

The **no ip as-path regex-mode** and **default ip as-path regex-mode** commands restore the regex mode to **asn** by removing the **ip as-path regex-mode** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip as-path regex-mode MODE_SETTING
no ip as-path regex-mode
default ip as-path regex-mode
```

Parameters

MODE_SETTING Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:

- **asn** AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
- **string** AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

Example

This command sets the regex mode to **string**.

```
switch(config)# ip as-path regex-mode string
switch(config) #
```

15.5.5.1 ip community-list

The `ip community-list` command creates and configures a BGP access list based on BGP communities.

The `no ip community-list` and `default ip community-list` commands delete the specified community list by removing the corresponding `ip community-list` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip community-list list_name [permit | deny] [GSHUT | aa:nn | internet | local-as | no-advertise | no-export | number]
```

```
no ip community-list list_name
```

```
default ip community-list list_name
```

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **permit** permits access to the specified community.
- **deny** denies access to the specified community.

Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.

- **GSHUT** well-known graceful shutdown community.
- ***aa:nn*** AA is **65535** and NN specifies the community number (**0-65535**) within the AS.
- **internet** advertises route to the Internet community.
- **local-as** advertises route only to local peers.
- **no-advertise** does not advertise route to any peer.
- **no-export** advertises route only within BGP AS boundary.
- **number** community number. Values ranges from 0 to 4294967040.

Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

Guideline

EOS does not support disabling the process of graceful shutdown community.

Note: The `ip community-list` command with the **permit internet** option permits access to all routes associated with any community.

Examples

- This command creates a BGP community list (named ***list_9***) that does not match members of route maps configured with AS-network number **100:250**.

```
switch(config)# ip community-list list_9 deny 100:250
```

```
switch(config) #
```

- These commands create a BGP community list that permits the graceful shutdown community, then use that list it in a route map to permit routes with that community.

```
switch(config)# ip community-list gshut_list permit GSHUT
switch(config)# route-map map1
switch(config-route-map-map1)# match community gshut_list
switch(config-route-map-map1)# exit
switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
    match community gshut_list
  SubRouteMap:
  Set clauses:
switch(config) #
```

- This command permits access to all routes associated with the BGP community list (**CLIST1**).

```
switch(config)# ip community-list CLIST1 permit internet
switch(config) #
```

15.5.5.52 ip community-list regexp

The **ip community-list regexp** command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the [ip community-list](#) command.

The **no ip community-list regexp** and **default ip community-list regexp** commands delete the specified community list. To delete a specific community-list entry, specify the entry in the **no ip community-list regexp** command.

Command Mode

Global Configuration

Command Syntax

```
ip community-list regexp list_name {deny | permit} reg_exp  
no ip community-list regexp list_name {deny | permit} reg_exp  
default ip community-list regexp list_name
```

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **permit** access is permitted for the specified community.
- **deny** access is denied for the specified community.

Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.

- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

Note: When using the **no** form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the **no** form of the command removes the entire list.

Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

Guideline

The **ip community-list regexp** command with the **permit internet** option permits access to only those routes that carry the community value of **0**.

Examples

- This command creates a BGP community list that permits routes from networks **20-24** and **30-34** in autonomous system **10**.

```
switch(config)# ip community-list regexp list_2 permit 10:[2-3][0-4]_  
switch(config)#{
```

-
- This command removes the above statement from the community list named *list_2*, leaving any other statements in the list intact.

```
switch(config)# no ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command deletes the community list named *list_2* entirely.

```
switch(config)# no ip community-list regexp list_2
switch(config)#
```

- This command permits access to all routes associated with the BGP community list (**CLIST1**) that carry the community value **0**.

```
switch(config)# ip community-list regexp CLIST1 permit internet
switch(config)#
```

15.5.5.53 ip extcommunity-list

The **ip extcommunity-list** command creates an extended community list to filter VRF routes or for Link BandWidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (RT)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (SoO)** identifies sites where the switch learned the route.
- **Link Bandwidth (LBW)** advertises BGP link bandwidth.

The **no ip extcommunity-list** and **default ip extcommunity-list** commands delete the specified extended community list by removing the corresponding **ip extcommunity-list** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip extcommunity-list list_name {deny | permit} COMM_1 [COMM_2...COMM_n]  
no ip extcommunity-list list_name  
default ip extcommunity-list list_name
```

Parameters

- ***list_name*** name of the extended community list.
- **deny** access is denied for the specified community.
- **permit** access is permitted for the specified community.
- **COMM_x** extended community attribute. Options include:
 - **rt aa:nn** route target, as specified by autonomous system:network number.
 - **rt ip_addr:nn** route target, as specified by ip address:network number.
 - **soo aa:nn** Site of Origin, as specified by autonomous system:network number.
 - **soo ip_addr:nn** site of origin, as specified by ip address:network number.
 - **lbw** link bandwidth in bits per second.

Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

Example

This command creates a BGP extended community list that denies routes from route target **100:250**.

```
switch(config)# ip extcommunity-list list_9 deny rt 100:250
switch(config) #
```

15.5.5.54 ip extcommunity-list regexp

The `ip extcommunity-list regexp` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the `ip extcommunity-list` command.

The following extcommunity-list types are supported:

- **Route Target (RT)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (SoO)** identifies sites where the switch learned the route.
- **Link Bandwidth (LBW)** advertises BGP link bandwidth.

The `no ip extcommunity-list regexp` and `default ip extcommunity-list regexp` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list regexp` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip extcommunity-list regexp list_name {deny | permit} reg_exp
no ip extcommunity-list regexp list_name {deny | permit} reg_exp
default ip extcommunity-list regexp list_name
```

Parameters

- ***list_name*** name of the extended community list. Valid input is text.
- **deny** access is denied for the specified extended community list.

Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.

- **permit** access is permitted for the specified extended community list.
- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
 - Expressions beginning with **RT**: match the **route target** extended community attribute option.
 - Expressions beginning with **SoO**: match the **site of origin** extended community attribute option.

Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

Example

This command creates a BGP extended community list that denies routes from route target networks **20-24** and **30-34** in autonomous system **10**.

```
switch(config)# ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
switch(config)#
```

15.5.5.55 ip large-community-list regexp

The `ip large-community-list regexp` command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the `ip large-community-list` command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The `no ip large-community-list regexp` and `default ip large-community-list regexp` commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the `no ip large-community-list regexp` command.

Command Mode

Global Configuration

Command Syntax

```
ip large-community-list regexp list_name {deny | permit} reg_exp  
no ip large-community-list regexp list_name {deny | permit} reg_exp  
default ip large-community-list regexp list_name
```

Parameters

- ***list_name*** name of the community list. Valid input is text.
- **deny** access is denied for the specified community.

Note: The **deny** statements are ignored for all set community/extcommunity/large-community operations.

- **permit** access is permitted for the specified community.
- ***reg_exp*** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

Note: When using the **no** form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the **no** form of the command removes the entire list.

Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

Examples

- This command creates a BGP large community list that permits routes from autonomous system **10** with local-part1 value of **20-24** or **30-34**.

```
switch(config)# ip large-community-list regexp list_2 permit 10:[2-3][0-4]:_  
switch(config)#

```

-
- This command removes the above statement from the large community list named *list_2*, leaving any other statements in the list intact.

```
switch(config)# no ip large-community-list regexp list_2 permit 10:[2-3]:[0-4]_
switch(config)#
```

- This command deletes the large community list named *list_2* entirely.

```
switch(config)# no ip large-community-list regexp list_2
switch(config)#
```

15.5.5.56 match as-range

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under peer-filter configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition for the group from **running-config**.

Command Mode

Peer-Filter Configuration

Command Syntax

```
[sequence_number] match as-range [as_number1] [as_number2] result {accept | reject} group_name
no match as-range [as_number1] [as_number2] result {accept | reject} group_name
default match as-range [as_number1] [as_number2] result {accept | reject} group_name
```

Parameters

- **sequence_number** optional sequence number for the match statement; one is automatically created if not assigned. Values range from **0** to **65535**.
- **group_name** name of the peer filter group.
- **as_number** the autonomous system number, values range from **1** to **4294967295**.

Examples

- These commands define a peer filter that accepts any AS number.

```
switch(config)# peer-filter group1
switch(config-peer-filter-group1)# 10 match as-range 1-4294967295 result accept
switch(config-peer-filter-group1) #
```

- These commands define a peer filter that accepts any AS number within **65000** and **65100** (inclusive) except **65008** and **65009**.

```
switch(config)# peer-filter group2
switch(config-peer-filter-group2)# 10 match as-range 65008-65009 result reject
switch(config-peer-filter-group2)# 20 match as-range 65000-651000 result accept
switch(config-peer-filter-group2) #
```

- These commands define a peer filter that accepts three specific remote AS numbers.

```
switch(config)# peer-filter group3
switch(config-peer-filter-group3) # 10 match as-range 65003 result accept
switch(config-peer-filter-group3) # 20 match as-range 65007 result accept
switch(config-peer-filter-group3) # 30 match as-range 65009 result accept
switch(config-peer-filter-group3) #
```

15.5.5.57 maximum-paths (BGP)

The **maximum-paths** command controls the maximum number of parallel BGP routes that the switch supports. The default maximum is one route. The command provides an Equal Cost Multiple Paths (ECMP) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be considered equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same Multi-Exit Discriminator (MED) value, use the [bgp always-compare-med](#) command. To require that their AS paths have the same contents, use the [bgp bestpath as-path multipath-relax](#) command.

The **no maximum-paths** and **default maximum-paths** commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding **maximum-paths** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
maximum-paths paths [ecmp ecmp_paths]  
no maximum-paths  
default maximum-paths
```

Parameters

- **paths** maximum number of parallel routes. Default value is **1**. Value must be less than or equal to the maximum number of ECMP paths.
- **ecmp_paths** maximum number of ECMP paths for each route. Default is maximum value as defined belows.

Value for each parameter ranges from **1** to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad**: Values range from **1** to **128**. Default value is **128**.
- **FM6000**: Values range from **1** to **32**. Default value is **32**.
- **PetraA**: Values range from **1** to **16**. Default value is **16**.
- **Trident**: Values range from **1** to **32**. Default value is **32**.
- **Trident II**: Values range from **1** to **128**. Default value is **128**.

Examples

- These commands configure the maximum number of BGP parallel paths to **12** without changing the ECMP value.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# maximum-paths 12  
switch(config-router-bgp)#{/pre>
```

- These commands configure the maximum number of BGP parallel routes to **2**, with a maximum of **4** ECMP paths for each route.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# maximum-paths 2 ecmp 4  
switch(config-router-bgp)#{/pre>
```

15.5.5.58 monitoring bgp rib bestpaths

The **monitoring bgp rib bestpaths** command configures exporting the BGP Local RIB to all monitoring stations. By default, BMP disables exporting Local RIB for all monitoring stations on all VRFs. Enable exporting the Local RIB per station or per VRF. You must configure the router ID for BGP and the RD for a non-default VRF. BMP exports IPv4 and IPv6 Unicast routes into the Local RIB including imported VPN routes. Use the **disable** parameter to explicitly disable the feature. BMP disables exporting the BGP Local RIB feature by default.

Command Mode

Router BGP Monitoring Configuration Mode

Router BGP Monitoring Station Configuration Mode

Router BGP VRF Configuration Mode

Command Syntax

```
monitoring bgp rib bestpaths
```

```
monitoring bgp rib bestpaths disable
```

Parameter

disable - Explicitly disable the feature.

Example

Use the following commands to explicitly disable best paths selection globally:

```
switch(config)# router bgp  
switch(config-router-bgp)# monitoring rib bestpaths disable
```

15.5.5.59 monitoring port

The **monitoring port** command configures a port number for stations in passive mode. The **no** | **default** removes the configuration from the **running-config** on the switch.

Command Mode

Router-BGP-Monitoring Configuration Mode

Command Syntax

`monitoring port port_number`

Parameter

port_number - Configure a port number from 1024 to 65535.

Example

Use the following command to enter Router BGP Monitoring Configuration Mode on the switch and configure port 5000:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring port 5000
```

15.5.5.60 monitoring qos

The **monitoring qos** command configures the DSCP value for BMP. The **no** | **default** removes the configuration from the **running-config** on the switch.

Command Mode

Router-BGP-Monitoring Configuration Mode

Command Syntax

monitoring qos dscp *dscp_value*

Parameter

dscp_value - Configure a DSCP value from 0 to 63.

Example

Use the following command to enter Router BGP Monitoring Configuration Mode on the switch and configure the DSCP value 25:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring qos dscp 25
```

15.5.5.61 monitoring received

The **monitoring received** command configures the BGP router to advertise pre-policy and post-policy routes to a BMP monitoring station. The **no** version of the command disables the route advertisement.

Command Mode

Router-BGP-Monitoring Configuration Mode

Command Syntax

```
monitoring received routes [pre-policy | post-policy]  
no monitoring received routes [pre-policy | post-policy]
```

Parameters

- **[pre-policy | post-policy]** - Specify to advertise pre-policy and post-policy routes to a BMP monitoring station.
 - **pre-policy** - BGP routes received directly from peer BGP routers.
 - **post-policy** - BGP routes that remain after applying routing policies to the BGP router.

Example

Use the following command to enter Router BGP Monitoring Configuration Mode on the switch and configure the BGP router to send post-policy routes:

```
switch(config)# router bgp 64512  
switch(config-router-bgp)# bgp monitoring  
switch(config-router-bgp)# monitoring received routes post-policy
```

15.5.5.62 monitoring station

The **monitoring station** command configures a name for the BMP monitoring station and places the switch in Monitoring Switch Configuration Mode. A monitoring station must be configured to enable exporting BGP received paths.

Command Mode

Router-BGP Configuration Mode

Command Syntax

```
monitoring station station_name
```

Parameter

station_name - Configure a name for the BMP monitoring station.

Example

Use the following commands to configure a monitoring station, *bmp_D*:

```
switch(config)# router bgp
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring station bmp_D
switch(config-router-bgp-station-bmp_D) #
```

15.5.5.63 monitoring statistics

The **monitoring statistics** command generates statistics counters for BMP and disabled by default for all monitoring stations. In the Monitoring Station Configuration Mode, configure statistics on individual monitoring stations.

The [**no** | **default**] versions of the command returns to the default interval of 30 seconds.

Command Mode

Router-BGP Configuration Mode

Command Mode

Router-BGP Configuration Mode

Monitoring Station Configuration Mode

Command Syntax

```
monitoring statistics [interval interval_seconds]
```

Parameters

interval *interval_seconds* - Specify an interval for sending statistics reports in seconds. Select an interval between 15 to 3600 seconds. The default value uses 30 seconds.

Note: The interval can only be configured in the Router-BGP Configuration Mode. Individual monitoring stations use this value.

Examples

- To configure statistics reporting globally and set the interval to 1800 seconds, use the following commands:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring statistics interval 1800
```

- To configure statistics reporting on monitoring station, *bmp_C*, use the following commands:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring station bmp_C statistics
```

15.5.5.64 monitoring timestamp

The **monitoring timestamp** command sets the timestamp in BMP Route Monitoring messages to zero or the time of message construction. The timestamp may not be equal to the time when the BGP peer received the BGP paths in the message. The timestamp defaults to **send-time** unless specifically configured to **none**.

Command Mode

Router-BGP Configuration Mode

Command Syntax

```
monitoring timestamp [send-time | none]
```

Parameters

- **send-time** - Specify to use the time that BMP sends the Route Monitoring message.
- **none** - Specify to set the timestamp to zero.

Example

Use the following commands to set the timestamp to zero:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# bgp monitoring
switch(config-router-bgp)# monitoring timestamp none
```

15.5.5.65 neighbor

Use the **neighbor** command to enable large communities on a ‘per-neighbor’ or ‘per-peer group’ basis. This behavior is consistent with all other forms of communities supported by EOS.

EOS enables receiving and processing of large communities by default.

Command Mode

BGP Router Configuration Mode

Command Syntax

```
neighbor [ipv4 [send-community [large]]| ipv6 | NAME | default | fe80::A:B:C:D% interface | interface]
```

Parameters

- **A.B.C.D.** Neighbor IPv4 address
 - **send-community** Enable sending communities.
 - **large** Send large community attribute to this neighbor.
- **A:B:C:D:E:F:G:H** Neighbor IPv6 address.
- **NAME** Name of the peer-group.
- **default** Apply to all neighbors.
- **fe80::A:B:C:D% interface** Neighbor IPv6 link-local address.
- **interface** Interface range to be used for BGP session establishment.

Example

You can enable large communities on a ‘per-neighbor’ or ‘per-peer group’ basis.

```
switch(config)# router bgp 1
switch(config-bgp-router)# neighbor 1.1.1.1 send-community large
```

15.5.5.66 neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- **IPv4 address family:** IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family:** IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor's default activation state within the **address family** configuration mode.

neighbor activate: the specified address is active in the address family.

no neighbor activate: the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from **running-config**, restoring the default address family activation state for the specified neighbor address.

Command Mode

Router BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID activate
no neighbor neighbor_ID activate
default neighbor neighbor_ID activate
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Limitations

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does *not* support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

Example

These commands activate the advertising of specified neighbors during IPv4 peering sessions, then display the result.

```
switch(config)# router bgp 1
switch(config-router-bgp)# no address-family ipv4
switch(config-router-bgp-af)# neighbor 172.41.18.15 activate
switch(config-router-bgp-af)# neighbor 172.49.22.6 activate
switch(config-router-bgp-af)# no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)# show active
    address-family ipv4
        no neighbor 172.15.21.18 activate
        neighbor 172.49.22.6 activate
        neighbor 172.41.18.15 activate
switch(config-router-bgp-af)# exit
switch(config-router-bgp)#

```

15.5.5.67 neighbor allowas-in

By default, BGP drops received routes if their Autonomous System (AS) paths contain the AS Number (ASN) of the switch. The **neighbor allowas-in** command configures the switch to accept routes from the specified BGP neighbor even if their AS paths contain the ASN of the switch. Optionally, the command can also configure the maximum number of times that the switch's ASN can appear in a route before dropping it.

The **no neighbor allowas-in** command configures the default behavior (dropping BGP routes that contain the ASN of the switch).

The default **neighbor allowas-in** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID allowas-in [asn_quantity]
```

```
no neighbor neighbor_ID allowas-in
```

```
default neighbor neighbor_ID allowas-in
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***asn_quantity*** number of repetitions of the switch's ASN allowed in the AS path of routes received from the specified BGP neighbor. Values range from **1** to **10**. Default is **3**.

Related Commands

This command is used on a customer edge router that is part of a split AS; to address the problem at the provider end, use the [neighbor as-path remote-as replace out](#) command.

Example

These commands configure the switch to accept routes from the BGP neighbor at **192.168.1.30** which contain the switch's ASN in their AS paths as many as three times.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 allowas-in
switch(config-router-bgp) #
```

15.5.5.68 neighbor as-path remote-as replace out

By default, BGP drops received routes if their Autonomous System (AS) paths contain the AS Number (ASN) of the switch. In a split AS sharing route advertisements through a provider network, this can result in valid routes being dropped. The **neighbor as-path remote-as replace out** command configures a provider edge switch to replace the customer's AS with its own in route advertisements sent to neighbors in that AS.

The **no neighbor as-path remote-as replace out** command configures the default behavior (leaving the customer's AS in the AS path attribute of routes advertised to the specified neighbor).

The **default neighbor as-path remote-as replace out** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID as-path remote-as replace out
no neighbor neighbor_ID as-path remote-as replace out
default neighbor neighbor_ID as-path remote-as replace out
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Related Commands

This command is used on a provider edge router forwarding BGP routes to a customer in a split AS; to address the problem at the customer end, use the **neighbor allowas-in** command.

Example

These commands configure the switch to substitute a local ASN for the ASN of the BGP neighbor at **192.168.2.15** in BGP routes advertised to that neighbor.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.2.15 as-path remote-as replace out
switch(config-router-bgp) #
```

15.5.5.69 neighbor auto-local-addr

The **neighbor auto-local-addr** command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRLs sent to the specified neighbor or peer group. This allows IPv4 NLRLs to be carried over IPv6 transport, or IPv6 NLRLs to be carried over IPv4 transport.

The **no neighbor auto-local-addr** command applies the system default configuration.

The **default neighbor auto-local-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Note: While this feature works well in eBGP deployments with directly connected pairing routers and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the **neighbor local-v4-addr** command for IPv6 neighbors, or the **neighbor local-v6-addr** for IPv4 neighbors.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID auto-local-addr  
no neighbor neighbor_ID auto-local-addr  
default neighbor neighbor_ID auto-local-addr
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

For the IPv6 neighbor at **2001:0DB8:c2a4:1761::2**, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 2001:0DB8:c2a4:1761::2 auto-local-addr  
switch(config-router-bgp) #
```

15.5.5.70 neighbor default-originate

The **neighbor default-originate** command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by **neighbor default-originate** is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The **no neighbor default-originate** command applies the system default configuration.

The **default neighbor default-originate** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID default-originate [MAP]
no neighbor neighbor_ID default-originate
default neighbor neighbor_ID default-originate
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **MAP** specifies route map that modifies attributes of the exported default route. Options include:
 - **no parameter** attributes are not modified by a route map.
 - **route-map *map_name*** attributes set by specified route map are assigned to the exported default route.

Example

These commands advertise a default route to the BGP neighbor at **192.168.14.5**.

```
switch(config) # router bgp 9
switch(config-router-bgp) # neighbor 192.168.14.5 default-originate
switch(config-router-bgp) #
```

15.5.5.71 neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group's description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID description description_string
```

```
no neighbor neighbor_ID description
```

```
default neighbor neighbor_ID description
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***description_string*** text string to be associated with the neighbor or peer group.

Example

These commands associate the string **PEER_1** with the peer located at **192.168.1.30**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 192.168.1.30 description PEER_1
switch(config-router-bgp) #
```

15.5.5.72 neighbor ebgp-multipath

The **neighbor ebgp-multipath** command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multipath if the only route to the peer is the default route (**0.0.0.0**).

The **no neighbor ebgp-multipath** command applies the system default configuration.

The **default neighbor ebgp-multipath** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID ebgp-multipath [hop_number]  
no neighbor neighbor_ID ebgp-multipath  
default neighbor neighbor_ID ebgp-multipath
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***hop_number*** time-to-live (hops). Values range from **1** to **255**. Default value is **255**.

Example

These commands configure the switch to accept and attempt BGP connections to the external peer located at **192.168.1.30**, setting the hop limit to **32**.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 192.168.1.30 ebgp-multipath 32  
switch(config-router-bgp) #
```

15.5.5.73 neighbor enforce-first-as

The **neighbor enforce-first-as** command causes a forced comparison of the first Autonomous System (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer Autonomous System Number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the **AS_PATH** attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the **no** form of the command. To configure first AS enforcement globally, use the [bgp enforce-first-as](#) command.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID enforce-first-as  
no neighbor neighbor_ID enforce-first-as  
default neighbor neighbor_ID enforce-first-as
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command disables enforcement of the first BGP AS for the neighbors in peer group ***region-3***.

```
switch(config-router-bgp) # no neighbor region-3 enforce-first-as  
switch(config-router-bgp) #
```

15.5.5.74 neighbor export-localpref

The **neighbor export-localpref** command determines the **LOCAL_PREF** value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The **no neighbor export-localpref** command resets the **LOCAL_PREF** value to the system default of **100** in packets sent to the specified peer or peer group.

The **default neighbor export-localpref** command resets the **LOCAL_PREF** value to the system default of **100** for individual neighbors, and applies the peer groups's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID export-localpref preference
```

```
no neighbor neighbor_ID export-localpref
```

```
default neighbor neighbor_ID export-localpref
```

Parameters

- **neighbor_ID** neighbor's IPv4 or IPv6 address or peer group name.
- **preference** preference value. Values range from **0** to **4294967295**.

Example

This command configures the switch to fill the **LOCAL_PREF** field with **200** in UPDATE packets that it sends to the peer located at **10.1.1.45**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp) #
```

15.5.5.75 neighbor graceful-restart

The **neighbor graceful-restart** command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is disabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart** and **default neighbor graceful-restart** commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID graceful-restart  
no neighbor neighbor_ID graceful-restart  
default neighbor neighbor_ID graceful-restart
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command enables BGP graceful restart mode for the neighbor with the IP address **192.168.12.1**.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 192.168.12.1 graceful-restart  
switch(config-router-bgp) #
```

15.5.5.76 neighbor graceful-restart-helper

The **neighbor graceful-restart helper** command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. The neighbor graceful-restart-helper is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the **graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart helper** command disables graceful restart helper mode for the specified BGP neighbor or peer group. The **default neighbor graceful-restart helper** command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart helper** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID graceful-restart helper long-lived
no neighbor neighbor_ID graceful-restart helper long-lived
default neighbor neighbor_ID graceful-restart helper long-lived
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **long-lived** Enables long lived graceful restart helper mode.

Example

These commands disable graceful restart helper mode for the neighbor at **192.168.12.1**.

```
switch(config) # router bgp 1
switch(config-router-bgp) # no neighbor 192.168.12.1 graceful-restart-helper
switch(config-router-bgp) #
```

15.5.5.77 neighbor import-localpref

The **neighbor import-localpref** command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.

The **no neighbor import-localpref** command resets the local preference to the default of **100** for routes received from the specified peer or peer group.

The **default neighbor import-localpref** command resets the local preference to the default of **100** for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

neighbor *neighbor_ID* import-localpref *preference*

no neighbor *neighbor_ID* import-localpref

default neighbor *neighbor_ID* import-localpref

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***preference*** preference value. Values range from **0** to **4294967295**.

Example

These commands configure the switch to assign a local preference of **50** to routes received from the peer located at **192.168.1.30**.

```
switch(config) # router bgp 1
switch(config-router-bgp) # neighbor 192.168.1.30 import-localpref 50
switch(config-router-bgp) #
```

15.5.5.78 neighbor local-as

The **neighbor local-as** command changes the local AS value sent to the specified peer in OPEN messages, allowing the switch to appear as a member of a different AS to the selected peer. Arista switches replace the local AS number with the modified value rather than prepending it to routes, so we implement the command only as **neighbor local-as no-prepend replace-as**.

Note: To establish a BGP connection with a static peer, the peer must also be configured to expect the specified ASN. This is done by using the **neighbor remote-as** command on the peer switch.

The **no neighbor local-as** command disables this modification for the specified peer or peer group. The **default neighbor local-as** command disables this modification for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID [local-as as_id] [no-prepend | replace-as]
no neighbor neighbor_ID local-as
default neighbor neighbor_ID local-as
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***as_id*** AS number that is sent in OPEN messages to the specified peer in place of the actual AS of the switch. Values range from **1** to **4294967295**.

This parameter cannot be set to the switch's AS number or to any AS number in the peer's network.

Examples

These commands configure the switch to replace its local ASN in OPEN messages sent to the peer at **10.13.64.1** with ASN **64500**, and configure the peer to expect that ASN in messages received from the switch.

- **Switch Configuration**

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.13.64.1 local-as 64500 no-prepend
switch(config-router-bgp) #
```

- **Peer Configuration**

```
peer(config)# router bgp 64502
peer(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
peer(config-router-bgp) #
```

15.5.5.79 neighbor local-v4-addr

The **neighbor local-v4-addr** command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The **no neighbor local-v4-addr** command applies the system default configuration.

The **default neighbor local-v4-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRIs to an IPv6 neighbor, use the [neighbor auto-local-addr](#) command.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID local-v4-addr ipv4_local
no neighbor neighbor_ID local-v4-addr
default neighbor neighbor_ID local-v4-addr
```

Parameters

- ***neighbor_ID*** neighbor's IPv6 address or peer group name.
- ***ipv4_local*** next hop address.

Example

For the neighbor at **2001:0DB8:c2a4:1761::2**, these commands specify an IPv4 NLRI value of **10.7.5.11** to be sent during IPv6 transport peering sessions.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 2001:0DB8:c2a4:1761::2 local-v4-addr 10.7.5.11
switch(config-router-bgp) #
```

15.5.5.80 neighbor local-v6-addr

The **neighbor local-v6-addr** command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with which IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The **no neighbor local-v6-addr** command applies the system default configuration.

The **default neighbor local-v6-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID local-v6-addr ipv6_local  
no neighbor neighbor_ID local-v6-addr  
default neighbor neighbor_ID local-v6-addr
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 address or peer group name.
- ***ipv6_local*** next hop address (A:B:C:D:E:F:G:H).

Example

For the neighbor at **10.7.5.11**, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2  
switch(config-router-bgp)# show active  
router bgp 1  
  bgp log-neighbor-changes  
  bgp default ipv6-unicast  
    neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2  
switch(config-router-bgp) #
```

15.5.5.81 neighbor maximum-routes

The **neighbor maximum-routes** command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action after exceeding the limit. To remove the maximum route limit, select a limit of zero (0).

The switch generates an error message when the number of routes a peer receives exceeds the limit. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state resets with the [clear ip bgp](#) command.

The **no neighbor maximum-routes** command applies the system default maximum-routes value of **256000** for the specified peer.

The **default neighbor maximum-routes** command applies the system default value for individual neighbors and the peer group settings for neighbors who are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID maximum-routes quantity [action]  
no neighbor neighbor_ID maximum-routes  
default neighbor neighbor_ID maximum-routes
```

Parameters

- **neighbor *neighbor_ID*** - Specify the neighbor IPv4 or IPv6 address or the peer group name.
- **maximum-routes *quantity*** - Specify the maximum number of routes. Values include the following:
 - **0** - Specify no defined route limit.
 - **1 to 4294967294** - Specify the maximum number of routes.
- **action** - Specify the action for the switch when exceeding the route limit. Values include:
 - **warning-limit [number_of_routes | percentage]** - Percentage of maximum routes to generate a warning. Setting this parameter to **0** does not send a warning.
 - **warning-only** - Send a warning when the number of routes exceeds the maximum route limit, but do not restart. Also, drop prefixes sent after exceeding the route limit.

Example

This command configures the switch to accept **15000** routes for the neighbor at **10.3.16.210**. If the neighbor exceeds **15000** routes, the switch disables peering with the neighbor.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 10.3.16.210 maximum-routes 15000  
switch(config-router-bgp) #
```

15.5.5.82 neighbor next-hop-peer

The **neighbor next-hop-peer** command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The **no neighbor next-hop-peer** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-peer** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID next-hop-peer  
no neighbor neighbor_ID next-hop-peer  
default neighbor neighbor_ID next-hop-peer
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command configures the peer address of **10.3.2.24** as the next hop for routes advertised to the switch from the peer BGP neighbor.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# neighbor 10.3.2.24 next-hop-peer  
switch(config-router-bgp) #
```

15.5.5.83 neighbor next-hop-self

The **neighbor next-hop-self** command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The **no neighbor next-hop-self** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-self** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID next-hop-self  
no neighbor neighbor_ID next-hop-self  
default neighbor neighbor_ID next-hop-self
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

This command configures the switch as the next hop for the peer at **10.4.1.30**.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# neighbor 10.4.1.30 next-hop-self  
switch(config-router-bgp) #
```

15.5.5.84 neighbor next-hop resolution v4-mapped-v6 translation

The `neighbor next-hop resolution v4-mapped-v6 translation` command configures the switch to enable translation of IPv4-mapped IPv6 addresses to IPv4 addresses. With this setting enabled, when the switch receives an IPv4-mapped IPv6 address for a next hop, it will translate it to an IPv4 address. This allows the next hop to be resolved in an IPv4 network.

The `no neighbor next-hop resolution v4-mapped-v6 translation` and `default neighbor next-hop resolution v4-mapped-v6 translation` commands disable the translation from IPv4-mapped IPv6 addresses to IPv4 addresses.

Command Mode

BGP IPv6 Labeled-Unicast Address Family Configuration

Command Syntax

```
neighbor {neighbor_ID} next-hop resolution v4-mapped-v6 translation
no neighbor {neighbor_ID} next-hop resolution v4-mapped-v6 translation
default neighbor {neighbor_ID} next-hop resolution v4-mapped-v6 translation
```

Parameter

neighbor_ID a neighboring peer or peer group that may send IPv4-mapped IPv6 addresses to this switch.

Guidelines

- This command is active only if the multi-agent routing protocol model is running.
- This command requires an IPv6 labeled-unicast address family.
- This command applies to the default VRF.

Example

These commands enter BGP IPv6 Labeled-Unicast Address Family Configuration mode for AS **64510** (creating the BGP instance if it does not exist) and enable the translation of IPv4-mapped IPv6 addresses to IPv4 addresses for neighbors in the **v6_pg** peer group.

```
switch(config)# router bgp 64510
switch(config-router-bgp)# address-family ipv6 labeled-unicast
switch(config-router-bgp-af-label)# neighbor v6_pg next-hop resolution v4-mapped-v6 translation
switch(config-router-bgp-af-label)#{
```

15.5.5.85 neighbor out-delay

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID out-delay delay_time
no neighbor neighbor_ID out-delay delay_time
default neighbor neighbor_ID out-delay delay_time
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***delay_time*** the out delay period (seconds). Values range from **0** to **600**. Default value is **0**.

Example

These commands set the out delay period to **5** seconds for the connection with the peer at **10.24.15.9**.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.24.15.9 out-delay 5
switch(config-router-bgp) #
```

15.5.5.86 neighbor passive

The **neighbor passive** command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer's transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The **no neighbor passive** command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The **default neighbor passive** command restores the default connection mode. The default mode is **active** for individual BGP peers, or the mode inherited from the peer group for peer group members.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID passive  
no neighbor neighbor_ID passive  
default neighbor neighbor_ID passive
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Example

These commands configure the neighbor at IP address **10.2.2.14** to not initiate TCP connections for BGP peering.

```
switch(config)# router bgp 300  
switch(config-router-bgp)# neighbor 10.2.2.14 passive  
switch(config-router-bgp) #
```

15.5.5.87 neighbor password

The **neighbor password** command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to **8** bytes in length. Peers must use the same password to ensure proper communication.

The **running-config** displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The **no neighbor password** command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The **default neighbor password** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor password** and **default neighbor password** commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID password [ENCRYPT_LEVEL] key_text
```

```
no neighbor neighbor_ID password
```

```
default neighbor neighbor_ID password
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **ENCRYPT_LEVEL** the encryption level of the ***key_text*** parameter. Values include:
 - **no parameter** the ***key_text*** is in clear text.
 - **0** the ***key_text*** is in clear text. Equivalent to the **no parameter** case.
 - **7** the ***key_text*** is MD5-encrypted.
- ***key_text*** the password.

Example

This command specifies a password in clear text.

```
switch(config)# router bgp 1
switch(config-router-bgp)# neighbor 10.25.25.13 password 0 code123
switch(config-router-bgp) #
```

Running-config stores the password as an encrypted string.

15.5.5.88 neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer group (create)** command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the [neighbor peer group \(neighbor assignment\)](#) command. To create a dynamic peer group, use the [bgp listen range](#) command.

The **no neighbor peer group (create)** and **default neighbor peer group (create)** commands remove the specified static peer group from **running-config**. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The **no** form of the [bgp listen range](#) command removes a dynamic peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor group_name peer group
no neighbor group_name peer group
default neighbor group_name peer group
```

Parameter

group_name peer group name.

Examples

- These commands create a BGP peer group called **bgpgroup1**, assign several neighbors to the group, apply a route map, and adjust the configuration for one group member.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor bgpgroup1 peer group
switch(config-router-bgp)# neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)# neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)# neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)# show active
router bgp 9
bgp log-neighbor-changes
    neighbor bgpgroup1 peer group
    neighbor bgpgroup1 route-map corporate in
    neighbor bgpgroup1 maximum-routes 12000
    neighbor 10.1.1.1 peer group bgpgroup1
    neighbor 10.2.2.2 peer group bgpgroup1
    neighbor 10.3.3.3 peer group bgpgroup1
    neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#

```

- This command removes peer group **bgpgroup1** from **running-config**. The group members remain, but all settings that group members inherited from the peer group are removed.

```
switch(config-router-bgp)# no neighbor bgpgroup1 peer group
switch(config-router-bgp)# show active
router bgp 9
bgp log-neighbor-changes
```

```
neighbor 10.1.1.1 maximum-routes 12000
neighbor 10.2.2.2 maximum-routes 12000
neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp) #
```

15.5.5.89 neighbor peer group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer group (neighbor assignment)** command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the **neighbor peer group (create)** command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The **no neighbor peer group** and **default neighbor peer group** commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor NEIGHBOR_ADDR peer group group_name
```

```
no neighbor NEIGHBOR_ADDR peer group
```

```
default neighbor NEIGHBOR_ADDR peer group
```

Parameters

- **NEIGHBOR_ADDR** address of a neighbor being added to peer group. Values include:
 - *ipv4_addr* neighbor's IPv4 address.
 - *ipv6_addr* neighbor's IPv6 address.
 - **group_name** peer group name.

Examples

- These commands create a BGP peer group called ***bgpgroup1***, assign several neighbors to the group, and apply a route map.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor bgpgroup1 peer group
switch(config-router-bgp)# neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)# neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)# neighbor bgpgroup1 route-map corporate in
```

- This command removes the neighbor at **1.1.1.1** from the peer group. All settings that neighbor **10.1.1.1** inherited from the peer group are maintained.

```
switch(config-router-bgp) # no neighbor 10.1.1.1 peer group  
switch(config-router-bgp) #
```

15.5.5.90 neighbor received attribute discard

The **neighbor received attribute discard** command allows the configuration of BGP Attribute Ignore Received Lists to discard update messages with a BGP attribute. The **default** parameter applies the configuration to all BGP neighbors. The **disabled** parameter explicitly disables the configuration.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor [default | ipv4 | ipv6] received attribute discard bgp_attribute_type
```

Command Syntax

- [default | ipv4 | ipv6] - Specify **default** to apply the configuration to all BGP neighbors. Specify an IPv4 or IPv6 address to apply the configuration to a specific BGP neighbor.
- **bgp_attribute_type** - Configure a single BGP attribute or a range of BGP attributes to discard.

Examples

- Use the following command to configure a BGP Attribute Ignore Received List with the BGP attributes 4-255 for all BGP neighbors on the network:

```
switch(config)# router bgp
switch(config-router-bgp)# neighbor default received attribute discard 4-255
! To make this command effective for existing BGP sessions, clear all routes by issuing "clear
  ip bgp"
```

- Use the following command to configure a BGP Attribute Ignore Received List with the BGP attributes 4-255 for BGP neighbor, 10.0.0.2 on the network:

```
switch(config)# router bgp
switch(config-router-bgp)# neighbor 10.0.0.2 received attribute discard 4-255
! To make this command effective for existing BGP sessions, clear all routes by issuing "clear
  ip bgp"
```

15.5.5.91 neighbor remote-as

The **neighbor remote-as** command configures the expected AS Number for a neighbor (peer). This configuration is required to establish a static peer connection. Internal neighbors have the same AS Number (ASN); external neighbors have different ASNs.

Note: To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the [router-id \(BGP\)](#) command.

When a static peer is using the [neighbor local-as](#) command to replace its local ASN with a configured ASN in OPEN messages, use the **neighbor remote-as** command to configure the switch to expect the configured ASN for that peer.

The **no neighbor remote-as** command applies the system default for the specified peer or peer group.

The **default neighbor remote-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID remote-as as_id
no neighbor neighbor_ID remote-as
default neighbor neighbor_ID remote-as
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***as_id*** Autonomous System (AS) of the peer. Values range from **1** to **4294967295**.

Example

These commands establish an eBGP connection with the router at **10.4.3.10** in **AS 64500**.

```
switch(config)# router bgp 64497
switch(config-router-bgp)# neighbor 10.4.3.10 remote-as 64500
switch(config-router-bgp) #
```

15.5.5.92 neighbor remove-private-as

The **neighbor remove-private-as** command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the Autonomous System (AS) path includes only private autonomous system numbers, the **REMOVAL** parameter specifies how the private autonomous system number is removed.

The **no neighbor remove-private-as** command applies the system default (preserves private AS numbers) for the specified peer.

The **default neighbor remove-private-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID remove-private-as [REMOVAL]
```

```
no neighbor neighbor_ID remove-private-as
```

```
default neighbor neighbor_ID remove-private-as
```

Parameters

- **neighbor_ID** neighbor's IPv4 or IPv6 address or peer group name.
- **REMOVAL** specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:
 - **all** removes all private AS numbers from AS path in outbound updates.
 - **all replace-as** all private AS numbers in AS path are replaced with router's local AS number.

Note: This command does not support a mix of public and private AS numbers.

Examples

- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at **10.5.2.11** only if the AS path does not contain any public AS number.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 remove-private-as
switch(config-router-bgp)#

```

- This command replaces all private AS numbers in the AS path with the switch's local AS number.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.11 remove-private-as all replace-as
switch(config-router-bgp)#

```

15.5.5.93 neighbor rib-in delay

The **neighbor rib-in delay** command configures an inbound delay for installing routes from a peer on a BGP network. Routes from a second peer install before processing routes on the first peer.

The **no | default** commands remove the configuration from the switch.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor peer rib-in delay seconds event peer-init
```

Parameters

- ***peer*** - the peer has one of the following formats:
 - **A.B.C.D** - Add the peer IPv4 address.
 - **A:B:C:D:E:F:G:H** - Add the peer IPv6 address.
 - **name** - Add the name of the peer-group.
 - **default** - apply the configuration to all neighbors.
 - **fe0::A:B:C:D%_interface** - Add the neighbor IPv6 link-local address.
 - **interface** - Specify the interface range to use for BGP session establishment.
- **rib-in** - Configure the peer inbound route policy.
- **delay** - Delay processing initial inbound route updates.
- **seconds** - Specify the length of time, in seconds, to delay the inbound route updates.
- **event** - Delay inbound route updates for specified events.
- **peer-init** - Start the delay timer when the peer establishes on the network.

Examples

- Use the following command to delay the inbound route processing for 2 minutes on the peer-group, *central-peer-group*:

```
switch(config)#router bgp
switch(config-router-bgp)#neighbor central-peer-group rib-in delay 120 event peer-init
```

- To disable the feature, configure the delay to zero (0) seconds:

```
switch(config-router-bgp)#neighbor peer rib-in delay 0 event peer-init
```

15.5.5.94 neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the inbound policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without the need to reset the BGP sessions. All routes received by the switch (including those that were filtered out by the inbound policy) can be seen by issuing the `show ip bgp neighbor received-routes` command.

The `no neighbor rib-in pre-policy retain` command configures the switch to discard those routes received from the specified neighbor (or peer group) that are filtered out by the inbound policy.

The `neighbor rib-in pre-policy retain` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of inbound policy).

The `default neighbor rib-in pre-policy retain` command applies the system default (retaining policy-rejected routes) for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID rib-in pre-policy retain [all]  
no neighbor neighbor_ID rib-in pre-policy retain  
default neighbor neighbor_ID rib-in pre-policy retain
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **all** the command applies to all routes from the specified neighbor or peer group, including those that would otherwise be discarded as invalid (because their AS-Path contains the switch's own ASN, for example). Without this keyword, the command applies only to routes that were filtered out by the inbound policy.

Examples

- These commands configure the switch to discard routes received from the neighbor at [10.5.2.23](#) which are filtered out by the switch's inbound policies.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# no neighbor 10.5.2.23 rib-in pre-policy retain  
switch(config-router-bgp)#{/pre>
```

- These commands configure the switch to retain all routes received from the neighbor at [10.5.2.23](#) (including invalid routes).

```
switch(config)# router bgp 9  
switch(config-router-bgp)# no neighbor 10.5.2.23 rib-in pre-policy retain all  
switch(config-router-bgp)#{/pre>
```

15.5.5.95 neighbor route-map (BGP)

The **neighbor route-map** command applies a route map to inbound or outbound BGP routes. When applying a route map to outbound routes, the switch advertises only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor replaces the previous route map.

Use the command in the Router BGP and the Router BGP Address Family Configuration Modes. The command execution mode determines the scope of the command:

- The Router BGP Configuration Mode applies the route map to the specified neighbor in all peering sessions where advertised.
- The Router BGP Address Family Configuration Mode applies the route map to the neighbors only in peering sessions corresponding to the configuration-mode address family.

The **no neighbor route-map** command applies no route map for individual neighbors and does not apply the peer group setting to neighbors participating as peer group members. Executing this command adds an entry to the ***running-config*** file.

The **default neighbor route-map** command applies the system default, no route map, for individual neighbors, and applies the peer group setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID route-map map_name [in | out]
```

Parameters

- ***neighbor_ID*** - Specify the neighbor IPv4 or IPv6 address or peer group name.
- ***route-map map_name*** - Specify the name of a route map.
- **[in | out]** Apply the route map to the specified routes. Options include the following:
 - **in** - Apply the route map is applied to inbound routes.
 - **out** - Apply the route map to outbound routes.

Example

This command applies a route map named ***inner-map*** to a BGP inbound route from **10.5.2.11**.

```
switch(config) # router bgp 9
switch(config-router-bgp) # neighbor 10.5.2.11 route-map inner-map in
switch(config-router-bgp) #
```

15.5.5.96 neighbor route-reflector-client

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The **neighbor route-reflector-client** command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The **no neighbor route-reflector-client** and **default neighbor route-reflector-client** commands disable route reflection by deleting the **neighbor route-reflector-client** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID route-reflector-client  
no neighbor neighbor_ID route-reflector-client  
default neighbor neighbor_ID route-reflector-client
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Related Commands

- [bgp client-to-client reflection](#)
- [bgp route-reflector preserve-attributes](#)

Example

This command configures the switch as a route reflector and the neighbor at **10.5.2.1** as one of its clients.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# neighbor 10.5.2.11 route-reflector-client  
switch(config-router-bgp) #
```

15.5.5.97 neighbor route-to-peer

The **neighbor route-to-peer** command allows BGP to establish a connection to reach the specified peer using kernel routing table information. By default, route-to-peer configuration is enabled for a peer or a peer group.

The **no neighbor route-to-peer** command prevents BGP from using kernel routing table information to establish a BGP connection to reach a peer and the **default neighbor route-to-peer** command enables route-to-peer configuration for a peer or a peer group by removing the corresponding **no neighbor route-to-peer** command from the **running-config**.

If the peer is directly connected, BGP instead uses ARP table or neighbor table information to establish a BGP connection to reach the peer.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID route-to-peer  
no neighbor neighbor_ID route-to-peer  
default neighbor neighbor_ID route-to-peer
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or the peer group name.

Example

These commands establish a connection between the switch and the BGP peer located at IP address **172.16.1.1**, and prevent BGP from using kernel routing table information to establish a route to that peer.

```
switch(config)# router bgp 64496  
switch(config-router-bgp)# no neighbor 172.16.1.1 route-to-peer  
switch(config-router-bgp)# neighbor 172.16.1.1 remote-as 100  
switch(config-router-bgp) #
```

15.5.5.98 neighbor send-community

The **neighbor send-community** command configures the switch to include community path attributes for routes in the UPDATE messages advertised to the specified BGP neighbor. By default, the command enables the switch to send all community attributes: standard, extended, and large. To advertise *only* a subset of community attributes, use the keyword(s) for the community attribute(s) to be included. To add additional community attributes in a separate command, or to remove specific community attributes from advertised routes, use the [neighbor send-community add / remove](#) command.

Note: The [neighbor send-community link-bandwidth](#) command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID send-community [extended] [large][standard]
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **extended** includes extended community attributes.
- **large** includes large community attributes.
- **standard** includes standard community attributes.

Examples

- These commands configure the switch to send all community attributes to the neighbor at address **10.5.2.23**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 send-community
switch(config-router-bgp)#

```

- These commands configure the switch to include only large community attributes in the routes sent to the neighbor at address **10.5.2.24**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community large
switch(config-router-bgp)#

```

- These commands configure the switch to send only standard and large community attributes to the neighbor at address **10.5.2.25**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.25 send-community standard large
switch(config-router-bgp)#

```

15.5.5.99 neighbor send-community add / remove

The **neighbor send-community add / remove** command modifies the types of community path attributes included for routes in the UPDATE messages advertised to the specified BGP neighbor without having to issue the [neighbor send-community](#) command.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID send-community {add | remove}{extended | large | standard}
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **add** appends the specified community path attribute type to the list of community path attribute types sent to the specified neighbor.
- **remove** removes the specified community path attribute type from the list of community path attribute types sent to the specified neighbor.
- **extended** enables (or disables) sending of the extended community path attribute to the specified neighbor.
- **large** enables (or disables) sending of the large community path attribute to the specified neighbor.
- **standard** enables (or disables) sending of the standard community path attribute to the specified neighbor.
- **link-bandwidth** see [neighbor send-community link-bandwidth](#) for a description of this parameter.

Guidelines

- If the **neighbor send-community** command has been issued for the neighbor without specifying any community types, that neighbor will receive all community attributes in the routes advertised to it. Using the **neighbor send-community add** command then to add an attribute will cause the switch to send *only* the specified community types in advertised routes. This results in the other community path attributes no longer being advertised to that BGP peer.
- If all community types are removed using the **neighbor send-community remove** command, the switch will then send routes with all community types. (This behavior is maintained for backward compatibility.) To remove all community path attributes from routes sent to the specified neighbor, use the [neighbor send-community](#) command.
- After using this command, issue the **show active** command in **router-bgp** configuration mode to ensure that the intended attributes are being sent to the specified neighbor.

Examples

- These commands configure the switch to send large community attributes in the routes sent to the neighbor at address **10.5.2.24**, then add extended community attributes as well.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community large
switch(config-router-bgp)# neighbor 10.5.2.24 send-community add extended
switch(config-router-bgp)# show active
switch(config-router-bgp)# neighbor 10.5.2.24 send-community add extended
switch(config-router-bgp)# show active
router bgp 9
    neighbor 10.5.2.24 send-community extended large
    neighbor 10.5.2.24 maximum-routes 12000
switch(config-router-bgp)#

```

-
- These commands configure the switch to include extended and large community attributes in the routes sent to the neighbor at address **10.5.2.27**, then remove the large attribute from the list of community types to be included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.27 send-community extended large
switch(config-router-bgp)# neighbor 10.5.2.27 send-community remove large
switch(config-router-bgp)# show active
router bgp 600
    neighbor 10.5.2.27 send-community extended
    neighbor 10.5.2.27 maximum-routes 12000
switch(config-router-bgp) #
```

- These commands attempt to configure the switch to remove large community attributes from routes sent to the neighbor at address **10.5.2.28**, but send all others. However, because the original command did not specify a list of attributes, the **remove** command has no effect, and all community path attributes are still included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.28 send-community
switch(config-router-bgp)# neighbor 10.5.2.28 send-community remove large
switch(config-router-bgp)# show active
router bgp 600
    neighbor 10.5.2.28 send-community
    neighbor 10.5.2.28 maximum-routes 12000
switch(config-router-bgp) #
```

- These commands configure the switch to send only large community attributes in routes sent to the neighbor at address **10.5.2.29**, then attempt to remove the large attribute from sent routes. However, because this removes the last specified attribute, *all* community path attributes (including large) will now be included.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.29 send-community large
switch(config-router-bgp)# neighbor 10.5.2.28 send-community remove large
switch(config-router-bgp)# show active
router bgp 600
    neighbor 10.5.2.29 send-community
    neighbor 10.5.2.29 maximum-routes 12000
switch(config-router-bgp) #
```

15.5.5.100 neighbor send-community link-bandwidth

The **neighbor send-community link-bandwidth** command is used to locally regenerate the link-bandwidth value to be advertised to a specific BGP neighbor or peer group. When this command is configured the regenerated link-bandwidth value is included in the extended community path attribute in UPDATE messages.

This command is used specifically for local regeneration of the link-bandwidth value. To send an explicitly-configured link-bandwidth value, add an extended community to a route map instead. (see [set extcommunity \(route-map\)](#)) and include extended community attributes in UPDATE messages sent to that neighbor.

Note: The [neighbor send-community](#) command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID send-community link-bandwidth {aggregate [reference_speed] | divide  
{equal | ratio}}  
  
no neighbor neighbor_ID send-community  
  
default neighbor neighbor_ID send-community
```

Parameters

- **neighbor_ID** neighbor's IPv4 or IPv6 address or peer group name.
- **aggregate** sends the sum of all link-bandwidth values for all paths toward a prefix to the specified neighbor or to each member of the specified peer group.
 - **reference_speed** optional value to specify a reference link speed in bits/second. Values range from **0.0** to **4294967295.0**; larger values can also be expressed using the multiplier K (*10^3), M (*10^6), or G (*10^9). The link speed of the connection to the peer is divided by this value, and the resulting ratio is used to scale down the link-bandwidth advertised to the peer. If the result is >1, the multiplier is ignored and the full aggregate value is advertised.
- **divide** divides the cumulative link-bandwidth value described above among the peers in an Adj-RIB-Out either equally or proportionally.
 - **equal** divides the cumulative total link-bandwidth value equally among all peers in the same Adj-RIB-Out.
 - **ratio** divides the cumulative total link-bandwidth value among peers proportionally according to the speed of the connection to each peer in the Adj-RIB-Out.

Examples

- These commands configure the switch to locally regenerate the link-bandwidth value, dividing the bandwidth proportionally and including it in UPDATE messages to all peers in the peer group **idaho**.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# neighbor idaho send-community link-bandwidth divide ratio  
switch(config-router-bgp)#

```

-
- These commands configure the switch to locally regenerate the link-bandwidth value, scale it down with a reference link speed of **20** gigabits/second, and include it in UPDATE messages to the neighbor at address **10.5.2.24**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.24 send-community link-bandwidth aggregate 20G
switch(config-router-bgp) #
```

15.5.5.101 neighbor shutdown

The **neighbor shutdown** command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The **no neighbor shutdown** command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID shutdown reason REASON
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address or peer group name.

Examples

- This command disables the neighbor at **10.5.2.23**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 shutdown
switch(config-router-bgp) #
```

- This command disables the neighbor at **10.5.2.23** with a reason - planned upgrade. The reason parameter is optional.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.5.2.23 shutdown reason Planned upgrade
switch(config-router-bgp) #
```

15.5.5.102 neighbor timers

The **neighbor timers** command configures the BGP keepalive and hold times for a specified peer connection. The **timers bgp** command configures the times on all peer connections for which an individual command is not specified.

- **Keepalive time** is the period between the transmission of consecutive keepalive messages.
- **Hold time** is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least **3** seconds and should be three times longer than the keepalive setting.

The **no neighbor timers** command applies the system default for the specified peer or group (the timers specified by the **timers bgp** command).

The **default neighbor timers** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID timers keep_alive hold_time
no neighbor neighbor_ID timers
default neighbor neighbor_ID timers
```

Parameters

- **neighbor_ID** neighbor's IPv4 or IPv6 address or peer group name.
- **keep_alive** keepalive period, in seconds. Values include:
 - **0** keepalive messages are not sent.
 - **1 to 3600** keepalive time (seconds).
- **hold_time** hold time. Values include:
 - **0** peering is not disabled by timeout expiry; keepalive packets are not sent.
 - **3 to 7200** hold time (seconds).

Example

This command sets the keepalive time to **30** seconds and the hold time to **90** seconds for the connection with the peer at **10.24.15.9**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.24.15.9 timers 30 90
switch(config-router-bgp) #
```

15.5.5.103 neighbor ttl maximum-hops

The **neighbor ttl maximum-hops** command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The **no neighbor ttl maximum-hops** command disables the GTSM configuration in the specified neighbor.

The **default neighbor ttl maximum-hops** command applies the system default configuration for individual neighbors; and applies the peer group's setting for neighbors that are members of a peer group.

Command-Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID ttl maximum-hops hop_number
```

```
no neighbor neighbor_ID ttl maximum-hops
```

```
default neighbor neighbor_ID ttl maximum-hops
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***hop_number*** maximum count of hops from a BGP peer. Values range from **0** to **254**.

Example

This command configures the TTL security for **10.20.20.30** with a maximum of **4** hops.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.20.20.30 ttl maximum-hops 4
switch(config-router-bgp) #
```

15.5.5.104 neighbor update-source

The **neighbor update-source** command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor's closest interface (also known as the best local address).

The **no neighbor update-source** command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default **neighbor update-source** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID update-source INTERFACE
```

```
no neighbor neighbor_ID update-source
```

```
default neighbor neighbor_ID update-source
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- **INTERFACE** interface type and number. Options include:
 - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
 - **loopback *l_num*** loopback interface specified by ***l_num***.
 - **management *m_num*** management interface specified by ***m_num***.
 - **port-channel *p_num*** port-channel interface specified by ***p_num***.
 - **vlan** VLAN interface specified by ***v_num***.

Example

This command configures the switch to use **ethernet 10** for TCP connections for the neighbor at **10.2.2.14**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.2.2.14 update-source ethernet 10
switch(config-router-bgp) #
```

15.5.5.105 neighbor weight

The **neighbor weight** command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from **0** to **65535** and are not propagated to other switches through route updates. The default weight for paths that the router originates is **32768**; the default weight for routes received through BGP is **0**.

A path's BGP weight is also configurable through route maps. Weight values set through route-map commands have precedence over neighbor weight command values.

The **no neighbor weight** command applies the system default (**32768** for router-originated paths, **0** for routes received through BGP) for the specified peer or group.

The **default neighbor weight** command applies the system default for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID weight weight_value
no neighbor neighbor_ID weight
default neighbor neighbor_ID weight
```

Parameters

- ***neighbor_ID*** neighbor's IPv4 or IPv6 address or peer group name.
- ***weight_value*** weight value. Values range from **1** to **65535**.

Example

This command specifies a weight of **4000** for all paths from the neighbor at **10.1.2.5**.

```
switch(config)# router bgp 9
eswitch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
switch(config-router-bgp) #
```

15.5.5.106 next-hop resolution route

The **next-hop resolution route** command configures BGP with next hop resolution with IGP distance on the switch.

Command Mode

Router-BGP Configuration

Command Syntax

```
next-hop resolution route igrp-nexthop-cost protocol bgp
```

Parameters

- **igrp-nexthop-cost** - Specify the IGP next hop cost.
- **protocol** - Specify the routing protocol used for resolving routes.
- **bgp** - Specify BGP as the routing protocol.

Example

Use the following command to add next hop with IGP distance to the BGP configuration:

```
switch(config)# next-hop resolution route igrp-nexthop-cost protocol bgp
```

15.5.5.107 network (BGP)

The **network** command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, **192.0.2.4/24** is stored as **192.0.2.0/24**. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The **no network** and **default network** commands remove the network from the routing table, preventing its advertisement.

Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

Command Syntax

```
network NET_ADDRESS [ROUTE_MAP]
```

```
no network NET_ADDRESS
```

```
default network NET_ADDRESS
```

Parameters

- **NET_ADDRESS** IP address range. Entry options include:
 - **ipv4_subnet** IPv4 subnet (CIDR notation).
 - **ipv4_addr mask subnet** IPv4 subnet (address-mask notation).
 - **ipv6_prefix** neighbor's IPv6 prefix (CIDR notation).
- **ROUTE_MAP** specifies route map that assigns attribute values to the network. Options include:
 - **no parameter** attributes are not assigned through a route map.
 - **route-map map_name** attributes listed by specified route map are assigned to the network.

Example

This command enables BGP advertising for the network located at **10.1.2.5**. The configuration stores the network as **10.1.2.5**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# network 10.1.2.5/24
switch(config-router-bgp) #
```

15.5.5.108 no neighbor

The **no neighbor** command removes all neighbor configuration commands for the specified neighbor.

Neighbor settings can also be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group *must* be removed individually.

Command Mode

Router-BGP Configuration

Command Syntax

```
no neighbor neighbor_ID
default neighbor neighbor_ID
```

Parameter

neighbor_ID neighbor's IPv4 or IPv6 address. This command does not accept a peer group name as an argument; peer group settings must be removed individually.

Example

This command removes all neighbor configuration commands for the neighbor at **10.1.1.1**.

```
switch(config) # router bgp 9
switch(config-router-bgp) # no neighbor 10.1.1.1
switch(config-router-bgp) #
```

15.5.5.109 peer-filter

The **peer-filter** command creates a peer filter group and places the switch in peer-filter configuration mode for that group. The peer-filter group parameters are defined using the **match as-range** command.

The **no peer-filter** and **default peer-filter** commands remove the peer-filter group from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
peer-filter filter_name
no peer-filter filter_name
default peer-filter filter_name
```

Parameters

filter_name name of the peer filter.

Example

This command creates a peer filter called **group1** and places the switch in peer-filter configuration mode for that filter.

```
switch(config-router-bgp) # peer-filter group1
switch(config-peer-filter-group1) #
```

15.5.5.110 rd (Router-BGP VRF and VNI Configuration Modes)

The `rd` command adds a Route Distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use `no` or `default` command forms to remove an RD from a VRF or VNI.

Note: Legacy RDs that were assigned in VRF Configuration Mode appear in `show vrf` outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of `show bgp evpn` command.

Command Modes

Router-BGP VRF Configuration

Router-BGP VNI Configuration

Command Syntax

`rd admin_ID:local_assignment`

`no rd`

`default rd`

Parameters

- **`admin_ID`** an AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- **`local_assignment`** a locally assigned number distinguishing the VRF. Values range from **0-65535** if the **`admin_ID`** is an IPv4 address, or from **0-4294967295** if the **`admin_ID`** is an AS number. If the **`admin_ID`** is an AS number, the **`local_assignment`** can also be entered in the form of an IPv4 address.

Examples

- These commands identify the administrator of the VRF named **purple** as AS **530** and assign **12** as its local number.

```
switch(config)# router bgp 50
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#{
```

- These commands identify the administrator of the MAC-VRF named **bundle1** as AS **530** and assign **12** as its local number.

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)#{
```

15.5.5.111 redistribute (BGP)

The **redistribute** command enables the redistribution of specified routes to the BGP domain.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** command from ***running-config***.

Note: Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command Mode

Router-BGP Configuration

Command Syntax

```
redistribute ROUTE_TYPE [ROUTE_MAP]
```

```
no redistribute ROUTE_TYPE
```

```
default redistribute ROUTE_TYPE
```

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
 - **connected** routes that are established when IP is enabled on an interface.
 - **match nssa-external all** OSPF NSSA external routes.
 - **match nssa-external 1 type 1** OSPF NSSA external routes.
 - **match nssa-external 2 type 2** OSPF NSSA external routes.
 - **ospf** internal routes from an OSPF domain.
 - **ospf match external** routes external to the AS, but imported from OSPF.
 - **ospf match internal** OSPF routes that are internal to the AS.
 - **ospf match nssa-external all** OSPF NSSA external routes.
 - **ospf match nssa-external 1 type 1** OSPF NSSA external routes.
 - **ospf match nssa-external 2 type 2** OSPF NSSA external routes.
 - **ospf3** routes from an OSPFv3 domain.
 - **ospf3 match external** routes external to the AS, but imported from OSPFv3.
 - **ospf3 match internal** OSPFv3 routes that are internal to the AS.
 - **rip** routes from a RIP domain.
 - **static** IP static routes.
 - **isis** IS-IS routes. Sub-options include:
 - **level-1** redistribute IS-IS level-1 routes.
 - **level-1-2** redistribute IS-IS level-1 and level-2 routes.
 - **level-2** redistribute IS-IS level-2 routes.
 - **route-map** route map reference.

Note: While redistributing IS-IS routes into BGP, the **level-1** or **level-2** keyword can be used to selectively redistribute level-1 routes or level-2 routes into BGP. The **level-1** or **level-2** keyword is optional, and the command defaults to **level-2** when it is not configured.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
 - **no parameter** all routes are redistributed.
 - **route-map map_name** only routes in the specified route map are redistributed.

Examples

- These commands redistribute internal OSPF routes into the BGP domain.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute ospf
switch(config-router-bgp)#{
```

- These commands redistribute ISIS routes into the BGP domain in the **address-family** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# address-family ipv4
switch(config-router-bgp-af)# redistribute isis level-1 route-map isis-to-bgp-v4
switch(config-router-bgp-af)#{
```

- These commands redistribute ISIS routes into the BGP domain in the **router-bgp** mode.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute isis level-1 route-map isis-to-bgp
switch(config-router-bgp)#{
```

15.5.5.112 rib fib fec ecmp ordered

The **rib fib fec ecmp ordered** command is configured to enforce ordering of next hops as determined by the protocol agents in the FEC programmed for the route.

The **no rib fib fec ecmp ordered** command removes the Ordered FEC configuration from the **running-config**.

Command Mode

Router General Configuration Mode

Command Syntax

```
rib fib fec ecmp ordered  
no rib fib fec ecmp ordered
```

Example

The **rib fib fec ecmp ordered** command configures the Ordered FEC feature on the switch.

```
switch(config)# router general  
switch(config-router-general)# rib fib fec ecmp ordered  
switch(config-router-general)#

```

15.5.5.113 router bgp

The **router bgp** command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group-change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The **no router bgp** and **default router bgp** commands delete the BGP instance.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router bgp as_id  
no router bgp  
default router bgp
```

Parameter

as_id Autonomous System (AS) number. Values range from **1** to **4294967295**.

Examples

- This command creates a BGP instance with AS number **64500**.

```
switch(config)# router bgp 64500  
switch(config-router-bgp)#End
```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in the **global** configuration mode.

```
switch(config)# router bgp 64501  
% BGP is already running with AS number 64500  
switch(config)#End
```

- This command exits the **bgp** configuration mode.

```
switch(config-router-bgp)#End  
switch(config)#End
```

- This command deletes the BGP instance.

```
switch(config)# no router bgp  
switch(config)#End
```

15.5.5.114 router-id (BGP)

The **router-id** command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

- the loopback IP address when a single loopback interface is configured.
- the loopback with the highest IP address when multiple loopback interfaces are configured.
- the highest IP address on a physical interface when no loopback interfaces are configured.

Note: The router ID must be specified if the switch has no IPv4 addresses configured.

The **no router-id** and **default router-id** commands remove the **router-id** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
router-id id_num
no router-id [id_num]
default router-id [id_num]
```

Parameter

id_num router ID number (32-bit dotted decimal notation).

Example

This command configures the fixed router ID address of **10.10.4.11**.

```
switch(config)# router bgp 9
switch(config-router-bgp)# router-id 10.10.4.11
switch(config-router-bgp) #
```

15.5.5.115 set large-community

Large communities are an optional transitive attribute of variable length. There are no predefined large-community types or values. Large communities may be configured alongside standard and extended communities within route-maps using additional configuration commands.

Large community values (**aa:nn:nn**) must consist of three decimal values each in the range (**0-4294967295**). All three sub-values of a large community value must be present. As-plain and As-dot notation are supported for the leading ASN value.

The **no** and **default** versions of the command return the command to the original configuration.

Command Mode

Route map configuration

Command Syntax

```
set large-community [large-community-list LIST1 [[LIST2] [additive | delete]]]  
no set large-community [large-community-list LIST1 [[LIST2] [additive | delete]]]  
default set large-community [large-community-list LIST1 [[LIST2] [additive | delete]]]
```

Parameters

large-community-list Add a large community list entry.

- **LIST1** Name of large community list.
 - **additive** Adds to the existing community.
 - **delete** Deletes matching communities.

Examples

- The following route-map sets a number of large-community values using both as-plain and as-dot notation.

```
switch(config)# route-map LC permit 10  
switch(config-route-map-LC)# set large-community 10.10:20:30 40.40:50:60 1000:80:90
```

- The following route-map adds additional large-community values.

```
switch(config)# route-map LC permit 10  
switch(config-route-map-LC)# set large-community 50:50:50 51:51:51 additive
```

- The following route-map removes the specified large-community values if they are present.

```
switch(config)# route-map LC permit 10  
switch(config-route-map-LC)# set large-community 60:60:60 61:61:61 delete
```

- The following route-map matches multiple large-community values from large-community lists (**LC_a1** and **LC_a2**) and sets **local-pref** accordingly.

```
switch(config)# ip large-community-list LC_1 permit 10:20:30 40:50:60  
switch(config)# ip large-community-list LC_2 permit 70:80:90  
switch(config)# route-map LC permit 10  
switch(config-map-LC)# match large-community LC_1 LC_2 exact_match  
switch(config-map-LC)# set local-pref 111
```

15.5.5.116 show bgp labeled-unicast tunnel

The **show bgp labeled-unicast tunnel** command displays the contents of the BGP Labeled-Unicast (LU) tunnel table. The user can optionally specify a tunnel index parameter to view the specific single tunnel information.

Command Mode

EXEC

Command Syntax

```
show bgp labeled-unicast tunnel tunnel_index
```

Parameter

tunnel_index index to view single tunnel information.

Examples

- This command displays the BGP LU tunnel table.

```
switch# show bgp labeled-unicast tunnel
Index Endpoint Nexthop Interface Labels Contributing Metric Metric 2 Pref Pref 2
----- -----
5 2.0.0.0/24 10.1.1.2 'Ethernet3' [ 123 899 900 ] Yes 0 100 200 0
6 2.0.1.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes 0 100 200 0
7 2.0.2.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes 0 100 200 0 switch#
```

- This command displays the BGP LU tunnel table for tunnel index **4**.

```
switch# show bgp labeled-unicast tunnel 4
Index Endpoint Nexthop/Tunnel Index Interface Labels Contributing Metric Metric 2 Pref Pref 2
----- -----
4 10.253.0.10/32 10.1.0.0 Port-Channel111 [ 3 ] Yes 0 0 200 0 switch#
```

15.5.5.117 show bgp convergence

The **show bgp convergence** command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

Command Mode

EXEC

Command Syntax

```
show bgp convergence [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- **no parameter** displays BGP information for the context-active VRF.
- **vrf vrf_name** displays BGP information for the specified VRF.
- **vrf all** displays BGP information for all VRFs.
- **vrf default** displays BGP information for the default VRF.

Examples

- This command displays the output when no peers have joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
First peer is not up yet
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
  IPv4 peers:
    201.1.1.1 (Session : Connect)
    202.1.1.1 (Session : Connect)
  IPv6 peers:
    None
```

- This command displays the output when the first peer has joined before convergence.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP
convergence)
  Convergence timer running, will expire in 00:01:50
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
```

```
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Active)
IPv6 peers:
None
```

- This command displays the output when the convergence timeout value is reached.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
201.1.1.1 (Session : Active)
202.1.1.1 (Session : Established)
IPv6 peers:
None
```

- This command displays the output during the converged state.

```
switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
None
IPv6 peers:
None
```

15.5.5.118 show bgp flow-spec

The **show bgp flow-spec ipv4** displays a brief description of each flowspec rule, including the matching rule and actions.

Command Mode

EXEC

Command Syntax

```
show bgp flow-spec [ipv4 | ipv6] [summary | detail] [vrf VRFNAME]
```

Parameters

- **ipv4** Displays information related to IPv4.
- **ipv6** Displays information related to IPv6.
- **summary** Displays summarized BGP information.
- **detail** Displays detailed information.
- **vrf VRFNAME** Displays flow-spec information in the named VRF.

Related Command

[show flow-spec](#)

Examples

- The **show bgp flow-spec ipv4 summary** command displays the count of flowspec rules received from each peer:

```
switch(config)# show bgp flow-spec ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 10
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS    MsgRcvd   MsgSent   InQ  OutQ  Up/Down State  RulesRcd RulesAcc
  10.0.0.2      4  10        12        4     0     0 00:02:18 Estab   2         2
  10.0.1.2      4  10        6         4     0     0 00:02:18 Estab   0         0
```

- The **show bgp flow-spec detail** displays the full details of each flowspec rule including the peer(s) it was received from, BGP properties, and an expanded description of the matching rule:

```
switch(config)# show bgp flow-spec ipv4 detail
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
BGP Flow Specification Matching Rule for 10.2.3.0/24;*;
  Rule identifier: 3882065752
  Matching Rule:
    Destination Prefix: 10.2.3.0/24
    Source Prefix: *
    Paths: 1 available
    Local
      from 10.0.0.2 (10.1.1.2)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Actions: Drop
BGP Flow Specification Matching Rule for 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
  Rule identifier: 3882090640
  Matching Rule:
    Destination Prefix: 10.2.4.0/24
    Source Prefix: 10.2.0.0/16
    IP Protocol: =6 |=17
    Destination Port: >1010 & <1024
    Paths: 1 available
    Local
      from 10.0.0.2 (10.1.1.2)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Actions: Drop
```

15.5.5.119 show bgp instance

The **show bgp instance** command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

Command Mode

EXEC

Command Syntax

```
show bgp instance [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- **no parameter** displays BGP information for the context-active VRF.
- **vrf vrf_name** displays BGP information for the specified VRF.
- **vrf all** displays BGP information for all VRFs.
- **vrf default** displays BGP information for the default VRF.

Examples

- This command displays information about the BGP instance in the context-active VRF.

```
switch# show bgp instance
BGP instance information for VRF purple
BGP Local AS: 64497, Router ID: 1.2.3.5
Total peers:      5
Configured peers: 3
    UnConfigured peers: 2
    Disabled peers: 0
    Established peers: 3
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged:no
    Outstanding EORs:0,Outstanding Keepalives: 0
    Convergence timeout: 00:10:00 switch#
```

- This command displays information about the BGP instance in the default VRF.

```
switch# show bgp instance vrf default
BGP instance information for VRF default
BGP Local AS: 64503, Router ID: 1.2.3.5
Total peers:      1
Configured peers: 1
    UnConfigured peers: 0
    Disabled peers: 0
    Established peers: 0
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
    BGP has converged:no
    Outstanding EORs:0,Outstanding Keepalives: 0
    Convergence timeout: 00:10:00 switch#
```

15.5.5.120 show bgp monitoring

The **show bgp monitoring** command displays information about the BGP Monitoring Protocol configuration on a switch.

Command Mode

EXEC

Command Syntax

```
show bgp monitoring summary
```

Examples

- Use the following command to display information about a BMP configuration on the switch:

```
switch# show bgp monitoring station
      BGP Monitoring status: enabled
      BMP Timestamp mode: send-time
      BMP Export policies: pre-policy, post-policy
      VRFs filtered: vrf1, vrf2

      Station - bmp_A
      Connection mode: active
      VRF: default
      Address: 192.0.2.1
      Port: 5000
      Connection: connected
      State: up
      Uptime: 00:09:17
      Station flap count: 0
```

- Add the **summary** parameter to display a summary of all station names, status, and duration of activity:

```
switch# show bgp monitoring summary
      BGP Monitoring status: enabled

      Station Name      Status      Uptime
      -----  -----
      bmp_A            connecting   -
      bmp_B            idle        -
      bmp_C            up          00:11:46
```

15.5.5.121 show bgp monitoring active

The **show bgp monitoring active** command displays information about stations in Active Mode and receiving TCP connection requests from a BGP router.

Command Mode

EXEC

Command Syntax

```
show bgp monitoring active [summary | [station station_name]]
```

Parameters

- **summary** - Display a summary of all BMP monitoring stations with Active mode connections.
- **station *station_name*** - Display information about a specific BMP monitoring station.

Example

To display a summary of all BMP monitoring stations with Active mode connections, use the following command:

```
switch# show bgp monitoring active
Active Station - bmp_C
  VRF: default
  Address: 172.24.64.68
  Port: 5000
  Retry interval: 30s
  Connection: connected
  Attempts: 4484
  Successes: 1
  Errors: 5
```

15.5.5.122 show bgp neighbors history

The **show bgp neighbors history** command stores and displays a list of failed BGP connection attempts for each peer. This may be particularly useful while troubleshooting flappy connections. If enabling dynamic peering, the failure history records even after the peers are no longer present.

Command Mode

EXEC

Command Syntax

```
show bgp neighbors [PEER | PREFIX | peer-group PEER_GROUP] history [connect-failures | socket []]
[vrf VRF]
```

Parameters

- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group PEER_GROUP** A peer group name.
- **connect-failures** Optional and does not affect the result.
- **socket** - TCP socket statistics.y
- **vrf VRF** A VRF name. If it is not supplied, the command acts upon the VRF default.

Guidelines

Relevant error messages are recorded by default, without any configuration. To clear all messages for a peer or group of peers, though, use the command **clear bgp history**. The following output provides the syntax for this command:

```
switch# clear bgp [PEER|PREFIX|peer-group PEER_GROUP] history [connect-failures][vrf VRF]
```

If no peer, prefix, or peer-group is supplied, this command clears the history for all peers in the specified VRF.

- The number of recorded messages is limited to eight per peer.
- Only errors that occur prior to session establishment get recorded.
- The **show bgp neighbors history** becomes available only with the multi-agent protocol model.

Related Command

[clear bgp history](#)

Example

For each peer, the address prints at the first line, along with the assigned VRF. Then, a table prints with the following columns:

- **Type** - The peer connection type. May be Static or Dynamic.
- **AS** - The remote Autonomous System number.
- **Time** - The time of the failure, using the local timezone.
- **Event** - A description related to the cause of the failed BGP connection.

```
switch> show bgp neighbors history
1.1.1.2 VRF default
Type      AS        Time                Event
Static    65538    Mon 2019-05-13 04:16:24  Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:31  Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:39  Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:47  Connect (No route to host)
Static    65538    Mon 2019-05-13 04:16:55  Connect (No route to host)
Static    65538    Mon 2019-05-13 04:17:03  Connect (No route to host)
```

```
Static      65538    Mon 2019-05-13 04:18:17  bad AS number
Static      65538    Mon 2019-05-13 04:19:40  bad AS number
```

15.5.5.123 show bgp monitoring station

The **show bgp monitoring station** command displays details about a specific BMP monitoring station.

Command Mode

EXEC

Command Syntax

```
show bgp monitoring station station_name detail
```

Parameters

- ***station_name*** - Specify the name of a BMP monitoring station.
- **detail** - Display TCP connection statistics for a BMP monitoring station.

Examples

- Use the following command to display information about the BMP monitoring station, *bmp_C*:

```
switch# show bgp monitoring station bmp_C
BGP Monitoring status: enabled
Station - bmp_C
    Connection mode: active
    VRF: default
    Address: 192.0.2.1
    Port: 5000
    Connection: connected
    State: up
    Uptime: 00:05:56
    Station flap count: 1
```

- Use the following command to display TCP connection statistics for the BMP monitoring station, *bmp_C*:

```
switch# show bgp monitoring station bmp_C detail
Station - bmp_C
    Connection mode: active
    VRF: default
    Address: 192.0.2.1
    Port: 5000
    Connection: connected
    State: up
    Uptime: 00:13:06
    Station flap count: 1
    TCP Socket Information:
        TCP state is ESTABLISHED
        Send-Q: 0/200
        Outgoing Maximum Segment Size (MSS): 1448
        Total Number of TCP retransmissions: 0
    Options:
        Timestamps enabled: yes
        Selective Acknowledgments enabled: yes
        Window Scale enabled: yes
        Explicit Congestion Notification (ECN) enabled: no
    Socket Statistics:
        Window Scale (wscale): 9,9
        Retransmission Timeout (rto): 204.0ms
        Round-trip Time (rtt/rtvar): 0.1ms/0.1ms
        Delayed Ack Timeout (ato): 0.0ms
        Congestion Window (cwnd): 10
        TCP Throughput: 864.48 Mbps
        Advertised Recv Window (rcv_space): 29200
```

15.5.5.124 show bgp summary passive

The **show bgp monitoring passive** command displays information about BMP monitoring stations with Passive mode connections.

Command Mode

EXEC

Command Syntax

```
show bgp monitoring active [summary | vrf vrf_name]
```

Parameter

vrf *vrf_name* - Display information about a specific VRF.

Example

To display a summary of all BMP monitoring stations with passive mode connections, use the following command:

```
switch# show bgp monitoring passive
IPv4 Passive Listener VRF - default
  Port 5000
  Status: Listening
  Stations:
    bmp_A: (198.51.100.100)
    bmp_B: (192.0.2.5)
  Accepted: 2
  Rejected: 5
IPv6 Passive Listener VRF - default
  Port 5000
  Status: Disabled
  Reason:
  Stations:
    bmp_A: (2001:DB8::800:1)
    bmp_B: (2001:DB8::900:2)
  Accepted: 4
  Rejected: 0
```

15.5.5.125 show bgp update-group

The **show bgp update-group** command displays how peers are grouped into update groups and can be used to verify that peers with different RCF functions with identical contents are grouped together.

Command Mode

EXEC

Command Syntax

```
show bgp update-group
```

Examples

This command displays information about how BGP peers are grouped into update groups.

```
switch# show bgp update-group  
switch#
```

15.5.5.126 show flow-spec

The **show flow-spec** command displays an overall status of how many flowspec rules were received and how many were installed.

Command Mode

EXEC

Command Syntax

```
show flow-spec (ipv4 | ipv6) [summary][vrf VRFNAME]
```

Parameters

- ipv4** Displays information related to IPv4.
- ipv6** Displays information related to IPv6.
- summary** Displays summary of flow-spec rule.
- vrf VRFNAME** Displays flow-spec information in the named VRF.

Related Command

[show bgp flow-spec](#)

Examples

- The **show flow-spec ipv4 summary** command displays an overall status of how many flowspec rules were received and how many were installed:

```
switch(config)# show flow-spec ipv4 summary
Flow specification rules summary for VRF default
  Total number of rules: 2
  Number of installed rules: 2
```

- The **show flow-spec ipv4** displays the installation status of the rule, and a counter of how many hits it has accumulated. This command also compiles the received flowspec rules into rules that can be programmed into the TCAM. For example, logical expressions on values such as the destination port are converted to ranges, as shown below:

```
switch(config)# show flow-spec ipv4
Flow specification rules for VRF default
Applied on: Ethernet47/1
  Flow-spec rule: 10.2.3.0/24;*;
    Rule identifier: 3882065752
    Matches:
      Destination prefix: 10.2.3.0/24
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
        Route via LDP tunnel index 4, MPLS label 100123
        Route via LDP tunnel index 1, MPLS label 116507
    Status:
      Installed: yes
      Counter: 312 packets
  Flow-spec rule: 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
    Rule identifier: 3882090640
    Matches:
      Destination prefix: 10.2.4.0/24
      Source prefix: 10.2.0.0/16
      Next protocol: 17
      6
      Destination port: 1011-1023
    Actions:
      Police: 80 Mbps (10 MBps)
      Redirect: VRF customer1
        Route via LDP tunnel index 4, MPLS label 100123
        Route via LDP tunnel index 1, MPLS label 116507
```

```
Status:  
Installed: yes  
Counter: 0 packets
```

15.5.5.127 show ip as-path access-list

The **show ip as-path access-list** command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

Command Mode

EXEC

Command Syntax

```
show ip as-path access-list [list_name]
```

Parameter

list_name the name of an AS path access list.

Example

This command displays the contents of the AS path access list named *list1*.

```
switch# show ip as-path access-list list1
ip as-path access-list list1 deny _3$
ip as-path access-list list1 permit .*
switch#
```

15.5.5.128 show ip bgp

The `show ip bgp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for the specified IPv4 addresses.

Command Mode

EXEC

Command Syntax

```
show ip bgp [FILTER][VRF_INSTANCE]
```

Parameters

- **FILTER** routing-table entries to display. Options include:
 - **no parameter** displays all routing-table entries in tabular format.
 - **detail** displays all routing-table entries in data-block format.
 - **ipv4_addr** displays IPv4 host address in data-block format.
 - **PREFIX** displays the route information of the specified IPv4 prefix in data block format. Options include:
 - **detail ipv4_prefix** displays the detailed route information of specified IPv4 prefix in data block format.
 - **longer-prefixes ipv4_prefix** displays the route information of IPv4 prefix in tabular block format.
 - **longer-prefixes detail ipv4_prefix** displays the detailed route information of specified IPv4 prefix in data block format.
 - **community-list cmnty_list_name** displays BGP routes filtered by the specified community list.
 - **installed** displays the information of installed BGP routes.
 - **labeled-unicast** displays the information of labeled-unicast BGP routes only.
 - **not-installed** displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Guidelines

You must provide the IPv4 prefix in CIDR notation.

Examples

- This command displays the BGP routing table with prefix “L” flag for all BGP LU route entries.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop       Metric     LocPref     Weight     Path
* > L    2.0.0.1/32      1.1.1.2        0        100         0      300 i
```

```
* # 2.0.0.1/32 1.0.0.2 0 100 0 200 ?
* > L 2.0.0.2/32 1.1.1.2 0 100 0 300 i
* # 2.0.0.2/32 1.0.0.2 0 100 0 200 ?
* > L 2.0.0.3/32 1.1.1.2 0 100 0 300 i
* # 2.0.0.3/32 1.0.0.2 0 100 0 200 ?
* > L 2.0.0.4/32 1.1.1.2 0 100 0 300 i
* # 2.0.0.4/32 1.0.0.2 0 100 0 200 ?
* > L 2.0.0.5/32 1.1.1.2 0 100 0 300 i
* # 2.0.0.5/32 1.0.0.2 0 100 0 200 ?
```

- This command displays the routing-table information of unicast routes for a default VRF.

```
switch# show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
BGP routing table entry for 2.0.0.1/32
  Paths: 2 available
    300
      1.1.1.2 labels [ 101 102 103 104 ] from 1.1.1.2 (1.1.1.2)
        Origin IGP, metric 0, localpref 100, weight 0, valid, external, best
        Rx path id: 0x0
    200
      1.0.0.2 from 1.0.0.2 (0.0.1.1)
        Origin INCOMPLETE, metric 0, localpref 100, weight 0, valid, external,
        not installed (labeled-route present)
```

- This command displays the BGP routing-table entry for the **10.100.1.0/24** network.

```
switch# show ip bgp 10.100.1.0/24
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
  Paths: 1 available
    64496 64497 65536
      10.1.0.100 from 10.1.0.100 (10.0.0.100)
        Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received
        01:57:33 ago, valid, external, best
        Community: 655:23590 64496:1000
        Rx SAIFI: Unicast
```

- This command displays the label stack associated with the route for a default VRF.

```
switch# show ip bgp detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
BGP routing table entry for 2.0.0.1/32
  Paths: 2 available
    200
      1.0.0.2 from 1.0.0.2 (0.0.1.1)
        Origin INCOMPLETE, metric 0, localpref 100, weight 0, valid, external, best
    300
      1.1.1.2 labels [ 101 102 103 104 ] from 1.1.1.2 (1.1.1.2)
        Origin IGP, metric 0, localpref 100, weight 0, valid, external
        Rx path id: 0x0
        Rx SAIFI: Labels
        Tunnel RIB eligible
```

- This command displays the BGP routing-table entry for the **10.105.1.1/24** network, including the reason why the route was discarded by the best-path algorithm. The reason for discarding a route is preceded by the label “**Not best:**”.

```
switch# show ip bgp 10.105.1.1/24 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status: [a.b.c.d] - Route is queued for advertisement to peer.

```

15.5.5.129 show ip bgp community

The **show ip bgp community** command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

Command Mode

EXEC

Command Syntax

```
show ip bgp community COMM_1 [COMM_2... COMM_n][MATCH_TYPE][DATA_OPTION]  
[VRF_INSTANCE]
```

Parameters

- **COMM_x** community number or name, as specified in the route map that sets the community list number.
 - **GSHUT** well-known graceful shutdown community.
 - **aa:nn** AS and network number, separated by colon. Each value ranges from **1** to **4294967295**.
 - **comm_num** community number. Values range from **1** to **4294967040**.
 - **internet** advertises route to Internet community.
 - **local-as** advertises route only to local peers.
 - **no-advertise** does not advertise the route to any peer.
 - **no-export** advertises route only within BGP AS boundary.
- **MATCH_TYPE** routes are filtered based on their communities. Options include:
 - **no parameter** routes must match at least one community in the list.
 - **exact** route must match all communities and include no other communities.
 - **regex** display routes matching the regular expression of communities.
- **DATA_OPTION** type of information the command displays. Options include:
 - **no parameter** displays table of the routing entry line items.
 - **detail** displays data block for each routing table entry.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Guidelines

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.

Example

This command displays the BGP routing table entries with the community **64496:1000**.

```
switch# show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
  Paths: 1 available
        64496 64497 65536
          10.1.0.100 from 10.1.0.100 (10.0.0.100)
            Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 00:03:16 ago, valid,
            external, best
              Community: 655:23590 64496:1000
```

```
Rx SAFI: Unicast switch#
```

15.5.5.130 show ip bgp installed

The **show ip bgp installed** command displays the list of installed routes in the RIB.

Command Mode

EXEC

Command Syntax

```
show ip bgp installed
```

Example

This command displays the list of installed routes in the RIB.

```
switch# show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
      S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop          Metric LocPref Weight Path
* >   6.0.0.0/24        1.0.0.1          0       100      0      ?
switch#
```

15.5.5.131 show ip bgp neighbors (route type)

The `show ip bgp neighbors (route type)` command displays information for next-hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected **FILTER** parameter:

- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
```

```
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

Related Commands

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

Parameters

- ***neighbor_addr*** location of the neighbor.
- **ROUTE_TYPE** filters route on route type. Options include:
 - **ipv4 unicast** displays IPv4 unicast routes.
 - **ipv6 unicast** displays IPv6 unicast route.
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Values include:
 - **no parameter** displays all routing table entries in tabular format.
 - **detail** displays all routing table entries in data-block format.
 - **ipv4_addr** displays IPv4 host address in data-block format.
 - **ipv4_prefix** displays the route information of specified IPv4 prefix in data-block format. Option includes:
 - **longer-prefixes** displays the route information of IPv4 prefix in data-block format.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command displays information for routes advertised to the neighbor at **10.3.0.103**.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop     Metric LocPref Weight  Path
* > 10.1.0.0/24    10.3.0.102      -    100    -      i
* > 10.2.0.0/24    10.3.0.102      -    100    -      i
* > 10.3.0.0/24    10.3.0.102      -    100    -      i
* > 10.100.0.0/24  10.1.0.100     200   100    -      64496 i
* > 10.100.1.0/24  10.1.0.100     -    100    -      64496 64497 65536 i
* > 10.100.2.0/24  10.1.0.100     42    100    -      64496 ?
* > 10.101.0.0/24  10.2.0.101     -    100    -      64510 i
* > 10.101.1.0/24  10.2.0.101     -    100    -      64510 i
* > 10.101.2.0/24  10.2.0.101     -    100    -      64510 i
```

15.5.5.132 show ip bgp neighbors (route-type) community

The `show ip bgp neighbors (route type) community` command displays information for next-hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and subnets.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors addr RTE community CM_1 [CM_2...CM_n][MATCH][INFO][VRF_INST]
```

Related Commands

- [show ip bgp neighbors](#)
- [show ip bgp neighbors \(route type\)](#)

Parameters

- **addr** location of the neighbor.
- **RTE** type of route that the command displays. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **CM_x** community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
 - **GSHUT** well-known graceful shutdown community.
 - **aa:nn** AS and network number, separated by colon. Each value ranges from **1** to **4294967295**.
 - **comm_num** community number. Values range from **1** to **4294967040**.
 - **internet** advertises route to Internet community.
 - **local-as** advertises route only to local peers.
 - **no-advertise** does not advertise route to any peer.
 - **no-export** advertises route only within BGP AS boundary.
- **MATCH** routes are filtered based on their communities.
 - **no parameter** routes must match at least one community in the list.
 - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Values include:
 - **no parameter** displays table of routing entry line items.
 - **detail** displays data block for each routing table entry.
- **VRF_INST** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command lists the routes advertised to the neighbor at **10.3.0.103** with community **655:23590**.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop        Metric LocPref Weight  Path
* >   10.100.1.0/24    10.1.0.100      -       100      -      64496 64497 65536 i
```

15.5.5.133 show ip bgp neighbors regexp

The `show ip bgp neighbors regexp` command displays information for next-hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors addr RTE regexp as_paths [VRF_INST]
```

Related Commands

- [show ip bgp neighbors](#)
- [show ip bgp neighbors \(route type\)](#)

Parameters

- ***addr*** location of the neighbor.
- **RTE** type of route that the command displays. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **VRF_INST** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command lists the routes advertised to the neighbor at **10.3.0.103** where the AS path is **64496**.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$  
BGP routing table information for VRF default  
Router identifier 10.0.0.102, local AS number 64500  
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -  
ECMP  
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast  
% - Pending BGP convergence  
Origin codes: i - IGP, e - EGP, ? - incomplete  
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop  
  
* > Network Next Hop Metric LocPref Weight Path  
* > 10.100.0.0/24 10.1.0.100 200 100 - 64496 i  
* > 10.100.2.0/24 10.1.0.100 42 100 - 64496 ?
```

15.5.5.134 show ip bgp neighbors

The **show ip bgp neighbors** command displays Border Gateway Protocol (BGP) and TCP-session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not specified.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

Parameters

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
 - **no parameter** command displays information for all IPv4 BGP neighbors.
 - **ipv4_addr** command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for the default VRF.

Related Commands

- [show ip bgp neighbors \(route type\)](#)
- [show ip bgp neighbors \(route-type\) community](#)

Examples

- This command displays information of the neighbor at **10.1.0.100**.

```
switch# show ip bgp neighbors 10.1.0.100
BGP neighbor is 10.1.0.100, remote AS 64496, external link
  BGP version 4, remote router ID 10.0.0.100, VRF default
  Inherits configuration from and member of peer-group EXTERNAL
  Negotiated BGP version 4
  Member of update group 3
  Last read 00:00:17, last write 00:00:18
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 00:05:17
  Number of transitions to established: 1
  Last state was OpenConfirm
  Last event was RecvKeepAlive
  Neighbor Capabilities:
    Multiprotocol IPv4 Unicast: advertised and received and negotiated
    Four Octet ASN: advertised and received and negotiated

```

15.5.5.135 show ip bgp not-installed

The **show ip bgp not-installed** command displays the list of non-installed routes in the RIB.

Command Mode

EXEC

Command Syntax

show ip bgp not-installed

Example

This command displays the list of non-installed routes in the RIB.

```
switch# show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
      S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop          Metric LocPref Weight Path
* #    7.0.0.0/24      1.0.0.1          0       100     0      ?
switch#
```

15.5.5.136 show ip bgp paths

The **show ip bgp paths** command displays all BGP AS paths in the database.

Command Mode

EXEC

Command Syntax

show ip bgp paths [VRF_INSTANCE]

Parameters

VRF_INSTANCE specifies VRF instances.

- **no parameter** displays routing table for context-active VRF.
- **vrf vrf_name** displays routing table for the specified VRF.
- **vrf all** displays routing table for all VRFs.
- **vrf default** displays routing table for default VRF.

Display Values

- **Refcnt**: number of routes using a listed path.
- **Metric**: the path's Multi Exit Discriminator (MED).
- **Path**: the route's AS path and its origin code.

Example

This command displays all BGP AS paths in the switch's database.

```
switch# show ip bgp paths
Refcnt Metric      Path
 6      0          64510 64505 64506 64507 i (HashID 9)
 6      0          64510 ? (HashID 8)
12      0          65530 65531 65532 e (HashID 5)
12      0          i (HashID 6)
 6      0          64100 64200 i (HashID 4)
28      0          i (HashID 1)
 7      0          ? (HashID 2)
40      0          64510 i (HashID 10)
19      0          64510 i (HashID 7)
 2      0          i (HashID 3)
```

15.5.5.137 show ip bgp peer-group

The `show ip bgp peer-group` command displays the BGP version, address family, and group members for all BGP peer groups defined on the switch.

Command Mode

EXEC

Command Syntax

```
show ip bgp peer-group [GROUP][VRF_INSTANCE]
```

Parameters

- **GROUP** peer group for which command displays information. Options include:
 - **no parameter** command displays information for all peer groups.
 - **group_name** name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command displays BGP peer group information for all peer groups on the switch.

```
switch# show ip bgp peer-group
BGP peer-group is EXTERNAL
  BGP version 4
  Static peer-group members:
    VRF default:
      10.1.0.100, state: Connect
        Negotiated MP Capabilities:
          IPv4 Unicast: No
          IPv6 Unicast: No
          IPv4 SR-TE: No
          IPv6 SR-TE: No
      10.2.0.101, state: Connect
        Negotiated MP Capabilities:
          IPv4 Unicast: No
          IPv6 Unicast: No
          IPv4 SR-TE: No
          IPv6 SR-TE: No
BGP peer-group is INTERNAL
  BGP version 4
  Listen-range subnets:
    VRF default:
      10.3.0.0/24, remote AS 64500
  Dynamic peer-group members:
    VRF default:
```

15.5.5.138 show ip bgp regexp

The `show ip bgp regexp` command displays Border Gateway Protocol (BGP) IPv4 routing-table entries that match the AS path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

```
show ip bgp regexp as_paths [VRF_INSTANCE]
```

Parameters

- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.

Note: The AS delimiter (_) regular expression is not supported when BGP routes are filtered by community lists and the command output does not display BGP route information.

- **VRF_INSTANCE** specifies the VRF instance of the BGP routing table to be displayed. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is **64510**.

```
switch# show ip bgp regex ^64510$  
BGP routing table information for VRF default  
Router identifier 10.0.0.102, local AS number 64500  
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -  
ECMP  
          S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast  
          % - Pending BGP convergence  
Origin codes: i - IGP, e - EGP, ? - incomplete  
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop  
  
      Network          Next Hop          Metric LocPref Weight Path  
*    10.2.0.0/24      10.2.0.101      0      100      0      64510 i  
* >  10.101.0.0/24   10.2.0.101      0      100      0      64510 i  
* >  10.101.1.0/24   10.2.0.101      0      100      0      64510 i  
* >  10.101.2.0/24   10.2.0.101      0      100      0      64510 i
```

15.5.5.139 show ip bgp summary

The **show ip bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is “IP” and SAFI is “unicast” information.

Command Mode

EXEC

Command Syntax

```
show ip bgp summary [VRF_INSTANCE]
```

Parameters

- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Display Values

Header Row

- **BGP router identifier**: the router identifier loopback address or highest IP address.
- **Local AS Number**: AS number assigned to the switch.

Neighbor Table Columns

- **(First) Neighbor**: neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor's AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been **Established**, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays **PfxRcd**, and the connection becomes **Idle**. Maximum number of routes is set using the [maximum paths \(BGP\)](#) command.

Related Command

[show ipv6 bgp summary](#)

Example

This command displays the status of the switch's BGP connections.

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS        MsgRcvd    MsgSent   InQ  OutQ  Up/Down State     PfxRcd PfxAcc
  10.1.0.100    4  64496      1075      1083      0      0 00:04:04 Connect
  10.2.0.101    4  64510      1079      1088      0      0 00:04:14 Connect
```

15.5.5.140 show ip community-list

The `show ip community-list` command displays the BGP community lists configured on the switch.

Command Mode

EXEC

Command Syntax

```
show ip community-list [COMMUNITY_LIST]
```

Parameters

COMMUNITY_LIST community list for which command displays information. Options include:

- **no parameter** command displays information for all community lists.
- **/listname** name of the community list (text string).

Example

This command displays the BGP paths in the switch's database.

```
switch# show ip community-list hs-comm-list
ip community-list hs-comm-list permit 0:10
```

15.5.5.141 show ip extcommunity-list

The **show ip extcommunity-list** command displays the BGP extended community lists configured on the switch.

Command Mode

EXEC

Command Syntax

```
show ip extcommunity-list [COMMUNITY_LIST]
```

Parameters

COMMUNITY_LIST extended community list for which command displays information. Options include:

- **no parameter** command displays information for all extended community lists.
- **listname** command displays information for the specified extended community list.

Example

This command displays information for all extended extcommunity lists on the switch.

```
switch# show ip extcommunity-list
ip extcommunity-list hs-extcomm-list permit rt 3050:20
ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list hs-extcomm-list permit rt 3050:70000
```

15.5.5.142 show ipv6 bgp

The `show ipv6 bgp` command displays IPv6 Border Gateway Protocol (BGP) routing-table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for specified IPv6 addresses.

Command Mode

EXEC

Command Syntax

`show ipv6 bgp [FILTER][VRF_INSTANCE]`

Parameters

- **FILTER** routing table entries that the command displays. Options include:
 - **no parameter** displays all routing-table entries in tabular format.
 - **detail** displays all routing-table entries in data-block format.
 - **ipv6_addr** displays IPv6 host address in data-block format.
 - **ipv6_prefix** displays the route information of specified IPv6 prefix address in data-block format. Options include:
 - **detail** displays the detailed route information of specified IPv6 prefix address in data-block format.
 - **longer-prefixes** displays the route information of IPv6 prefix in data-block format.
 - **longer-prefixes detail** displays detailed route information of specified IPv6 prefix in data-block format.
 - **community-list *cmnty_list_name*** displays BGP routes filtered by the specified community list.
 - **installed** displays the information of installed BGP routes.
 - **labeled-unicast** displays the information of labeled-unicast BGP routes only.
 - **not-installed** displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf *vrf_name*** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Guidelines

You must provide the IPv6 prefix in CIDR notation.

Related Command

[show ip bgp](#)

Example

This command displays the route information of **2001:10:1:0::102/64** in data-block format.

```
switch# show ipv6 bgp 2001:10:1:0::102/64
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:1::/64
  Paths: 2 available
    Local
      - from - (10.0.0.102)
```

```
Origin IGP, metric 1, localpref 0, IGP metric -, weight -, received 00:16:27 ago, valid,
local, best,
redistributed (Connected)
    Rx SAFI: Unicast
64496
2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
Origin INCOMPLETE, metric 42, localpref 100, IGP metric 1, weight 0, received 00:10:09 ago,
valid,
external
    Rx SAFI: Unicast
```

15.5.5.143 show ipv6 bgp match community

The `show ipv6 bgp match community` command displays IPv6 Border Gateway Protocol (BGP) routing-table entries, filtered by community.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp match community [COMM_1 ... COMM_n][MATCH_TYPE][INFO][VRF_INSTANCE]
```

Parameters

- **COMM_x** community number or name, as specified in the route map that sets the community-list number. Options include:
 - **aa:nn** AS and network number, separated by colon. Each value ranges from 1 to **4294967295**.
 - **comm_num** community number. Values range from 1 to **4294967040**.
 - **internet** advertises route to Internet community.
 - **local-as** advertises route only to local peers.
 - **no-advertise** does not advertise route to any peer.
 - **no-export** advertises route only within BGP AS boundary.
- **MATCH_TYPE** routes are filtered based on their communities. Options include:
 - **no parameter** routes must match at least one community in the list.
 - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Options include:
 - **no parameter** displays table of the routing entry-line items.
 - **detail** displays data block for each routing-table entry.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing-table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Example

This command displays information in data-block format for each routing-table entry with community **655:23590**.

```
switch(config)# show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
Paths: 1 available
 64496 64497 65536
    2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
      Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0, received 01:09:29 ago, valid,
      external, best
      Community: 655:23590 64496:1000
      Rx SAIFI: Unicast
switch(config)#

```

15.5.5.144 show ipv6 bgp peers

The **show ipv6 bgp peers** command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp peers [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

Parameters

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
 - **no parameter** command displays information for all neighbors.
 - **ipv6_addr** command displays information for the specified neighbor.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for the context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for the default VRF.

Related Command

```

15.5.5.145 show ipv6 bgp peers (route type)

The `show ipv6 bgp peers (route type)` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The [show ipv6 bgp peers \(route type\) community](#) command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the `show ipv6 bgp peers` command.

The output format depends on the selected **FILTER** parameter:

- **data-block format** displays comprehensive information for each specified route.
- **tabular format** displays routing table entries in tabular format for the specified IP addresses.

Output produced by the **longer-prefixes** option includes the specified route and all more specific routes.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp peers neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
```

```
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

Parameters

- **neighbor_addr** location of the neighbor.
- **ROUTE_TYPE** filters route on route type. Options include:
 - **ipv4 unicast** displays IPv4 unicast routes.
 - **ipv6 unicast** displays IPv6 unicast routes.
- **HOPDIRECT** filters route on the basis of direction from neighbor. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **FILTER** routing table entries that the command displays. Options include:
 - **no parameter** displays all routing table entries in tabular format.
 - **detail** displays all routing table entries in data-block format.
 - **ipv6_addr** displays the IPv6 host address in data-block format.
 - **ipv6_prefix** displays the route information of specified IPv6 prefix in data-block format.
Additional option:
 - **longer-prefixes** displays the route information of IPv4 prefix in data-block format.
- **VRF_INSTANCE** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Related Commands

[show ipv6 bgp peers \(route type\) community](#)

Example

This command displays information of all routes advertised to the neighbor at **2001:10:1:0::100**.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop       Metric LocPref Weight  Path
* > 2001:10:1::/64  2001:10:1::102  -      -      -      64500 i

switch#
```

15.5.5.146 show ipv6 bgp peers (route type) community

The `show ipv6 bgp peers (route type) community` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The `show ipv6 bgp peers (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp peers addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO] [VRF_INST]
```

Parameters

- **addr** neighbor location (IPv6 address).
- **RTE** type of route that the command displays. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **CM_x** community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
 - **GSHUT** well-known graceful shutdown community.
 - **aa:nn** AS and network number, separated by colon. Each value ranges from **1** to **4294967295**.
 - **comm_num** community number. Values range from **1** to **4294967040**.
 - **internet** advertises route to Internet community.
 - **local-as** advertises route only to local peers.
 - **no-advertise** does not advertise route to any peer.
 - **no-export** advertises route only within BGP AS boundary.
- **MATCH** routes are filtered based on their communities. Options include:
 - **no parameter** routes must match at least one community in the list.
 - **exact** route must match all communities and include no other communities.
- **INFO** type of information the command displays. Values include:
 - **no parameter** displays table of the routing entry line items.
 - **detail** displays data block for each routing table entry.
- **VRF_INST** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Related Command

[show ipv6 bgp peers](#)

Example

This command lists the routes advertised to the neighbor at **2001:10:1:0::102** with the community **64496:1000**.

```
switch# show ipv6 bgp peers 2001:10:1:0::102 advertised-routes community 64496:1000
BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Network          Next Hop           Metric LocPref Weight Path
* > 2001:10:100:1::/64 2001:10:1::100      -      -      -      64496 64497 65536 i
switch#
```

15.5.5.147 show ipv6 bgp peers regexp

The **show ipv6 bgp peers regexp** command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS-path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp peers addr ROUTE regexp as_paths [VRF_INST]
```

Parameters

- **addr** neighbor location (IPv6 address).
- **ROUTE** type of route that the command displays. Options include:
 - **advertised-routes** displays routes advertised to the specified neighbor.
 - **received-routes** displays routes received from the specified neighbor (accepted and rejected).
 - **routes** displays routes received and accepted from specified neighbor.
- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **VRF_INST** specifies VRF instances. Options include:
 - **no parameter** displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Related Commands

- [show ip bgp regexp](#)
- [show ipv6 bgp peers](#)

Example

This command displays information for routes received from the neighbor at **2001:10:1:0::100** which include AS number **64496** in their AS paths.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e -
ECMP
          S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
                  Network          Next Hop          Metric LocPref Weight Path
*        2001:10:1::/64    2001:10:1::100      42      -      - 64496 ?
* >    2001:10:100::/64   2001:10:1::100     200      -      - 64496 i
* >    2001:10:100:1::/64 2001:10:1::100      -      -      - 64496 64497 65536 i
* >    2001:10:100:2::/64 2001:10:1::100     42      -      - 64496 ?
switch#
```

15.5.5.148 show ipv6 bgp regexp

The **show ipv6 bgp regexp** command displays Border Gateway Protocol (BGP) IPv6 routing-table entries that match the AS-path attributes specified in the given regular expression.

Command Mode

EXEC

Command Syntax

```
show ipv6 bgp regexp as_paths [VRF_INSTANCE]
```

Parameters

- **as_paths** list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- **VRF_INSTANCE** specifies the VRF instance of the BGP routing table to be displayed. Options include:
 - **no** parameter displays routing table for context-active VRF.
 - **vrf vrf_name** displays routing table for the specified VRF.
 - **vrf all** displays routing table for all VRFs.
 - **vrf default** displays routing table for default VRF.

Related Command

[show ip bgp regexp](#)

Example

This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS **64496**.

```
switch# show ipv6 bgp regex _64496_
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
                  S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
                  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop        Metric  LocPref Weight  Path
*    2001:10:1::/64  2001:10:1::100   42      100      0    64496  ?
* >  2001:10:100::/64 2001:10:1::100  200      100      0    64496  i
* >  2001:10:100:1::/64 2001:10:1::100   0      100      0    64496  64497  65536  i
* >  2001:10:100:2::/64 2001:10:1::100   42      100      0    64496  ?
switch#
```

15.5.5.149 show ipv6 bgp summary

The **show ipv6 bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI) negotiations where AFI is “IPv6” and SAFI is “Unicast” information.

Command Mode

EXEC

Command Syntax

show ipv6 bgp summary [VRF_INSTANCE]

Parameters

VRF_INSTANCE specifies VRF instances. Options include:

- **no parameter** displays routing table for context-active VRF.
- **vrf vrf_name** displays routing table for the specified VRF.
- **vrf all** displays routing table for all VRFs.
- **vrf default** displays routing table for default VRF.

Display Values

Header Row

- **BGP router identifier**: the router identifier; loopback address or highest IP address.
- **Local AS number**: AS number assigned to switch.

Neighbor Table Columns

- **(First) Neighbor**: neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor's AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been **Established**, or its current status.
- **(Ninth) State**: state of the BGP session and the number of routes received from a neighbor.
- **(Tenth) PfxRcd**: the count of prefixes received by BGP per neighbor.
- **(Eleventh) PfxAcc**: the count of prefixes added to the BGP RIB among all received prefixes.

Related Command

[show ip bgp summary](#)

Example

This command displays the status of the switch's BGP connections.

```
switch# show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
      Neighbor      V   AS        MsgRcvd    MsgSent    InQ  OutQ  Up/Down  State      PfxRcd  PfxAcc
  2001:10:1::100    4  64496          37         36       0     0  00:29:33  Estab      4        4
  2001:10:2::101    4  64510          35         38       0     0  00:29:37  Estab      4        4
switch#
```

15.5.5.150 show peer-filter

The **show peer-filter** command displays the definition of a peer filter.

Command Mode

EXEC

Command Syntax

```
show peer-filter filter_name
```

Parameter

filter_name name of the peer-filter group.

Example

This command displays the peer-filter group information for **group3**.

```
switch# show peer-filter group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept switch#
```

15.5.5.151 show run|section bgp

When using the `show run` command, it displays the entire running configuration. Sometimes this is unnecessary, so to target your output you can use the `show run|section bgp` command which will display only the BGP section.

Command Mode

bgp-router

Command Syntax

```
show run | section bgp [name]
```

Parameter

name name of the peer-group.

Example

Once the peer group request are completed, then run the `show run|section bgp` command to display only the BGP section of the running configuration.

```
switch(config-router-bgp) # show run|section bgp router bgp 300
switch(config-router-bgp) # neighbor interface Et1-2,4-6 peer-group PG1 remote-as 100
switch(config-router-bgp) # neighbor interface Et3 peer-group PG2 remote-as 200
switch(config-router-bgp) # neighbor interface vlan2000-2002 peer-group PG1 remote-as 100
```

15.5.5.152 show tunnel rib brief

The **show tunnel rib brief** command displays the preferred tunnels for various IP endpoints, optionally filtered by endpoint. Each tunnel RIB entry in the output displays the type of the tunnel (such as BGP LU) and a numerical index uniquely identifying that tunnel within the type-specific tunnel table.

Command Mode

EXEC

Command Syntax

```
show bgp tunnel rib brief
```

Example

This command displays the tunnel type and the index value.

```
switch# show tunnel rib brief
Endpoint          Tunnel Type      Indexes
-----
10.1.1.0/32      BGP LU          2
11.1.1.0/32      BGP LU          1, 3
switch#
```

15.5.5.153 shutdown (BGP)

The **shutdown** command disables BGP on the switch without modifying the BGP configuration.

The **no shutdown** and **default shutdown** commands enable the BGP instance by removing the **shutdown** command from *running-config*.

Command Mode

Router-BGP Configuration

Command Syntax

```
shutdown  
no shutdown  
default shutdown
```

Examples

- These commands disable BGP on the switch.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# shutdown  
switch(config-router-bgp)#[/pre>
```

- These commands enable BGP on the switch.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# no shutdown  
switch(config-router-bgp)#[/pre>
```

15.5.5.154 shutdown

The **shutdown** command closes TCP sessions on BMP monitoring stations. For an active mode connection, stops initiating TCP connections to the BMP monitoring station. For a passive mode connection, the router stops accepting TCP connections from the BMP monitoring station.

Access this command in the Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

shutdown

Example

To shutdown BMP monitoring station, *bmp_E*, use the following commands:

```
switch(config) # router bgp 64512
switch(config-router-bgp) # monitoring bgp
switch(config-router-bgp) # monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E) # shutdown
```

15.5.5.155 timers bgp

The **timers bgp** command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The **neighbor timers** command configures the times on a specified peer connection.

- **Keepalive time:** period between the transmission of consecutive keepalive messages.
- **Hold time:** period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least **3** seconds and should be three times longer than the keepalive setting.

The **no timers bgp** and **default timers bgp** commands return the time settings to their default values by removing the **timers bgp** command from **running-config**. The default values are:

- **keepalive:** **60** seconds.
- **hold time:** **180** seconds.

Command Mode

Router-BGP Configuration

Command Syntax

```
timers bgp keep_alive hold_time
no timers bgp
default timers bgp
```

Parameters

- **keep_alive** keepalive period, in seconds. Values include:
 - **0** keepalive messages are not sent.
 - **1** to **3600** keepalive time (seconds).
- **hold_time** hold time. Values include:
 - **0** peering is not disabled by timeout expiry; keepalive packets are not sent.
 - **3** to **7200** hold time (seconds).

Example

This command sets the keepalive time to **30** seconds and the hold time to **90** seconds.

```
switch(config) # router bgp 9
switch(config-router-bgp) # timers bgp 30 90
switch(config-router-bgp) #
```

15.5.5.156 update-source

The **update-source** command specifies a local source interface for the BGP monitoring session. Access this command in Monitoring Station Configuration Mode.

Command Mode

Monitoring Station Configuration

Command Syntax

update-source *interface*

Parameter

interface - Specify a local interface to send the source IP address from the router for the TCP session.

Example

Use the following commands to specify the interface, *Eth1/1*, and use the source IP address:

```
switch(config)# router bgp 64512
switch(config-router-bgp)# monitoring bgp
switch(config-router-bgp)# monitoring station bmp_E
switch(config-router-bgp-monitoring-station-bmp_E)# update-source Eth1/1
```

15.5.5.157 update wait-for-convergence

The **update wait-for-convergence** command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB updates and route advertisement irrespective of the BGP convergence state.

Command Mode

Router-BGP Configuration

Command Syntax

```
update wait-for-convergence  
no update wait-for-convergence  
default update wait-for-convergence
```

Related Commands

- [clear ip bgp](#) removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- [bgp convergence slow-peer time](#) configures the BGP convergence idle peer timeout value.
- [bgp convergence time](#) configures the BGP convergence timeout value.
- [show bgp convergence](#) displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

Guidelines

The initiation of BGP instance includes the following scenarios:

- the BGP instance starts for the first time after a switch is reloaded.
- the BGP instance restarts.
- all sessions are cleared by using the **clear ip bgp *** command.

Configuration changes made by using this command are effective from the next initiation of a BGP instance.

Example

This command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

```
switch(config)# router bgp 9  
switch(config-router-bgp)# update wait-for-convergence  
switch(config-router-bgp) #
```

15.5.5.158 update wait-install

The `update wait-install` command causes BGP to defer the advertisement of routes until the routes have been programmed in hardware. This applies to new routes and does not affect routes that have already been advertised to peers.

15.5.5.159 vrf

The **vrf** command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

Command Mode

Router-BGP Configuration

Command Syntax

vrf *vrf_instance*

Parameter

vrf_instance VRF to be configured.

Example

These commands place the switch in BGP VRF configuration mode for VRF ***purple***.

```
switch(config)# router bgp 9
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)#{
```

15.6 Maintenance Mode

This section describes configuration for performing maintenance of switch elements.

This section contains these topics:

- [Overview](#)
- [Maintenance Mode Elements](#)
- [Maintenance Mode Features](#)
- [Maintenance Mode Configuration](#)
- [Maintenance Mode Commands](#)

15.6.1 Overview

Using maintenance mode, you can perform several maintenance activities, such as:

- EOS image upgrade.
- Initial configuration or reconfiguration of a production system.
- Replacement of hardware.
- Changing line cards or transceiver modules.
- Replace, reattach, and reroute cables.

Maintenance mode uses BGP to reroute traffic from the switch when performing maintenance tasks, minimizing traffic impact. Set the traffic thresholds and time limits at which the switch or parts of the switch are considered available for maintenance tasks.

You can activate maintenance mode on a switch at boot-up or during operation. The mode provides the following benefits:

- Rerouting of traffic when activating the mode during operation and other routes are present.
- Replace hardware in modular systems or redundant hardware systems.

The switch is placed into maintenance mode, serviced, and returned to normal operation.

15.6.2 Maintenance Mode Elements

Maintenance mode elements include [Units](#), [Groups of Interfaces and BGP Peers](#), and [Profiles](#). Arista Network switches perform maintenance mode operations on a fundamental, configurable element called a Unit. Maintenance mode will quiesce a unit, which places the unit into maintenance mode by gracefully transitioning traffic away from it.

For the most common maintenance mode operations, such as removing an entire switch system or individual switch components, including a single line card, interface, or BGP peer, from service, minimal configuration is required.

15.6.2.1 Units

Units are configurable maintenance mode elements that comprise a collection of various groups. In addition, units contain policies that decide whether the member groups should be put into maintenance mode automatically upon boot. Built-in units, such as the System unit representing the entire system, are configured by default. EOS executes all maintenance mode operations at the unit level.

You can directly place an interface, interface range, and BGP peer (or peer-group) under maintenance.

15.6.2.1.1 Built-in Units

There are various built-in units, such as **System** and **Linecard<n>**. Fixed systems contain only one built-in unit called **System**, which comprises the interface group containing all Ethernet interfaces, sub-interfaces and BGP groups per VRF containing all the peers in the respective VRF.

Modular Systems have both **System** and **Linecard<n>** units. **Linecard<n>** units are present for each line card, which comprises the **Linecard<n>** groups containing all Ethernet interfaces and sub-interfaces of that line card.

15.6.2.1.2 User-configured Units

You can also configure customized units containing user-defined groups and policies. The following example creates a custom group called **BG1** with a custom interface **IG1** and a unit profile **UP1**. The **show** command displays the details.

Example

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)# show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface
Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
Interface Groups:
IG1
```

15.6.2.2 Groups of Interfaces and BGP Peers

Maintenance mode group types include the groups for interfaces and BGP peers. Groups are identified by a group name unique to a particular group type.

By default, several built-in groups are available on the device, such as **linecard** groups containing physical interfaces.

15.6.2.2.1 Built-in Groups

Several built-in groups exist, such as **AllEthernetInterface**, **Linecard1**, **Linecard2**, etc., and **AllBgpNeighborVrf-vrf_name**.

AllEthernetInterface is the built-in interface group that contains all physical Ethernet interfaces and sub-interfaces on the switch and is part of the **System** unit. **Linecard1**, **Linecard2**, etc., are the built-in groups containing respective line card interfaces and sub-interfaces, and are part of the **Linecard1** and **Linecard2** units, respectively.

AllBgpNeighborVrf-vrf_name is the built-in BGP group that contains all the BGP peers in that particular VRF.

15.6.2.2.2 User-defined Groups

The following series of commands creates a custom group (**IG1**) of interfaces, which includes physical ports, port-channels, and SVIs.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet1
switch(config-group-if-IG1)# interface Port-Channel11,20
switch(config-group-if-IG1)# interface Vlan1-20
switch(config-group-if-IG1)# exit
switch(config) #
```

Note: User-defined interface groups do not contain sub-interfaces.

The following series of commands creates a custom group (**BG1**) of BGP peers.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 10.0.0.1
switch(config-group-bgp-BG1)# neighbor BGP_PG1
switch(config-group-bgp-BG1)# vrf vrf1
switch(config-group-bgp-BG1)# exit
switch(config) #
```

Note: BGP groups are specific to VRF.

15.6.2.3 Profiles

Profiles are configurable maintenance mode elements that define policies for related software or hardware components to carry out maintenance mode operations.

15.6.2.3.1 Default Profiles

Default profiles are the built-in policies that are applied to groups interface/BGP and unit.

The system uses the default profile in the absence of an explicit interface/BGP profile associated with the group or explicit unit profile associated with the unit.

BGP Profile

The default BGP profile has route-map with Set clauses set community GSHUT additive and set local-preference 0.

```
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: Default
Initiator route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
description System generated initiator route-map
```

```
Match clauses:  
SubRouteMap:  
Set clauses:  
set local-preference 0  
set community GSHUT additive
```

Interface Profile

Default interface profile has rate-monitoring load-interval set to **60** seconds, threshold set to **100 kbps**, and shutdown disabled as shown. The max-delay parameter is set to **300** seconds but is not enabled.

```
switch(config-maintenance)# show maintenance profile interface default  
Interface Profile: Default  
Rate Monitoring:  
load-interval: 60 seconds  
threshold (in/out): 100 kbps  
shutdown:  
enabled: no  
max-delay: 300 seconds
```

Unit Profile

Default unit profile has on-boot setting disabled.

```
switch(config-maintenance)# show maintenance profiles unit default  
Unit Profile: Default  
On-boot:  
enabled: no  
duration: 300 seconds
```

15.6.2.3.2 User-defined Profiles

You can define your own profiles, which can be associated with groups or set as default profiles.

Interface Profile: The following set of commands creates an Interface Profile (**IP1**) with a load interval set to **10** seconds, a rate-monitoring threshold set to **100kbps**, and a maximum delay for shutting down the interface set to **100** seconds. The interface will be shut down with cause `maint-down` if traffic does not drain below the threshold even after the specified maximum delay period of **100** seconds.

```
switch(config)# maintenance  
switch(config-maintenance)# profile interface IP1  
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10  
switch(config-profile-intf-IP1)# rate-monitoring threshold 100  
switch(config-profile-intf-IP1)# shutdown max-delay 100  
switch(config-profile-intf-IP1)# exit  
switch(config-maintenance)#[/pre]
```

Associate an interface profile to only interface groups using the following set of commands.

```
switch(config)# group interface IG1  
switch(config-group-if-IG1)# maintenance profile interface IP1  
switch(config-group-if-IG1)# exit  
switch(config)#[/pre]
```

You can set the interface profile as the default interface profile using the following set of commands.

```
switch(config)# maintenance  
switch(config-maintenance)# profile interface IP1 default  
switch(config-maintenance)# exit  
switch(config)#[/pre]
```

BGP Profile: The following set of commands sets up a BGP profile (**BP1**) with an initiator route map called RM that applies to both inbound and outbound directions..

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM inout
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#

```

Using the following commands, associate a BGP profile to both interface and bgp groups.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# maintenance profile bgp BP1
switch(config-group-if-IG1)# exit
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# maintenance profile bgp BP1
switch(config-group-bgp-BG1)# exit
switch(config)#

```

Using the following commands, you can set the bgp profile as the default bgp profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1 default
switch(config-maintenance)# exit
switch(config)#

```

Unit Profile: The following set of commands sets up a Unit profile (**UP1**) with an on-boot duration of **300** seconds. The unit will enter into maintenance mode at boot-up and exit maintenance mode at the end of **5** minutes (**300sec**) after boot-up.

```
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)#

```

A Unit profile can be associated to a Unit using the following commands.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# profile unit UP1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)#

```

You can set the Unit profile as the default Unit profile using the following set of commands.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# exit
switch(config)#

```

15.6.3 Maintenance Mode Features

Arista Network switches provide maintenance mode features including, rate monitoring, BGP maintenance route map, on-boot maintenance, and EventMgr integration.

15.6.3.1 Rate Monitoring

Rate monitoring provides a mechanism for monitoring traffic on interfaces identified for maintenance. You can set the traffic threshold and a time limit for shutting down the interface for maintenance tasks.

Configure the **shutdown** parameter in the interface profile that signals the interface to shut down after it has entered maintenance mode.

The max-delay parameter specifies the maximum number of seconds for traffic to dissipate from the interface before shutting it down.

The default interface profile settings appear in the output of the **show maintenance profile interface default** command.

Note: The exclusive rate monitoring of sub-interfaces is not supported. Sub-interfaces inherit the interface profile from their parent interface. Regarding multiple sub-interfaces configured for a single parent interface, rate monitoring of the parent interface includes aggregate values of all respective sub-interfaces.

15.6.3.2 BGP Maintenance Route Map

Route-maps are used within a BGP maintenance profile to tag the inbound and outbound routes to direct traffic away from the unit.

The default profile tags the inbound and outbound routes with the global shutdown community. Other methods, such as alternate communities or **AS_PATH** prepend operations, can be configured under the route map.

15.6.3.3 On-boot Maintenance

There are two ways of placing a unit in maintenance mode on switch boot-up:

- The unit is placed into maintenance mode before the switch reboots, and the running-config is saved before the switch boot-up.
- The on-boot property in the unit maintenance profile specifies that the unit will be placed into maintenance mode as part of the boot-up, and remains so for the specified duration.

Note: The duration value in the on-boot unit maintenance profile starts when the unit enters maintenance mode on boot-up.

15.6.3.4 Single Event Upset Handling

All electronic devices are subject to interference from cosmic radiation. Arista products use a combination of hardware and software to detect and correct the results of this interference automatically. For instance, many chip memories contain parity or Error Correcting Code (ECC) bits. However, Single Event Handling (SEU) is a random event, and the following configuration determines the handling behavior.

```
switch(config)# platform sand seu  
switch(config-sand-seu) #
```

By default, the system corrects the first instance of an ECC or parity event without logging. However, the system logs a message if a further error occurs within a 4-hour time window, whether related to the first or not.

The following example illustrates changing the default 4-hour logging window and detecting a second SEU within **3** hours (10800 seconds) from a prior SEU.

```
switch(config-sand-seu) # log window 10800 seconds
```

Hardware uses static memories to hold configuration and determine switching behavior. When SEUs occur, repairs are made automatically. The following command disables automatic repair by a specific agent.

```
switch(config-sand-seu) # repair table static manager SandFap disabled
```

The following command disables automatic repair by specific memories, overriding any specific configurations.

```
switch(config-sand-seu) # repair table static disabled
```

Important: Only disable the repair of static tables in consultation with the Arista Support team.

The following command disables the automatic repair of fabric chip memories on modular or fixed systems which use fabric chip.

```
switch(config-sand-seu) # repair table fabric manager SandFabric disabled
switch(config-sand-seu) # repair table fabric disabled
```

The following command disables dynamic memories globally. Dynamic memories are internal memory the hardware uses to hold transient data, such as packet header encapsulations.

```
switch(config-sand-seu) # repair table dynamic disabled
```

The following command disables SEU resets without affecting other dynamic table repairs.

```
switch(config-sand-seu) # repair table dynamic action reset full disabled
```

The following command configures the SEU to **12** hours; by default the minimum interval between SEUs is **24** hours.

```
switch(config-sand-seu) # repair action reset full interval 43200 seconds
```

Show Command

SEU events generate interrupts, which are seen along with all other interrupts.

```
switch# show platform fap interrupts
Jericho0
-----
| Interrupt Bit           | Count | First Occurrence   | Last Occurrence    |
-----| ...                   | ...   | 2020-10-15 04:27:59 | 2020-10-15 04:31:41 |
| CFC_ECC_Ecc_2bErrInt[0] | 2     |                |                  |
| ...                   | ...   |                |                  |
-----
```

All SEU interrupt names are in the form of **<block>_ECC_<type>Int**. The block indicates the part of a switch chip affected. The type can be one of the following:

- **Ecc_1bErr** - Single bit error in ECC-protected memory, corrected automatically in hardware.
- **Ecc_2bErr** - Two bit error in ECC-protected memory detected, requires software correction.
- **ParityErr** - Single bit error in parity protected memory detected, requires software correction.

Single bit ECC errors do not affect the correct operation of the switch. Two bit ECC and parity errors can disrupt correct operation, for example, by dropping one or more packets or by misforwarding packets. The exact effect depends on the memory and location affected by the SEU.

15.6.4 Maintenance Mode Configuration

You can configure maintenance mode for the entire device, specific line cards, or any other Unit and set up the configuration for maintenance mode for the device at boot-up or while it is running.

Note: Explicit maintenance of sub-interfaces is not supported. Sub-interfaces are put into maintenance implicitly in the case of built-in unit maintenance and interface maintenance but not in the case of user-configured units.

15.6.4.1 Unit Configuration

Arista Network switches provide the ability to place the switch in maintenance mode, provide configuration options for groups and profiles, associate profiles with groups and units, and perform maintenance mode operations.

System is a predefined (built-in) unit on all switches. Built-in groups include **AllEthernetInterface**, **AllBgpNeighborVRF-<vrf_name>**, and **Linecardn**.

Linecardn can also be a built-in unit and differentiated depending on the command, as shown in the following examples.

- `switch(config-maintenance) # unit Linecardn`
- `switch(config) # group interface Linecardn`

Built-in unit **System** comprises the following groups:

- **AllEthernetInterface** is a built-in interface group that contains all physical Ethernet interfaces on the switch on a fixed system.
- **Linecardn** is a built-in interface group that contains all interfaces for the line card numbered n for modular systems.
- **AllBgpNeighborVRF-<vrf_name>** is a built-in BGP group that contains all the BGP peers in the named VRF.

For each Linecard n, there is a built-in unit that consists of all the **Linecardn** groups.

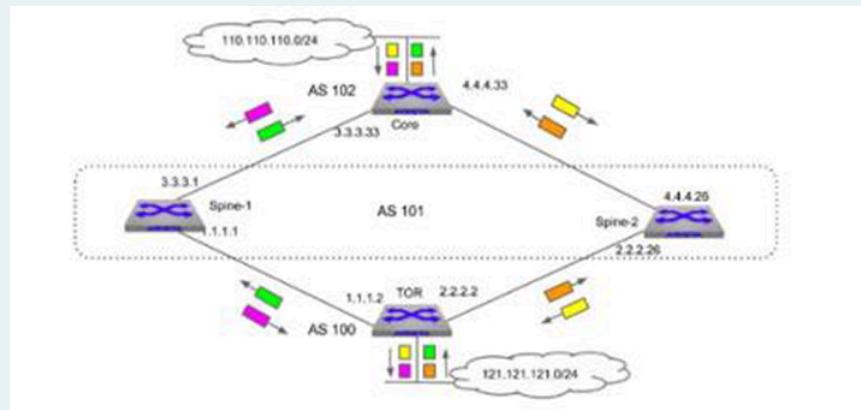

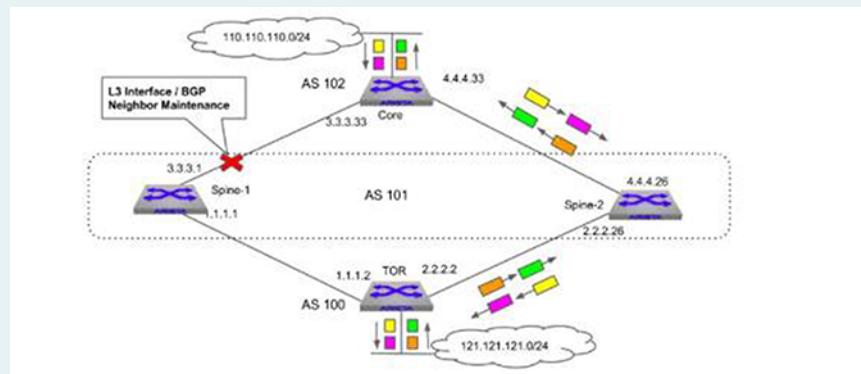

By default, the default interface and BGP profiles are applied to the built-in interface and BGP groups, and the default built-in unit profile is applied to the built-in unit. You can also configure your own profiles and choose a default.

In the following example, traffic flows through multiple switches in the spine to and from one switch to another when you elect to put one of the Units (entire switch or parts thereof) in the spine switch in maintenance mode. The traffic is then gracefully steered away from the Unit, provided other paths are available. Traffic will continue to flow through the Unit placed into maintenance mode if no other path is available.

Example

Note: The illustration shows an entire switch as the Unit. Replace switch with Linecardn or another relevant Unit as appropriate.

Figure 15-19: Traffic Flow Pattern Between TOR and Core Before Maintenance**Figure 15-20: Traffic Flow Pattern Between TOR and Core After Unit on Spine-1 is put into Maintenance**

For the earlier example, you can see the status of the Unit (System) using the **show maintenance units System** command before placing the system into maintenance mode. If the device being placed into maintenance mode is Modular and the Unit is a line card, replace the argument **System** with **Linecardn** to see the status of the Unit (Linecardn).

```
switch(config)# show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
```

Place the Unit (System) into maintenance mode and recheck the status using the following series of commands.

```
switch(config-maintenance)# unit System
switch(config-built-in-unit-System)# quiesce
switch(config-built-in-unit-System)# exit
switch(config-maintenance)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
```

| Unit Name | Status | Time since last change | Flags |
|-----------|--------|------------------------|-------|
|-----------|--------|------------------------|-------|

```

----- -----
System Under Maintenance 0:02:03 ago
----- 

switch(config-maintenance) # show ip bgp summary
BGP summary information for VRF default
Router identifier 1.1.1.1, local AS number 101
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS        MsgRcvd  MsgSent  InQ OutQ Up/Down State
PfxRcd PfxAcc
m 1.1.1.2      4  100        24       17     0    0 00:00:40 Estab  5      5
m 3.3.3.33     4  102        15       16     0    0 00:06:23 Estab  1      1

```

Note: The **o** flag appears for on-boot maintenance in the **show maintenance** command, and the **m** neighbor status flag in the **show ip bgp summary** command indicates that the peer is in maintenance mode.

15.6.4.2 On-boot Maintenance Mode Configuration

To configure on-boot maintenance, you can use one of two methods:

- **quiesce config**, or
- **on-boot profile**

15.6.4.2.1 Using quiesce config

Perform the following tasks to place the Unit in maintenance mode on boot-up using the **quiesce** command.

1. Place the unit into maintenance mode before switch reboot using the following commands.

```

switch(config)# maintenance
switch(config-maintenance) # unit System
switch(config-unit-System) # quiesce
switch(config-unit-System) # exit
switch(config-maintenance) # show maintenance

Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
System Under Maintenance 00:01:10 ago

```

2. Save the **running-config** using the following command.

```

switch(config) # copy running-config startup-config
Copy completed successfully
switch(config) #

```

3. Reload the device.

```

switch(config) # reload
Proceed with reload? [Confirm] Yes
Connection to switch closed.

```

4. After the device comes up, you must execute the **no quiesce** command for the Unit to come out of maintenance mode. Check the status of the device after it comes up using the **show maintenance** command.

```

switch# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags

```

```
-----  
System Under Maintenance 00:03:10 ago
```

15.6.4.2.2 Using on-boot profile

The on-boot property in the Unit maintenance profile specifies that the Unit will be placed into maintenance mode during boot-up for the specified duration. To use this method, you must perform the following tasks.

1. Check whether the on-boot maintenance mode is enabled using the **show maintenance profiles unit default**.

```
switch# show maintenance profiles unit default
Unit Profile: Default
On-boot:
  enabled: no
  duration: 300 seconds
```

2. Configure an on-boot profile with on-boot enabled and a duration specified. Make this the default Unit profile. The following code example shows the creation of an on-boot duration of **300** seconds in the profile unit **UP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# show maintenance profiles unit default
Unit Profile: UP1
On-boot:
  enabled: yes
  duration: 300 seconds
switch(config-maintenance) #
```

3. Save the **running-config** and reload the device.

```
switch(config)# copy running-config startup-config
Copy completed successfully
switch(config)# reload
Connection to switch closed.
```

4. After the device comes up, execute the **show maintenance** and **show maintenance units System** commands.

```
switch(config)# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
System Under Maintenance 00:00:08 ago o
switch(config)# show maintenance units System
Unit Name: System
Origin: Built-in
Status: Under Maintenance (on-boot)
Unit Profile: UP1
Time Since Last State Change: 0:00:16 ago
Will come out of on-boot Maintenance after 0:04:43
Interface Groups:
AllEthernetInterface
History:
2017-01-18 00:44:39 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:16 ago
2017-01-18 00:43:54 old state: 'active' to new state: 'maintenanceModeEnter'
0:01:01 ago
```

The `o` - flag shows that the unit, System, is under maintenance due to the on-boot profile. Also, `show maintenance units System` output shows the following - Will come out of on-boot Maintenance after 0:04:43, which is the time remaining of the specified duration of **5** minutes.

The Unit will come up in maintenance mode when the device boots up and will exit maintenance mode when the specified duration of **300** seconds in the default profile finishes. The BGP sessions will remain under maintenance for the duration and will resume after the specified duration ends.

15.6.4.3 Interface-level Maintenance Mode Configuration

To configure the maintenance mode at the interface-level, you must perform the following tasks:

1. Configure an interface-level profile (or use a pre-configured one). The following code example creates a user-defined interface profile IP1 with a rate-monitoring load-interval of **100** seconds, a rate-monitoring threshold of **500** kbps and a maximum shutdown delay of **100** seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-maint-if-Et5)# rate-monitoring load-interval 100
switch(config-maint-if-Et5)# rate-monitoring threshold 500
switch(config-maint-if-Et5)# shutdown max-delay 100
```

2. Make the user-defined interface profile IP1 the default interface profile.

```
switch(config-maintenance)# profile interface IP1 default
```

3. Place the interface into maintenance mode.

```
switch(config)# maintenance
switch(config-maintenance)# interface Ethernet 1
switch(config-maint-if-Et1)# quiesce
```

4. Remove the interface from maintenance mode after the service has been performed.

```
switch(config-maintenance)# interface Ethernet 1
switch(config-maint-if-Et1)# no quiesce
```

 **Note:** If interface **Et1** has sub-interfaces (**Et1.1**, **Et1.2**, etc.) with BGP peers on these sub-interfaces, then these sub-interfaces are also placed into maintenance mode. The `show maintenance interface sub-interface detail` command displays the maintenance state of sub-interfaces.

15.6.4.4 Entering Maintenance Mode

Enter configuration commands `unit` and `quiesce` using the `maintenance profile bgp` mode command to place the switch into maintenance mode.

The following code sequence places unit **ex1**, the **interface 3/3**, and BGP **1.1.1.1** in maintenance mode.

Example

```
switch(config)# maintenance
switch(config-maintenance)# unit ex1
switch(config-unit-ex1)# quiesce
switch(config-unit-ex1)# exit
switch(config-maintenance)# interface ethernet 3/3
switch(config-maint-if-Et3/3)# quiesce
```

```
switch(config-unit-if-Et3/3)# exit
switch(config-maintenance)# bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)# quiesce
switch(config-maint-bgp-1.1.1.1)# exit
switch(config-maintenance)#

```

15.6.4.5 Exiting Maintenance Mode

Enter configuration commands **unit** and **no quiesce** using the **maintenance profile bgp** mode command for the switch to exit maintenance mode.

The following code sequence causes unit **ex1**, the **interface 3/3**, and BGP **1.1.1.1** to exit maintenance mode.

Example

```
switch(config) # maintenance
switch(config-maintenance) # unit ex1
switch(config-unit-ex1) # no quiesce
switch(config-unit-ex1) # exit
switch(config-maintenance) # interface ethernet 3/3
switch(config-maint-if-Et3/3) # quiesce
switch(config-unit-if-Et3/3) # exit
switch(config-maintenance) # bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1) # no quiesce
switch(config-maint-bgp-1.1.1.1) # exit
switch(config-maintenance) #
```

15.6.4.6 Configuring Event Handlers

Enter configuration options for the **show maintenance** command to fire at different stages while entering or exiting maintenance mode.

Example for Maintenance Mode Event Handler for all Stages

```
switch(config) # event-handler ex1
switch(config-handler-ex1) # trigger on-maintenance enter unit unit-ex1 all
switch(config-handler-ex1) # action bash /mnt/flash/mm-event-handler-script
switch(config-handler-ex1) # timeout 20
switch(config-handler-ex1) # exit
switch(config) #
```

Note: The system expects a configured timeout value as this is when the script should complete execution and exit. If the script has not exited by the end of this period, then the following will occur:

1. Send the **SIGUSR1** signal to the script.
 2. Wait for a **GRACE-PERIOD** of **10** seconds for the script to exit.
 3. If the script does not exit even after that **GRACE-PERIOD**, then send a **SIGKILL** to the script.
 4. The maintenance operation progresses to the next stage.
 5. **GRACE-PERIOD** is not configurable.

```
switch(config)# event-handler bar
switch(config-handler-bar)# trigger on-maintenance exit unit unit-ex1 before
stage ratemon
switch(config-handler-bar)# action bash /mnt/flash/mm-event-handler-script
switch(config-handler-bar)# exit
switch(config)#

```

15.6.4.7 Configuring Groups

Enter the maintenance mode configuration options for groups with the [maintenance](#) and [group bgp](#) commands.

Example for Group Interface IG1

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet1
switch(config-group-if-IG1)# interface Port-Channel11,20
switch(config-group-if-IG1)# interface Vlan1-20
switch(config-group-if-IG1)# exit
switch(config)#

```

Example for Group BGP BG1

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 10.0.0.1
switch(config-group-bgp-BG1)# neighbor BGP_PG1
switch(config-group-bgp-BG1)# vrf vrf1
switch(config-group-bgp-BG1)# exit
switch(config)#

```

Note: BGP groups are specific to VRF.

15.6.4.8 Configuring Profiles

Enter the maintenance mode configuration options for profiles with the [profile interface](#), [rate-monitoring threshold](#), [profile bgp](#), and [profile unit <profile_name>](#) commands.

These command examples assign a user-configured profile as the **default** profile.

Example for Profile Interface IP1

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# rate-monitoring threshold 100
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# profile interface IP1 default
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#

```

Example for Profile BGP BP1

```
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map rmap inout
switch(config-profile-bgp-BP1)# profile bgp BP1 default
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#

```

Example for Profile Unit UP1

```
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 300

```

```
switch(config-profile-unit-UP1) # profile unit UP1 default
switch(config-profile-unit-UP1) # exit
switch(config-maintenance) #
```

15.6.4.9 Associating Profiles with Groups

Enter the maintenance mode configuration options for associating profiles with groups using the **maintenance** and **group bgp** commands.

Example

```
switch(config)# group interface IG1
switch(config-group-if-IG1) # maintenance profile bgp BP1
switch(config-group-if-IG1) # maintenance profile interface IP1
switch(config-group-if-IG1) #
```

Note: An interface or BGP profile can be associated with the interface group, and a BGP profile can be associated with the BGP group.

15.6.4.10 Configuring Units

Enter the maintenance mode configuration options for units using the **unit**, **group bgp**, and **maintenance** commands.

Example

```
switch(config)# maintenance
switch(config-maintenance) # unit ex1
switch(config-unit-ex1) # group bgp BG1
switch(config-unit-ex1) # group interface IG1
switch(config-unit-ex1) #profile unit UP1
```

15.6.5 Maintenance Mode Commands

Global Configuration Commands

- **group bgp**
- **group bgp <group_name>**
- **group interface**
- **group interface <group_name>**
- **maintenance**

Group Configuration Commands

- **interface**
- **maintenance profile bgp**
- **maintenance profile interface**
- **neighbor**
- **vrf**

Maintenance Configuration Commands

- bgp <peer> [vrf <vrf_name>]
- interface intf-name
- profile bgp
- profile bgp <profile_name> default
- profile interface
- profile interface <profile_name> default
- profile unit
- profile unit <profile_name>
- profile unit <profile_name> default
- unit

Unit Configuration Commands

- group bgp <group_name>
- group interface <group_name>
- quiesce

Interface Profile Configuration Commands

- rate-monitoring load-interval
- rate-monitoring threshold
- shutdown max-delay

BGP Profile Configuration Commands

- initiator route-map <route-map-name> inout

Unit Profile Configuration Commands

- on-boot duration

EventMgr Configuration Commands

- trigger on-maintenance

Display Commands

- show interface
- show interface <intf_name> status
- show ip | ipv6 bgp
- show ip | ipv6 bgp summary [vrf <vrf_name>]
- show maintenance
- show maintenance bgp
- show maintenance bgp receiver route-map
- show maintenance debug
- show maintenance groups
- show maintenance interface
- show maintenance interface status
- show maintenance interface status quiesced

15.6.5.1 bgp

The **bgp** command places the switch in Maintenance Dynamic BGP Configuration mode. If no VRF specified, the BGP peer uses the default VRF.

The command creates the dynamic BGP unit if the specified dynamic BGP unit does not exist prior to issuing the command.

The **no bgp vrf** and **default vrf** commands remove the dynamic BGP unit from *running-config*.

Command Mode

Maintenance Configuration Mode

Command Syntax

```
bgp [[ipv4 | ipv6] ip_addr] [vrf vrf_name] quiesce  
bgp ipv4_addr [vrf vrf_name]  
bgp ipv4_addr [vrf vrf_name]  
no bgp [ipv4_addr | ipv6_addr | peer_group_name][vrf vrf_name]  
default bgp [ipv4_addr | ipv6_addr | peer_group_name][vrf vrf_name]
```

Parameters

- **ipv4_addr** - Specify the BGP neighbor IPv4 address.
- **ipv6_addr** Specify the BGP neighbor IPv6 address.
- **peer_group_name** Specify the BGP peer group name.
- **vrf vrf_name** Specify the name of the VRF for the BGP peer belongs.
- **quiesce** - Execute the maintenance operation.

Example

This command creates dynamic BGP unit for IPv4 address **1.0.1.1**, IPv6 addr **1::1** with quiesce and peer-group **PG** in **VRF VRF1** under maintenance configuration.

```
switch(config)# maintenance  
switch(config-maintenance)# bgp 1.0.1.1  
switch(config-maint-bgp-1.0.1.1)# exit  
switch(config-maintenance)# bgp 1::1  
switch(config-maint-bgp-1::1)# quiesce  
switch(config-maint-bgp-1::1)# exit  
switch(config-maintenance)# bgp PG vrf VRF1  
switch(config-maint-bgp-PG)# exit  
switch(config-maint-bgp-PG)# show active  
maintenance  
    bgp 1.0.1.1  
    !  
    bgp 1::1  
        quiesce  
    !  
    bgp PG vrf VRF1  
switch(config-maintenance) #
```

15.6.5.2 group bgp

The **group bgp** command places the switch in group-BGP configuration mode for configuring the members of a BGP group in a particular VRF and associating a BGP maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The **no group bgp** and **default group bgp** removes the BGP group.

Command Mode

Global Configuration

Command Syntax

```
group bgp group_name
no group bgp group_name
default group bgp group_name
```

Parameters

group_name name of the BGP group.

Commands available in group-BGP configuration mode:

- **neighbor (ipv4 address | ipv6 address | peer-group)**
- **vrf (vrf-name)**
- **maintenance profile bgp**

Note: Built-in BGP groups like **AllBgpNeighborVrf-default** and **AllBgpNeighborVrf-<vrf_name>** do not allow neighbor configuration. Only BGP maintenance profile can be associated to them.

Examples

- This command creates a BGP group **BG1** and enters into group **BGP BG1** configuration mode.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# show active
group bgp BG1
exit
switch(config-group-bgp-BG1) #
```

- This command enters into **BGP** built-in configuration mode for **AllBgpNeighborVrf-default**.

```
switch(config)# group bgp AllBgpNeighborVrf-default
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)# 
group bgp AllBgpNeighborVrf-default
exit
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)# exit
switch(config)# show maintenance groups bgp AllBgpNeighborVrf-default
BGP Group: AllBgpNeighborVrf-default
Origin: Built-in
Neighbors:
Ipv4 Peers: 1.0.0.1, 1.0.1.2
Bgp Profile: Default
Vrf: default
Units: System
switch(config) #
```

15.6.5.3 group bgp <group_name>

The `group bgp <group_name>` command adds a BGP group to a unit.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group from a unit.

Command Mode

Maintenance Unit Configuration

Command Syntax

```
group bgp group_name
no group bgp group_name
default group bgp group_name
```

Parameter

group_name name of the BGP group.

Example

This command adds a BGP group **BG1** to unit **UNIT1**.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group bgp BG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
group bgp BG1
switch(config-unit-UNIT1)
```

15.6.5.4 group interface

The `group interface` command places the switch in group-intf configuration mode for configuring the members of interface group and associating a BGP/interface maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The `no group interface <group_name>` and `default group interface <group_name>` removes the interface group.

Command Mode

Global Configuration

Command Syntax

```
group interface group_name
no group interface group_name
default group interface group_name
```

Parameter

group_name name of the interface group.

Commands available in group-BGP configuration mode:

- **interface**
- **maintenance profile bgp**
- **maintenance profile interface**

Note: Built-in Interface groups like **AllEthernetInterface**, **Linecard3**, **Linecard4**, etc. do not allow interface configurations. Only BGP/interface maintenance profiles can be associated to them.

Examples

- This command creates an interface group **IG1** and enters into **group interface IG1** configuration mode.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# show active
group interface IG1
exit
switch(config-group-if-IG1)#

```

- This command enters into built-in interface group **AllEthernetInterface**.

```
switch(config)# group interface AllEthernetInterface
switch(config-builtin-group-if-AllEthernetInterface)# show active
group interface AllEthernetInterface
exit
switch(config-builtin-group-if-AllEthernetInterface)# exit
switch(config)# show maintenance groups interface AllEthernetInterface
Interface Group: AllEthernetInterface
Origin: Built-in
Interfaces:
Et1, Et2, Et3, Et4, Et5/1, Et34, Et35, Et36
Profiles:
Interface Profile: Default
Bgp Profile: Default
Units: System#

```

15.6.5.5 group interface <group_name>

The **group interface <group_name>** command adds an interface to a unit.

The **no group interface <group_name>** and **default group interface <group_name>** removes the interface group from a unit.

Command Mode

Maintenance Unit Configuration

Command Syntax

```
group interface group_name
no group interface group_name
default group interface group_name
```

Parameter

group_name name of the interface group.

Example

This command adds an **group interface IG1** to unit **UNIT1**.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
group interface IG1
switch(config-unit-UNIT1)
```

15.6.5.6 initiator route-map <route-map-name> inout

The **initiator route-map <route-map-name> inout** command is a maintenance BGP profile configuration option for assigning the initiator route-map, which will be applied to inout (inbound and outbound).

The **no initiator route-map <route-map-name> inout** and **default initiator route-map <route-map-name> inout** removes this configuration from the BGP profile.

Command Mode

Maintenance-Profile-BGP Configuration

Command Syntax

```
initiator route-map route-map-name inout
no initiator route-map
default initiator route-map
```

Parameter

route-map-name initiator route-map name.

Example

This command configures initiator route-map **RM1** within a BGP profile **BP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM1 inout
switch(config-profile-bgp-BP1)# show active
maintenance
    profile bgp BP1
        initiator route-map RM1 inout
switch(config-profile-bgp-BP1) #
```

15.6.5.7 interface

The **interface** command adds interfaces to interface group.

The **interface <intf-name>** and **default interface <intf-name>** removes the interface from the group.

Command Mode

Group-Interface Configuration

Command Syntax

```
interface interface-name
no interface interface-name
default interface interface-name
```

Parameters

- **interface-name** name of the interface.
- **ethernet e_range** Ethernet interfaces specified by **e_range**.
- port-channel **p_range** port channel interfaces specified by **p_range**.

-
- **vlan *v_range*** vlans specified by ***v_range***.

Valid **e_range**, **p_range**, and **v_range** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

- This command adds **Ethernet8**, **Ethernet9**, and **port-channel10** to the interface group **IG1**.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet8-9
switch(config-group-if-IG1)# interface port-channel10
switch(config-group-if-IG1)# show active
group interface IG1
interface Et8-9
interface Po10
switch(config-group-if-IG1)# exit
switch(config)#
```

15.6.5.8 interface intf-name

The **interface <intf-name>** command places the switch in maintenance dynamic interface unit configuration mode.

The command creates the dynamic interface unit if the specified dynamic interface unit does not exist prior to issuing the command.

The **no interface <intf-name>** and **default interface <intf-name>** removes the dynamic interface unit from ***running-config***.

Command Mode

Maintenance Configuration

Command Syntax

```
interface interface-name
no interface interface-name
default interface interface-name
```

Parameters

- ***interface-name*** name of the interface.
- **ethernet e_range** Ethernet interfaces specified by **e_range**.
- **port-channel p_range** port channel interfaces specified by **p_range**.
- **vlan v_range** vlans specified by **v_range**.

Valid **e_range**, **p_range** and **v_range** formats include number, range, or comma-delimited list of numbers and ranges.

Note: Different dynamic interface units are created for each interface in the range.

Commands available in maintenance dynamic interface unit configuration mode:

quiesce

Example

This command creates two dynamic interface units for interfaces **Ethernet1-2** under maintenance configuration.

```
switch(config)# maintenance
switch(config-maintenance)# interface Ethernet1-2
switch(config-maint-if-Et1-2)# exit
switch(config-maintenance)# show active
maintenance
    interface Ethernet1
    !
    interface Ethernet2
switch(config-maintenance) #
```

15.6.5.9 maintenance

The **maintenance** command allows you to enter maintenance configuration mode and specify maintenance configuration options.

The **no maintenance** and **default maintenance** command removes the maintenance configuration from the *running-config*.

Command Mode

Global Configuration

Command Syntax

```
maintenance  
no maintenance  
default maintenance
```

Commands available in maintenance configuration mode:

- **unit**
- **bgp**
- **interface**
- **profile bgp**
- **profile interface**
- **profile unit**
- **profile interface <profile-name> default**
- **profile bgp <profile-name> default**
- **profile unit <profile-name> default**

Example

This example shows the commands to enter maintenance configuration mode and configure maintenance related parameters.

```
switch(config)# maintenance  
switch(config-maintenance)# profile unit foo  
switch(config-profile-unit-foo)# on-boot duration 300  
switch(config-profile-unit-foo)# exit  
switch(config-maintenance)# unit U1  
switch(config-unit-U1)# group interface IG1  
switch(config-unit-U1)# group bgp BG1  
switch(config-unit-U1)# profile unit foo  
switch(config-unit-U1)# exit  
switch(config-maintenance)# show active  
maintenance  
    profile unit foo  
        on-boot duration 300  
    unit U1  
        group interface IG1  
        group bgp BG1  
        profile unit foo  
switch(config-maintenance)#[/pre]
```

15.6.5.10 maintenance profile bgp

The **maintenance profile bgp <profile-name>** command associates a BGP maintenance profile to an interface/BGP group. A BGP profile can be associated to both the interface and BGP group.

The **no maintenance profile bgp <profile-name>** and **default maintenance profile bgp <profile-name>** removes the profile from the interface/BGP group.

Command Mode

Group-Interface Configuration

Group-BGP Configuration

Built-in-Group-Interface Configuration

Built-in-Group-BGP Configuration

Command Syntax

```
maintenance profile bgp profile-name
no maintenance profile bgp profile-name
default maintenance profile bgp profile-name
```

Parameter

profile name name of the BGP profile.

Examples

- This command adds **BGP profile BP1** to a BGP group **BG1**.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# maintenance profile bgp BP1
switch(config-group-bgp-BG1)# show active
group bgp BG1
    neighbor 1.0.1.1
    neighbor 1::1
    neighbor PG
    maintenance profile bgp BP1
switch(config-group-bgp-BG1)# exit
switch(config)#[/pre]

```

- This command adds BGP **profile BP1** to interface group **IG1**.

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet8-9
switch(config-group-if-IG1)# maintenance profile bgp BP1
switch(config-group-if-IG1)# show active
group interface IG1
    interface Et8-9
    maintenance profile bgp BP1
switch(config-group-if-IG1)# exit
switch(config)#[/pre]

```

- This command adds BGP **profile BP1** to built-in interface group **AllEthernetInterface**.

```
switch(config)# group interface AllEthernetInterface
switch(config-builtin-group-if-AllEthernetInterface)# maintenance profile bgp BP1
switch(config-builtin-group-if-AllEthernetInterface)# show active
group interface AllEthernetInterface
    maintenance profile bgp BP1
switch(config)#[/pre]

```

```
switch(config-built-in-group-if-AllEtherentInterface) #
```

15.6.5.11 maintenance profile interface

The **maintenance profile interface <profile-name>** command associates interface profile to interface group.

The **no maintenance profile interface <profile-name>** and **default maintenance profile interface <profile-name>** removes the interface profile from interface group.

Command Mode

Group-Interface Configuration

Built-in-Group-Interface Configuration

Command Syntax

```
maintenance profile interface profile-name  
no maintenance profile interface profile-name  
default maintenance profile interface profile-name
```

Parameter

profile-name name of the interface profile.

Example

- This command adds **profile interface IP1** to interface group **IG1**.

```
switch(config)# group interface IG1  
switch(config-group-if-IG1)# interface Ethernet8-9  
switch(config-group-if-IG1)# maintenance profile interface IP1  
switch(config-group-if-IG1)# show active  
group interface IG1  
    interface Et8-9  
        maintenance profile interface IP1  
  
switch(config-group-if-IG1) #
```

- This command adds **profile interface IP1** to built-in interface group **AllEthernetInterface**.

```
switch(config)# group interface AllEthernetInterface  
switch(config-builtin-group-if-AllEthernetInterface)# maintenance profile  
interface IP1  
switch(config-builtin-group-if-AllEthernetInterface)# show active  
group interface AllEthernetInterface  
    maintenance profile interface IP1  
  
switch(config-builtin-group-if-AllEthernetInterface) #
```

15.6.5.12 neighbor

The **neighbor** command adds BGP peer(s) to a BGP group. The neighbors can be IPv4, IPv6, or a peer group. The **no neighbor <peer>** and **default neighbor <peer>** removes the BGP peer from the group.

Command Mode

Group-BGP Configuration

Command Syntax

```
neighbor [ipv4_addr | ipv6_addr | peer group name]  
no neighbor [ipv4_addr | ipv6_addr | peer group name]  
default neighbor [ipv4_addr | ipv6_addr | peer group name]
```

Parameters

- **ipv4_addr** BGP neighbor ipv4 address.
- **ipv6_addr** BGP neighbor ipv6 address.
- **peer group name** BGP peer group name.

Example

- This command adds ipv4 peer **1.0.1.1**, ipv6 peer **1::1**, and peer group **PG** to the BGP group **BG1**.

```
switch(config)# group bgp BG1  
switch(config-group-bgp-BG1)# neighbor 1.0.1.1  
switch(config-group-bgp-BG1)# neighbor 1::1  
switch(config-group-bgp-BG1)# neighbor PG  
switch(config-group-bgp-BG1)# group bgp BG1  
switch(config-group-bgp-BG1)# neighbor 1.0.1.1  
switch(config-group-bgp-BG1)# neighbor 1::1  
switch(config-group-bgp-BG1)# neighbor PG  
switch(config-group-bgp-BG1)# exit  
switch(config)#
```

15.6.5.13 on-boot duration

The **on-boot duration** command is a maintenance unit profile configuration option for specifying the duration after which the associated unit will be brought out of maintenance after reboot. The on-boot property in the maintenance unit profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remain so for the specified duration.

The **no on-boot** and **default on-boot** removes this configuration from the unit profile.

Command Mode

Maintenance-Profile-Unit Configuration

Command Syntax

```
on-boot duration duration
no on-boot
default on-boot
```

Parameter

duration number of seconds for which unit will remain under maintenance after reboot (from **300** to **3600** seconds).

Example

This command configures on-boot duration of **1000** seconds in profile unit **UP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 1000
switch(config-profile-unit-UP1)# show active
maintenance
    profile unit UP1
        on-boot duration 1000
switch(config-profile-unit-UP1)#

```

15.6.5.14 profile bgp

The **profile bgp** command places the switch in maintenance profile BGP configuration mode for configuring initiator route-map.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **no profile bgp <profile-name>** and **default profile bgp <profile-name>** removes the profile from **running-config**.

Command Mode

Maintenance Configuration

Command Syntax

```
profile bgp profile-name
no profile bgp profile-name
default profile bgp profile-name
```

Parameter

profile-name name of the BGP profile.

Commands available in maintenance profile BGP configuration mode:

```
initiator route-map (route-map name) inout
```

Example

This command creates BGP profile **BP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# show active
maintenance
    profile bgp BP1
switch(config-profile-bgp-BP1) #
```

15.6.5.15 profile bgp <profile_name> default

The `profile bgp <profile_name> default` command configures a user-configured BGP profile as default BGP profile.

The `no profile bgp <profile_name> default` and `default profile bgp <profile_name> default` removes the user-configured BGP profile as default BGP profile.

Command Mode

Maintenance Configuration

Command Syntax

```
profile bgp profile_name default
no profile bgp profile_name default
default profile bgp profile_name default
```

Parameter

profile_name name of the BGP profile.

Example

This command configures user configured BGP profile BP1 as default BGP profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map RM1 inout
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
    route-map SystemGenerated permit 10
      Description:
        description System generated initiator route-map
      Match clauses:
      Set clauses:
        set community GSHUT additive
        set local-preference 0

switch(config-maintenance)# profile bgp BP1 default
switch(config-maintenance)# show maintenance profile bgp default
Bgp Profile: BP1
  Initiator route-map: RM1
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
  profile bgp BP1
    initiator route-map RM1 inout
  profile bgp BP1 default

switch(config-maintenance)#

```

15.6.5.16 profile interface

The **profile interface** command places the switch in maintenance profile interface configuration mode for configuring rate-monitoring threshold, load-interval, and shutdown max-delay.

The command creates the profile if the specified interface profile does not exist prior to issuing the command.

The **no profile interface <profile-name>** and **default profile interface <profile-name>** removes the profile from *running-config*.

Command Mode

Maintenance Configuration

Command Syntax

```
profile interface profile-name
no profile interface profile-name
default profile interface profile-name
```

Parameters

profile-name name of the interface profile.

Commands available in maintenance profile interface configuration mode:

- rate-monitoring load-interval
- rate-monitoring threshold
- shutdown max-delay

Example

This command creates interface profile **IP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
switch(config-profile-intf-IP1) #
```

15.6.5.17 profile interface <profile_name> default

The `profile interface <profile_name> default` command configures a user-configured interface profile as default interface profile.

The `no profile interface <profile_name> default` and `default profile interface <profile_name> default` removes the user-configured interface profile as default interface profile.

Command Mode

Maintenance Configuration

Command Syntax

```
profile interface profile_name default
no profile interface profile_name default
default profile interface profile_name default
```

Parameter

profile_name name of the interface profile.

Example

This command configures user configured interface profile **IP1** as default interface profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 100
switch(config-profile-intf-IP1)# rate-monitoring threshold 500
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profile interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config-maintenance)#
switch(config-maintenance)# profile interface IP1 default
switch(config-maintenance)# show maintenance profile interface default
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 100 seconds
    threshold (in/out): 500 kbps
  shutdown:
    enabled: yes
    max-delay: 100 seconds
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
  profile interface IP1 default
  profile interface IP1
    rate-monitoring load-interval 100
    rate-monitoring threshold 500
    shutdown max-delay 100

switch(config-maintenance)#

```

15.6.5.18 profile unit

The **profile unit** command places the switch in maintenance profile unit configuration mode for configuring on-boot duration.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **no profile unit <profile-name>** and **default profile unit <profile-name>** removes the profile from *running-config*.

Command Mode

Maintenance Configuration

Command Syntax

```
profile unit profile-name
no profile unit profile-name
default profile unit profile-name
```

Parameter

profile-name name of the unit profile.

Commands available in maintenance profile unit configuration mode:

on-boot duration

Example

This command creates unit profile **UP1**.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# show active
maintenance
    profile unit UP1
switch(config-profile-unit-UP1)#

```

15.6.5.19 profile unit <profile_name>

The **profile unit <profile_name>** command associates unit profile to a particular unit.

The **no profile unit <profile_name>** and **default profile unit <profile_name>** removes the unit profile from a unit.

Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Command Syntax

```
profile unit profile-name
no profile unit profile-name
default profile unit profile-name
```

Parameter

profile-name name of the unit profile.

Examples

- This command adds **profile unit UP1** to **UNIT1**.

```
switch(config)# maintenance
switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)# group interface IG1
switch(config-unit-UNIT1)# exit
switch(config-maintenance)# show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Interface Groups:
    IG1

switch(config-maintenance)# unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)# show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: never
  Interface Groups:
    IG1
switch(config-unit-UNIT1)# show active
maintenance
  unit UNIT1
    group interface IG1
    profile unit UP1

switch(config-unit-UNIT1)#

```

- This command adds **profile unit UP2** to built-in **unit System**.

```
switch(config)# maintenance
switch(config-maintenance)#profile unit UP2
switch(config-profile-unit-UP2)# on-boot duration 600
switch(config-profile-unit-UP2)# exit
switch(config-maintenance)#
switch(config-maintenance)# unit System
switch(config-builtin-unit-System)# show active
maintenance
```

```
    unit System
switch(config-builtin-unit-System)# exit
switch(config-maintenance)# show maintenance units System
Unit Name: System
    Origin: Built-in
    Status: Not Under Maintenance
    Unit Profile: Default
    Time Since Last State Change: never
    Interface Groups:
        AllEthernetInterface

switch(config-maintenance)#
switch(config-maintenance)# unit System
switch(config-builtin-unit-System)# profile unit UP2
switch(config-builtin-unit-System)# show active
maintenance
    unit System
        profile unit UP2
switch(config-builtin-unit-System)# exit
switch(config-maintenance)# show maintenance units System
Unit Name: System
    Origin: Built-in
    Status: Not Under Maintenance
    Unit Profile: UP2
    Time Since Last State Change: never
    Interface Groups:
        AllEthernetInterface

switch(config-maintenance)#
```

15.6.5.20 profile unit <profile_name> default

The `profile unit <profile_name> default` command configures a user-configured unit profile as default unit profile.

The `no profile unit <profile_name> default` and `default profile unit <profile_name> default` removes the user-configured unit profile as default unit profile.

Command Mode

Maintenance Configuration

Command Syntax

```
profile unit profile_name default
no profile unit profile_name default
default profile unit profile_name default
```

Parameters

profile_name name of the interface profile.

Example

This command configures user-configured unit profile **UP1** as the default unit profile.

```
switch(config)# maintenance
switch(config-maintenance)# profile unit UP1
switch(config-profile-unit-UP1)# on-boot duration 1000
switch(config-profile-unit-UP1)# exit
switch(config-maintenance)#
switch(config-maintenance)# show maintenance profiles unit default
Unit Profile: Default
    On-boot:
        enabled: no
        duration: 300 seconds

switch(config-maintenance)# profile unit UP1 default
switch(config-maintenance)# show maintenance profile unit default
Unit Profile: UP1
    On-boot:
        enabled: yes
        duration: 1000 seconds
switch(config-maintenance)#
switch(config-maintenance)# show active
maintenance
    profile unit UP1 default
    profile unit UP1
        on-boot duration 1000

switch(config-maintenance)#

```

15.6.5.21 quiesce

The **quiesce** command places a unit or dynamic interface/BGP unit into maintenance mode, gracefully transitioning traffic away from it.

The **no quiesce** and **default quiesce** exits the unit from maintenance.

Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Maintenance Dynamic-Interface Unit Configuration

Maintenance Dynamic-Bgp Unit Configuration

Command Syntax

```
quiesce  
no quiesce  
default quiesce
```

Example

This command places unit **UNIT1**, **interface Et1**, BGP peer **1.0.1.1** in VRF default, and BGP peer **1::1** in **vrf VRF1** into maintenance.

```
switch(config)# group interface IG1  
switch(config-group-if-IG1)# interface Ethernet3-6  
switch(config-group-if-IG1)# maintenance profile interface IP1  
switch(config-group-if-IG1)# exit  
switch(config)# maintenance  
switch(config-maintenance)# unit UNIT1  
switch(config-unit-UNIT1)# group interface IG1  
switch(config-unit-UNIT1)# quiesce  
switch(config-unit-UNIT1)# exit  
switch(config-maintenance)# interface Ethernet1  
switch(config-maint-if-Et1)# quiesce  
switch(config-maint-if-Et1)# exit  
switch(config-maintenance)# bgp 1.0.1.1  
switch(config-maint-bgp-1.0.1.1)# quiesce  
switch(config-maint-bgp-1.0.1.1)# exit  
switch(config-maintenance)# bgp 1::1 vrf VRF1  
switch(config-maint-bgp-1::1)# quiesce  
switch(config-maint-bgp-1::1)# exit  
switch(config-maintenance)# show active  
maintenance  
    bgp 1.0.1.1  
        quiesce  
    !  
    bgp 1::1 vrf VRF1  
        quiesce  
    interface Et1  
        quiesce  
    unit UNIT1  
        quiesce  
  
switch(config-maintenance)# show maintenance  
Flags:  
o - On-boot maintenance  
v - Violating traffic threshold  
  
Unit Name          Status           Time since last change   Flags  
-----  
System             Not Under Maintenance      never  
UNIT1              Under Maintenance       0:00:06 ago  
  
Interface Name     Status           Time since last change   Flags  
-----  
Ethernet1          Entering Maintenance  0:00:06 ago

switch(config-maintenance)#

```

15.6.5.22 rate-monitoring load-interval

The **rate-monitoring load-interval** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring load interval with a load interval value between 5 and 600 seconds.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

```
rate-monitoring load-interval load_interval
no rate-monitoring load-interval load_interval
default rate-monitoring load-interval load_interval
```

Parameter

load_interval load interval value between **5** and **600** seconds.

Example

This command configures the rate monitoring load interval for the profile interface **IP1** to a load interval of **10** seconds.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#

```

15.6.5.23 rate-monitoring threshold

The **rate-monitoring threshold** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring threshold with a threshold value between **1** and **4294967295** kilobytes.

The **no rate-monitoring threshold** and **default rate-monitoring threshold** removes this configuration from the interface profile.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

```
rate-monitoring threshold threshold_in_kbps
no rate-monitoring threshold threshold_in_kbps
default rate-monitoring threshold threshold_in_kbps
```

Parameter

threshold_in_kbps threshold in kilobytes per second (kbps) between **1** and **4294967295** kilobytes.

Example

This command configures the rate monitoring threshold for the profile interface **IP1** to a threshold of **1000** kilobytes per second (kbps).

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring threshold 1000
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        rate-monitoring threshold 1000
switch(config-profile-intf-IP1)#

```

15.6.5.24 show interface

The **show interface** command displays detailed information about the interface.

It displays an extra line that reads: Under maintenance for time in hours and minutes.

Command Mode

EXEC

Command Syntax

```
show interface intf_name
```

Parameters

intf_name name of the interface.

- **ethernet e_range** Ethernet interfaces specified by **e_range**.
- **port-channel p_range** port channel interfaces specified by **p_range**.
- **vlan v_range** vlans specified by **v_range**.

Note: Valid **e_range**, **p_range**, and **v_range** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

This command displays detailed information about **interface ethernet 16/1**.

```
switch# show interface ethernet 16/1
Ethernet16/1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.7373.efc7
Internet address is 1.0.1.1/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 1500 bytes, BW 40000000 kbit
Full-duplex, 40Gb/s, auto negotiation: off, uni-link: n/a
Up 4 hours, 44 minutes, 36 seconds
Under maintenance for 4 hours, 22 minutes, 26 seconds
Loopback Mode : None
2 link status changes since last clear
Last clearing of "show interface" counters 4:45:12 ago
5 minutes input rate 20 bps (0.0% with framing overhead), 0 packets/sec
5 minutes output rate 20 bps (0.0% with framing overhead), 0 packets/sec
    580 packets input, 46286 bytes
    Received 1 broadcasts, 0 multicast
    0 runts, 0 giants
    0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
    0 PAUSE input
    601 packets output, 48954 bytes
    Sent 7 broadcasts, 15 multicast
    0 output errors, 0 collisions
    0 late collision, 0 deferred, 0 output discards
    0 PAUSE output
switch#
```

15.6.5.25 show interface <intf_name> status

The `show interface <intf_name> status` command displays an `m` flag if the interface is undergoing maintenance operation.

Command Mode

EXEC

Command Syntax

`show interface [intf_name] status`

Parameters

`intf_name` name of the interface.

- **ethernet e_range** Ethernet interfaces specified by `e_range`.
- **port-channel p_range** port channel interfaces specified by `p_range`.
- **vlan v_range** vlans specified by `v_range`.

Note: Valid `e_range`, `p_range`, and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

Example

This command display tabular output and shows `m` flag for **Ethernet16/1** status.

```
switch# show interface Ethernet16/1 status
Port Name Status Vlan Duplex Speed Type Flags
Et1 disabled 1 auto auto 1000BASE-T
...
Et14/1 connected 2 full 40G 40GBASE-CR4
Et15/1 connected 2 full 40G 40GBASE-CR4
Et16/1 connected routed full 40G 40GBASE-CR4 m
Et17/1 notconnect 1 full 10G Not Present
...
switch#
```

15.6.5.26 show ip | ipv6 bgp

The `show ip | ipv6 bgp` command displays maintenance related information when relevant.

Command Mode

EXEC

Command Syntax

```
show ip bgp neighbors peer_addr [vrf vrf_name]
show ipv6 bgp peers peer_addr [vrf vrf_name]
```

Parameters

peer_addr name of the peer.

- ***ipv4_addr*** BGP neighbor IPv4 address.
- ***ipv6_addr*** BGP neighbor IPv6 address.
- ***peer-group-name*** BGP peer group name.
- ***vrf_name*** name of the VRF.

Example

This command displays the `m` flag in `show ip bgp summary` output for peer **1.0.1.2** which is in maintenance mode.

```
switch# show ip bgp neighbors 1.0.1.2
BGP neighbor is 1.0.1.2, remote AS 300, external link
  BGP version 4, remote router ID 0.0.2.1, VRF default
  Negotiated BGP version 4
  Last read 00:00:09, last write 00:00:11
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds

```

15.6.5.27 show ip | ipv6 bgp summary [vrf <vrf_name>]

The `show ip | ipv6 bgp summary [vrf <vrf_name>]` command displays the `m` flag if the BGP IPv4 or IPv6 peer is undergoing maintenance operation.

Command Mode

EXEC

Command Syntax

```
show ip bgp summary [vrf vrf_name]  
show ipv6 bgp summary [vrf vrf_name]
```

Parameter

vrf_name name of the VRF.

Example

This command displays the `m` flag in `show ip bgp summary` output for peer **1.0.1.2** which is in maintenance mode.

```
switch# show ip bgp summary  
BGP summary information for VRF default  
Router identifier 0.0.1.1, local AS number 200  
Neighbor Status Codes: m - Under maintenance  
    Neighbor V  AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd  
PfxAcc  
    1.0.0.1 4 100 292 296 0 0 04:47:44 Estab 1 1  
m 1.0.1.2 4 300 292 296 0 0 04:47:44 Estab 1 1
```

15.6.5.28 show maintenance

The **show maintenance** command provides brief information about all units/dynamic interface unit/dynamic bgp unit and status.

o' - flag displays that unit is undergoing or has undergone a maintenance operation because of on-boot.

v - flag displays that one/some of the interfaces are violating traffic, i.e. traffic for those interfaces is above threshold.

Command Mode

EXEC

Command Syntax

show maintenance

Example

This command displays maintenance mode details.

```
switch# show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
System Not Under Maintenance never
Foo Under Maintenance 0:00:40 ago o

Interface Name Status Time since last change Flags
-----
Ethernet16/1 Entering Maintenance 0:00:02 ago v

Bgp Neighbor(vrf: defa) Status Time since last change Flags
-----
1.0.0.2 Not Under Maintenance never

Bgp Neighbor(vrf: red) Status Time since last change Flags
-----
2.0.1.2 Under Maintenance 0:00:16 ago switch#
```

15.6.5.29 show maintenance bgp

The `show maintenance bgp` command displays detailed maintenance information about BGP peers.

Command Mode

EXEC

Command Syntax

```
show maintenance bgp ipv4_addr [vrf vrf_name] | ipv6_addr [vrf vrf_name] | peer_group [vrf vrf_name] | ip all [vrf vrf_name | vrf all] | ipv6 all [vrf vrf_name | vrf all]
```

Parameters

- ***ipv4_addr*** BGP neighbor ipv4 address.
- ***ipv6_addr*** BGP neighbor ipv6 address.
- ***peer_group*** BGP peer group name.
- ***vrf_name*** name of the VRF to which peer belongs.
- ***ip all vrf *vrf_name**** all ipv4 peers in specified VRF.
- ***ipv6 all vrf *vrf_name**** all ipv6 peers in specified VRF.
- ***ip all vrf all*** all ipv4 peers in all the VRFs.
- ***ipv6 all vrf all*** all ipv6 peers in all the VRFs.

Example

This command displays maintenance information about BGP peers **1.0.0.1** and **1.0.1.1** and maintenance route-map applied.

```
switch# show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 0.0.1.1, local AS number 200
  Neighbor: 1.0.0.1
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated
  Neighbor: 1.0.1.2
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated switch#
```

15.6.5.30 show maintenance bgp receiver route-map

The **show maintenance bgp receiver route-map** command displays receiver route-map which is applied during maintenance operation.

Command Mode

EXEC

Command Syntax

```
show maintenance bgp receiver route-map
```

Example

This command displays receiver route-map contents.

```
switch# show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:
switch#
```

15.6.5.31 show maintenance interface status quiesced

This example of the **show maintenance interface status quiesced** command displays maintenance mode interface status details for quiesced interfaces.

Example

```
switch(config)# show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status          In   Out Flags
----- ----- --- --- -----
Ethernet1 Under Maintenance 0.3 0.0 v
Ethernet2 Under Maintenance 0.0 0.0
Ethernet4 Under Maintenance 0.0 0.0
switch(config) #
```

15.6.5.32 show maintenance debug

The **show maintenance debug** command displays the history of various maintenance operations on a unit/interface/BGP peer.

Command Mode

EXEC

Command Syntax

```
show maintenance debug bgp [peer_name] | interface [intf_name] | units [unit_name]
```

Parameters

- **bgp** display history of all dynamic BGP units which have undergone maintenance operation.
- **interface** display history of all dynamic interface units which have undergone maintenance operation.
- **units** display history of all units which have undergone maintenance operation.
- **peer_name** name of the peer.
 - **ipv4_addr** BGP neighbor IPv4 address.
 - **ipv6_addr** BGP neighbor IPv6 address.
 - **peer-group-name** BGP peer group name.
- **intf_name** name of the interface.
 - **ethernet e_range** Ethernet interfaces specified by **e_range**.
 - **port-channel p_range** port channel interfaces specified by **p_range**.
 - **vlan v_range** vlans specified by **v_range**.

 **Note:** Valid **e_range**, **p_range**, and **v_range** formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

- **unit_name** name of the unit.

Example

This command displays history of maintenance operation on **Ethernet 16/1**.

```
switch# show maintenance debug interface Ethernet 16/1-4
Interface Ethernet16/1
History:
Maintenance Enter Stage Progression started 4:07:07 ago @ 2016-08-29 22:38:54

15.6.5.33 show maintenance groups

The **show maintenance groups** command displays all the interface/BGP groups along with their members and associated profiles.

Command Mode

EXEC

Command Syntax

```
show maintenance groups [interface | bgp] <group_name>
```

Parameters

- **interface** display only interface groups
- **bgp** display only BGP groups
- **group_name** name of the group

Example

This command displays group details for built-in interface group **AllEthernetInterface** and built-in BGP group **AllBgpNeighborVrf-default** and user-configured interface group **IG1**.

```
switch# show maintenance groups
Interface Group: AllEthernetInterface
  Origin: Built-in
  Interfaces:
    Et1, Et2, Et3, Et4, Et5/1, Et5/2, Et5/3, Et5/4, Et6/1, Et6/2, Et6/3, Et6/4,
    Et7/1, Et7/2, Et7/3, Et7/4, Et8/1, Et8/2, Et8/3, Et8/4, Et9/1, Et9/2, Et9/3,
    Et9/4, Et10/1, Et10/2, Et10/3, Et10/4, Et11/1, Et11/2, Et11/3, Et11/4, Et12/1,
    Et12/2, Et12/3, Et12/4, Et13/1, Et13/2, Et13/3, Et13/4, Et14/1, Et14/2, Et14/3,
    Et14/4, Et15/1, Et15/2, Et15/3, Et15/4, Et16/1, Et16/2, Et16/3, Et16/4, Et17/1,
    Et17/2, Et17/3, Et17/4, Et18/1, Et18/2, Et18/3, Et18/4, Et19/1, Et19/2, Et19/3,
    Et19/4, Et20/1, Et20/2, Et20/3, Et20/4, Et21/1, Et21/2, Et21/3, Et21/4, Et22/1,

    Et27/2, Et27/3, Et27/4, Et28/1, Et28/2, Et28/3, Et28/4, Et29, Et30, Et31, Et32,
    Et33, Et34, Et35, Et36
  Profiles:
    Interface Profile: low-load-interval-profile
    Bgp Profile: Default
    Units: System
Interface Group: IG1
  Origin: User Configured
  Interfaces:
    Et1, Et2, Et3, Et4, Po10, Po11, Po12
  Profiles:
    Interface Profile: IP1
    Bgp Profile: BP1
    Units: UNIT1
Bgp Group: AllBgpNeighborVrf-default
  Origin: Built-in
  Neighbors:
    Ipv4 Peers: 1.0.0.1, 1.0.1.2
    Bgp Profile: Default
    Vrf: default
    Units: System
```

15.6.5.34 show maintenance interface

The **show maintenance interface** command displays detailed information about interfaces and their maintenance status with traffic rates.

Command Mode

EXEC

Command Syntax

```
show maintenance interface [intf_name [detail] | detail]
```

Parameters

- ***intf_name*** name of the interface or sub-interface. Options include:
 - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
 - **port-channel *p_range*** port channel interfaces specified by ***p_range***.
 - **vlan *v_range*** vlans specified by ***v_range***.
- **detail** provides the detailed rate-monitoring information

Guidelines

Valid ***e_range***, ***p_range***, and ***p_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Examples

- This command displays interface status and traffic rates.

```
switch# show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status In Out Flags
-----

```

15.6.5.35 show maintenance interface status

The **show maintenance interface status** command displays maintenance status and rates for interfaces.

Command Mode

EXEC

Command Syntax

```
show maintenance interface status [active | entering | exiting | quiesced]
```

Parameters

- **active** interfaces which are active.
- **entering** interfaces which are entering maintenance.
- **exiting** interfaces which are exiting maintenance.
- **quiesced** interfaces which are under maintenance.

Example

This command displays interface status and traffic rates of interfaces which are quiesced.

```
switch# show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
    Rate (Mbps)
Interface      Status          In   Out   Flags
-----
Ethernet1  Not Under Maintenance  -  -
Ethernet2  Not Under Maintenance  -  -
Ethernet3  Not Under Maintenance  -  -
Ethernet4  Not Under Maintenance  -  -
Ethernet16/1 Under Maintenance  0.0 0.0
Port-Channel10 Under Maintenance 100.5 50.5v
Port-Channel11 Entering Maintenance 15.5 10.5
Port-Channel10 Under Maintenance  -  -
switch#
```

15.6.5.36 show maintenance profiles

The **show maintenance profiles** command displays all the interface/BGP/unit profiles configuration.

Command Mode

EXEC

Command Syntax

```
show maintenance profiles [interface | bgp | unit] profile_name
```

Parameters

- **interface** display only interface profiles.
- **bgp** display only BGP profiles.
- **unit** display only unit profiles.
- ***profile_name*** name of the profile.

Example

This command displays profile configuration details for interface profile **IP1**, **unit profile UP1** and BGP profile **BP1**.

```
switch# show maintenance profiles
Interface Profile: IP1
    Rate Monitoring:
        load-interval: 444 seconds
        threshold (in/out): 4000 Kbps
    shutdown:
        enabled: yes
        max-delay: 399 seconds
Bgp Profile: BP1
    Initiator route-map:
        name: RM1
Unit Profile: UP1
    On-boot:
        enabled: yes
        duration: 340 seconds
```

15.6.5.37 show maintenance stages

The **show maintenance stages** command displays stages of maintenance operation while entering/exiting maintenance.

Command Mode

EXEC

Command Syntax

```
show maintenance stages [enter | exit]
```

Parameters

- **enter** display maintenance stages during maintenance enter operation.
- **exit** display maintenance stages during maintenance exit operation.

Examples

- This command displays maintenance mode stages details.

```
switch# show maintenance stages
No.      Stage      Description
-----  -----
1 bgp     BGP       Maintenance processing
2 ratemon Interface Rate Monitoring
Maintenance Exit      Stage Sequence
No.      Stage      Description
-----  -----
1 ratemon Interface Rate Monitoring
2 bgp BGP Maintenance processing
```

- This command displays maintenance mode stage details during entry.

```
switch# show maintenance stages enter
No.      Stage      Description
-----  -----
1 bgp     BGP       Maintenance processing
2 ratemon Interface Rate Monitoring
```

15.6.5.38 show maintenance summary

The **show maintenance summary** command displays summarized information about the maintenance mode operations such as number of units configured, number of units Entering/Exiting maintenance etc.

Command Mode

EXEC

Command Syntax

```
show maintenance summary
```

Example

This command displays summary of maintenance mode operations.

```
switch# show maintenance summary
Number of Units Configured: 0
Number of Units Exiting Maintenance: 0
Number of Units Entering Maintenance: 0
Number of Units Not Under Maintenance: 1
Number of Units Under Maintenance: 0
Directly Put Under Maintenance:
    Number of interfaces Entering Maintenance: 0
    Number of interfaces Under Maintenance: 1
    Number of bgp peers Entering Maintenance: 0
    Number of bgp peers Under Maintenance: 1
Rate Monitoring:
    Number of interfaces Entering Maintenance: 0
    Number of interfaces Under Maintenance: 1
    Number of interfaces Under Maintenance with threshold violation: 0
    Number of interfaces shutdown for maintenance: 0
switch#
```

15.6.5.39 show maintenance units

The **show maintenance units** command displays detailed information about the particular unit.

Command Mode

EXEC

Command Syntax

```
show maintenance units [unit_name]
```

Parameters

unit_name name of unit.

Example

This command displays maintenance units details.

```
switch# show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface

Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
Interface Groups:
IG1
History:
2016-08-29 23:05:30 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:08 ago
2016-08-29 23:05:30 old state: 'active' to new state: 'maintenanceModeEnter'
0:00:08 ago
```

15.6.5.40 shutdown max-delay

The **shutdown max-delay** command is a maintenance interface profile configuration option for configuring the maximum duration after which the interface is shutdown with a value between **1** and **4294967295** seconds.

The **no shutdown** and **default shutdown** removes this configuration from the interface profile.

Command Mode

Maintenance-Profile-Interface Configuration

Command Syntax

```
shutdown max-delay delay
no shutdown max-delay delay
default shutdown max-delay delay
```

Parameter

delay maximum shutdown delay between **1** and **4294967295** seconds.

Example

This command configures the shutdown max-delay for the profile interface **IP1** to **500** seconds or **1** hour.

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# shutdown max-delay 500
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        shutdown max-delay 500
switch(config-profile-intf-IP1)#

```

15.6.5.41 trigger on-maintenance

The **trigger on-maintenance** command is an event handler configuration for triggering actions during the maintenance operation of a unit, interface and BGP peer at specified stages.

The event-handler configuration takes effect only after exiting the event-handler configuration mode.

Command Mode

Event-handler Configuration

Command Syntax

```
trigger on-maintenance [enter | exit][unit unit_name | bgp [ipv4_addr | ipv6_addr | peer_group][vrf_name] | [interface intf_name] [begin | end | all] |[before | after][stage stage_name]
```

Parameters

- **enter** trigger on-maintenance event-handler on maintenance enter operation.
- **exit** trigger on-maintenance event-handler on maintenance exit operation.
- **bgp** trigger event-handler on dynamic BGP unit maintenance operation.
 - ***pv4_addr*** BGP neighbor ipv4 address.
 - ***pv6_addr*** BGP neighbor ipv6 address.
 - ***peer_group*** BGP peer group name.
- ***vrf vrf_name*** name of the VRF to which BGP peer belongs.
- **interface** trigger event-handler on dynamic interface unit maintenance operation.
 - ***intf_name*** name of the interface.
 - **ethernet** trigger event-handler on specified Ethernet interface.
 - **port-channel** trigger event-handler on specified port channel interface.
 - **vlan** trigger event-handler on specified VLAN.

Note: Comma-delimited list, ranges are not supported.

- **unit** trigger event-handler on maintenance operation of unit.
- **begin** action is triggered in the beginning of maintenance operation.
- **end** action is triggered at the end of maintenance operation.
- ***stage_name*** action is triggered at specified stage.
 - **bgp** and **ratemon** are the two stages.
- **all** action is triggered at all the stages.
- **before** action is triggered before the specified stage.
- **after** action is triggered after the specified stage.

Examples

- This command configures event-handler **E1**, which triggers on maintenance an enter operation of unit **UNIT1** at all the stages.

```
switch(config)# event-handler E1
```

```

switch(config-handler-E1)# trigger on-maintenance enter unit UNIT1 all
switch(config-handler-E1)# action bash FastCli -c "show maintenance"
switch(config-handler-E1)# exit
switch(config)# show event-handler E1
Event-handler E1
Trigger: Asynchronous on-maintenance enter unit UNIT1 all delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#

```

- This command configures event-handler **E2**, which triggers on maintenance an exit operation of dynamic interface unit **Ethernet1** before stage bgp.

```

switch(config)# event-handler E2
switch(config-handler-E2)# trigger on-maintenance exit interface Ethernet1 before
stage bgp
switch(config-handler-E2)# action bash FastCli -c "show maintenance summary"
switch(config-handler-E2)# exit
switch(config)# show event-handler E2
Event-handler E2
Trigger: Asynchronous on-maintenance exit interface Ethernet1 before stage bgp
delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance summary"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#

```

- This command configures event-handler **E3**, which triggers on maintenance an enter operation of dynamic BGP unit **1::1** in VRF **VRF1** at the last stage end.

```

switch(config)# event-handler E3
switch(config-handler-E3)# trigger on-maintenance enter bgp 1::1 vrf VRF1 end
switch(config-handler-E3)# action bash FastCli -c "show maintenance bgp ip all vrf all"
switch(config-handler-E3)# exit
switch(config)# show event-handler E3
Event-handler E3
Trigger: Asynchronous on-maintenance enter bgp 1::1 vrf VRF1 end delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance bgp ip all vrf all"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#

```

15.6.5.42 unit

The **unit <unit_name>** command places the switch in maintenance unit configuration mode for configuring BGP/interface groups in the unit.

The command creates the unit if the specified unit profile does not exist prior to issuing the command.

The **no unit <unit-name>** and **default unit <unit-name>** removes the unit from *running-config*.

Command Mode

Maintenance Configuration

Command Syntax

```
unit linecard [I_range | 0 I_range | unit_name]  
no unit linecard [I_range | 0 I_range | unit_name]  
default unit linecard [I_range | 0 I_range | unit_name]
```

Parameters

- ***I_range*** name of the Linecard built-in unit.
- **0 *I_range*** linecards available on the switch.
- ***unit_name*** name of the user-configured unit.

Commands available in maintenance unit configuration mode:

- group interface
- group bgp
- profile unit
- quiesce

Note: Built-in units like System, Linecard3, Linecard4, etc. do not allow group configuration but unit profile can be associated to these units.

Examples

- This command creates maintenance unit **UNIT1**.

```
switch(config)# maintenance  
switch(config-maintenance)# unit UNIT1  
switch(config-unit-UNIT1)# show active  
maintenance  
unit UNIT1  
switch(config-unit-UNIT1)#{/pre>
```

- This command enters the built-in **Linecard1** unit configuration mode.

```
switch(config)# maintenance  
switch(config-maintenance)# unit Linecard1  
switch(config-builtin-unit-Linecard1)# show active  
maintenance  
unit Linecard1  
switch(config-builtin-unit-Linecard1)#{/pre>
```

15.6.5.43 vrf

The **vrf** command specifies the VRF for BGP group. All the neighbors configured in the BGP group are considered to be members of the BGP group in the particular VRF context.

The **no vrf <vrf-name>** and **default vrf <vrf-name>** removes the VRF configuration from the BGP group and sets the VRF context to default.

Command Mode

Group-BGP Configuration

Command Syntax

```
vrf vrf_name
no vrf vrf_name
default vrf vrf_name
```

Parameter

vrf_name name of the VRF in a group belonging to neighbors in that group.

Example

This command specifies VRF **VRF1** for the neighbors in the BGP group **BGP1**.

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 1.0.1.1
switch(config-group-bgp-BG1)# neighbor 1::1
switch(config-group-bgp-BG1)# neighbor PG
switch(config-group-bgp-BG1)# vrf VRF1
switch(config-group-bgp-BG1)# show active
group bgp BG1
    neighbor 1.0.1.1
    neighbor 1::1
    neighbor PG
    vrf VRF1
switch(config-group-bgp-BG1)# exit
switch(config)#End
```

15.7 Bidirectional Forwarding Detection

This section describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Topics in this section include:

- [Introduction](#)
- [BFD Configuration](#)
- [Hardware Accelerated BFD Transmit](#)
- [BFD Commands](#)

15.7.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

Bidirectional Forwarding Detection (BFD) is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in [RFC 5880](#).

15.7.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.

- [Asynchronous Mode](#)
- [Demand Mode](#)

15.7.1.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

15.7.1.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

15.7.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port **3784**, BFD echo messages use UDP port **3785** for both source and destination.

15.7.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel's BFD sessions. When BFD per-link is enabled, BFD considers the port channel "up" as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with *RFC 7130*, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. *RFC7130* mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.

15.7.1.4 Seamless Bidirectional Forwarding Detection (S-BFD) Timer

Seamless Bidirectional Forwarding Detection (S-BFD) Hold-down Timers monitor the health and availability of your Segment Routing Traffic Engineering (SR-TE) paths on your network. The feature enables delaying the steering of traffic to a previously preferred SR-TE Down path returning to the Up status. This allows time for the path to stabilize by avoiding potential further path flapping and provide time to debug and diagnose the failure state.

15.7.2 BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- [Configuring BFD on an Interface](#)
- [Configuring BFD on a Port Channel](#)
- [Configuring the Echo Function](#)
- [Configuring BFD for PIM](#)
- [Configuring BFD for BGP](#)
- [Configuring BFD for VRRP](#)
- [Configuring BFD for OSPF](#)
- [Configure BFD for IS-IS](#)
- [Configuring BFD Session Telemetry](#)
- [Configuring S-BFD Hold-down Timers](#)
- [Using BFD Status for Faster Failover and Convergence](#)
- [Displaying BFD Neighbor Information](#)

15.7.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- **transmission rate 300** milliseconds
- **minimum receive rate 300** milliseconds
- **multiplier 3**

To configure different values for these parameters on an interface, use the [bfd interval](#) command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

Example

These commands set the transmit and receive intervals to **200** milliseconds and the multiplier to **3** for all BFD sessions passing through **interface ethernet 3/20**.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# bfd interval 200 min-rx 200 multiplier 3
switch(config-if-Et3/20) #
```

15.7.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in [Configuring BFD on an Interface](#) above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with *RFC 7130* (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either *RFC 7130* or legacy mode).

Note: In *RFC 7130* mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.

15.7.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the [bfd per-link](#) command.

Example

These commands enabled BFD per-link on port channel **5**.

```
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd per-link
switch(config-if-Po5) #
```

15.7.2.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable **RFC 7130** mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

1. If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the **bfd local-address** command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.
2. Enable BFD per-link on the port channel using the **bfd per-link** command.
3. Specify the L3 address of the port channel's BFD neighbor using the **bfd neighbor** command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

Examples

- These commands configure BFD per-link in **RFC 7130** mode over an L2 port channel.
 - Switch 1 configuration:

```
switch1(config)# bfd local-address 10.0.0.5
switch1(config)# interface port-channel 5
switch1(config-if-Po5)# bfd per-link rfc-7130
switch1(config-if-Po5)# bfd neighbor 10.0.0.4
switch1(config-if-Po5)#

```

- Switch 2 configuration:

```
switch2(config)# bfd local-address 10.0.0.4
switch2(config) #interface port-channel 5
switch2(config-if-Po5)# bfd per-link rfc-7130
switch2(config-if-Po5)# bfd neighbor 10.0.0.5
switch2(config-if-Po5)#

```

These commands configure BFD per-link in **RFC 7130** mode over an L3 port channel.

- Switch 1 configuration:

```
switch1(config)# interface port-channel 5
switch1(config-if-Po5)# no switchport
switch1(config-if-Po5)# bfd per-link rfc-7130
switch1(config-if-Po5)# ip address 10.0.0.5/24
switch1(config-if-Po5)# bfd neighbor 10.0.0.4
switch1(config-if-Po5)#

```

- Switch 2 configuration:

```
switch2(config)# interface port-channel 5
switch2(config-if-Po5)# no switchport
switch2(config-if-Po5)# bfd per-link rfc-7130
switch2(config-if-Po5)# ip address 10.0.0.4/24
switch2(config-if-Po5)# bfd neighbor 10.0.0.5

```

15.7.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the **bfd echo** command.

When the BFD echo function is enabled, a "slow-timer" value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the **bfd slow-timer** command.

Examples

- These commands enable the BFD echo function on **interface ethernet 5**. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to **2000** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd echo
switch(config-if-Et5)#{
```

- This command configures BFD to expect control packets from the peer every **10000** milliseconds when the BFD echo function is enabled.

```
switch(config)# bfd slow-timer 10000
switch(config)#{
```

15.7.2.4 Configuring BFD for PIM

The [bfd \(Router-PIM Sparse-mode\)](#) command enables or disables Bidirectional Forwarding Detection (BFD) globally for all Protocol-Independent Multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the [pim ipv4 bfd](#) command. The interface-level configuration supersedes the global setting.

Examples

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# bfd
switch(config-router-pim-sparse-ipv4)#{
```

- These commands configure **interface vlan 200** to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# pim ipv4 bfd
switch(config-if-VL200)#{
```

15.7.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the [neighbor bfd](#) command.

Example

These commands enable BFD failure detection for BGP connections with the neighbor at **10.13.64.1**.

```
switch(config)# router bgp 300
switch(config-router-bgp)# neighbor 10.13.64.1 bfd
switch(config-router-bgp)#{
```

15.7.2.6 Configuring BFD for VRRP

To enable or disable Bidirectional Forwarding Detection (BFD) for Virtual Router Redundancy Protocol (VRRP), use the [vrrp bfd ip](#) command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

Example

These commands enable BFD on ***interface ethernet 3/20*** for VRRP ID **15** with a connection to a router at IP address **192.168.2.1**.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#{/pre}
```

15.7.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the [bfd default \(OSPF\)](#) command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the [ip ospf neighbor bfd](#) command. The interface-level configuration supersedes the global setting.

Examples

- These commands enable BFD in OSPF instance **100** for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```
switch(config)# router ospf 100
switch(config-router-ospf)# bfd default
switch(config-router-ospf)#{/pre}
```

- This command enables OSPF BFD on ***interface ethernet 3/21***.

```
switch(config)# interface ethernet 3/21
switch(config-if-Et3/21)# ip ospf neighbor bfd
switch(config-if-Et3/21)#{/pre}
```

15.7.2.8 Configure BFD for IS-IS

The [isis bfd](#) command configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

Examples

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd default#{/pre}
```

```
switch(config-router-af) #
```

- These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6) #
```

15.7.2.9 Configuring BFD Session Telemetry

The BFD session telemetry automatically collects the per-session statistics and the rbfd kernel module statistics at a set interval and stores them in a shared memory where Cloud Vision Portal (CVP) or other applications may collect this information. Also, several new statistics have been added which are updated within the session-stats interval and provides a finer snapshot view of the session health. The BFD session telemetry supports both hardware-accelerated and software (kernel module) accelerated BFD sessions.

Use the **session stats snapshot interval** command to enable the BFD session telemetry. This command is configured under the **router-bfd** configuration mode. By default, this command is disabled and the telemetry interval is set to **0** seconds. A telemetry interval between **10** and **3600** seconds may be configured.

Use the **no** and **default** form of the command to disable the session stats snapshot interval command from the running configuration and sets the telemetry interval is set to .

Example

```
switch(config-router-bfd) # session stats snapshot interval 10
```

A telemetry interval may be configured to a value less than **10** seconds and as little as **1** second using an additional keyword **dangerous**, as follows:

```
switch(config-router-bfd) # session stats snapshot interval dangerous 1
```

However, note that, configurations including a telemetry interval of less than **10** seconds are not advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel module and result in BFD session instability.

15.7.2.10 Configuring S-BFD Hold-down Timers

The **sbfd** command configures S-BFD hold-down timers for SR-TE paths and by default, disabled on the switch. Configure a timer between 1 and 3600 seconds. To enable S-BFD hold-down timer on an SR-TE path, use the following commands:

```
switch(config) # router traffic-engineering
switch(config-te) # segment-routing
switch(config-te-sr) # sbfd hold down seconds seconds
```

Example

To configure an S-BFD hold-down timer for 1800 seconds (3 minutes), use the following commands:

```
switch(config) # router traffic-engineering
switch(config-te) # segment-routing
```

```
switch(config-te-sr) # sbfd hold down 1800 seconds
```

Enabling and disabling S-BFD hold-down timers does not disrupt existing S-BFD sessions, and the timer starts after an S-BFD session state transitions from **Down** to **Up**.

If you configure a new timeout value while a current timer runs, the new value takes effect on the next S-BFD session state transitions from **Down** to **Up**. It does not affect timers for tunnels currently in the **Down** state.

Removing the S-BFD Hold-down Timer configuration takes effect immediately and all current timers stop.

Displaying S-BFD Hold-down Timer Information

Use the **show traffic-engineering segment-routing policy** to display information about the S-BFD Hold-down Timer configuration:

```
switch# show traffic-engineering segment-routing policy
Endpoint 1.0.1.3 Color 20, Counters: not available
    Path group: State: active (for 00:00:12), modified: 00:09:31 ago
        Protocol: Static
        Endpoint provisioning: Static
        Originator: 0.0.0.0(AS0)

                                SBFD Hold Down Time: enabled, state: active (expires in 3594
seconds)
                                    Label Stack: [99999 0], Weight: 1
```

15.7.2.11 Using BFD Status for Faster Failover and Convergence

If a BFD session configured for a routing protocol never transitions to **Up** status, then no transition from **Up** to **Down** required by a Layer 3 forwarding agent to prune out the relevant next hops occurs. Configure the L3 forwarding agent to rely solely on the current BFD session status for determining the next-hop viability rather than relying on BFD transition events.

Use the following command to enable the feature:

```
switch(config) # ip hardware fib bfd mode current all
```

With this configuration, the switch always uses the current status when determining next-hop viability for FECs.

15.7.2.12 Displaying BFD Neighbor Information

Use the [show bfd peers](#) command to display information about Bidirectional Forwarding Detection (BFD) neighbors.

Examples

- This command displays general information about BFD neighbors.

```
switch> show bfd peers
DstAddrMyDiscYoDiscIfUpLDownLdiagState
10.168.1.561613et52_1(81)17151450 0NoDiagnosticUp
10.168.1.581714et52_2(65)17151883 0NoDiagnosticUp
10.168.1.241815et51_1(73)17152175 0NoDiagnosticUp
```

- This command displays detailed information about BFD neighbors.

```
switch> show bfd peers detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3

Detect Time: 900
Registered protocols: bgp

Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up
VRF default, LAddr 10.168.1.59, LD/RD 17/14
Last Up 17151883
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 434235, Tx Count: 434050
Detect Time: 900
Registered protocols: bgp
```

15.7.3 Hardware Accelerated BFD Transmit

Hardware Accelerated BFD Transmit adds support for offloading BFD Transmit path to hardware (ASIC) for specific types of BFD sessions.

Hardware Accelerated BFD Transmit improves accuracy of transmit timer implementations for BFD (especially with fast timers like **50** ms) and relieves pressure on the main CPU in scenarios of scale. The RX packet processing for all BFD sessions is still handled by the BFD agent on the main CPU. The feature does not add any additional timer interval or multiplier configurations.

On supported platforms, hardware acceleration-capable BFD sessions is offloaded by default. Memory resources are required on ASIC to offload sessions (one unit per discriminator). Currently, the number of session discriminators that can be offloaded is restricted to **200** per ASIC.

Only single-hop BFD sessions on front panel ports are capable of being offloaded. In **EOS Release 4.23.0F**, the following sessions types **cannot** be offloaded:

- BFD sessions over Port-Channel Sub-Interfaces
- BFD sessions over L3 Sub-Interfaces
- BFD sessions over an entire Port-Channel (not per member BFD)
- BFD sessions over a Switched Virtual Interface
- BFD sessions over a Loopback interface
- BFD sessions over Tunnel interfaces
- Multi-hop BFD sessions
- BFD sessions with Authentication configured

From *EOS Release 4.23.1F* onwards, the following additional session types **can** be offloaded:

- BFD sessions over L3 Sub-Interfaces

From *EOS Release 4.24.0F* onwards, hardware acceleration is only supported on certain SSO redundancy protocol configured modular systems.

Note: For the purposes of memory management in hardware, each discriminator occupies one unit of memory. When echo mode is enabled on a session, both asynchronous mode and the echo function have separate discriminators and each take up a unit each amongst the 200 available per ASIC.

15.7.3.1 Configuration

The Hardware Accelerated BFD Transmit feature is enabled by default on supported platforms. No explicit configuration is required.

The feature may be disabled using the following command:

```
switch(config-router-bfd) # hardware acceleration disabled
```

15.7.3.2 Show Commands

Hardware Acceleration Information

To view whether hardware acceleration is running use the **show bfd hardware acceleration** command. In this example, hardware acceleration is running.

Example

```
switch(config)# show bfd hardware acceleration
Hardware acceleration is running
```

The following example displays when hardware acceleration is not enabled and the reasons why.

Example

```
switch# show bfd hardware acceleration
Hardware acceleration is not running: user disabled, no eligible sessions, not supported with SSO
```

The reasons listed for when hardware acceleration could be a subset of the following:

- **User disabled:** The feature was explicitly disabled in the CLI configuration.
- **No eligible sessions:** There are no BFD sessions configured that could be hardware accelerated. For example, all current BFD sessions have authentication enabled.
- **Not supported with SSO:** On certain modular systems, the feature is not supported when the redundancy protocol is configured to SSO.

The following example output of the command is when the hardware acceleration feature is not supported on a product:

```
Hardware acceleration is not supported
```

Session Information

Use the **show bfd peers detail** command to display whether an individual session is hardware accelerated or not. An additional line has been added to the command to display hardware acceleration as shown in the following example.

```
switch# show bfd peers detail
VRF name: default
-----
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
Hardware Acceleration: Async On, Echo On
...
```

Async On denotes the Asynchronous Transmit component of the session has been offloaded.

Echo On denotes the Echo Transmit function of the session has been offloaded.

Note: There is no guarantee that both the Asynchronous transmit component and the echo function will be offloaded together to the hardware.

Hardware Acceleration Summary

Use the **show bfd hardware utilization** command to display a summary of the number of offloaded discriminators per ASIC.

Example

```
switch# show bfd hardware utilization
Chip Name    Number Of Sessions   Maximum Number Of Sessions
-----        -----              -----
Jericho0      20                  200
Jerichol      0                   200
```

Detailed Hardware Acceleration Information

Use the **show bfd hardware utilization detail** command to display a detailed list of the BFD discriminators whose transmit path is offloaded can be viewed per ASIC using:

Example

```
switch# show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0
Dst Addr My Disc Interface VRF Type
----- -----
1.1.6.2 3175653802 Ethernet1/1 default normal
1.1.3.2 1151992021 Ethernet2/1 default normal

Chip: Jericho1
Dst Addr My Disc Interface VRF Type
----- -----
```

15.7.3.3 Limitations

The following limitations are associated with the Hardware Accelerated BFD Transmit feature.

- Hardware acceleration is not supported on certain modular systems configured with SSO redundancy protocol.
- Before *EOS Release 4.24.0F*, on 7500 series modular systems with both 7500E series and 7500R series line cards, hardware acceleration is not supported if the systems **Forwarding Mode** is **Arad**, as shown by **show platform sand compatibility** command display output. From the *EOS Release 4.24.0F* onwards, this does not apply because the 7500E series line cards are deprecated.
- Hardware acceleration is not supported on Port-Channel Sub-Interfaces.
- In the *EOS Release 4.23.0F*, hardware acceleration is not supported on L3 Sub-Interfaces.
- Hardware acceleration is not supported on Switched Virtual Interfaces.
- Hardware acceleration is not supported on Port-Channel interfaces (non-per-link BFD).
- Hardware acceleration is not supported on Loopback interfaces.
- Hardware acceleration is not supported on Tunnel interfaces.
- Hardware acceleration is not supported on front-panel or Port-Channel sub-interfaces.
- Hardware acceleration is not supported with Multi-hop BFD.
- Hardware acceleration is not supported when Authentication is enabled.
- Configuring authentication on an already offloaded session results in the session being migrated back to software. Similarly, deconfiguring authentication migrates the session to hardware if the session is hardware acceleration capable and if resources are available on the ASIC in question.
- Hardware acceleration limits the number of accelerated transmit discriminators to 200 per ASIC.
- Configuring more than 200 session discriminators on interfaces attached to an ASIC results in the additional session discriminators falling back to the default software transmit implementation, where the accuracy of transmit timers are dependent on the host CPU load.
- When enabling hardware acceleration with a high enough number of existing offload-capable software sessions, **a flap in some sessions may be observed once at the time of migration from software to hardware**.
- When disabling hardware acceleration with a high enough number of existing offloaded sessions, **a flap in some sessions may be observed once at the time of migration from hardware to software**.
- Sessions are offloaded to hardware in a first-come, first-served fashion. Currently, in an overflow scenario with more than 200 session discriminators per chip, there is no guarantee that shorter intervals are always offloaded.

15.7.4 BFD Commands

BFD Configuration Command

- [bfd echo](#)
- [bfd interval](#)
- [bfd local-address](#)
- [bfd neighbor](#)
- [bfd per-link](#)
- [bfd slow-timer](#)

- [bfd default \(ISIS\)](#)

OSPF-BFD Configuration Commands

- [bfd default \(OSPF\)](#)
- [ip ospf neighbor bfd](#)

PIM-BFD Configuration Commands

- [bfd \(Router-PIM Sparse-mode\)](#)
- [pim ipv4 bfd](#)

QoS-BFD Commands

- [bfd qos dscp](#)

VRRP-BFD Configuration Commands

- [vrrp bfd ip](#)

TE-BFD Configuration Commands

- [sbfd hold down](#)

15.7.4.1 bfd (Router-PIM Sparse-mode)

The **bfd (Router-PIM Sparse-mode)** command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the **pim ipv4 bfd** command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The **no bfd** and **default bfd** commands disable PIM BFD globally by deleting the **bfd** statement from **running-config**. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
bfd  
no bfd  
default bfd
```

Example

These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)# router pim sparse-mode  
switch(config-router-pim-sparse)# ipv4  
switch(config-router-pim-sparse-ipv4)# bfd  
switch(config-router-pim-sparse-ipv4) #
```

15.7.4.2 **bfd default (ISIS)**

The **bfd default** command places the switch in address-family configuration mode.

The **bfd default** and **isis bfd** commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

Command Mode

Router-Address-Family Configuration

Command Syntax

bfd default

Example

These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)# router isis 1
switch(config-router-isis)# address-family ipv4
switch(config-router-af)# bfd default
switch(config-router-af)#{
```

15.7.4.3 **bfd default (OSPF)**

The **bfd default** command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the [ip ospf neighbor bfd](#) command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the [bfd interval](#) command.

The **no bfd default** and **default bfd default** commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the [ip ospf neighbor bfd](#) command.

Command Mode

Router-OSPF Configuration

Command Syntax

```
bfd default  
no bfd default  
default bfd default
```

Examples

These commands enable BFD for OSPF instance **100** on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)# router ospf 100  
switch(config-router-ospf)# bfd default  
switch(config-router-ospf)#{
```

15.7.4.4 bfd echo

The **bfd echo** command enables the BFD echo function on the configuration mode interface.

The **no bfd echo** and **default bfd echo** commands disable the BFD echo function by removing the corresponding **bfd echo** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
bfd echo
```

```
no bfd echo
```

```
default bfd echo
```

Example

These commands enable the BFD echo function on **interface ethernet 5**. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to **2000** milliseconds.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd echo
switch(config-if-Et5) #
```

15.7.4.5 bfd interval

The **bfd interval** command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

Note: For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd interval** and **default bfd interval** commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding **bfd interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
bfd interval transmit_rate min-rx receive_minimum multiplier factor
```

```
no bfd interval
```

```
default bfd interval
```

Parameters

- **transmit_rate** rate in milliseconds at which control packets will be sent. Values range from **50** to **60000**; the default value is **300**.
- **receive_minimum** rate in milliseconds at which control packets will be expected. Values range from **50** to **60000**.
- **factor** number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from **3** to **50**.

Example

These commands configure BFD on **interface ethernet 5** to expect packets from the peer every **200** milliseconds and declare the session down after failing to receive **5** consecutive packets. This configuration overrides any values configured globally.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# bfd interval 200 min-rx 200 multiplier 5
switch(config-if-Et5) #
```

15.7.4.6 **bfd local-address**

The **bfd local-address** command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in *RFC 7130* mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The **no bfd local-address** and **default bfd local-address** commands remove the local L3 address by removing the corresponding **bfd local-address** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
bfd local-address [address]
no bfd local-address [address]
default bfd local-address [address]
```

Parameter

address local IPv4 or IPv6 address for BFD.

Example

This command specifies the local L3 address for BFD.

```
switch(config)# bfd local-address 10.0.0.4
switch(config#
```

15.7.4.7 **bfd neighbor**

The **bfd neighbor** command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in *RFC 7130* mode. For an L2 port channel, this address should be the BFD per-link "local address" globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The **no bfd neighbor** and **default bfd neighbor** commands remove the BFD neighbor address by removing the corresponding **bfd neighbor** command from *running-config*.

Command Mode

Interface-Port-channel Configuration

Command Syntax

```
bfd neighbor [address]
no bfd neighbor [address]
default bfd neighbor [address]
```

Parameter

address IPv4 or IPv6 address of the port channel's BFD neighbor.

Example

These commands specify the L3 address of the port channel's BFD neighbor.

```
switch(config)# interface port-channel 5
switch(config-if-Po5)# bfd neighbor 10.0.0.5
switch(config-if-Po5)#{/pre>
```

15.7.4.8 **bfd per-link**

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be up as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with *RFC 7130*, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the **rfc-7130** keyword to enable per-link in *RFC 7130* mode. You must also configure an L3 BFD neighbor address for each port-channel running *RFC 7130* per-link using the **bfd neighbor** command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the **bfd local-address** command.

For the BFD session to come up, both peers must be configured in the same way (either *rfc-7130* or legacy mode).

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from *running-config*.

Command Mode

Interface-Port-channel Configuration

Command Syntax

```
bfd per-link[rfc-7130]  
no bfd per-link[rfc-7130]  
default bfd per-link[rfc-7130]
```

Examples

- These commands enable the BFD per-link function in legacy mode on **port-channel 5**.

```
switch(config)# interface port-channel 5  
switch(config-if-Po5)# bfd per-link  
switch(config-if-Po5) #
```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in the *rfc-7130* mode on **port-channel 5**, and specify the L3 address of the port channel's BFD neighbor.

```
switch(config)# bfd local-address 10.0.0.5  
switch(config)# interface port-channel 5  
switch(config-if-Po5)# bfd per-link rfc-7130  
switch(config-if-Po5)# bfd neighbor 10.0.0.4  
switch(config-if-Po5) #
```

15.7.4.9 bfd slow-timer

The **bfd slow-timer** command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is **2000** milliseconds.

Note: For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd slow-timer** and **default bfd slow-timer** commands return the BFD slow-timer to the default value of **2000** milliseconds by removing the corresponding **bfd interval** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
bfd slow-timer receive_minimum
no bfd slow-timer
default bfd slow-timer
```

Parameters

receive_minimum rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from **2000** to **60000**; default value is **2000**.

Examples

This command configures BFD to expect control packets from the peer every **10000** milliseconds when the BFD echo function is enabled.

```
switch(config)# bfd slow-timer 10000
switch(config) #
```

15.7.4.10 **bfd qos dscp**

The **bfd qos dscp** allows the configuration of the Differentiated Services Code Point (DSCP) for BFD traffic originating from the local switch to take advantage of Quality of Service (QoS) on the network. The **no bfd qos dscp** and the **default bfd qos dscp** commands remove the feature from the **running-config**.

Command Mode

BFD Router Configuration Mode

Command Syntax

qos dscp *DSCP_value*

Parameter

DSCP_value - Configure a DSCP value from 0 to 63 or the default value of 48.

Example

Use the following commands to set the DSCP value to 25:

```
switch(config) #router bfd
switch(config-router-bfd) #qos dscp 25
```

15.7.4.11 hardware acceleration disabled

Hardware acceleration is enabled by default on supported platforms and no explicit configuration is needed. Use the **hardware acceleration disabled** command to disable hardware acceleration.

Command Mode

BFD configuration mode

Command Syntax

```
hardware acceleration disabled
```

Example

```
switch(config-router-bfd) # hardware acceleration disabled
```

15.7.4.12 ip ospf neighbor bfd

The **ip ospf neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for the Open Shortest Path First protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the **bfd interval** command.

The **no ip ospf neighbor bfd** command disables OSPF BFD on the interface and terminates all BFD sessions with the interface OSPF peers. The **default ip ospf neighbor bfd** command causes the interface to follow global OSPF BFD settings configured by the **bfd default (OSPF)** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf neighbor bfd  
no ip ospf neighbor bfd  
default ip ospf neighbor bfd
```

Examples

- These commands enable BFD on **interface ethernet 3/20**.

```
switch(config)# interface ethernet 3/20  
switch(config-if-Et3/20)# ip ospf neighbor bfd  
switch(config-if-Et3/20) #
```

- These commands cause **interface ethernet 3/20** to follow the global OSPF BFD configuration.

```
switch(config)# interface ethernet 3/20  
switch(config-if-Et3/20)# default ip ospf neighbor bfd  
switch(config-if-Et3/20) #
```

15.7.4.13 isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
isis bfd  
no isis bfd  
default isis bfd
```

Example

These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6  
switch(config-if-Et5/6)# isis bfd  
switch(config-if-Et5/6) #
```

15.7.4.14 neighbor bfd

The **neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for Border Gateway Protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to down as well.

The **no neighbor bfd** and **default neighbor bfd** commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding **neighbor bfd** command from **running-config**.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor NEIGHBOR_ID bfd  
no neighbor NEIGHBOR_ID bfd  
default neighbor NEIGHBOR_ID bfd
```

Parameters

NEIGHBOR_ID IP address or peer group name. Values include:

- **ipv4_addr** neighbor IPv4 address.
- **ipv6_addr** neighbor IPv6 address.
- **group_name** peer group name.

Example

These commands enable BFD failure detection for BGP connections with the neighbor at **10.13.64.1**.

```
switch(config)# router bgp 300  
switch(config-router-bgp)# neighbor 10.13.64.1 bfd  
switch(config-router-bgp) #
```

15.7.4.15 pim ipv4 bfd

The **pim ipv4 bfd** command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the [bfd \(Router-PIM Sparse-mode\)](#) command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The **no pim ipv4 bfd** disables PIM BFD on the configuration mode interface regardless of global settings. The **default pim ipv4 bfd** command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding **pim ipv4 bfd** statement from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

pim ipv4 bfd

no pim ipv4 bfd

default pim ipv4 bfd

Example

These commands configure **interface vlan 200** to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# pim ipv4 bfd
switch(config-if-VL200) #
```

15.7.4.16 show bfd hardware acceleration

The **show bfd hardware acceleration** command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session. The **show bfd peers detail** command displays the status of hardware acceleration.

Command Mode

EXEC

Command Syntax

```
show bfd hardware acceleration
```

Examples

- This command displays the status for hardware acceleration for BFD.

```
switch# show bfd hardware acceleration
Output when hardware acceleration is enabled(default) and running
Hardware acceleration is running
```

- Output when hardware acceleration is disabled with explanation.

```
Hardware acceleration is not running:
user disabled, no eligible sessions, not supported with SSO
```

- Output when hardware acceleration is not supported by switch.

```
Hardware acceleration is not supported
```

15.7.4.17 show bfd hardware utilization

The **show bfd hardware utilization** command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session.

Command Mode

EXEC

Command Syntax

show bfd hardware utilization [INFO_LEVEL]

Parameters

INFO_LEVEL amount of information that is displayed. Options include:

- **no parameter** command displays a summary of offloaded discriminators per ASIC.
- **detail** command displays details of the BFD discriminators whose transmit path is offloaded per ASIC.

Examples

- This command displays a summary of offloaded discriminators per ASIC for BFD.

```
switch# show bfd hardware utilization
Chip Name          Number Of Sessions   Maximum Number Of Sessions
-----  -----
Jericho0           20                  200
Jericho1           0                   200
```

- This command displays a details list of offloaded discriminators per ASIC for BFD.

```
switch# show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0
Dst Addr      My Disc    Interface      VRF      Type
-----  -----
1.1.6.2       3175653802  Ethernet1/1   default   normal
1.1.3.2       1151992021  Ethernet2/1   default   normal

Chip: Jericho1
Dst Addr      My Disc    Interface      VRF      Type
-----  -----
```

15.7.4.18 show bfd peers

The **show bfd peers** command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

Command Mode

EXEC

Command Syntax

show bfd peers [INFO_LEVEL]

Parameters

INFO_LEVEL amount of information that is displayed. Options include:

- **no parameter** command displays data block for each specified interface.
- **detail** command displays table that summarizes interface data.
- **summary** displays the summary of the interface.

Display Values

- **DstAddr** IP address of the BFD neighbor.
- **MyDisc** Local discriminator value of the BFD session.
- **YoDisc** Neighbor's discriminator value for the BFD session.
- **If** Interface to which the neighbor is connected.
- **LUp** Last up.
- **LDown** Last down.
- **Ldiag** Diagnostic for the last change in session state.
- **State** State of the BFD session.
- **TxInt** Transmit interval of the local interface.
- **RxInt** Minimum receive interval set on the local interface.
- **Multiplier** Local multiplier (number of packets that must be missed to declare session down).
- **Received RxInt** Minimum receive interval set on the neighbor interface.
- **Received Multiplier** Neighbor's multiplier (number of packets that must be missed to declare session down).
- **Rx Count** BFD control packets transmitted.
- **Tx Count** BFD control packets received.
- **Detect Time** Total time in milliseconds it takes for BFD to detect connection failure.
- **Registered Protocols** Protocols using BFD with this neighbor.

Examples

- This command displays general information about BFD neighbors.

```
switch> show bfd peers
DstAddr MyDisc YoDisc If LUp LDown Ldiag S
tate
10.168.1.56 16 13 et52_1(81) 17151450 0 No

15.7.4.19 show bfd peers detail

Use the **show bfd peers detail** to display whether an individual session is hardware accelerated or not. An extra line has been added to highlight hardware acceleration.

Command Mode

EXEC

Command Syntax

```
show bfd peers detail
```

Parameter

detail Displays a comprehensive view of the individual session.

Guidelines

- **Async On** Denotes the Asynchronous Transmit component of the session has been offloaded.
- **Echo On** Denotes the Echo Transmit function of the session has been offloaded.

Note: There is no guarantee that both the Asynchronous transmit component and the echo function are offloaded to hardware together.

Example

```
switch# show bfd peers detail
VRF name: default
-----
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
Hardware Acceleration: Async On, Echo On
...
```

15.7.4.20 session stats snapshot interval (BFD)

The `session stats snapshot interval` enables the BFD session telemetry on a switch. By default, this command is disabled and the telemetry interval is set to **0** seconds. A telemetry interval between **10** and **3600** seconds may be configured. A telemetry interval may be configured to a value less than **10** seconds and as small as **1** second using an additional keyword **dangerous**.

Note: Configurations including a telemetry interval of less than **10** seconds are not advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel module and result in BFD session instability.

The `no session stats snapshot interval` and `default session stats snapshot interval` commands disable the BFD telemetry command from the `running-config` and sets the telemetry interval is set to **0**.

Command Mode

Router BFD Configuration

Command Syntax

```
session stats snapshot interval timer_interval dangerous  
no session stats snapshot interval  
default session stats snapshot interval
```

Parameters

- ***timer_interval*** Session statistics timer interval in seconds between 10-3600.
- **dangerous** Set session statistics timer interval less than 10 seconds.

Examples

- The following commands places the switch in router BFD mode and enables the BFD session telemetry. In this example a BFD telemetry session with a time interval of **10** seconds is configured.

```
switch(config)# router bfd  
switch(config-router-bfd)# session stats snapshot interval 10
```

- In this example a BFD telemetry session with a time interval of **1** second is configured using a keyword **dangerous**.

```
switch(config-router-bfd)# session stats snapshot interval dangerous 1
```

15.7.4.21 sbfd hold down

The **sbfd hold down** command configures S-BFD Hold-down Timers on an SR-TE path. The feature enables delaying the steering of traffic to a previously preferred SR-TE Down path returning to the Up status. This allows time for the path to stabilize by avoiding potential further path flapping and provide time to debug and diagnose the failure state.

The **no** version of the command removes the configuration from the running-config. The **default** version of the command disables the feature on the switch, the default behavior.

Command Mode

Traffic Engineering Segment Routing Configuration Mode

Command Syntax

```
sbfd hold down seconds seconds
```

Parameters

seconds seconds - Configure a timer from 1 to 3600 seconds.

Example

Use the following commands to configure a timer for 1800 seconds:

```
switch(config)# router traffic-engineering
switch(config-te)# segment-routing
switch(config-te-sr)# sbfd hold down 1800 seconds
```

15.7.4.22 vrrp bfd ip

The **vrrp bfd ip** command enables and configures Bidirectional Forwarding Detection (BFD) for Virtual Router Redundancy Protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The **no vrrp bfd ip** and **default vrrp bfd ip** commands disable BFD for VRRP on the configuration mode interface by removing the corresponding **vrrp bfd ip** statement from **running-config**. The **no vrrp** command also removes the **vrrp bfd ip** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group bfd ip ipv4_address
```

```
no vrrp group bfd ip
```

```
default vrrp group bfd ip
```

Parameters

- **group** virtual router identifier (VRID). Values range from **1** to **255**.
- **ipv4_address** IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

Example

These commands enable BFD on **interface ethernet 3/20** for VRRP ID **15** with a connection to a router at IP address **192.168.2.1**.

```
switch(config)# interface ethernet 3/20
switch(config-if-Et3/20)# vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20) #
```

15.8 Routing Control Functions

This section discusses the following topics:

- Understanding RCF Language and Syntax
- Configuring RCF Functions
- Using RCF Code with Configuration Sessions
- RCF Function Show Commands
- Router Control Functions Commands

Overview

Routing Control Functions (RCF functions) provide a language for powerful and programmatically expressed route filtering and attribute modification logic. RCF Functions allow network administrators to create very granular and customized routing policies, especially within protocols such as BGP.

RCF configurations define RCF functions to apply at points of application or reused in other RCF functions. Each function consists of a sequence of statements evaluated in the order written. For example, the following RCF function accepts currently configured routes:

```
# Accept all routes as they are
function ACCEPT_ALL() {
    return true;
}
```

The following RCF Function rejects all currently configured routes:

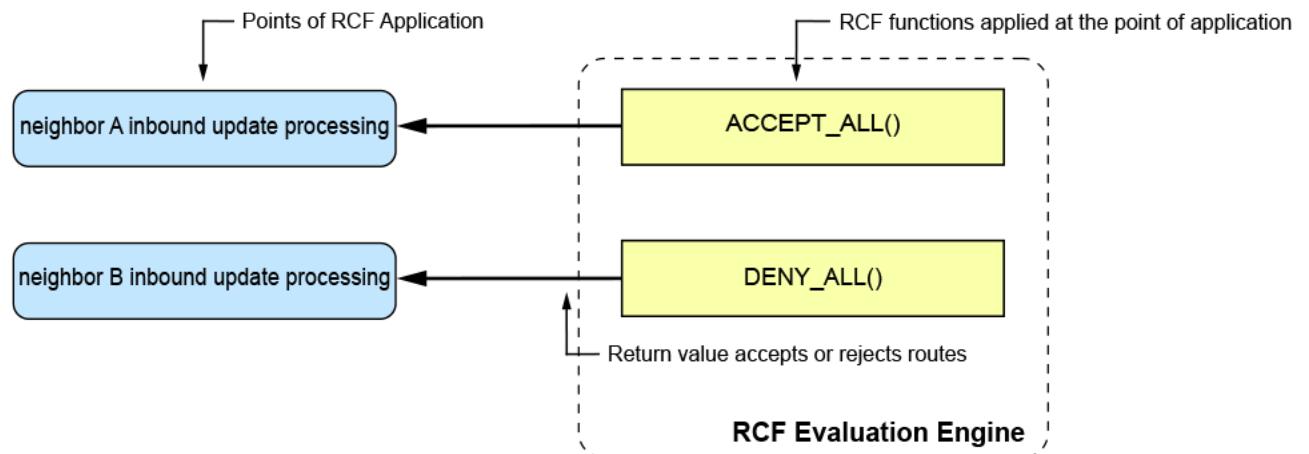

```
# Reject all routes unconditionally
function DENY_ALL() {
    return false;
}
```

The following RCF Function sets the MED to 100 and accepts all routes:

```
# Set the med to 100 and accept all routes
function SET_MED() {
    med = 100;
    return true;
}
```

RCF Functions always return a **true**, **false**, or **unknown** value with possible modifications made to the route attributes in the function.

Figure 15-21: RCF Evaluation Engine

RCF Function Value Actions

- A function returns the value **unknown** if no explicit return statement specified.
- A return value of **true** from an RCF Function applied at a point where the RCF Function application accepts the route with all modifications. A return value of **false** or **unknown** rejects the route.
- If the point of the RCF Function application refers to an RCF Function not configured as part of the RCF code, all routes get rejected at that point of the RCF application. For example, if `ACCEPT_ALL()` applies to peer 192.168.1.1 inbound but no configuration exists for `ACCEPT_ALL`, the switch drops all updates from peer 192.168.1.1.

Reusing RCF Functions with Other RCF Functions

RCF functions can also reuse other RCF functions to call additional RCF functions to perform the following actions:

Note: These examples assume that `FUNC_A()` applies to a Point of Application (POA).

- Make conditional code executions using **if** or **else**.

```
# DEFAULT_ROUTE() returns if the prefix is 0.0.0.0/0 or ::/0

function DEFAULT_ROUTE() {
    return prefix is 0.0.0.0/0 or prefix is ::/0;
}

# All routes are accepted by FUNC_A(). If the route under review
# is the default route, then the med is set to 100.

function FUNC_A() {
    if DEFAULT_ROUTE() {
        med = 100;
    }
    return true;
}
```

- Delegate **return** value evaluation.

```
function DEFAULT_ROUTE() {
    return prefix is 0.0.0.0/0 or prefix is ::/0;
}

# Only accepts the default route. All other prefixes are rejected
```

```

function FUNC_A() {
    # some RCF code
    return DEFAULT_ROUTE();
}

```

- Apply a common set of path attribute modifications.

```

# Modify LOCAL_PREF and AS_PATH attributes. Note that
# TAG_PEERS() returns 'unknown' implicitly since
# no explicit 'return true' or 'return false' is
# specified.

function TAG_PEERS() {
    local_preference = 1000;
    as_path prepend 64501 64502;
}

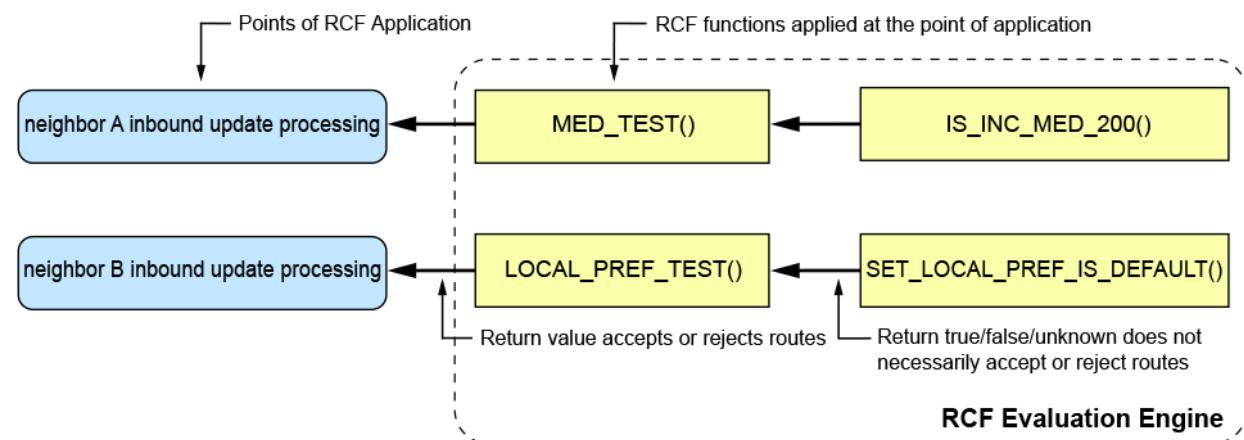

# Reuse TAG_PEERS to apply a common set of path attribute
# modifications. The return value of 'unknown' from
# TAG_PEERS() is ignored.

function FUNC_A() {
    TAG_PEERS();
    return true;
}

```

The RCF return value at the point of application maps to accepting routes, where the return value equals **true**, or rejecting routes, where the return value equals **false** or **unknown**. However, the return value of reused RCF functions does not have to accept or reject routes, as shown in the following example:

Figure 15-22: RCF Evaluation Engine Return Values

```

# Returns if the MULTI_EXIT_DISC is 200 after incrementing
# it by 100
function IS_INC_MED_200() {
    med += 100;
    return med is 200;
}

# MED_TEST() demonstrates that even though IS_INC_MED_200()
# returns true, the route gets rejected because of the
# decision made in MED_TEST()

function MED_TEST() {
    if IS_INC_MED_200() {
        return false;
    }
    return true;
}

# Sets LOCAL_PREF for all routes (in the RCF evaluation

```

```

# engine) to 100. Return true only for 0.0.0.0/0; false
# for all other routes

function SET_LOCAL_PREF_IS_DEFAULT() {
    local_preference = 100;
    return prefix is 0.0.0.0/0;
}
# The return value (true/false) is returned as is from
# LOCAL_PREF_TEST() and thus accepts or rejects routes

function LOCAL_PREF_TEST() {
    # some RCF code
    return SET_LOCAL_PREF_IS_DEFAULT();
}

```

The RCF function allows reusing policy containers such as AS path lists, community lists, IPv4 prefix lists, or IPv6 prefix lists. If an RCF function contains references to undefined AS path lists, community lists, or prefix lists, the switch drops all routes evaluated at this point of RCF function application. Reusing RCF functions allows the use of arbitrary levels of ***if*** or ***else***.

```

function COND_EXAMPLE() {
    if med >= 100 {
        if prefix is 0.0.0.0/0 {
            local_preference = 200;
        } else {
            local_preference = 100;
        }
        return true;
    } else {
        return false;
    }
}

```

RCF functions also support logical expressions using ***and***, ***or***, and ***not***. These expressions return a value of **true** or **false**.

```

function EXPR_EXAMPLE() {
return not ( med >= 100 and ( not prefix match prefix_list_v4 DEFAULT_ROUTE or community match
    community_list CLIST ) );
}

```

The expressions can be short circuited in the following ways:

- With the ***and*** operator, if the first operand returns **false** or **unknown**, no evaluation of the second operand occurs.

```

function SET_MED() {
    med = 100;
    return true;
}

function SHORT_CIRCUITING_1() {
    return false and SET_MED();      # SET_MED() is never
                                    # evaluated
}

```

- With the ***or*** operator, if the first operand returns **true**, no evaluation of the second operand occurs.

```

function SET_MED() {
    med = 100;
    return true;
}

function SHORT_CIRCUITING_2() {
    return true or SET_MED();       # SET_MED() is never
                                    # evaluated
}

```

By default, RCF functions run comparisons against modified path attributes. All modifications of path attributes take immediate effect inside the RCF evaluation engine. All subsequent reads and comparisons of the path attribute return the modified value.

```

function MOD_COMP_EXAMPLE() {
    local_preference = 150;
    return local_preference is 150; # Compares against modified value of local_preference
}

```

In addition, values of unmodified path attributes can be determined.

```

# FUNC() is applied as inbound RCF function

function FUNC() {
    med = 10;
    return input.med is 5 and      # Compare the unmodified value and
    med is 10;                   # the modified value. 'med is 10' is true.
}

```

RCF functions have the ability to perform sequential modifications of the same attribute in a user-defined order:

```

function COMM_MODIFICATIONS() {
    community add community_list COMM_LIST1;    # Add communities from COMM_LIST1
    community remove community_list COMM_LIST2; # Next, remove communities from COMM_LIST2
    return true;
}

```

15.8.1 Understanding RCF Language and Syntax

This topic contains information about using the RCF Language syntax to program RCFs and contains the following sections:

- [Comments](#)
- [Functions](#)
- [Function Calls](#)
- [RCF Function Arguments](#)
- [Trilean Logic States](#)
- [Expressions](#)
- [Logical Operators](#)
- [Sequential Operators](#)
- [Numerical Operators](#)
- [Return Statements](#)
- [Exit Statements](#)
- [Attribute Modification Statements](#)
- [if Conditions](#)
- [Immediate Values](#)
- [Attributes and Functions](#)
- [External References to EOS Policy Constructs](#)
- [External Reference Compilation Checks](#)
- [Using the input Attribute Scope](#)

Comments

Comments begin with a hash tag (#) character and continue to the end of the line. Comments can be placed anywhere in the code.

```

# This comment appears before a function
function DENY_ALL() {
    # comments can appear inside functions too!
}

```

```
    return false;  # This function always returns false
}
```

Functions

The function syntax has the following format:

```
function <FUNCTION_NAME>() {
# statements
}
```

A function name can only contain letters, **a-z**, **A-Z**, numbers **0-9**, and the underscore (**_**) character and must start with a letter or an underscore.

Valid Name Examples

- **MY_FUNCTION_11**
- **MyFunction11**
- **_good_function_11**

Invalid Name Examples

- **9badFunctionName**
- **Bad Function Name**
- **Bad-Function-Name**

RCF Function Calls

An RCF function (callee) can be called from another RCF function (caller), and an RCF function call can be used as part of an expression.

```
<CALLER_FUNCTION_NAME>();
```

For example, the RCF function call has the following syntax:

```
function SET_MED() { med = 100; }

function ACCEPT_ALL() { return true; }

function CALLER() { return local_preference is 10 or ACCEPT_ALL(); }
```

When used as a standalone statement, it must be followed by a semicolon (;**.**).

```
function SET_MED() { med = 100; }

function CALLER() {
    SET_MED();
    return true;
}
```

RCF Function Arguments

RCF functions can optionally accept one or more comma-separated arguments. Functions that accept arguments cannot apply to a point of RCF application.

Define a function argument using one of the following:

- Argument Type
- Argument Name

An argument name must start with a dollar (\$) sign followed by letters, **a-z**, **A-Z**, numbers **0-9** and the underscore (**_**) character, such as **\$GoodArgument** or **\$Good_Argument_11**.

Functions reference arguments by name only and can be used in any of the following ways:

- To the right of a comparison operation
- To the right of a modification operation
- As an argument to a function call

In addition, a trilean type function argument can be used inside of logical and sequential expressions or as a return or exit value.

Use function arguments in the body of the function that defines them. For example,

```
function SET_MED( int_type $arg ) {
    med = $arg;
}
```

An RCF function (caller) calling another RCF function that expects arguments (callee) must satisfy the following requirements:

- Number of passed arguments equals the number of callee arguments.
- Arguments passed in order.
- Caller argument types compatible with the expected argument types of the callee.

Example

Passing an immediate value as a function argument:

```
function SET_MED( int_type $arg, prefix_list_type $list ) {
    if prefix_match $list {
        med = $arg;
    }
}

function CALLER() {
    SET_MED( 100, prefix_list_v4 KNOWN_V4_PREFIXES );
    SET_MED( 100, prefix_list_v6 KNOWN_V6_PREFIXES );
    return true;
}
```

Example

Passing an attribute as a function argument:

```
function PREPEND_ATTRIBUTE_REPEAT_4( as_number_type $arg ) {
    as_path prepend $arg $arg $arg $arg;
}

function CALLER() {
    PREPEND_ATTRIBUTE_REPEAT_4( med );
    return true;
}
```

Example

Passing another function argument as a function argument:

```
function FUNC_C( int_type $arg ) {
    local_preference = $arg;
}

function FUNC_B( int_type $arg ) {
    FUNC_C( $arg );
}

function FUNC_A() {
    FUNC_B( 100 );
    return true;
}
```

Trilean Logic States

RCF functions support **true**, **false**, and **unknown** as trilean values.

Expressions

RCF functions use expressions composed of clauses of the following types:

- Comparisons
 - `local_preference is 100`
- Match operations
 - `prefix match prefix_list_v4 ALLOW_ROUTES`
- Function calls
 - `DEFAULT_ROUTE()`
- Sequential operator expressions
 - `FUNC_A() ?? FUNC_B() ?? true`

Logical Operators

Combine expressions using logical operators such as **and**, **or**, and **not** to form complex expressions. Use parentheses () for grouping and setting precedence. The RCF evaluation engine evaluates the expression from left to right and honors the decreasing precedence of the evaluation:

- parentheses "()"
- **not**
- **and**
- **or**

Examples

- `local_preference is 100`
- `not prefix match prefix_list_v4 PREFIX_LIST_NAME`
- `DEFAULT_ROUTE() and (local_preference >= 100 and community match community_list COMM_LIST) or $arg`

The **not** operator inverts the result of an expression.

Table 81: Not Operator

| NOT | Operand | true | false | unknown |
|--------|---------|-------|-------|---------|
| Result | | false | true | true |

Example

```
not prefix match prefix_list_v4 PREFIX_LIST_NAME
```

Table 82: And Operator

| AND | RHS | true | false | unknown |
|---------|-----|-------|-------|---------|
| LHS | | | | |
| true | | true | false | false |
| false | | false | false | false |
| unknown | | false | false | false |

If the left operand of an **and** operation evaluates to **false** or **unknown**, no evaluation of the second operand occurs.

The **and** operator combines expressions so that both expressions must evaluate to **true** for the entire expression to evaluate to **true**.

Table 83: Or Operator

| OR | RHS | true | false | unknown |
|---------|-----|------|-------|---------|
| LHS | | | | |
| true | | true | true | true |
| false | | true | false | false |
| unknown | | true | false | false |

If the left operand of an **or** operation evaluates to **true**, no evaluation of the second operand occurs.

The **or** operator combines expressions so that either of the expressions must evaluate to **true** for the entire expression to evaluate to **true**.

Sequential Operators

The sequential operator, ?? allows the conditional evaluation of functions in a sequence and has the following syntax:

```
<FUNC1_NAME>() ?? <FUNC2_NAME>()
```

The operator can be repeated to form longer sequences of function invocations:

```
<FUNC1_NAME>() ?? <FUNC2_NAME>() ?? <FUNC3_NAME>() ?? <FUNC4_NAME>()
```

The sequential operator evaluates the first function and takes one of the following actions:

1. If the function invocation returns **true**, the evaluation of the expression terminates and the entire expression returns **true**.
2. If the function invocation returns **false**, the evaluation of the expression terminates and the entire expression returns **false**.
3. If the function invocation returns **unknown**, the sequential operator proceeds to the next function and repeats.

In summary, if a function cannot return a **true** or **false** decision, but returns an **unknown** decision, then the evaluation process proceeds to the next function. When the process reaches the last function in the sequence, the expression returns the value from the last function. For example,

```
function PEER_192_168_1_1_IN() {
    ### RCF function for peer 192.168.1.1.
    # If FUNC_GLOBAL() returns true (or false), accept (or reject) the
    # route immediately.
    # Otherwise, if FUNC ASN100() returns true (or false), accept (or
    # reject) the route immediately.
    # Otherwise, return the result from evaluating FUNC_192_168_1_1_IN().
    return FUNC_GLOBAL() ?? FUNC ASN100() ?? FUNC_192_168_1_1_IN();
}
```

The trailing term can be **true**, **false**, **unknown** or a trilean logic state. This allows defining the default return value when all function invocations return **unknown**.

```
function PEER_192_168_1_1_IN() {
    ### RCF function for peer 192.168.1.1.
    # If the 3 function calls don't return an explicit true or false,
    # accept the route.
    return FUNC_GLOBAL() ?? FUNC ASN100() ?? FUNC_192_168_1_1_IN() ?? true;
```

```

}

function PEER_192_168_1_2_IN( trilean_type $arg ) {
    ## RCF function for peer 192.168.1.2.
    return FUNC_GLOBAL() ?? FUNC ASN100() ?? FUNC_192_168_1_2_IN() ?? $arg;
}

```

Comparing Sequential Expressions, Logical and Expressions, Logical or Expressions, and Statements

Use the four syntaxes with the sequential operator `??`, `and`, `or`, and functions in statements with `(;)` to achieve different goals with function invocations. The following table illustrates the difference between the functions:

Table 84: Comparing Syntaxes

| | |
|---|--|
| <pre> function SEQ_OP() { return FUNC1() ?? FUNC2(); } </pre> | FUNC2() evaluates conditionally and returns the result by SEQ_OP() only if FUNC1() evaluation returns unknown. |
| <pre> function AND() { return FUNC1() and FUNC2(); } </pre> | FUNC2() evaluates conditionally and returns the result by AND() only if FUNC1() evaluation returns true. |
| <pre> function OR() { return FUNC1() or FUNC2(); } </pre> | FUNC2() evaluates conditionally and returns the result by OR() only if FUNC1() evaluation returns false or unknown. |
| <pre> function STMT() { FUNC1(); return FUNC2(); } </pre> | FUNC1() always evaluates. The return value from this invocation is not used. FUNC2() also always evaluates and returns a result by STMT(). |

Numerical Operators

Modification operators on numerical attributes do not allow the result to exceed the range of values valid for the attribute. For example, the result of `local_preference += 100` becomes bounded by **4294967295** and `med -= 10000` becomes bounded by 0.

Return Statements

The `return` statement returns the provided immediate value or the result from evaluating the provided expression to the caller.

```
return true | false | unknown | <ARGUMENT> | <EXPRESSION>;
```

The `return` statement requires a semicolon `(;)` at the end of the statement.

Example

```

function ALWAYS_TRUE() {
    # Example of returning an immediate value
    return true;
}

function DEFAULT_ROUTE() {
    # Example of returning a comparison
    return prefix is 0.0.0.0/0;
}
function RETURN_EXPR() {
    # Example of returning the result of an expression
    return ALWAYS_TRUE() and DEFAULT_ROUTE();
}

```

```

}

function RETURN_ARGUMENT( trilean_type $arg ) {
    # Example of returning an argument
    return $arg;
}

```

Exit Statements

The **exit** statement immediately stops the RCF evaluation and returns the provided immediate value or the result from evaluating the provided expression to the point of application. Use this value at the point of application to accept or reject the route.

```
exit true | false | unknown | <EXPRESSION>;
```

Examples

```

function MAYBE_EXIT_TRUE() {
    # Example of function that may immediately exit true
    if prefix is 1.2.3.0/24 {
        exit true;
    }
}

function MAYBE_SET_MED() {
    # If MAYBE_EXIT_TRUE() exits, med does not set and the policy evaluates to
    # true even though we do not explicitly handle it.
    MAYBE_EXIT_TRUE();
    med = 10;
    return false;
}

```

Attribute Modification Statements

Attribute modification statements use the following syntax:

```
<ATTRIBUTE> <OPERATION> <VALUE>;
```

The statement requires a semicolon (;) at the end.

if Conditions

RCF allows an **if** construct followed by an optional **else if** and concluding with an optional **else** clause.

An **if** syntax without an **else** block:

```
if <EXPRESSION> {
    # if block
}
```

An **if** syntax with an **else** block:

```
if <EXPRESSION> {
    # if block
} else {
    # else block
}
```

An **if** syntax with an **else if** block:

```
if <EXPRESSION1> {
    # if block
} else if <EXPRESSION2> {
    # else if block
} else {
    # else block
}
```

Immediate Values

asdot notation

For operations that include AS number immediate values, four (4) byte AS numbers can be given in the **asdot notation** specified in [RFC5396](#). For example,

```
as_path.origin_as is 1.10
```

Bandwidth Values

For operations that include bandwidth values, immediate values can be expressed as a number immediately followed by a unit. Supported units include **bps**, **Bps**, **Kbps**, **Mbps**, **Gbps**, **KBps**, **MBps**, and **GBps**. For example,

```
ecmp.aggregate_link_bandwidth is 200GBps
ecmp.aggregate_link_bandwidth >= 12.25Mbps
```

MAC Address Notation

For operations that include MAC addresses, immediate values can use colon or dot notation. For example,

```
evpn.mac_ip_route.mac_address is 1a:2b:3c:4d:5e:6f
evpn.mac_ip_route.mac_address is 1a2b.3c4d.5e6f
```

Ethernet Segment Identifier Notation

For operations that include Ethernet Segment Identifiers, structure immediate values as 5 groups of 4 hex characters each, delimited by colons. For example,

```
evpn.mac_ip_route.esi is AAAA:BBBB:CCCC:DDDD:EEEE
```

Sets

RCF functions support a set collection. A set consists of a collection of unique values. When multiple instances of the same value appear, only one takes effect.

```
community add { 100, 200, 300 }
community add { 100, 200, igp.tag }
```

Ranges

RCF supports a range construct with a lower and upper bound value. A value matches against a range if the following parameters true:

- The parameter has a value greater than or equal to the lower bound value.
- The parameter has a value less than or equal to the upper bound value.

If the lower bound value has a greater value than the upper bound value in a given range, no value matches against it. A range can be defined as part of a set collection. For example,

```
as_path.origin_as in { 64500, 64505 to 64510, 64503, 64515 to 64520 }
```

Attributes and Functions

The RCF function language provides a list of supported attributes that can be compared against values or modified. The language also includes built-in functions that provide some predefined functionality.

External References to EOS Policy Constructs

The RCF function can refer to policy constructs in the **running config** external to the RCF configuration called external references. Examples include AS path lists (`as_path_list`), route origin authorization (ROA) tables (`roa_table`), community lists (`community_list`), and extended/large community lists.

Refer to the following examples:

```
return prefix match prefix_list_v4 TEST_PREFIX_LIST;
    community add community_list TEST_COMM_LIST;
```

Define the policy constructs in the ***running config*** before referencing them in an RCF Function.

External Reference Compilation Checks

The **command rcf external reference unconfigured action error** command in the Router General Configuration Mode directs the RCF compiler to treat missing external references as compilation errors in all RCF configuration workflows.

```
switch(config)# router general
switch(config-router-general)# command rcf external reference unconfigured action error
```

EOS disables this feature by default. When disabled, the RCF compiler treats missing external references as errors in interactive workflows such as configuring from the CLI or using configure sessions, and ignores missing external references in non-interactive workflows such as copying or replacing configurations. The following table provides a description of RCF behavior across various workflows:

Table 85: RCF Compilation Behavior

| RCF Compilation Workflows | Default State/Disabled | Enabled |
|---------------------------|------------------------|---------|
| CLI | Error | Error |
| Configure session | Error | Error |
| Copy | Ignored | Error |
| Config replace | Ignored | Error |
| eAPI | Ignored | Error |
| OpenConfig | Ignored | Error |

Using the `input` Attribute Scope

The RCF evaluation engine provides access to the unmodified attribute values, as seen by the evaluation engine at the point of application, during the evaluation of the function.

```
router general
control-functions
code
function INPUT_AND_MODIFIED_LP_CHECK() {
    return input.local_preference is 500 and
           local_preference is 1000;
}

function INBOUND_POLICY() {
    local_preference = 1000;
    return INPUT_AND_MODIFIED_LP_CHECK();
}
EOF
!
```

In the example, `local_preference` modifies to 1000 for all paths in the `INBOUND_POLICY()`. However, `INPUT_AND_MODIFIED_LP_CHECK()` returns `true` only if the `local_preference` value at the start of the RCF evaluation has a value of 500.

15.8.2 Configuring RCF Functions

The EOS configuration contains the RCF function code, and the supported workflows allow adding, modifying, and removing RCF function configurations. Perform RCF function code operations in the Router-General Configuration Mode using the [control-functions](#) configuration commands.

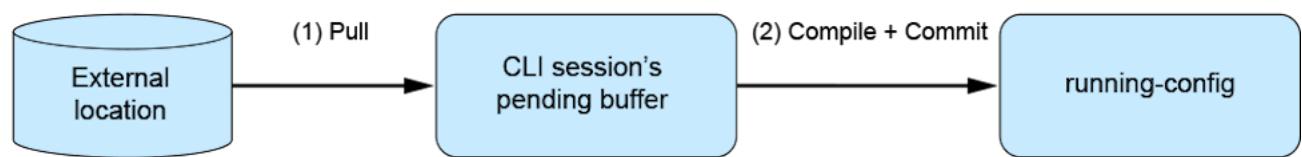

Adding RCF Function Code to the EOS Configuration

Use the following commands to add RCF function code to a pending buffer:

- [edit](#) - Write RCF function code using Nano, a built-in text editor.
- [pull](#) - Load RCF function code from a file.
- [code](#) - Provide RCF function code directly from the CLI.
- [compile](#) - Compile the RCF function code in the pending buffer of the CLI.
- [commit](#) - Commit the RCF function code in the pending buffer of the CLI into the running configuration after successfully compiling the code.

Use the following workflow to add the RCF Function configuration:

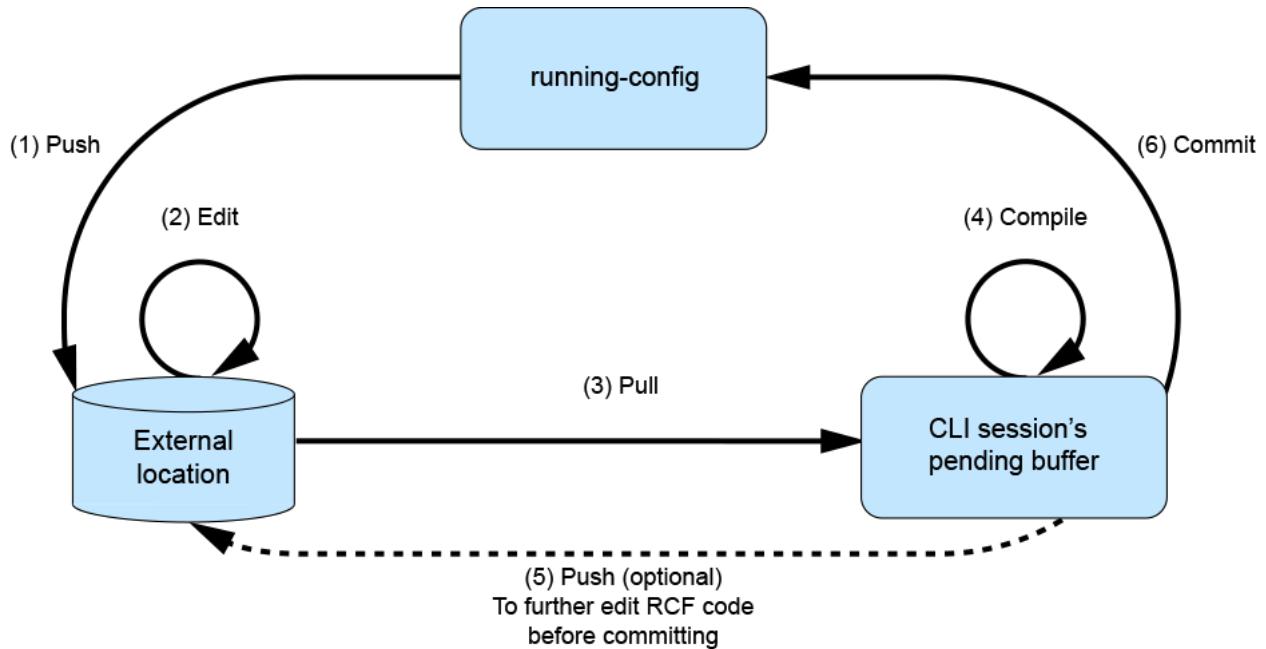

Figure 15-23: RCF Function Configuration Workflow

Modifying RCF Function Code

To modify the RCF function code, push the RCF function code to an external source where you can edit the code, and then pull the modified code into the pending buffer. Next, compile the code successfully and commit the successfully compiled code to the running-configuration.

Figure 15-24: Modifying RCF Function Code

Working with RCF Function Code Units

Organize RCF function code into named code units which consist of zero or more RCF functions. RCF function code units provide the smallest unit of RCF function configuration that you can commit to the running configuration. After compiling the RCF function code units, run the `commit` command to update all modified code units in the running configuration. RCF function code units have the following properties:

- Functions in one code unit may invoke functions in another code unit.
- Function names must be unique across all code units.

The following code example displays the usage of RCF function code units:

```
router general
    control-functions
        code unit COMMON
            function DEFAULT_ROUTE() {
                return prefix is 0.0.0.0/0 or prefix is ::/0;
            }
        EOF
        code unit AS_65535_FUNCTIONS
            function AS_65535_IN() {
                # Rejects default route, accepts all other routes
                if DEFAULT_ROUTE() {
                    return false;
                }
                return true;
            }

            function AS_65535_OUT() {
                # Add a community and advertise all routes
                community add { 64500:200 };
                return true;
            }
        EOF
```

RCF Configuration Examples

Once RCF code units commit to the running configuration, they appear in the `show running-config` output. This preserves the ease of provisioning devices by EOS and keeps all system configurations in a single file.

Pulling, Compiling, and Committing an RCF Code Unit Example

The following example demonstrates RCF pulling, compiling, and then committing two RCF code units to a switch:

```
switch(config)# router general
Arista(config-router-general)# control-functions
Arista(config-router-general-control-functions)# pull unit A replace http://192.168.1.1/rcf-code-unit-a.txt
Arista(config-router-general-control-functions)# pull unit B replace http://192.168.1.1/rcf-code-unit-b.txt
Arista(config-router-general-control-functions)# compile
Compilation successful
Arista(config-router-general-control-functions)# commit
Arista(config-router-general-control-functions)#

```

The `router general` command enters the Router General Configuration Mode, and the `control-functions` command enters the Control Functions Configuration Mode. The two `pull` commands retrieve the RCF code unit text from the specified locations. The `compile` command processes the RCF code units successfully, and the `commit` command puts the configuration into the `running-config` file.

Modifying and Committing an RCF Code Unit Example

The following example demonstrates taking an RCF code unit from the `running-config` file, modifying it, addressing any compilation errors, and committing the RCF code unit to the `running-config` file.

```
switch(config)# router general
switch(config-router-general)# control-functions
```

```
switch(config-router-general-control-functions)# push unit A flash:rcf-code-unit-a.txt
switch(config-router-general-control-functions)# bash vi /mnt/flash/rcf-code-unit-a.txt ! edit
the contents
switch(config-router-general-control-functions)# pull unit A replace flash:rcf-code-unit-a.txt
h(config-router-general-control-functions)# compile
% Error (syntax): line 1:13: mismatched input '{' expecting ')'
switch(config-router-general-control-functions)# push unit A flash:rcf-code-unit-a.txt ! 
optionally push the RCF code unit again
switch(config-router-general-control-functions)# bash vi /mnt/flash/rcf-code-unit-a.txt ! edit
the contents to fix compilation errors
switch(config-router-general-control-functions)# pull unit A replace flash:rcf-code-unit-a.txt
switch(config-router-general-control-functions)# compile
Compilation successful
switch(config-router-general-control-functions)# commit
switch(config-router-general-control-functions)#

```

The **router general** command enters the Router-General Configuration Mode, and the **control-functions** command enters the Control-Functions Configuration Mode. The **push** command pushes the code unit to an external file, then executing the **bash** command allows editing of the code unit. The two **pull** commands retrieve the RCF code unit text from the specified location. The **compile** command runs unsuccessfully and exposes an error in the syntax of the code.

The next two commands push the RCF code to the specified destination where you can modify and fix any errors. The next `pull` command retrieves the corrected file and then the `compile` command reruns the compilation of the new code successfully. The modified RCF code unit replaces the previous code in the *running-config*.

Modifying an RCF Code Unit in the CLI

Add and modify RCF code units directly from the CLI using the `edit unit unit_name` command to open the GNU Nano text editor with the specified RCF code unit content or create a new one. Saving the file and closing the editor writes the content to the pending buffer.

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)# edit unit A
! edit the contents of a code unit
switch(config-router-general-control-functions)# compile
Compilation successful
switch(config-router-general-control-functions)# commit
switch(config-router-general-control-functions)#

```

The `router general` command enters the Router-General Configuration Mode, and the `control-functions` command enters the Control-Functions Configuration Mode. The `edit unit A` command opens the Nano editor to edit or add RCF code unit text. Once saved to the buffer, the `compile` command compiles the code and then the `commit` command adds the RCF code unit to the `running-config`.

15.8.3 Using RCF Code with Configuration Sessions

Add, modify, or delete RCF code using the **configure session** command described in the *Configuration Sessions* topic in the *EOS User Guide*. At the end of the session, use the **commit** command to add the changes to the ***running-config*** on the switch. You must commit the RCF changes while in the Router General Control Functions Configuration Mode and then again after exiting the configure session. If you exit the session before committing the changes, you lose the RCF code changes. The following example demonstrates using a configure session to commit RCF changes to the ***running-config***:

```
switch(config)# configure session
switch(config-s-sess-2)# router general
switch(config-s-sess-2-router-general)# control-functions
switch(config-s-sess-2-router-general-control-functions)# pull unit A replace flash:rcf-code-unit-a.txt
switch(config-s-sess-2-router-general-control-functions)# compile
Compilation successful
switch(config-s-sess-2-router-general-control-functions)#commit      ! RCF code commit
switch(config-s-sess-2-router-general-control-functions)#show session-config
```

```

...
router general
  control-functions
    code unit A
    function ACCEPT_ALL() {
      # Accepts all routes
      return true;
    }

    function DENY_ALL() {
      # Rejects all routes
      return false;
    }
EOF
...
switch(config-s-sess-2-router-general-control-functions)# exit
switch(config-s-sess-2-router-general)# commit      ! session commit

```

Replacing the RCF Configuration

Use the **configure replace url** to replace the running configuration with contents from the specified URL. If the configuration from the URL fails to compile, the entire **configure replace** fails to complete and generates an error log at the end of the command execution.

Copying the RCF Configuration

Use the **copy src_url running-config** and **copy src_url session-config** commands to replace the full RCF code at the destination with the RCF code available at the source if the code compiles successfully. If the RCF code does not compile successfully, EOS ignores the configuration from the source URL. Compilation errors in the RCF code do not affect the copying of other configuration parameters present at the source.

15.8.4 RCF Function Show Commands

Displaying Pending RCF Function Configurations

The **show router rcf pending** command in the Global Configuration Mode or the **show pending** in the Router General Control Functions Configuration Mode displays the contents of the CLI session pending buffer. The output also displays the source of the RCF code unit pull at the top of the uncommitted RCF code.

These commands also display the contents of all RCF code units that take effect after committing the code. The output displays all code units whether or not changes have occurred in the pending buffer.

If the code has no pending changes to commit, the output displays the message, **No pending routing control function changes** at the top of the **show** command output.

```

switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)# pull unit A replace flash:rcf-code-unit-a.txt
switch(config-router-general-control-functions)# show pending
code unit A
! Source: file:/tmp/rcf-code-unit-a.txt
function ACCEPT_ALL() {
  # Accepts all routes
  return true;
}

function DENY_ALL() {
  # Rejects all routes
  return false;
}
EOF
switch(config-router-general-control-functions)# compile
Compilation successful
switch(config-router-general-control-functions)# commit

```

```

switch(config-router-general-control-functions)#
No pending routing control function changes
code unit A
! Source: file:/tmp/rcf-code-unit-a.txt
function ACCEPT_ALL() {
    # Accepts all routes
    return true;
}

function DENY_ALL() {
    # Rejects all routes
    return false;
}
EOF
switch(config-router-general-control-functions)#

```

Displaying the Difference between the Pending Buffer and the Running Configuration

The **show diff** command in the Router General Control Functions Configuration Mode displays the difference between the RCF Function code units in the pending buffer and the RCF Function code units in the ***running-config***.

```

switch(config-router-general-control-functions)#
pull unit A replace file:/tmp/rcf-code-unit-a-
2.txt
switch(config-router-general-control-functions)#
compile
Compilation successful
switch(config-router-general-control-functions)#
show diff
--- running-config: code unit A
+++ pending: code unit A
@@ -7,3 +7,7 @@
    # Rejects all routes
    return false;
}
+
+function DEFAULT_ROUTE() {
+    return prefix is 0.0.0.0/0 or prefix is ::/0;
+}

switch(config-router-general-control-functions)#

```

Displaying an Active RCF Configuration

The **show active** command in the Router General Control Functions Configuration Mode displays the configured RCF Function code units in the ***running-config***.

```

switch(config-router-general-control-functions)#
show active
router general
control-functions
    code unit A source pulled-from flash:rcf-code-unit-a.txt
    code unit A
    function ACCEPT_ALL() {
        # Accepts all routes
        return true;
    }

    function DENY_ALL() {
        # Rejects all routes
        return false;
    }
EOF
switch(config-router-general-control-functions)#

```

Displaying RCF Code Units

The **show router rcf code unit *unit_name*** command in the Router General Control Functions Configuration Mode displays the committed RCF code units in the ***running-config***. RCF code units committed in a configure session only display when the configure session commits changes.

```
switch(config-router-general-control-functions)# show router rcf code unit A
function ACCEPT_ALL() {
    # Accepts all routes
    return true;
}
```

Displaying RCF Function Locations

The **show router rcf function location function_name unit unit_name** command displays the code unit name and starting line number within the code unit for committed RCF function definitions.

Sample RCF Function Configuration

```
router general
  control-functions
    code
      function testA() {
        med = 10;
        return true;
      }

    EOF
    code unit unit2
    function testC() {
      med = 20;
      return true;
    }

    function testB() {
      med = 30;
      return true;
    }

    EOF
    code unit unit3
    function testD() {
      return true;
    }
EOF
```

The **show** output displays all RCF functions across all code units:

```
switch(config-router-general-control-functions)# show router rcf function location
Function Name Code Unit      Line Number
----- -----
testA      unnamed code unit      1
testB      unit2          6
testC      unit2          1
testD      unit3          1
```

Locate all functions in an RCF code unit by adding the **unit unit_name** filter to the command

```
switch(config-router-general-control-functions)# show router rcf function location unit unit2
Function Name Code Unit Line Number
----- -----
testB      unit2          6
testC      unit2          1
```

15.8.5 Router Control Functions Commands

Router General Configuration Mode

- [control-functions](#)

Router Control Functions Commands

- [code](#)
- [code unit](#)
- [commit](#)
- [compile](#)
- [discard](#)
- [edit](#)
- [pull](#)
- [push](#)

Show Commands

- [show active](#)
- [show diff](#)
- [show pending](#)
- [show router rcf function location](#)
- [show router rcf code unit](#)

15.8.5.1 code

The **code** command allows you to add RCF code directly to the switch through the CLI. Access the command through the Router General Control Functions Configuration Mode. Enter the RCF code and type **EOF** to return to the CLI to end the code entry.

Command Mode

Router General Control Functions Configuration

Command Syntax

```
code
```

Example

The following commands add RCF code through the CLI:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-function)# code
Enter RCF code. Type 'EOF' on its own line to end.
# Accept all routes as they are

function ACCEPT_ALL() {
    return true;
}

# Reject all routes unconditionally

function DENY_ALL() {
    return false;
}

# Set the med to 100 and accept all routes

function SET_MED() {
    med = 100;
    return true;
}
EOF
switch(config-router-general-control-function)#

```

The example code accepts and rejects routes based on the configuration.

15.8.5.2 code unit

The **code unit** command allows the organization of RCF code into named code units. A code unit consists of zero or more RCF functions and provides the smallest unit of RCF configuration to commit to the **running-config**. Access this command through the Router General Control Functions Configuration Mode.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
code unit unit_name
```

Parameters

- **code unit *unit_name*** - Enter a name for the code unit function. Function names must be unique across all RCF code units.

Example

Use the following commands to create an RCF code unit with the name *BGPRoute*:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-function)# code unit BGPRoute
Enter RCF code. Type 'EOF' on its own line to end.
    function AS_65535_OUT() {
        # Add a community and advertise all routes
        community add { 64500:200 };
        return true;
    }
EOF
switch(config-router-general-control-function)#

```

15.8.5.3 commit

The **commit** command adds all modified code units from the pending buffer to the ***running-config***. Access this command in the Router General Control Functions Configuration Mode.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
commit
```

Example

Use the following commands to commit compile RCF code in the configuration buffer:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)# commit
```

15.8.5.4 **compile**

The **compile** command compiles all modified code units from the pending buffer and unmodified code units from the running configuration. Access this command in the Router General Control Functions Configuration Mode.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

`compile`

Example

Use the following commands to compile RCF code in the configuration buffer:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)# compile
Compilation successful
```

15.8.5.5 control-functions

The **control-functions** command enters the Router Control Functions Configuration Mode. From this configuration mode, configure Router Control Functions.

Command Mode

Router General Configuration Mode

Command Syntax

```
control-functions
```

Example

Use the following commands to enter the Router Control Functions Configuration Mode:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)#

```

15.8.5.6 **discard**

The **discard** command discards the contents of the pending buffer for the specified code unit, or all code units if specified. Access the command through the Router General Control Functions Configuration Mode.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
discard [unit unit_name | all]
```

Parameters

- **unit *unit_name*** - Specify the name of the code unit to discard changes from the pending buffer.
- **all** - Specify to discard all changes from the pending buffer.

Examples

- Use the following command to discard changes for code unit, *TestB*, from the pending buffer:

```
switch(config-router-general-control-functions)# discard TestB
```

- Use the following command to discard all changes from the pending buffer:

```
switch(config-router-general-control-functions)# discard all
```

15.8.5.7 edit

The **edit** command allows you to edit RCF code using a **GNU nano** text editor. Access the command through the Router General Control Functions Configuration Mode. Enter the RCF code and type **EOF** to end the code entry. Exit the **nano** editor using the keyboard command **Ctrl+X**.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

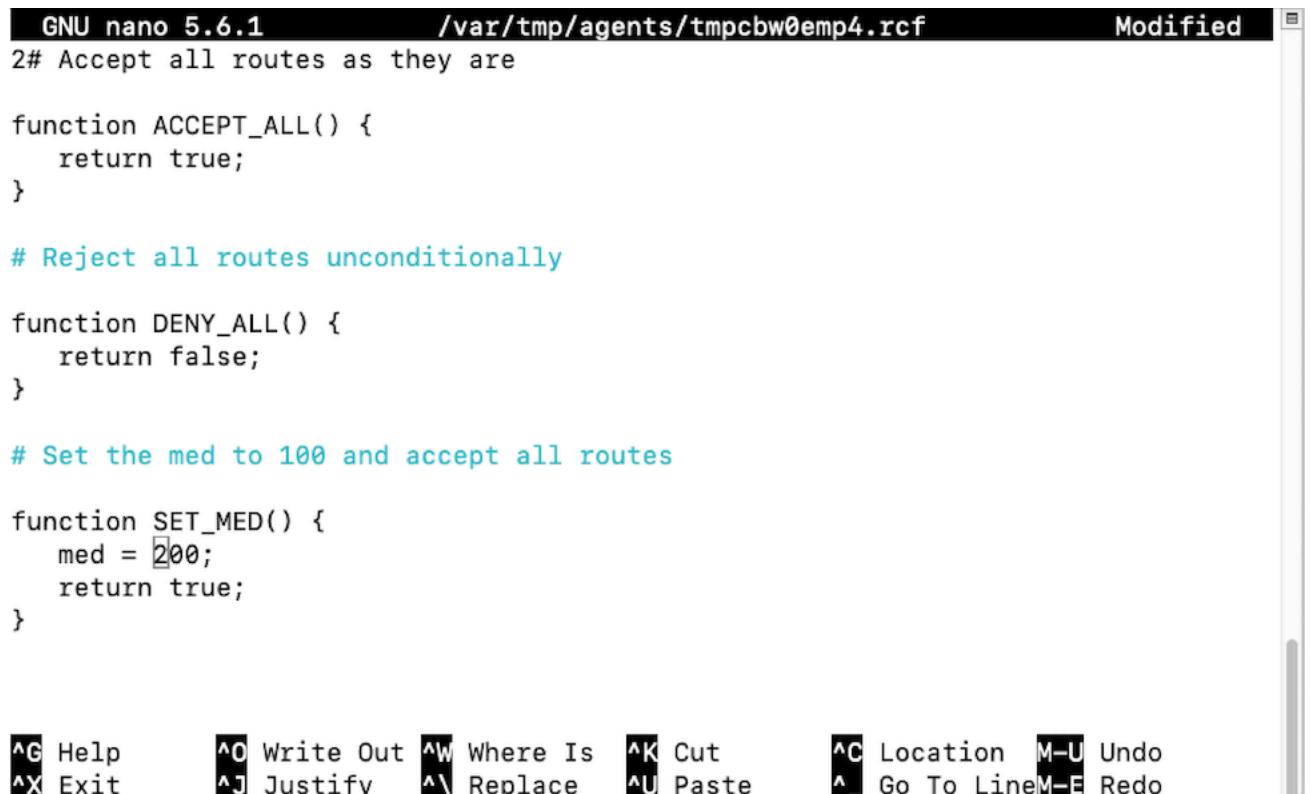

```
edit
```

Example

Use the following commands to edit the RCF code and set the *med* = 200:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-function)# edit
```

Figure 15-25: Editing the RCF Code Using the nano Editor

```
GNU nano 5.6.1          /var/tmp/agents/tmpcbw0emp4.rcf      Modified
2# Accept all routes as they are

function ACCEPT_ALL() {
    return true;
}

# Reject all routes unconditionally

function DENY_ALL() {
    return false;
}

# Set the med to 100 and accept all routes

function SET_MED() {
    med = 200;
    return true;
}
```

| | | | | | |
|----------------|---------------------|--------------------|-----------------|---------------------|-----------------|
| ^G Help | ^O Write Out | ^W Where Is | ^K Cut | ^C Location | M-U Undo |
| ^X Exit | ^J Justify | ^V Replace | ^U Paste | A Go To Line | M-E Redo |

The example code changes the *med* = 200. Use the keyboard command **Ctrl+X** to exit the editor. Enter **Y** to save the configuration. Use the **Enter** key to save the file and return to the CLI.

```
switch(config-router-general-control-functions) #
```

15.8.5.8 pull

The **pull** command allows the population of the pending buffer for the specified code unit with the contents of the file located at the specified URL. Pulling in unnamed code units compiles the code automatically. Access the command through the Router General Control Functions Configuration.

Command Mode

Router General Control Functions Configuration

Command Syntax

pull arg

Parameters

arg - Enter a URL or other file location to pull the RCF code. to the switch.

Example

Use the following commands to pull RCF code from <http://www.mysite.com/file.2025-03-24-1719.txt>.

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-function)# pull http://www.mysite.com/file
Saving config with label http://www.mysite.com/file.2025-03-24-1719.txt and timestamp to startup-
config.
% Total    % Received % Xferd  Average Speed   Time     Time      Time  Current
          Dload  Upload   Total Spent   Left Speed
0         0       0       0       0       0 0:00:00 0:00:00 0:00:00 0
0         0       0       0       0       0 0:00:00 0:00:00 0:00:00 0

> copy tftp://tactools.sjc.aristanetworks.com/configs/push-pull/tg213.http://www.mysite.com/file.2
025-03-24-1719.txt..txt flash:startup-config
switch(config-router-general-control-function)#

```

The example code pulls the RCF code with the filename, *file.2025-03-24-1719.txt*, from an external site. Compile the RCF code and commit the code to the running configuration.

15.8.5.9 push

The **push** command pushes the content of the specified code unit from the pending buffer to the location identified by the URL. If the contents have not changed, the switch uses the code unit contents from the **running-config**. Access the command through the Router General Control Functions Configuration Mode.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

push arg

Parameters

push arg - Enter a URL or other file location to push the RCF for editing externally.

Example

Use the following commands to push RCF code to <http://www.mysite.com/file>:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-function)# push http://www.mysite.com/file
Attempting to save configuration using label "http://www.mysite.com/file" and timestamp
2025-03-24-1719
Saving to tftp://tactools.sjc.aristanetworks.com/configs/push-pull/tg213.http://www.mysite.com/
file.2025-03-24-1719.txt
Restore this configuration by executing "pull http://www.mysite.com/file 2025-03-24-1719"
% Total % Received % Xferd Average Speed Time Time Current
Dload Upload Total Spent Left Speed
0 3757 0 0 0 0 0 0 0 0 0 0 0 0 0
0 3757 0 0 0 0 0 0 0 0 0 0 0 0 0

> copy running-config tftp://tactools.sjc.aristanetworks.com/configs/push-pull/tg213.http://
www.mysite.com/file.2025-03-24-1719.txt
switch(config-router-general-control-function)#

```

The example code pushes the RCF code to an external site with the filename *file.2025-03-24-1719.txt*. Edit the file using a text editor and then use the **pull** command to add the modified configuration to the switch.

15.8.5.10 show active

The **show active** command in the Router General Control Functions Configuration Mode displays the configured RCF Functions on the switch.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

show active [all]

Parameters

all - Displays configuration with default values.

Example

Use the following commands to display the active RCF configuration:

```
switch(config-router-general-control-functions)# show active
router general
    control-functions
        code unit A source pulled-from flash:rcf-code-unit-a.txt
        code unit A
        function ACCEPT_ALL() {
            # Accepts all routes
            return true;
        }

        function DENY_ALL() {
            # Rejects all routes
            return false;
        }
    EOF
switch(config-router-general-control-functions)#

```

The output displays **code unit A** in the configuration.

15.8.5.11 show diff

The **show diff** command in the Router General Control Functions Configuration Mode displays the difference between the RCF code units in the pending buffer and the RCF code units in the running configuration.

Command Mode

Router General Control Functions Configuration

Command Syntax

```
show diff
```

Example

Use the following commands to display the difference between the RCF code units in the pending buffer and the running configuration:

```
switch(config-router-general-control-functions)# pull unit A replace file:/tmp/rcf-code-unit-a-2.txt
switch(config-router-general-control-functions)# compile
Compilation successful
switch(config-router-general-control-functions)# show diff
--- running-config: code unit A
+++ pending: code unit A
@@ -7,3 +7,7 @@
    # Rejects all routes
    return false;
}
+
+function DEFAULT_ROUTE() {
+    return prefix is 0.0.0.0/0 or prefix is ::/0;
+}

switch(config-router-general-control-functions)#

```

From the output, the difference, **DEFAULT_ROUTE**, displays in text surrounded by a plus (+) sign.

15.8.5.12 show pending

The **show pending** command in the Router General Control Functions Configuration mode displays the contents of the CLI session pending buffer. The output also displays the source of the RCF code unit pull at the top of the uncommitted RCF code unit.

These commands also display the contents of all RCF code units that take effect after committing the code. The output displays all code units whether or not changes have occurred in the pending buffer.

If the code has no pending changes to commit, the output displays the message, **No pending routing control function changes** at the top of the show command output.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
show pending
```

Example

Use the following commands to display pending changes to RCF code:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)# pull unit A replace flash:rcf-code-unit-a.txt
switch(config-router-general-control-functions)# show pending
code unit A
! Source: file:/tmp/rcf-code-unit-a.txt
function ACCEPT_ALL() {
    # Accepts all routes
    return true;
}

function DENY_ALL() {
    # Rejects all routes
    return false;
}
EOF
switch(config-router-general-control-functions)# compile
Compilation successful
switch(config-router-general-control-functions)# commit
switch(config-router-general-control-functions)# show pending
No pending routing control function changes
code unit A
! Source: file:/tmp/rcf-code-unit-a.txt
function ACCEPT_ALL() {
# Accepts all routes
return true;
}

function DENY_ALL() {
# Rejects all routes
return false;
}
EOF
switch(config-router-general-control-functions)#

```

The output displays code unit A as pending in the CLI session buffer. Executing the **compile** command invokes the RCF compilation engine and compiles the code unit. Executing the **commit** command saves the changes to the **running-config**. Rerunning the **show pending** displays the **No pending routing control function changes** at the top of the show command output.

15.8.5.13 show router rcf code unit

The **show router rcf code unit *unit_name*** command in the Router General Control Functions Configuration Mode displays the committed RCF code units in the ***running-config***. RCF code units committed in a configure session only display when the configure session commits changes.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
show router rcf code unit unit_name
```

Parameters

unit_name - Specify the name of the RCF code unit to display information.

Example

Use the following command to display *code unit A* information:

```
switch(config-router-general-control-functions)# show router rcf code unit A
function ACCEPT_ALL() {
    # Accepts all routes
    return true;
}
```

15.8.5.14 show router rcf function location

The **show router rcf function location function *function_name* unit *unit_name*** command in the Router General Control Functions Configuration Mode displays the code unit name and starting line number within the code unit for committed RCF function definitions.

Command Mode

Router General Control Functions Configuration Mode

Command Syntax

```
show router rcf function location [function function_name][unit unit_name]
```

Parameters

- **function *function_name*** - Filter the output by RCF function.
- **unit *unit_name*** - Filter the output by RCF code unit.

Example

Sample RCF Function Configuration

```
router general
    control-functions
        code
            function testA() {
                med = 10;
                return true;
            }

        EOF
        code unit unit2
            function testC() {
                med = 20;
                return true;
            }

            function testB() {
                med = 30;
                return true;
            }

        EOF
        code unit unit3
            function testD() {
                return true;
            }
        EOF
```

The show output displays all RCF functions across all code units:

```
switch(config-router-general-control-functions)# show router rcf function location
Function Name Code Unit      Line Number
-----
testA      unnamed code unit      1
testB      unit2          6
testC      unit2          1
testD      unit3          1
```

Locate all functions in an RCF code unit by adding the **unit *unit_name*** filter to the command:

```
switch(config-router-general-control-functions)# show router rcf function location unit unit2
Function Name Code Unit Line Number
-----
testB      unit2          6
testC      unit2          1
```

15.8.6 RCF - BGP Agent Support

This section covers the following topics:

- Configuring an RCF Function for BGP Points of Applications
- [Displaying the Operational Status of the RCF](#)

Configuring RCF for BGP Points of Applications

RCF functions filter routes and update route attributes at different points of application in BGP.

Configuring an Instance

The following configuration statements allow filtering and modifying path attributes while instantiating IPv4 Unicast and IPv6 Unicast AFI/SAFI paths from the respective sources such as the RIB, VPN AFI/SAFI, and more.

Redistribute Statement

Table 86: connected

| Syntax | Example |
|---|---|
| <pre>router bgp ASN [vrf NAME] redistribute connected rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 redistribute connected rcf CONNECTED_POLICY()</pre> |

Table 87: dynamic

| Syntax | Example |
|---|---|
| <pre>router bgp ASN [vrf NAME] redistribute dynamic rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 redistribute dynamic rcf DYNAMIC_POLICY()</pre> |

Table 88: EOS SDK

| Syntax | Example |
|--|--|
| <pre>router bgp ASN [vrf NAME] redistribute user rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 redistribute user rcf EOS_SDK_POLICY()</pre> |

Table 89: isis

| Syntax | Example |
|--|--|
| <pre>router bgp ASN [vrf NAME] redistribute isis (level-1 level-2 level-1-2) rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 redistribute isis level-1 rcf LEVEL_1_POLICY()</pre> |

Table 90: static

| Syntax | Example |
|--|---|
| <pre>router bgp ASN [vrf NAME] redistribute static rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 redistribute static rcf STATIC_POLICY()</pre> |

MPLS L3 VPN import

The **IMPORT_FUNCTION_NAME()** function applies to the unicast route created on import. The unicast route attributes populate with the BGP Customer Attribute Set per [RFC 6368](#) if it exists, otherwise, the function uses the VPN path attributes.

The **VPN_FUNCTION_NAME()** function applies to the VPN route imported using the provider attributes. Modifications to path attributes in the **VPN_FUNCTION_NAME()** function don't apply to the provider path.

Table 91: import

| Syntax | Example |
|--|--|
| <pre>router bgp ASN [vrf NAME] route-target import (vpn-ipv4 vpn- ipv6) rcf IMPORT_FUNCTION_NAME() [vpn-route filter-rcf VPN_FUNCTION_ NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 route-target import vpn-ipv4 rcf IMPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES()</pre> |

MPLS L3 VPN export

The **EXPORT_FUNCTION_NAME()** function applies to the unicast route created on export. The unicast route path attributes populate a BGP Customer Attribute Set if the iBGP as PE-CE Protocol fr BGP/MPLS L3 VPNS configured per [RFC 6368](#), these attributes do not modify in the policy.

The **VPN_FUNCTION_NAME()** function applies to the VPN route exported. Modifications to path attributes in the **VPN_FUNCTION_NAME()** function apply to the provider path.

/p>

Table 92: import

| Syntax | Example |
|--|--|
| <pre>router bgp ASN [vrf NAME] route-target export (vpn-ipv4 vpn- ipv6) rcf EXPORT_FUNCTION_NAME() [vpn-route filter-rcf VPN_FUNCTION_ NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 route-target export vpn-ipv4 rcf EXPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES() route-target export vpn-ipv6 rcf EXPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES()</pre> |

L3 EVPN import

The **IMPORT_FUNCTION_NAME()** function applies to the unicast route created on import.

Table 93: import

| Syntax | Example |
|--|---|
| <pre>router bgp ASN [vrf NAME] route-target import evpn rcf IMPORT_FUNCTION_NAME()</pre> | <pre>router bgp 64500 vrf VRF1 route-target import evpn rcf IMPORT_POLICY()</pre> |

L3 EVPN export

The **EXPORT_FUNCTION_NAME()** function applies to the EVPN route created on export.

Table 94: import

| Syntax | Example |
|--|---|
| <pre>router bgp ASN [vrf NAME] route-target export evpn rcf EXPORT_FUNCTION_NAME()</pre> | <pre>router bgp 64500 vrf VRF1 route-target export evpn rcf IMPORT_POLICY()</pre> |

Aggregate-Address Configuration

The **AGGREGATE_ATTRIBUTES_FUNCTION()** function uses the generated aggregate route and the aggregate path attributes of the aggregate contributor roles as input to the function.

Table 95: Aggregate-Address Function

| Syntax | Example |
|---|---|
| <pre>router bgp ASN aggregate-address prefix as-set attribute rcf AGGREGATE_ATTRIBUTES_FUNCTION()</pre> | <pre>router bgp 64500 aggregate-address 192.0.2.0/24 attribute rcf AGGREGATE_FUNCTION()</pre> |

15.8.6.1 IPv4 and IPv6 Labeled Unicast**Inbound BGP Neighbor Application****Table 96: Inbound Neighbor Application**

| Syntax | Example |
|---|---|
| <pre>address-family (ipv4 ipv6) labeled-unicast neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 labeled-unicast neighbor 192.0.2.1 rcf in INBOUND_POLICY() address-family ipv6 labeled-unicast neighbor 192.0.2.1 rcf in INBOUND_POLICY()</pre> |

Outbound BGP Neighbor Application

Table 97: Outbound Neighbor Application

| Syntax | Example |
|---|--|
| address-family (ipv4 ipv6) labeled-unicast neighbor (<i>NEIGHBOR</i> <i>PEER_GROUP</i>) rcf in <i>FUNCTION_NAME()</i> | router bgp 64500 address-family ipv4 labeled-unicast neighbor 192.0.2.1 rcf in <i>OUTBOUND_POLICY()</i> address-family ipv6 labeled-unicast neighbor 192.0.2.1 rcf in <i>OUTBOUND_POLICY()</i> |

LDP Tunnel Distribution

Only the IPv4 Labeled Unicast Address Family supports LDP tunnel redistribution.

Table 98: LDP Tunnel Redistribution

| Syntax | Example |
|---|--|
| address-family ipv4 labeled-unicast tunnel source-protocol ldp rcf <i>FUNCTION_NAME()</i> | router bgp 64500 address-family ipv4 labeled-unicast tunnel source-protocol ldp rcf <i>LDP_POLICY()</i> |

IS-IS Segment Routing Tunnel Redistribution

Only the IPv4 Labeled Unicast Address Family supports IS-IS Segment Routing Tunnel Redistribution.

Table 99: IS-IS Segment Routing Tunnel Redistribution

| Syntax | Example |
|--|---|
| address-family ipv4 labeled-unicast tunnel source-protocol isis segment-routing rcf <i>FUNCTION_NAME()</i> | router bgp 64500 address-family ipv4 labeled-unicast tunnel source-protocol isis segment- routing rcf <i>SR_POLICY()</i> |

15.8.6.2 IPv4 and IPv6 Unicast Address Family

Inbound BGP Neighbor Application

Table 100: EOS CLI Support

| Syntax | Example |
|--|---|
| <pre>address-family (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() address-family ipv6 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y()</pre> |

Outbound BGP Neighbor Application**Table 101: EOS CLI Support**

| Syntax | Example |
|---|---|
| <pre>address-family (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() address-family ipv6 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y()</pre> |

Redistribute Statement**Table 102: connected**

| Syntax | Example |
|--|---|
| <pre>address-family (ipv4 ipv6) redistribute connected rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 redistribute connected rcf CONNECTED_POLICY() address-family ipv6 redistribute connected rcf CONNECTED_POLICY()</pre> |

Table 103: dynamic

| Syntax | Example |
|--|---|
| <pre>address-family (ipv4 ipv6) redistribute dynamic rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 redistribute dynamic rcf DYNAMIC_POLICY() address-family ipv6 redistribute dynamic rcf DYNAMIC_POLICY()</pre> |

Table 104: isis

| Syntax | Example |
|---|---|
| <pre>address-family (ipv4 ipv6) redistribute isis (level-1 level-2 level-1-2) rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 redistribute isis level-1 rcf LEVEL_1_POLICY() address-family ipv6 redistribute isis level-1 rcf LEVEL_1_POLICY()</pre> |

Table 105: static

| Syntax | Example |
|---|---|
| <pre>address-family (ipv4 ipv6) redistribute static rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family ipv4 redistribute isis level-1 rcf LEVEL_1_POLICY() address-family ipv6 redistribute isis level-1 rcf LEVEL_1_POLICY()</pre> |

Network Statement

The **NETWORK_FUNCTION()** evaluates the route injected into BGP through the network statement.

Table 106: Network Statement

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) network <i>prefix</i> rcf FUNCTION_NAME >()</pre> | <pre>router bgp 64500 address-family ipv4 network 192.0.2.0/24 rcf NETWORK_FUNCTION() address-family ipv6 network 2001:DB8::/32 rcf NETWORK_FUNCTION()</pre> |

MPLS L3 VPN Import

The **IMPORT_FUNCTION_NAME()** function applies to the unicast route created on import. The unicast route attributes populate with the BGP Customer Attribute Set ([RFC 6368](#)) if it exists, otherwise uses the VPN path attributes.

The **VPN_FUNCTION_NAME()** applies to the VPN route imported using the provider attributes. Modifications to the path attributes in the **VPN_FUNCTION_NAME()** do not apply to the provider path.

Table 107: MPLS L3 VPN Import

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) route-target import (vpn-ipv4 vpn-ipv6) rcf IMPORT_FUNCTION_NAME() [vpn-route filter- rcf VPN_FUNCTION_NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 route-target import vpn- ipv4 rcf IMPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES() address-family ipv6 route-target import vpn- ipv6 rcf IMPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES()</pre> |

MPLS L3 VPN Export

The **EXPORT_FUNCTION_NAME()** function applies to the unicast route created on export. The unicast route path attributes push into a **BGP Customer Attribute Set** if you configured iBGP as PE-CE for BGP/MPLS L3 VPNs. The **VRF_FUNCTION_NAME()** function applies to the unicast route to export. Modifications to the **VRF_FUNCTION_NAME()** function do not apply to the provider path.

Table 108: MPLS L3 VPN Export

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) route-target export (vpn-ipv4 vpn-ipv6) rcf EXPORT_FUNCTION_NAME() [vpn-route filter- rcf VRF_FUNCTION_NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 route-target export rcf EXPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES() address-family ipv6 route-target export vpn- ipv6 rcf EXPORT_POLICY() vpn-route filter-rcf FILTER_VPN_ROUTES()</pre> |

L3 EVPN Import

The **IMPORT_FUNCTION_NAME()** function applies to the unicast route created on import.

Table 109: L3 VPN Import

| Syntax | Example |
|---|--|
| <pre>address-family (ipv4 ipv6) route-target import evpn rcf IMPORT_FUNCTION_NAME()</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 route-target import evpn rcf IMPORT_POLICY() address-family ipv6 route-target import evpn rcf IMPORT_POLICY()</pre> |

L3 EVPN Export

The `EXPORT_FUNCTION_NAME()` function applies to the unicast route created on export.

Table 110: L3 VPN Export

| Syntax | Example |
|---|--|
| <pre>address-family (ipv4 ipv6) route-target export evpn rcf EXPORT_FUNCTION_NAME()</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 route-target export evpn rcf EXPORT_POLICY() address-family ipv6 route-target import evpn rcf EXPORT_POLICY()</pre> |

Default Route Originate Neighbor Application

The neighbor default-originate feature advertises a default route to the neighbor (peer or peer-group) even when no default route exists in the BGP RIB.

Table 111: Default Route Originate Neighbor Application

| Syntax | Example |
|---|---|
| <pre>address-family (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) default-originate [always] [rcf FUNCTION_NAME()]</pre> | <pre>router bgp 64500 address-family ipv4 neighbor 192.0.2.1 default- originate always rcf DEFAULT_ORIGI- NATE_POLICY() address-family ipv6 neighbor 192.0.2.1 default- originate always rcf DEFAULT_ORIGI- NATE_POLICY()</pre> |

MPLS L3 Default Route Export

Table 112: MPLS L3 Default Route Export

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) default-route export (vpn- ipv4 vpn-ipv6) [always] [rcf FUNCTION_NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 default-route export vpn- ipv4 rcf EXPORT_POLICY() address-family ipv6 default-route export vpn- ipv6 rcf EXPORT_POLICY()</pre> |

L3 EVPN Default Route Export

Table 113: L3 Default Route Export

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) default-route export evpn [always] [rcf FUNCTION_NAME()]</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 default-route export evpn always rcf DEFAULT_EXPORT_POLICY() address-family ipv6 default-route export evpn always rcf DEFAULT_EXPORT_POLICY()</pre> |

Next Hop Resolution RIBS

If configuring an inbound policy for the same VRF and address-family, the **RESOLUTION_RIBS_POLICY()** function applies to the result of the inbound policy. Otherwise, the function applies directly to inbound routes.

The next hop of the route becomes unresolved if the RCF applied at this point of the application returns any of the following during the evaluation:

- Returns false.
- Returns no value
- Does not modify the **resolution_routes** attribute.

Table 114: Next Hop Resolution RIBS

| Syntax | Example |
|--|--|
| <pre>address-family (ipv4 ipv6) next-hop resolution ribs rcf FUNCTION_NAME()</pre> | <pre>router bgp 64500 vrf VRF1 address-family ipv4 next-hop resolution ribs rcf RESOLUTION_RIBS_POLICY() address-family ipv6 next-hop resolution ribs rcf RESOLUTION_RIBS_POLICY()</pre> |

15.8.6.3 IPv4 and IPv6 Multicast Address Family

Aggregate Address Configuration

The generated aggregate route evaluates the **AGGREGATE_ATTRIBUTES_FUNCTION_NAME()** function. The aggregate path attributes of the aggregate contributor routes takes the function as input.

Table 115: Aggregate Address Configuration

| Syntax | Example |
|--|---|
| <pre>address-family (ipv4 ipv6) multicast aggregate-address prefix [as-set] attribute rcf AGGREGATE_ATTRIBUTES_FUNCTION_NAME()</pre> | <pre>address-family ipv4 multicast aggregate-address 192.0.2.0/24 attribute rcf AGGREGATE_ATTRIBUTES_FUNCTION()</pre> |

Unicast Redistribution

Table 116: Unicast Redistribution

| Syntax | Example |
|--|---|
| <pre>address-family (ipv4 ipv6) multicast route input address-family (ipv4 ipv6) unicast rcf ROUTE_INPUT_FUNCTION_NAME()</pre> | <pre>address-family ipv4 multicast route input address-family ipv4 unicast rcf ROUTE_INPUT_FUNCTION()</pre> |

15.8.6.4 EVPN Address Family

Inbound BGP Neighbor Application

Table 117: Inbound BGP Neighbor Application

| Syntax | Example |
|--|--|
| <pre>address-family evpn neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family evpn neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y()</pre> |

Outbound BGP Neighbor Application

Table 118: Outbound BGP Neighbor Application

| Syntax | Example |
|---|--|
| <pre>address-family evpn neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family evpn neighbor 192.0.2.1 rcf out OUTBOUND_POLICY()</pre> |

Default Route Originate Neighbor Application

Table 119: Default Route Originate Neighbor Application

| Syntax | Example |
|--|---|
| <pre>address-family evpn neighbor (NEIGHBOR PEER_GROUP) default- route [rcf FUNCTION_NAME()]</pre> | <pre>router bgp 64500 address-family evpn neighbor 192.0.2.1 default-route rcf out DEFAULT_ORIGINATE_POLICY()</pre> |

15.8.6.5 MPLS L3 VPN IPv4 and IPv6 Address Family

Table 120: Inbound BGP Neighbor Application

| Syntax | Example |
|---|--|
| <pre>address-family (vpn-ipv4 vpn-ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family vpn-ipv4 neighbor 192.0.2.1 rcf in INBOUND_POLICY()</pre> |

Table 121: Outbound BGP Neighbor Application

| Syntax | Example |
|--|---|
| <pre>address-family (vpn-ipv4 vpn-ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family vpn-ipv4 neighbor 192.0.2.1 rcf outn OUTBOUND_POLICY()</pre> |

Table 122: Default Route Originate BGP Neighbor Application

| Syntax | Example |
|---|---|
| <pre>address-family (vpn-ipv4 vpn-ipv6) neighbor (NEIGHBOR PEER_GROUP) default- route [rcf FUNCTION_NAME()]</pre> | <pre>router bgp 64500 address-family vpn-ipv4 neighbor 192.0.2.1 default-route [rcf DEFAULT_ORIGINATE_POLICY()]</pre> |

15.8.6.6 Route-Target Membership Address Family

Table 123: Inbound BGP Neighbor Application

| Syntax | Example |
|--|---|
| <pre>neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family rt-membership neighbor 192.0.2.1 rcf in INBOUND_POLICY()</pre> |

Table 124: Outbound BGP Neighbor Application

| Syntax | Example |
|---|--|
| neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME() | router bgp 64500 address-family rt-membership neighbor 192.0.2.1 rcf out OUTBOUND_POLICY() CY() |

15.8.6.7 IPv4 and IPv6 Unicast Flowspec Address Family

Table 125: Inbound BGP Neighbor Application

| Syntax | Example |
|--|--|
| address-family flow-spec (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME() | router bgp 64500 address-family flow-spec ipv4 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() router bgp 64500 address-family flow-spec ipv6 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() |

Table 126: Outbound BGP Neighbor Application

| Syntax | Example |
|---|---|
| address-family flow-spec (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME() | router bgp 64500 address-family flow-spec ipv4 neighbor 192.0.2.1 rcf out OUTBOUND_POLICY() CY() router bgp 64500 address-family flow-spec ipv6 neighbor 192.0.2.1 rcf out OUTBOUND_POLICY() |

15.8.6.8 IPv4 and IPv6 VPN Flowspec Address Family

Table 127: Inbound BGP Neighbor Application

| Syntax | Example |
|--|--|
| address-family flow-spec (vpn-ipv4 vpn- ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME() | router bgp 64500 address-family flow-spec vpn-ipv4 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() router bgp 64500 address-family flow-spec vpn-ipv6 neighbor 192.0.2.1 rcf in INBOUND_POLICY() Y() |

Table 128: Outbound BGP Neighbor Application

| Syntax | Example |
|--|--|
| <pre>address-family flow-spec (ipv4 ipv6) neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family flow-spec vpn-ipv4 neighbor 192.0.2.1 rcf out OUTBOUND_POLI CY() router bgp 64500 address-family flow-spec vpn-ipv6 neighbor 192.0.2.1 rcf out OUTBOUND_POLI CY()</pre> |

15.8.6.9 VPLS Address Family**Table 129: Inbound BGP Neighbor Application**

| Syntax | Example |
|--|---|
| <pre>address-family vpls neighbor (NEIGHBOR PEER_GROUP) rcf in FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family vpls neighbor 192.0.2.1 rcf in INBOUND_POLIC Y()</pre> |

Table 130: Outbound BGP Neighbor Application

| Syntax | Example |
|---|---|
| <pre>address-family vpls neighbor (NEIGHBOR PEER_GROUP) rcf out FUNCTION_NAME()</pre> | <pre>router bgp 64500 address-family vpls neighbor 192.0.2.1 rcf out OUTBOUND_POLI CY()</pre> |

15.8.6.10 Configuring Dynamic Prefix Lists**Table 131: Dynamic Prefix Lists**

| Syntax | Example |
|---|---|
| <pre>dynamic prefix-list DYN_PFX_LIST match rcf DPL_FUNCTION_NAME()</pre> | <pre>dynamic prefix-list DYN1 match rcf TRIGGERING_ROUTE_EXISTS()</pre> |

15.8.6.11 Displaying RCF BGP Status

To view the status of RCF functions for BGP, use the **show bgp rcf function_name**:

| switch# show bgp rcf | Function | Status | Detail |
|----------------------|--------------|--------|--------|
| | ACCEPT_ALL() | active | |
| | DENY_ALL() | active | |

```

USES_MISSING_PFXL()           prefix_list_v4 not found      MISSING_PFXL
switch# show bgp rcf ACCEPT_ALL()
FunctionStatus Detail
-----
ACCEPT_ALL()     active

```

The output displays the following status values:

- **active** - The RCF has a valid configuration and available for use.
- **reference not found** - The RCF refers to an external construct such as an undefined AS path list, community list, or prefix. The configuration does not accept routes evaluated against the RCF. The undefined reference can be found in the **Details** column.
- **missing symbol** - The RCF has a status of getting programmed on the switch. This appears only transiently and not persistently.

Use the **detail** parameter to view information on RCF updates.

```

switch# show bgp rcf detail
Function: ACCEPT_ALL
Status: active
Update count: 1
Last updated: 00:00:41 ago
Last update reason: function definition change

Function: USES_MISSING_PFXL
Status: inactive (prefix_list_v4 MISSING_PFXL missing)
Update count: 2
Last updated: 00:02:41 ago
Last update reason: external reference change

```

The output contains the following fields:

- **Update count** - Displays the total number of updates to the RCF.
- **Last updated** - Displays the time elapsed as **HH:MM:SS** if the last update occurred less than 24 hours ago. Otherwise, the time displays as **DD:HH:MM**.
- **Last update reason** - Displays the reason for the last update:
 - **function definition change** - the RCF recompiled with a different definition. Recompiling the RCF by only adding white space does not increment the update count.
 - **external reference change** - One of the RCF referenced external policy constructs has been added, removed, or modified.

The **show bgp neighbors** indicates if the RCF or route-map applied at the inbound or outbound BGP neighbors has a configuration for the point of application but not defined.

```

switch# show bgp neighbors
BGP neighbor is 1.0.1.2, remote AS 500, internal link
...
Outbound route map is RM1 (configured but not defined)
Inbound RCF function for IPv4 unicast is rcf1() (configured but not defined)
...

```

15.8.7 RCF - IpRIB Agent Support

Applying RCF to IpRib Points of Application

Filtered Unicast RIBs

Use this feature to create subsets of the IPv4 or IPv6 Unicast RIB with routes matching the RCF become members of the subset.

Table 132: EOS CLI Support

| Syntax | Example |
|--|--|
| <pre>router general vrf default unicast-rib (ipv4 ipv6) NAME match rcf FUNCTION_NAME()</pre> | <pre>router general vrf default unicast-rib ipv4 BACKBONE_COND match rcf ROUTE_TO_BACKBONE()</pre> |

15.8.8 RCF - IS-IS Agent Support

This chapter covers the following topics:

- Configuring an RCF for IS-IS points of application.
- [Displaying operational status and visibility into IS-IS configurations.](#)

Applying an RCF to IS-IS Instance Points of Application

Use RCFs to filter routes and updating route attributes at different points of application in an IS-IS instance configuration.

BGP IPv4 Labeled Unicast Tunnel End-Point Redistribution

The RCF accepts BGP IPv4 Labeled Unicast tunnels end-point IP addresses and redistributes them into IS-IS.

Table 133: BGP IPv4 Labeled Unicast tunnels

| Syntax | Example |
|---|---|
| <pre>router isis WORD [vrf NAME] address-family ipv4 unicast tunnel source-protocol bgp ipv4 labeled- unicast rcf FUNCTION_NAME()</pre> | <pre>router isis inst1 address-family ipv4 unicast tunnel source-protocol bgp ipv4 labeled- unicast rcf ISIS_POLICY()</pre> |

Redistribute

Table 134: static

| Syntax | Example |
|--|--|
| <pre>router isis WORD [vrf NAME] redistribute static rcf FUNCTION_NAME()</pre> | <pre>router isis default redistribute static rcf STATIC_POLICY()</pre> |

15.8.8.1 Displaying RCF IS-IS Agent Status

The implementation detail for this particular IS-IS point of policy application, where a route transitioning from a BGP route to a IS-IS route, RCF performs the policy application within the BGP agent. Use the `show bgp rcf` command to query the BGP agent state, rather than IS-IS agent state.

To view the status of RCF functions for BGP, use the `show bgp rcf function_name`:

```
switch# show bgp rcf
```

```

Function      Status      Detail
-----
ACCEPT_ALL()  active
DENY_ALL()   active
USES_MISSING_PFXL() prefix_list_v4 not found      MISSING_PFXL
switch# show bgp rcf ACCEPT_ALL()
FunctionStatus Detail
-----
ACCEPT_ALL()  active

```

The output displays the following status values:

- **active** - The RCF has a valid configuration and available for use.
- **reference not found** - The RCF refers to an external construct such as an undefined AS path list, community list, or prefix. The configuration does not accept routes evaluated against the RCF. The undefined reference can be found in the **Details** column.
- **missing symbol** - The RCF has a status of getting programmed on the switch. This appears only transiently and not persistently.

Use the **detail** parameter to view information on RCF updates.

```

switch# show bgp rcf detail
Function: ACCEPT_ALL
Status: active
Update count: 1
Last updated: 00:00:41 ago
Last update reason: function definition change

Function: USES_MISSING_PFXL
Status: inactive (prefix_list_v4 MISSING_PFXL missing)
Update count: 2
Last updated: 00:02:41 ago
Last update reason: external reference change

```

The output contains the following fields:

- **Update count** - Displays the total number of updates to the RCF.
- **Last updated** - Displays the time elapsed as **HH:MM:SS** if the last update occurred less than 24 hours ago. Otherwise, the time displays as **DD:HH:MM**.
- **Last update reason** - Displays the reason for the last update:
 - **function definition change** - the RCF recompiled with a different definition. Recompiling the RCF by only adding white space does not increment the update count.
 - **external reference change** - One of the RCF referenced external policy constructs has been added, removed, or modified.

The **show bgp neighbors** indicates if the RCF or route-map applied at the inbound or outbound BGP neighbors has a configuration for the point of application but not defined.

```

switch# show bgp neighbors
BGP neighbor is 1.0.1.2, remote AS 500, internal link
...
Outbound route map is RM1 (configured but not defined)
Inbound RCF function for IPv4 unicast is rcf1() (configured but not defined)
...

```

15.8.9 RCF - KernelFib Agent Support

This chapter covers the following topics:

- Configuring an RCF for KernelFib points of application.
- [Displaying operational status and visibility into KernelFib configurations.](#)

Applying RCF to KernelFib Points of Application

Use RCF functions to filter routes and control programming routes into the kernel at various points of applications.

IPv4 and IPv6 VRF Address Family

The following configurations allow the filtering of routes and modifying attributes while creating IPv4 and IPv6 Unicast routes in the kernel for a VRF, default or others.

Offloading Route Hardware

If a **FUNCTION_NAME()** returns **true**, the KernelFib agent uses a forwarding device instance as the next-hop interface of the kernel route, instead of the regular next-hop interface in the FIB route, when programming the FIB route into the kernel routing table for the VRF network namespace.

Packets sent over the forwarding device inset into the ingress pipeline of hardware forwarding, and cause the necessary route lookup and forwarding in hardware instead of the kernel. Kernel traffic covered by this type of route benefits from all of the convergence optimizations and functionality provided by hardware forwarding.

Table 135: Route Hardening Offload

| Syntax | Example |
|---|--|
| <pre>software forwarding hardware offload route rcf FUNCTION_NAME()</pre> | <pre>router kernel vrf ABC address-family ipv4 software forwarding hardware offload route rcf OFFLOAD_POLICY()</pre> |

15.8.9.1 Displaying RCF KernelFib Status

Use the **show kernelfib rcf detail FUNCTION_NAME** command to display the status of RCF functions in the KernelFib agent.

| switch# show kernelfib rcf | | |
|---------------------------------------|--------------------------|--------------|
| Function | Status | Details |
| ACCEPT_ALL | active | |
| DENY_ALL | active | |
| USES_MISSING_PFXL | prefix_list_v4 not found | MISSING_PFXL |
| switch# show kernelfib rcf ACCEPT_ALL | | |
| Function | Status | Details |
| ACCEPT_ALL | active | |

The output displays the following status values:

- active** - The RCF has a valid configuration and available for use.
- reference not found** - The RCF refers to an external construct such as an undefined AS path list, community list, or prefix. The configuration does not accept routes evaluated against the RCF. The undefined reference can be found in the **Details** column.
- missing symbol** - Programming currently in progress for the RCF. This status appears transiently and not persistently in the output.

Use the **detail** parameter to view information on function updates:

```
switch# show kernelfib rcf detail
Function: ACCEPT_ALL
Status: active
Update count: 1
Last updated: 00:00:41 ago
Last update reason: function definition change

Function: USES_MISSING_PFXL
Status: inactive (prefix_list_v4 MISSING_PFXL missing)
Update count: 2
Last updated: 00:02:41 ago
Last update reason: external reference change
```

The output contains the following fields:

- **Update count** - Displays the total number of updates to the RCF.
- **Last updated** - Displays the time elapsed as **HH:MM:SS** if the last update occurred less than 24 hours ago. Otherwise, the time displays as **DD:HH:MM**.
- **Last update reason** - Displays the reason for the last update:
 - **function definition change** - the RCF recompiled with a different definition. Recompiling the RCF by only adding white space does not increment the update count.
 - **external reference change** - One of the RCF referenced external policy constructs has been added, removed, or modified.

15.8.10 RCF - LDP Agent Support

This chapter covers the following topics:

- Configuring an RCF for LDP points of application.
- [Displaying operational status and visibility into LDP configurations.](#)

Applying an RCF to LDP Points of Application

Use RCFs to filter routes and updating route attributes at different points of application in LDP configuration.

BGP IPv4 Labeled Unicast Tunnel End-Point Redistribution

The RCF accepts BGP IPv4 Labeled Unicast tunnels end-point IP addresses and redistributes them into LDP.

Table 136: BGP IPv4 Labeled Unicast tunnels

| Syntax | Example |
|---|--|
| <pre>tunnel source-protocol bgp ipv4 labeled-unicast rcf <i>FUNCTION_NAME</i></pre> | <pre>mpls ldp tunnel source-protocol bgp ipv4 labeled-unicast rcf LDP_POLICY()</pre> |

15.8.10.1 Displaying RCF LDP Status

To view the status of RCF functions in the LdpAgent, use the **show mpls ldp rcf detail *FUNCTION_NAME*** command.

```
switch# show mpls ldp rcf
```

| Function | Status | Details |
|------------|--------|---------|
| ACCEPT_ALL | active | |
| DENY_ALL | active | |

The output displays the following status values:

- **active** - The RCF has a valid configuration and available for use.
- **reference not found** - The RCF refers to an external construct such as an undefined AS path list, community list, or prefix. The configuration does not accept routes evaluated against the RCF. The undefined reference can be found in the **Details** column.
- **missing symbol** - Programming currently in progress for the RCF. This status appears transiently and not persistently in the output.

Use the **detail** parameter to view information on function updates:

```
switch# show mpls ldp rcf detail
Function: ACCEPT_ALL
Status: active
Update count: 1
Last updated: 00:00:41 ago
Last update reason: function definition change

Function: USES_MISSING_PFXL
Status: inactive (prefix_list_v4 MISSING_PFXL missing)
Update count: 2
Last updated: 00:02:41 ago
Last update reason: external reference change switch#
```

The output contains the following fields:

- **Update count** - Displays the total number of updates to the RCF.
- **Last updated** - Displays the time elapsed as **HH:MM:SS** if the last update occurred less than 24 hours ago. Otherwise, the time displays as **DD:HH:MM**.
- **Last update reason** - Displays the reason for the last update:
 - **function definition change** - the RCF recompiled with a different definition. Recompiling the RCF by only adding white space does not increment the update count.
 - **external reference change** - One of the RCF referenced external policy constructs has been added, removed, or modified.

15.8.11 RCF - VrfLeak Agent Support

This chapter covers the following topics:

- Configuring an RCF for VRF Leaking points of application.
- [Displaying operational status and visibility into VRF Leak Status](#).

Applying a RCF to VRF Leaking Points of Application

VRF Leaking allows a route in one VRF to specify a next-hop in another VRF and install routes in the RIB and FIB tables. RCF functions can be used for filtering routes and controlling certain attributes of routes when leaked from one VRF to another using the VrfLeak Agent.

Table 137: VrfLeak Agent RCF

| Syntax | Example |
|---|--|
| <pre>router general vrf <i>vrf_name</i> leak routes source-vrf <i>vrf_name</i> subscribe rcf <i>function_name()</i></pre> | <pre>router kernel vrf ABC address-family ipv4 software forwarding hardware offload route rcf OFFLOAD_POLICY()</pre> |

15.8.11.1 Displaying VrfLeak Agent Status

Use the **show vrf leak rcf *function_name*** to display the status of the RCF VrfLeak agent on the switch.

```
switch# show vrf leak rcf
Function          Status          Details
-----
ACCEPT_ALL       active
DENY_ALL         active
USES_MISSING_PFXL prefix_list_v4 not found      MISSING_PFXL
switch# show vrf leak rcf ACCEPT_ALL
Function          Status          Details
-----
ACCEPT_ALL       active
```

The output displays the following information:

- **active** - RCF fully configured and available for use.
- **reference not found** - The RCF contains an external reference to an undefined EOS policy construct such as an AS path list, community list, or prefix list. The RCF does not accept the evaluated routes. Locate the undefined reference in the **Details** column. In the example, the RCF **USES_MISSING_PFXL** cannot locate the prefix list, **prefix_list_v4**.
- **missing symbol** - Programming currently in progress for the RCF. This status appears transiently and not persistently in the output.

Multicast

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Sections covered in this chapter include:

- [Multicast Architecture](#)
- [IGMP and IGMP Snooping](#)
- [Protocol Independent Multicast](#)
- [Multicast Source Discovery Protocol \(MSDP\)](#)
- [Audio Video Bridging \(AVB\)](#)

16.1 Multicast Architecture

IP multicast transmits data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through the Internet Group Management Protocol (IGMP), IGMP Snooping, and PIM Sparse Mode (PIM-SM).

The following topics describe the Arista multicast architecture.

- [Overview](#)
- [Multicast Architecture Description](#)
- [Multicast Listener Discovery \(MLD\)](#)
- [Multicast Route Counters](#)
- [Multicast \(S,G\) Counters](#)
- [Static IP Mroute](#)
- [Static Multicast](#)
- [Configuring Multicast](#)
- [Multicast Commands](#)

16.1.1 Overview

Arista switches provide Layer 2 multicast filtering and Layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other Layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and Multicast Source Discovery Protocol (MSDP) to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may impact the maximum number of multicast routes.

Features Not Supported

The multicast functions not supported by Arista switches include (*, *, G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.

16.1.2 Multicast Architecture Description

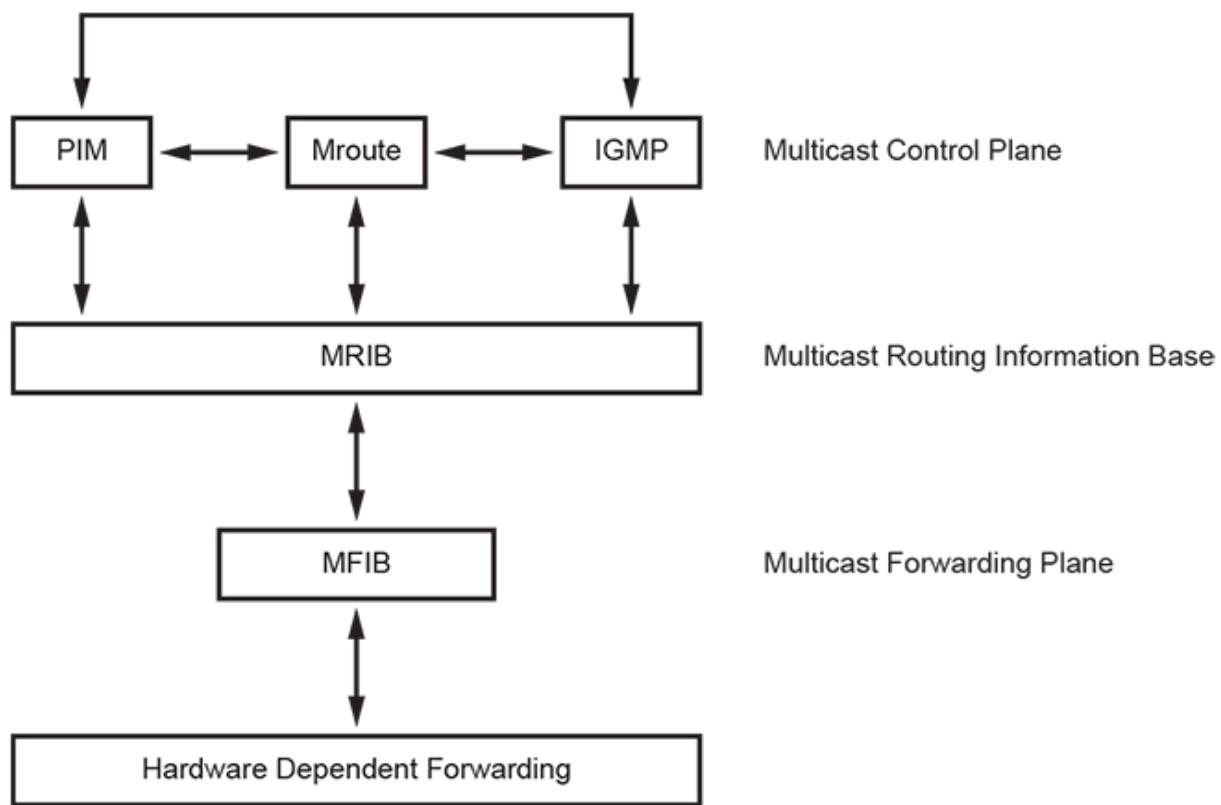

IP multicast transmits data to a subset of all hosts through a single multicast group address. Similar to unicast packets, multicast packets are delivered using best-effort reliability. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from **224.0.0.0** to **239.255.255.255**. Multicast routing protocol control traffic reserves the address range **224.0.0.0** to **224.0.0.255**. The address **224.0.0.0** is never assigned to any group.

Multicast group membership is dynamic; a group's activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Multicast Architecture depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

Figure 16-1: Multicast Architecture

16.1.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the Multicast Forwarding Information Base (MFIB) for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using Reverse Path Forwarding (RPF) on a unicast routing table.

- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets based on this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

16.1.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The `show ip mroute` command displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries.

MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

16.1.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the Multicast Forwarding Information Base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware Multicast Expansion Table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

16.1.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound Reverse Path Forwarding (RPF) interface. The CPU subsystem software may perform PIM processing on packets that arrive on non-RPF interfaces.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets that do not require PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast-dropped. Packets that were correctly fast-dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.

16.1.3 Multicast Listener Discovery (MLD)

Networks use Multicast Listener Discovery (MLD) to control the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

A multicast router is either a querier or non-querier with respect to each of its attached networks. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

In an MLD Report or Done message, the multicast address field holds a specific IPv6 multicast address to which the message sender is listening or is ceasing to listen, respectively.

16.1.3.1 MLDv2 Snooping

MLDv2 Snooping optimizes the transmission of multicast packets in Layer 2 by using Layer 3 information contained in MLDv2 and PIM packets. MLDv2 is the protocol used to manage the membership of hosts in multicast groups for IPv6.

[RFC 3810](#) talks about MLDv2 functionality. MLDv2 is the IPv6 counterpart of IGMPv3. Beginning with **EOS Release 4.25.0F**, MLDv2 snooping is supported on MLAG deployments.

16.1.3.1.1 Limitations

- The extraneous “Switch” interface should be ignored in `show mld snooping counters` and `show mld snooping counters errors` command outputs.
- MLDv2 Snooping with Ethernet VPN (EVPN) is not supported.
- On CCS-720XP, CCS-750, DCS-7050CX3, DCS-7050SX3, DCS-7050TX3, and DCS-7300X3 switches to enable MLDv2 snooping on a VLAN, IGMP snooping needs to be enabled for IPv6 unknown multicast traffic to be forwarded over IPv4 and IPv6 router ports; otherwise, such traffic would flood the entire VLAN. Forwarding IPv6 unknown multicast traffic over only IPv6 router ports is not supported on these platforms.

16.1.3.2 Configuring Multicast Listener Discovery

16.1.3.2.1 Enabling MLD

Use the `mld` command to enable MLD on an interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the MLD group. By default, MLD is disabled on an interface.

Examples

- This command enables MLD on the **interface Ethernet 1**.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld
```

- This command disables MLD on the **interface Ethernet 1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# no mld
```

16.1.3.2.2 Configuring MLD

An interface that runs MLD uses default protocol settings unless otherwise configured. The switch provides commands that alter the startup query, last member query, and normal query settings.

MLD

The **mld** command configures multicast routers on the configuration mode interface. Version 2 is the default MLD version.

Example

This command enables MLD on **interface Ethernet 1**.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld
```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to establish the group state quickly. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The **mld startup-query-interval** command specifies the interval between membership queries that an interface immediately sends after it starts up. The **mld startup-query-count** command specifies the number of queries the switch sends from the interface at the startup interval rate.

Examples

- This command configures the startup query count of **4** on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-count 4
```

- This command configures the startup query interval of **100** seconds on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-interval 100
```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the MLD querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **mld query-interval** command configures the frequency at which the active interface sends membership query messages as an MLD querier.

The **mld query-response-interval** command configures the time that a host has to respond to a membership query.

Examples

- This command configures the query interval of **30** seconds on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-interval 30
```

- This command configures the query response interval of **30** seconds on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-response-interval 30
```

Last Member Query

When the querier receives an MLD leave message, it verifies the group has no remaining hosts by sending a series of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The **mld last-listener-query-count** command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The **mld last-listener-query-interval** command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Examples

- This command configures the last listener query count to **3** on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-count 3
```

- This command configures the last listener query interval to **2** seconds on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-interval 2
```

Static Groups

The **mld static-group** command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Example

This command configures static groups on **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld static-group ff30::1 a::1
```

16.1.3.3 MLDv2 Snooping Configuration

16.1.3.3.1 Enabling or Disabling MLDv2 Snooping

MLDv2 snooping supports global and per-VLAN configuration. The **global** configuration mode provides access to MLD-related snooping commands.

Example

```
switch(config)# mld snooping
switch(config-mld-snooping)# disabled
switch(config-mld-snooping)# vlan 1-100
switch(config-mld-snooping)# vlan 101
```

```
switch(config-mld-snooping-vlan-101) # disabled
```

Items to consider:

- MLDv2 snooping requires an explicit configuration for each VLAN inside the **mld-snooping** configuration mode to enable snooping for those VLANs.
- Use the global **disabled** command to disable the mld-snooping for all VLANs. The global **disabled** setting is off by default.
- Snooping can be explicitly **disabled** for a given VLAN. This is useful once there is a configuration within the VLAN. The **disabled** setting is off by default.
- Snooping cannot be explicitly enabled for a given VLAN if it is disabled globally.
- Beginning with the **EOS Release 4.25.0F**, EOS allows the configuration of MLD versus snooping on PIM non-DR (Designated Router) VLANs.

16.1.3.3.2 Static Groups and Multicast Router

To configure static groups, refer to the following commands:

```
switch(config) # mld snooping
switch(config-mld-snooping) # vlan 100
switch(config-mld-snooping-vlan-100) # member ipv6-group-addr
                                interface intfs
```

To configure a static multicast router, refer to the following commands:

```
switch(config) # mld snooping
switch(config-mld-snooping) # vlan 100
switch(config-mld-snooping-vlan-100) # multicast-router interface intfs
```

In the examples above, **intfs** can be a group of similar interfaces (for example, **Ethernet1-5,8** or **port-channel 1-5,8**).

16.1.3.4 Displaying MLDv2 Snooping Status

The following show commands display the MLD snooping status of the switch:

- ```
switch# show mld snooping
 Global MLD Snooping configuration:

 MLD snooping : Enabled
 Robustness variable : 2

 VLAN 1 :

 MLD snooping : Disabled
 MLD max group limit : No limit set
 Recent attempt to exceed limit : No
 MLD snooping pruning active : False
```

```

Flooding traffic to VLAN : True
VLAN 100 :

MLD snooping : Enabled
MLD max group limit : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active : True
Flooding traffic to VLAN : False

• switch# show mld snooping
 Global MLD Snooping configuration:

MLD snooping : Enabled
Robustness variable : 2

VLAN 1 :

MLD snooping : Disabled
MLD max group limit : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active : False
Flooding traffic to VLAN : True

VLAN 100 :

MLD snooping : Enabled
MLD max group limit : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active : True
Flooding traffic to VLAN : False

```

- Use the **show mld snooping groups** command to display MLDv2 snooping by group.

```

switch# show mld snooping groups
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN Group Members
----- ----- -----
100 ff05::2 Cpu, Et4
100 ff08::11 Et1
100 ff08::21 Et2
100 ff08::31 Et3
100 * Et3, Et4

```

- Use the **show mld snooping groups detail** command to display detailed MLDv2 snooping information.

```

switch(config-mld-snooping-vlan-100)# show mld snooping groups detail
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN Group Source Mode Uptime Members
----- ----- ----- -----
100 ff05::2 * - 0d00h13m20 Cpu, Et4
100 ff08::11 * - 0d00h13m17 Et1
100 ff08::21 1::1 IN 0d00h13m20 Et2
100 ff08::31 2::1 EX 0d00h01m31 Et3
100 * * - - Et3, Et4

```

Refine the **show mld snooping groups** output using the following filters:

- **local** groups - groups learned locally using the **show mld snooping groups local** command.
- **user** groups - groups configured by the user.
- **mlag** groups - groups learned from the MLAG peer.
- ```
switch# show mld snooping mrouter

Et3      0           0       0       0       0       0       0       0       0       0
Et4      0           0       0       0       0       0       0       0       0       0
Switch   0           0       0       0       0       0       0       0       0       0
```

16.1.4 Multicast Route Counters

Multicast Route Counters provides per multicast route ingress packet and byte counters for multicast routed packets.

16.1.4.1 Configuration

To enable multicast route ingress packet and byte counters, use the following command:

```
switch(config) # hardware counter feature multicast ipv4
```

To disable multicast route ingress packet and byte counters, use the following command:

```
switch(config) # no hardware counter feature multicast ipv4
```

On DCS-7020R, DCS-7280R/R2, and 7500R/R2 platforms, create and apply a user-defined TCAM profile with the multicast counter feature db enabled. This example creates a profile by copying it from the default and then modifying it.

```
switch(config) # hardware tcam
switch(config-hw-tcam) # profile <profileName> copy default
switch(config-hw-tcam-profileName) # feature counter multicast ipv4
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4) # exit
switch(config-hw-tcam-profileName) # no feature mirror ip
switch(config-hw-tcam-profileName) # exit
switch(config-hw-tcam) # system profile <profileName>
```

16.1.4.2 Show Commands

Use the **show ip mfib counters** command to display per multicast route ingress packet and byte counters:

```
switch# show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
 225.1.2.1 10.46.1.2
    Byte: 1200200
    Packet: 12002
    Ethernet46 (iif)
    Ethernet47
    Activity 0:02:52 ago switch#
```

```
switch# show ip mfib counters
Activity poll time: 60 seconds
 225.1.1.1 0.0.0.0/0
    Byte: 234100
    Packet: 2341
    1 (rpaIndex)
    Ethernet21
    Ethernet23
    Activity 1:00:52 ago
 225.1.2.1 10.46.1.2
    Byte: 1200200
    Packet: 12002
    Ethernet46 (iif)
```

```

Ethernet47
Activity 0:02:52 ago
224.0.0.0/4 10.45.1.0/24
Byte: N/A
Packet: N/A
Ethernet45 (iif)
Cpu
Activity 0:02:04 ago switch#

```

Use the **clear counters** command to clear all counters, including per multicast route ingress counters.

```
switch# clear counters
```

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the **clear ip multicast counters** command.

```
switch# clear ip multicast <vrf [vrf-name]> counters <group_addr>
<source_addr>
```

16.1.4.3 Limitations

This feature has the following limitations:

- Counters are not supported on fastdrop multicast routes.
- For PIM sparse mode, counters are supported only on (**Source_addr**, **Group_addr**) multicast routes.
- Counting is supported for IPv4 multicast packets only.

16.1.5 Multicast (S,G) Counters

The Multicast Route Counters count the packets and bytes per group, source, and Virtual Route Forwarding (VRF). Every multicast route is counted when the Multicast (S,G) counters are enabled and if sufficient hardware counter resources are available. Since the number of hardware counter resources is limited, selected multicast routes can be **prioritized** to provide them with the needed hardware counter resources over the **non-priority** multicast routes in case of resource contention.

Priority multicast routes can be configured if:

- Hardware counter resources are available:
 - The priority multicast routes do not affect the existing non-priority multicast route counters.
- In case there are insufficient hardware counter resources:
 - If there are non-priority multicast routes, one non-priority multicast route counter resource will be freed, which results in losing the counters for the non-priority multicast route, and the priority multicast route will be programmed, meanwhile the non-priority multicast route will be pending to be programmed until there are hardware counter resources available.
 - If there are only priority multicast groups, the newly configured priority multicast groups will wait until existing priority groups free the resources.

16.1.5.1 Configuring Multicast (S,G) Counters

Configure the multicast (S, G) counters feature using the following command in the configuration mode:

```
hardware counter feature multicast [ipv4 | ipv6]
```

The **hardware counter feature multicast** command enables counting all groups as non-priority groups unless the groups requiring priority treatment have been configured under router multicast, as described in the next paragraph. Use the **no** form of the command to disable the multicast (S, G) counters on a switch.

Certain multicast routes can be configured as priority multicast routes for counting purposes, and they will be counted with higher priority. If hardware counter resources run out, the existing multicast (S, G) counters could be deleted. The following illustrates an IPV6 configuration; it's similar to IPv4. Use the **no counters** command to disable the priority routes.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv6
switch(config-router-multicast-ipv6)# counters
switch(config-router-multicast-ipv6)# counters ff08::e101:101 2002::a01:101
```

You must be in the **switch(config-router-multicast-ipv6)** command mode before configuring the specific multicast routes:

```
switch(config-router-multicast-ipv6) #
```

Otherwise, the system prompts returns following error:

```
! 'counters' not configured, packet will not be counted
```

To clear the counters use the following command:

```
clear ipv6 multicast [vrf [vrf-name]] counters group source
```

The **clear ipv6 multicast** command can clear the counters for all multicast routes or a specific **vrf**, **group**, or **source**. The default VRF is used unless an alternate is specified. All IPv6 counters are cleared if no **group** and **source** are specified.

The IPv4 version of the command is:

```
clear ip multicast [vrf [vrf-name]] counters group source
```

The following command clears the counters of all multicast routes along with all other counters.

```
switch# clear counters
```

16.1.5.2 Multicast (S,G) Counters Show Commands

The system allocates hardware counter resources if Multicast (S,G) Counters are configured. The configuration state displays as follows: **Mcast** appears in the **Feature ID** field, and the **Counters** column indicates the total number of hardware counter resources assigned to the Multicast (S,G) Counters:

```
switch# show platform trident flexcounters summary
Feature ID    Type      Request ID   Pool ID   Start Index   Counters
-----+-----+-----+-----+-----+-----+
Mcast       ingress     0            0          1           8191
```

Use the following command to display the current counter resource allocation for each multicast route. The **Pool ID** column indicates the pool used, and the **Base Counter Index** indicates the entry index in that pool.

| Group | Source | VRF | VLAN | Counter Index | Pool ID | Offset | Mode | Base Counter Index |
|----------------|---------------|-----|------|---------------|---------|--------|------|--------------------|
| ff08::e101:101 | 2002::a01:105 | 0 | 2570 | 1 | | 0 | 0 | 1 |
| 225.1.1.1 | 10.1.1.5 | 0 | 2571 | 2 | | 0 | 0 | 2 |

Use the following command to display the raw counter value of each multicast route. The **cntTbl** reflects the hardware table, the counters are copied from **ctnTbl** to **snapTbl** when the **clear counter** command is issued. The difference between **ctnTbl** and **snapTbl** is the current counter.

| Group | Source | VRF | VLAN | Counter Index | Offset | Bytes (cntTbl) | Bytes (snapTbl) | Pkts (cntTbl) | Pkts (snapTbl) |
|----------------|---------------|-----|------|---------------|--------|----------------|-----------------|---------------|----------------|
| (snapTbl) | | | | | | | | | |
| ff08::e101:101 | 2002::a01:105 | 0 | 2570 | 1 | | 6600 | 0 | 100 | 0 |
| 225.1.1.1 | 10.1.1.5 | 0 | 2571 | 2 | | 8800 | 0 | 100 | 0 |

Use the following command to display the multicast (S,G) counters. In the example, **Byte** and **Packet** are the counters:

| switch# show multicast fib ipv6 <vrf [vrf-name]> <group> <source> counters | | | | | | | |
|--|--|--|--|--|--|--|--|
| Activity poll time: 60 seconds | | | | | | | |
| ff08::e101:101 2002::a01:101 | | | | | | | |
| Byte: 66 | | | | | | | |
| Packet: 1 | | | | | | | |
| Vlan2780 (iif) | | | | | | | |
| Ethernet6/4 | | | | | | | |
| Vlan2899 | | | | | | | |
| switch# show multicast fib ipv4 <vrf [vrf-name]> <group> <source> counters | | | | | | | |
| Activity poll time: 60 seconds | | | | | | | |
| 255.1.1.1 10.1.1.5 | | | | | | | |
| Byte: 66 | | | | | | | |
| Packet: 1 | | | | | | | |
| Vlan2781 (iif) | | | | | | | |
| Ethernet8/4 | | | | | | | |
| Vlan2999 | | | | | | | |

16.1.5.3 Limitations

The number of counters for which the hardware counters can be enabled simultaneously will be limited by the system's availability of counter hardware resources.

When the configured hardware features exceed the available counter resources, not all counters for all features will be available.

The following CLI command shows the current allocation of the hardware resources:

| switch# show platform trident flexcounters summary | | | | | | |
|--|---------|------------|---------|-------------|----------|--|
| Feature ID | Type | Request ID | Pool ID | Start Index | Counters | |
| Mcast | ingress | 0 | 0 | 1 | 8191 | |

16.1.6 Static IP Mroute

The Static IP Multicast route (or Static Mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependency on the unicast topology for the multicast topology. Let us assume that PIM routers in a multicast network send PIM joins toward a source to receive traffic from that source. The interface on which to send a PIM join is determined by looking up the unicast routing table for the source address. This interface is the upstream or RPF interface for that source. When receiving traffic from that source, the system ensures its reception on the RPF interface for that source. This mechanism causes multicast traffic to take the same path through a network as unicast traffic. In some cases, having the multicast traffic take a different path than the unicast traffic is desirable. For example, to avoid a slow firewall required for unicast traffic but not for multicast traffic or to receive multicast across a low latency, low bandwidth microwave link while unicast traverses a higher latency, higher bandwidth fiber path.

EOS provides a static IP multicast route (or Static Mroute) `ip mroute` command to address this situation. The `ip mroute` command specifies a candidate for the RPF interface of any (S,G) multicast route where the source falls within the given source/mask. This interface potentially overrides the interface that would ordinarily have been selected from the matching route in the unicast routing table. This command, therefore, provides a means of breaking the dependence of the multicast topology on the unicast topology. The method of selecting the RPF interface for an (S,G) route is described later in this document.

Example

This command configures a Static IP mroute for a source **1.1.1.1/32** with an administrative distance of **20** on **interface ethernet 2/1**.

```
switch(config) # ip mroute 1.1.1.1/32 ethernet 2/1 20
```

16.1.6.1 Selecting Static Mroute

The Static Mroute is selected based on the following parameters:

- Longest Match
- Administrative Distance
- Interface Status

Longest Match

The longest match will be selected when a given source matches multiple static Mroutes in the MRIB. The order in which the static Mroutes were configured will not be a factor.

Example

If the static mroutes were configured in the following order:

```
ip mroute 0.0.0.0/0 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
```

For an (S,G) route where S = **192.168.1.1**, the third static mroute in the example would be selected since it is the most specific route to the source. The RPF interface is **Ethernet3**. The following table shows the selected RPF interface for three different sources based on the configuration example:

| Source | RPF Interface |
|-------------|---------------|
| 192.168.1.1 | Ethernet 3 |
| 192.168.1.2 | Ethernet 3 |
| 192.168.2.1 | Ethernet 2 |
| 10.0.0.1 | Ethernet 1 |

Administrative Distance

You can specify an administrative distance with each static Mroute. While selecting a Static Mroute for a source, the one with the lowest Admin distance is selected if multiple Static Mroute exist in the MRIB with the same source/mask. The default administrative distance for a Static Mroute is **1**.

Interface Status

For a Static Mroute to be considered for selection, the specified interface must be **up** and **PIM** enabled on the interface.

16.1.6.2 Selecting RPF Interface

Static Mroutes are BGP IP Multicast (SAFI 2) learned routes. A separate routing table, the Multicast Routing Information Base (MRIB), stores these routes. The RPF interface is selected for a source as follows:

Initially, the system looks up a source route in the MRIB. If the MRIB lookup yields a route, it uses that route to select the RPF interface. Therefore, any configured Static Mroutes matching the source wins the selection process over a "**connected**" route to the source. For a static mroute to be considered for selection, the specified interface must be **up** and **PIM** enabled on the interface. By default, Static Mroute has an Admin distance of **1**. If multiple Static Mroutes exist with equal longest prefix match, the mroute with the lowest Admin distance will win. The Admin distance is not to be used to compare selection between unicast RIB and MRIB routes. A successful Static Mroute lookup in the MRIB is always chosen over unicast RIB lookups.

If the MRIB lookup does not yield a route, the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as the RPF neighbor.

Note: The path to choose the RPF neighbor is selected based on the hashing scheme and protocols specified for valid paths, multi-path configuration, directly connected sources, and assert winners.

Example

Suppose a Static Mroute is configured, and in the following example, the default Admin distance for connected routes is **0**, **1** for static routes and **110** for OSPF routes.

```
ip mroute 172.16.0.0/16 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
ip mroute 192.168.1.0/24 Ethernet4 255
ip mroute 192.168.1.3/32 Ethernet5 255
ip mroute 200.10.0.0/16 Ethernet6
ip mroute 200.11.0.32/16 Ethernet7
```

So, based on the example, the MRIB table contains the following:

| Prefix | Interface | Admin Distance |
|----------------|------------------|-----------------------|
| 172.16.0.0/16 | Ethernet 1 | 1 |
| 192.168.0.0/16 | Ethernet 2 | 1 |
| 192.168.1.0/24 | Ethernet 3 | 1 |
| 192.168.1.0/24 | Ethernet 4 | 255 |
| 192.168.1.3/32 | Ethernet 5 | 255 |
| 200.10.0.0/16 | Ethernet 5 | 1 |
| 200.11.0.1/32 | Ethernet 5 | 1 |

Further, the unicast RIB table contains the following:

| Prefix | Interface | Protocol | Admin Distance |
|----------------|------------------|-----------------|-----------------------|
| 10.0.0.0/24 | Ethernet 6 | OSPF | 110 |
| 172.16.1.0/24 | Ethernet 7 | OSPF | 110 |
| 192.168.0.0/16 | Ethernet 8 | OSPF | 110 |
| 192.168.1.0/24 | Ethernet 9 | Static | 1 |
| 192.168.1.3/32 | Ethernet 10 | OSPF | 110 |
| 200.10.0.0/16 | Ethernet 11 | Connected | 0 |

The following table shows the RPF interface selections for a set of sources, along with the Static Mroute chosen, the unicast RIB route chosen, the eventual winner, and the reasoning behind the selection.

| Source | Static Mroute | Unicast Route | Winner | RPF Interface | Reasoning |
|-------------|---------------|---------------|---------------|---------------|--|
| 10.0.0.1 | - | 1 | Unicast Route | Ethernet 6 | Only the unicast Rib yields a route to the source so it wins. |
| 200.11.0.1 | 7 | - | Static Mroute | Ethernet 5 | Only the MRIB yields a route to the source so it wins. |
| 192.168.1.3 | 5 | 5 | Unicast Route | Ethernet 10 | In the MRIB (5) is the longest match. While comparing the static mroute and the unicast route, the unicast route is the winner because it has a lower Admin distance. |
| 192.168.2.1 | 2 | 3 | Static Mroute | Ethernet 2 | In the MRIB (2) is the longest match. While comparing the static mroute and the unicast route, the static Mroute is the winner because it has a lower Admin distance. |
| 192.168.1.1 | 3 | 4 | Static Mroute | Ethernet 3 | In the MRIB both (3) and (4) are the longest match but (3) has the lower Admin distance While comparing the static mroute and the unicast route, the static mroute is the winner even though both have the same distance. |

16.1.7 Static Multicast

Static Multicast configures multicast routes statically on Arista switches and per VRF granularity. However, static multicast routes do not perform any VRF validation for the interfaces involved in the route, which can lead to route leakage. Static Multicast coexists with PIM-SM and PIM-BIDIR protocols, which are dynamic variants of programming multicast routes. However, to obtain the best results, choose the appropriate route selection method before the static routes are programmed.

Static multicast routes compete with the routes provided by PIM-SM and PIM-BIDIR mainly because this static variant allows the configuration of PIM-SM-like or PIM-BIDIR-like routes, among other routes. The route chosen depends upon the priority setting.

Currently, PIM-SM/PIM-BIDIR installs routes with a priority value of 0 (zero), while static routes install routes with a priority of **255** by default.

The priorities of PIM-SM and PIM-BIDIR are subject to future change. A higher priority wins in the case of conflicts while programming the hardware. Any conflicts here imply the same route is present as a static multicast route and in a PIM-SM or PIM-BIDIR. It concludes that, by default, static multicast routes will always be the winner.

16.1.8 Configuring Multicast

This section describes the following configuration tasks:

- [Enabling IPv4 Multicast Routing](#)
- [Enabling IPv6 Multicast Routing](#)
- [Multicast-Routing Configuration Example](#)
- [Configuring a Multicast Boundary](#)
- [Multicast multipath router-ID \(IPv4\)](#)
- [Configuring MFIB](#)
- [Configuring Static Multicast](#)
- [Displaying and Clearing the Mroute Table](#)

16.1.8.1 Enabling IPv4 Multicast Routing

Enabling IPv4 multicast routing allows the switch to forward multicast packets. The **routing** command enables multicast routing. When multicast routing is enabled, **running-config** contains a **routing** statement.

Example

These commands enable IPv4 multicast routing on the switch.

```
switch(config) # router multicast
switch(config-router-multicast) # ipv4
switch(config-router-multicast-ipv4) # routing
```

16.1.8.2 Enabling IPv6 Multicast Routing

Enabling IPv6 Multicast routing allows the switch to distribute IPv6 datagrams to one or more recipients. IPv6 PIM builds and maintains Multicast routing using Reverse Path Forwarding (RPF) based on a unicast routing table. IPv6 PIM is protocol-independent and can use routing tables consisting of OSPFv3, IPv6 BGP, or static routes for RPF lookup. MLD is used to discover Multicast hosts and maintain group membership on a directly attached link. This feature is supported on 7280R and 7500R. Source-specific multicast (SSM) is currently supported on the L3 routed port.

PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a Designated Router (DR), which acts for all directly connected hosts in PIM-SM transactions. Upon receiving an MLD report from a host or a PIM join from a downstream PIM neighbor, a (S,G) route is created or programmed, and the router sends a PIM join to the upstream PIM neighbor with the shortest path to the source.

Configuring IPv6 Multicast Routing

The following steps are to configure IPv6 multicast routing on the switch.

1. Enabling IPv6 multicast routing.

By default, EOS disables multicast routing on the switch. Use the following commands to enable IPv6 multicast routing and software forwarding using the Software Forwarding Engine.

Example

```
switch(config) # router multicast
switch(config-router-multicast) # ipv6
switch(config-router-multicast-ipv6) # routing
switch(config-router-multicast-ipv6) # software-forwarding sfe
```

2. Enabling IPv6 PIM Sparse Mode.

By default, EOS disables IPv6 PIM on an interface. The **pim ipv6 sparse-mode** command enables an interface to participate in the IPv6 multicast-routing domain.

Example

```
switch(config)# interface ethernet 15/1
switch(config-if-Et15/1)# pim ipv6 sparse-mode
```

Note: EOS does not support SVI.

3. Configure the checksum header and the local interface loopback to use for PIM IPv6 register messages:

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv6
switch(config-router-pim-sparse-ipv6)# register checksum header
switch(config-router-pim-sparse-ipv6)# register local-interface loopback 2
```

4. Enabling MLD.

By default, EOS disables MLD on an interface. Enable MLD only on the interface connected to the MLD host that receives IPv6 multicast traffic.

Example

```
switch(config)# interface ethernet 15/1
switch(config-if-Et15/1)# mld
```

16.1.8.3 Multicast-Routing Configuration Example

Use the following commands to display MLD and IPv6 configuration details:

```
switch# show running-configuration section router
router multicast
  ipv6
    routing
    software-forwarding sfe
switch# show running-config interfaces ethernet 15/1
interface Ethernet15/1
  no switchport
  ipv6 enable
  ipv6 address 40:1::3/64
  mld
  pim ipv6 sparse-mode
```

Displaying IPv6 Multicast Routing Information

The **show mld membership** command displays the MLD group membership table.

| Interface | Group | Source |
|--------------------|---------------|----------|
| Filter Mode | | |
| Ethernet2/1.1 | ff33::1:0:0:1 | 101:1::2 |
| include | | |

| | | |
|---------------|---------------|----------|
| Ethernet2/1.1 | ff33::1:0:0:2 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:3 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:4 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:5 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:6 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:7 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:8 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:9 | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:a | 101:1::2 |
| include | | |
| Ethernet2/1.1 | ff33::1:0:0:b | 101:1::2 |
| include | | |

The **show pim ipv6 sparse-mode route** command displays the PIM Sparse Mode Multicast Routing table.

```
switch# show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
      R - RPT bit is set, S - SPT bit is set, L - Source is attached
      W - Wildcard entry, X - External component interest
      I - SG Include Join alert rcvd, P - (*,G) Programmed in hardware
      H - Joining SPT due to policy, D - Joining SPT due to protocol
      Z - Entry marked for deletion, C - Learned from a DR via a register
      A - Learned via Anycast RP Router, M - Learned via MSDP
      N - May notify MSDP, K - Keepalive timer not running
      T - Switching Incoming Interface, B - Learned via Border Router
RPF route: U - From unicast routing table
           M - From multicast routing table
ff33::1:0:0:1
  101:1::2, 2:03:00, flags: S
    Incoming interface: Ethernet11/1
    RPF route: [U] 101:1::/64 [110/1] via fe80::464c:a8ff:feb7:39e9
    Outgoing interface list:
      Ethernet6/1.1
      Ethernet4/1.1
      Ethernet7/1.1
      Ethernet9/1.1
      Ethernet8/1.1
      Ethernet2/1.1
      Ethernet5/1.1
      Ethernet3/1.1
```

The **show multicast fib ipv6** command displays the Multicast Forwarding Information Base (MFIB) table.

```
switch# show mfib ipv6
Activity poll time: 60 seconds
ff33::1:0:0:1 101:1::2
  Ethernet11/1 (iif)
  Ethernet9/1.1
  Ethernet2/1.1
  Ethernet3/1.1
  Ethernet6/1.1
  Ethernet5/1.1
  Ethernet8/1.1
  Ethernet7/1.1
  Ethernet4/1.1
Activity 0:00:35 ago
```

The **show platform fap mroute ipv6** command displays the Platform Hardware Forwarding table.

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
-----
Location      GroupId      Group          Source
IIF           McId         OIF
FLP/TT        FLP/TT       TT            FLP
FLP           FLP          FLP
-----
4096/2048    1/1          ff33::1:0:0:23/128   101:1::2/128
Vlan1357 21504      Vlan1044(Et7/1)  Vlan1123(Et9/1)

Vlan1200(Et8/1)  Vlan1223(Et2/1)

Vlan1226(Et5/1)  Vlan1232(Et3/1)

Vlan1307(Et6/1)  Vlan1337(Et4/1)
```

16.1.8.4 Configuring a Multicast Boundary

The multicast boundary specifies subnets that filter source traffic entering an interface to prevent the creation of mroute states on the interface. The interface The Outgoing Interface List (OIL) does not include the interface. Multicast PIM, IGMP, and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

In addition, an interface with a boundary ACL filters any joins (RX or TX) for groups denied by the ACL. This also applies to multicast boundary ACLs with the **s** option.

The **ip multicast boundary** command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the permit entries of the ACL allow the multicast subnets and denies or filters the rest. In contrast, in a non-ACL method, the statements configure only denied or filtered subnets.

Examples

- These commands configure the multicast address of **229.43.23.0/24** as a multicast boundary restricting source traffic from **interface vlan 300**.

```
switch(config)# interface vlan 300
switch(config-if-vl300)# ip multicast boundary 229.43.23.0/24
switch(config-if-vl300) #
```

- These commands create a standard ACL, then implement the ACL in an **ip multicast boundary** command to deny multicast traffic to **225.130.0.0/16** and **239.120.10.0/24** subnets and allow multicast traffic to all remaining subnets.

```
switch(config)# ip access-list standard mbac1
switch(config-std-acl-mbac1)# 10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)# 20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)# 30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)# exit
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip multicast boundary mbac1
switch(config-if-Vl200)# exit
switch(config) #
```

16.1.8.5 Multicast multipath router-ID (IPv4)

The **multipath deterministic** command with the **router-id** allows downstream PIM neighbors to direct traffic for a group or source-group route through only the specified upstream PIM neighbor for all downstream PIM neighbors with the same ECMP routes. Traffic is load balanced by group or source-group across upstream PIM neighbors as in the default multipath mode.

Multipath router-ID uses the Interface Identifier (from the Hello Option for PIM) to give PIM-enabled devices a globally unique router ID for each of their PIM neighbors.

The following configures the switch to use the router ID.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic router-id
```

The following displays the switch before the configuration.

```
switch(config-router-multicast-ipv4)# show active all
router multicast
  ipv4
    counters bytes
    activity polling-interval 60
    no routing
    multipath deterministic
    max-fastrrops 1024
    unresolved cache-entries max 4000
    unresolved packet-buffers max 3
    software-forwarding kernel
```

The following displays the switch after the configuration.

```
switch(config-router-multicast-ipv4)# show active all
router multicast
  ipv4
    counters bytes
    activity polling-interval 60
    no routing
```

```

multipath deterministic router-id
max-fastdrops 1024
unresolved cache-entries max 4000
unresolved packet-buffers max 3
software-forwarding kernel

```

16.1.8.6 Configuring MFIB

Multicast Forwarding Information Base (MFIB) formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware Multicast Expansion Table (MET) and the hardware Forwarding Information Base (FIB).

MFIB Polling Interval

After polling the corresponding hardware activity bits, the switch records activity levels for multicast routes in the MFIB. The **activity polling-interval** command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

Example

These commands set the MFIB activity polling period to 15 seconds.

```

switch(config) # router multicast
switch(config-router-multicast) # ipv4
switch(config-router-multicast-ipv4) # activity polling-interval 15
switch(config-router-multicast-ipv4) #

```

MFIB Fast Drops

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound Reverse Path Forwarding (RPF) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU, therefore, updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The **no ip mfib fastdrop** command disables MFIB fast drop for the configuration mode interface.

Example

This command disables MFIB fast drop for the **interface vlan 120**.

```

switch(config) # interface vlan 120
switch(config-if-Vl120) # no ip mfib fastdrop
switch(config-if-Vl120) #

```

The **ip mfib max-fastdrops** command limits the number of fast-drop routes the switch's MFIB table can contain. The default fast-drop route limit is **1024**.

Example

This command sets the maximum number of fast-drop routes to **2000**.

```

switch(config) # ip mfib max-fastdrops 2000
switch(config) #

```

The **clear ip mfib fastdrop** command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Example

This command removes all fast-drop entries from the MFIB table.

```
switch# clear ip mfib fastdrop
switch#
```

The **show multicast fib ipv4** command displays information about the routes and interfaces in the IPv4 MFIB.

- **show multicast fib ipv4** displays MFIB information for hardware-forwarded routes.
- **show multicast fib ipv4 software** displays MFIB information for software-forwarded routes.

Example

This command displays MFIB information for hardware-forwarded routes.

```
switch# show multicast fib ipv4
Activity poll time: 60 seconds
239.255.255.250 172.17.26.25
    Vlan26 (iif)
    Vlan2028
    Cpu
        Activity 0:02:11 ago
239.255.255.250 172.17.26.156
    Vlan26 (iif)
    Vlan2028
    Cpu
        Activity 0:02:11 ago
239.255.255.250 172.17.26.178
    Vlan26 (iif)
    Vlan2028
    Cpu
        Activity 0:03:37 ago
switch#
```

MFIB Unresolved Cache-entries Max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. All packets belonging to (S,G) routes exceeding the limit are dropped. The default buffer size is **4000** routes. See **ip multicast boundary** to limit the number of cached packets per S,G.

Example

This command sets the maximum MFIB unresolved cache-entry buffer size to **6000** routes in the default VRF.

```
switch(config)# router multicast
switch(config-router-mcast)# ipv4
switch(config-router-mcast-ipv4)# unresolved cache-entries max 6000
switch(config-router-mcast-ipv4)#

```

MFIB Unresolved Packet-buffers Max

The **ip multicast boundary** command specifies the number of queued packets per unresolved route while the switch resolves the route. The limit for **ip multicast boundary** is for an individual route; packets that exceed this limit are dropped. By default, the switch processes three unresolved packets for an individual route. Refer to and use the **unresolved cache-entries max** command to limit the number of cached unresolved routes.

Example

This command configures the switch in the default VRF to cache up to **30** multicast packets from any route before that route is resolved.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#

```

16.1.8.7 Configuring Static Multicast

Use the **route** command to configure the Static Multicast in the Router Multicast mode.

Example

```
switch(config)# router multicast
switch(config-router-multicast)# route
```

Configuring Static Multicast routes for a VRF

Configure the Static Multicast route on a VRF in the Router Multicast VRF IPv4 Configuration mode.

Note: Static multicast commands belong in the router multicast mode.

To maintain backward compatibility for the default VRF, static multicast commands for the default VRF can be entered without changing to router multicast mode.

Example

```
switch(config)# router multicast
switch(config-router-multicast)# route
```

Entering a source address is optional. However, when no source address is specified, it is assumed to be **0.0.0.0**.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif
```

Note: For the configuration to take effect, the incoming interface (**iif**) must belong to the same VRF for which the command is being executed.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30 oif
```

Multiple ethernet interfaces can be entered following the outgoing interface (**oif**). However, OIF is also optional. When no OIFs exist, traffic for the S,G on the incoming interface is dropped.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30 oif
    ethernet
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30 oif
    ethernet 30 ethernet 32
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30 oif
    ethernet 30 ethernet 32 cpu priority
```

If required, use the CPU option to set the CPU in the OIF. Setting the **priority** is also optional, ranging from **1** to **255**. By default, the value is **255**.

```
switch(config-router-multicast)# route 1.1.1.1 10.1.1.1 iif ethernet 30 oif
ethernet 30 ethernet 32 cpu priority 40
```

Displaying Static Multicast Information

Use the **show multicast fib ipv4** command to verify the status of the Static Multicast configured interfaces.

```
switch# show multicast fib ipv4
Activity poll time: 60 seconds
 225.1.1.1 10.1.1.1
  Ethernet1 (iif)
  Ethernet2
  Cpu
```

16.1.8.8 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source and group pair (S,G). The switch discards and forwards packets based on this state information. Each table entry, referred to as a mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The **clear ip mroute** command removes route entries from the mroute table:

- **clear ip mroute *** all entries from the mroute table.
- **clear ip mroute gp_ipv4** all entries for the specified multicast group.
- **clear ip mroute gp_ipv4 src_ipv4** all entries for the specified source sending to a specified group.

Examples

This command removes all route entries from the mroute table.

```
switch# clear ip mroute *
switch#
```

This command removes entries for source **228.3.10.1** sending to multicast group **224.2.205.42**.

```
switch# clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

Displaying the mroute Table

The **show ip mroute count** command displays IP multicast routing table statistics.

Example

This command displays IP multicast routing table statistics.

```
switch# show ip mroute count
IP Multicast Statistics
```

```
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1 switch>
```

The **show ip mroute** command displays information from the IP multicast routing table.

- **show ip mroute** displays information for all routes in the table.
- **show ip mroute gp_addr** displays information for the specified multicast group.

Example

This command displays the IP multicast routing table for the multicast group **225.1.1.1**.

```
switch# show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999 switch>
```

16.1.9 Multicast Commands

Multicast Configuration Commands (Global)

- activity polling-interval
- hardware counter feature multicast ipv4
- ip mfib max-fastdrops
- ip mroute
- ip multicast static
- mld last-listener-query-count
- mld last-listener-query-interval
- mld query-interval
- mld query-response-interval
- mld robustness
- mld snooping
- mld startup-query-count
- mld startup-query-interval
- mld static-group
- mld
- multipath deterministic
- multipath none
- route
- router multicast
- routing
- rpf route
- unresolved cache-entries max
- unresolved packet-buffers max

Multicast Configuration Commands (Interface)

- ip mfib fastdrop
- ip multicast boundary

Multicast Clear Commands

- clear ip mfib fastdrop
- clear ip multicast counters
- clear ip mroute

Multicast Display Commands

- show ip mroute
- show ip mfib counters
- show ip mroute count
- show ip multicast boundary
- show mld membership
- show mld querier
- show mld snooping
- show mld statistics
- show mld summary

- [show multicast fib ipv4](#)
- [show multicast fib ipv4 software](#)
- [show multicast fib ipv6](#)
- [show pim ipv6 sparse-mode route](#)
- [show platform fap mroute ipv6](#)

16.1.9.1 activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The **activity polling-interval** command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The **no activity polling-interval** and **default activity polling-interval** commands restore the default interval of **60** seconds by removing the **activity polling-interval** command from **running-config**.

Command Mode

Router Multicast IPv4 Configuration

Command Syntax

```
activity polling-interval period
no activity polling-interval
default activity polling-interval
```

Parameter

period interval (seconds) between polls. Values range from **1** to **60**. Default is **60**.

Example

These commands set the MFIB activity polling period to **15** seconds.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# activity polling-interval 15
switch(config-router-multicast-ipv4)#

```

16.1.9.2 clear ip mfib fastdrop

The `clear ip mfib fastdrop` command removes all fast-drop entries from the MFIB table.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip mfib fastdrop
```

Example

This command removes all fast-drop entries from the MFIB table.

```
switch# clear ip mfib fastdrop
switch#
```

16.1.9.3 clear ip mroute

The **clear ip mroute** command removes route entries from the mroute table, as follows:

- **clear ip mroute *** removes all entries from the mroute table.
- **clear ip mroute *gp_ipv4*** removes all entries for the specified multicast group.
- **clear ip mroute *gp_ipv4src_ipv4*** removes all entries for the specified source sending to the specified group.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip mroute ENTRY_LIST
```

Parameters

ENTRY_LIST entries that the command removes from the mroute table. Options include:

- * all route entries.
- ***gp_ipv4*** all entries for multicast group ***gp_ipv4*** (dotted decimal notation)
- ***gp_ipv4 src_ipv4*** all entries for source (***src_ipv4***) sending to group (***gp_ipv4***)

Examples

- This command removes all route entries from the mroute table.

```
switch# clear ip mroute *
switch#
```

- This command removes entries for the source **228.3.10.1** sending to multicast group **224.2.205.42**.

```
switch# clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

16.1.9.4 clear ip multicast counters

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the **clear ip multicast counters** command.

Command Mode

EXEC

Command Syntax

```
clear ip multicast [vrf [vrf-name]] counters group_addr source_addr
```

Parameters

- **vrf vrf-name** VRF name.
- **counters** Counter for bytes/packets.
- **group_addr** Group address.
- **source_addr** Source address.

16.1.9.5 hardware counter feature multicast ipv4

Use the **hardware counter feature multicast ipv4** command to enable per multicast router ingress packets and byte counters. The **no** and **default** forms of the command disables the feature. The feature is disabled by default.

Command Mode

Configuration mode

Command Syntax

```
hardware counter feature multicast ipv4  
no hardware counter feature multicast ipv4  
default hardware counter feature multicast ipv4
```

Example

On DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, create and apply user defined TCAM profile with multicast counter feature db enabled. This example creates a profile copying it from the default, then modifying the profile.

```
switch(config)# hardware tcam  
switch(config-hw-tcam)# profile <profileName> copy default  
switch(config-hw-tcam-profileName)# feature counter multicast ipv4  
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4))# exit  
switch(config-hw-tcam-profileName)# no feature mirror ip  
switch(config-hw-tcam-profileName)# exit  
switch(config-hw-tcam)# system profile <profileName>
```

16.1.9.6 ip mfib fastdrop

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound Reverse Path Forwarding (RPF) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drop for the configuration mode interface.

The `ip mfib fastdrop` and `default ip mfib fastdrop` commands enable MFIB fast drop for the configuration mode interface by removing the corresponding `no ip mfib fastdrop` command from ***running-config***.

The `clear ip mfib fastdrop` command, in the ***global*** configuration mode, removes all MFIB fast-drop entries on all interfaces.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip mfib fastdrop
no ip mfib fastdrop
default ip mfib fastdrop
```

Example

This command disables MFIB fast drop for ***interface vlan 120***.

```
switch(config)# interface vlan 120
switch(config-if-V1120)# no ip mfib fastdrop
switch(config-if-V1120) #
```

16.1.9.7 ip mfib max-fastdrops

The **ip mfib max-fastdrops** command limits the number of fast-drop routes that the switch's MFIB table can contain.

The **no ip mfib max-fastdrops** and **default ip mfib max-fastdrops** commands restore the default fast-drop route limit of **1024** by removing the **ip mfib max-fastdrops** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip mfib max-fastdrops quantity
no ip mfib max-fastdrops
default ip mfib max-fastdrops
```

Parameters

quantity maximum number of fast-drop routes. Value ranges from **0** to **1000000** (one million). Default is **1024**.

Example

This command sets the maximum number of fast-drop routes to **2000**.

```
switch(config)# ip mfib max-fastdrops 2000
switch(config) #
```

16.1.9.8 ip mroute

The **ip mroute** command configures the Static Mroute on the switch.

The **no ip mroute** and **default ip mroute** commands remove the specified static mroute from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip mroute [source-prefix | source-address mask] [rpf-interface | rpf-neighbor] [admin distance]
```

Example

This command configures a Static IP mroute for a source **1.1.1.1/32** with an administrative distance **20** on **interface ethernet 2/1**.

```
switch(config)# ip mroute 1.1.1.1/32 ethernet 2/1 20
```

16.1.9.9 ip multicast boundary

The **ip multicast boundary** command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the Outgoing Interface List (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The **no ip multicast boundary** and **default ip multicast boundary** commands delete the specified subnet restriction by removing the corresponding **ip multicast boundary** command from **running-config**. When these commands do not specify a subnet address, all **ip multicast boundary** statements for the configuration mode interface are removed.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip multicast boundary SUBNET [TCAM]
no ip multicast boundary [SUBNET]
default ip multicast boundary [SUBNET]
```

Parameters

- **SUBNET** the subnet address configured as the multicast boundary. Options include:
 - **net_addr** multicast subnet address (CIDR or address mask).
 - **acl_name** standard Access Control List (ACL) that specifies the multicast group addresses.
- **TCAM** specifies address inclusion in the routing table. Options include:
 - **no parameter** boundaries ((S,G) entries) are added to routing table.
 - **out** boundaries are not added to routing table.

Guidelines

When **out** is selected, the first inbound data packet corresponding to the **SUBNET** may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

Restrictions

Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

Examples

- This command configures the multicast address of **229.43.23.0/24** as a multicast boundary where source traffic is restricted from **interface vlan 300**.

```
switch(config)# interface vlan 300
switch(config-if-vl300)# ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#{
```

- These commands create a standard ACL, then implement the ACL in an ip multicast boundary command to allow multicast for subnet (**224.0.0.0/4**) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)# ip access-list standard mbac1
switch(config-std-acl-mbac1)# 10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)# 20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)# 30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)# exit
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip multicast boundary mbac1
switch(config-if-Vl200)# exit
switch(config)#{
```

16.1.9.10 ip multicast static

The **ip multicast static** command enables static multicast routing on the switch.

The **exit** command returns the switch to global configuration mode.

Command Mode

Interface Ethernet Configuration

Command Syntax

ip multicast static

Example

The following commands configure the static multicast routing on the switch.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# no switchport
switch(config-if-Et1/2)# ip address 1.1.1.1/24
switch(config-if-Et1/2)# ip multicast static
```

16.1.9.11 mld last-listener-query-count

The **mld last-listener-query-count** command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by **mld last-listener-query-interval**. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

The **no mld last-listener-query-count** and **default mld last-listener-query-count** commands reset the last-listener-query-count to the default value by removing the corresponding **mld last-listener-query-count** command from the **running-config**. Default value is **2**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld last-listener-query-count number
no mld last-listener-query-count
default mld last-listener-query-count
```

Parameter

number the last listener query count. Values range from **0** to **100**. Default value is **2**.

Example

This command configures the last listener query count to **3** on an **interface Ethernet 1**.

```
switch(config)# interface Ethernet 1
switch(config-if-Et1)# mld last-listener-query-count 3
```

16.1.9.12 mld last-listener-query-interval

The **mld last-listener-query-interval** command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group, it sends query messages at intervals set by this command. The **mld last-listener-query-count** specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The **no mld last-listener-query-interval** and **default mld last-listener-query-interval** commands reset the last-listener-query-interval to the default value by removing the corresponding **mld last-listener-query-interval** command from the **running-config**. Default value is **1** second.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld last-listener-query-interval period
no mld last-listener-query-interval
default mld last-listener-query-interval
```

Parameter

period the last listener query interval in seconds. Values range from **1** to **3175**.

Example

This command configures the last listener query interval to **2** seconds on an **interface Ethernet1**.

```
switch(config) #interface Ethernet1
switch(config-if-Et1)# mld last-listener-query-interval 2
```

16.1.9.13 mld query-interval

The **mld query-interval** command configures the frequency at which the configuration mode interface, as an MLD querier, sends host-query messages.

An MLD querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of **125** seconds.

The **no mld query-interval** and **default mld query-interval** commands reset the query interval to the default value by removing the corresponding **mld query-interval** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld query-interval period
no mld query-interval
default mld query-interval
```

Parameter

period the interval between query messages in seconds. Values range from **1** to **3175**.

Example

This command configures the query interval of **30** seconds on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-interval 30
```

16.1.9.14 mld query-response-interval

The `mld query-response-interval` command configures the maximum response time that the recipient can wait before responding with a membership report on receipt of a general query.

The `no mld query-response-interval` and `default mld query-response-interval` commands reset the query interval to the default value by removing the corresponding `mld query-response-interval` command from the *running-config*.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld query-interval period
no mld query-interval
default mld query-interval
```

Parameter

period the query response interval in seconds. Values range from **1** to **3175**.

Example

This command configures the query response interval of **30** seconds on an *interface Ethernet1*.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld query-response-interval 30
```

16.1.9.15 mld robustness

The **mld robustness** command configures the number of general queries to be sent before the router assumes there are no more listeners.

The **no mld robustness** and **default mld robustness** commands reset the robustness to the default value by removing the corresponding **mld robustness** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld robustness robust_value
```

```
no mld robustness
```

```
default mld robustness
```

Parameter

robust_value the robustness count. Values range from **1** to **100**.

Example

This command configures the robustness value to **2** on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld robustness 2
```

16.1.9.16 mld snooping

Multicast Listener Discovery (MLD) snooping constrains the flooding of IPv6 multicast traffic on VLANs and IGMP snooping for IPv4 environments. When MLD snooping is enabled on a VLAN, the device examines MLD messages between the hosts and multicast routers and learns which hosts are interested in receiving traffic for a multicast group. You can use the **mld snooping** command to configure MLDv2 snooping globally and per VLAN.

The **no** and the **default** forms of the command removes the mld snooping configuration.

Command Mode

Global configuration mode

Command Syntax

```
mld snooping  
no mld snooping  
default mld snooping
```

Example

The following example configures MLDv2 snooping globally and per VLAN.

```
switch(config)# mld snooping  
switch(config-mld-snooping)# disabled  
switch(config-mld-snooping)# vlan 1-100  
switch(config-mld-snooping)# vlan 101  
switch(config-mld-snooping-vlan-101)# disabled
```

16.1.9.17 mld startup-query-count

The **mld startup-query-count** command specifies the number of query messages that an interface sends during the startup query interval.

When an interface starts running MLD, it can establish the group state more quickly by sending query messages at a higher frequency. The **mld startup-query-interval** and **mld startup-query-count** commands define the startup period and the query message transmission frequency during that period.

The **no mld startup-query-count** and **default mld startup-query-count** commands restore the default startup-query-count value by removing the corresponding **mld startup-query-count** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld startup-query-count number
no mld startup-query-count
default mld startup-query-count
```

Parameters

number the startup query count. Values range from **1** to **100**.

Example

This command configures the startup query count of **4** on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-count 4
```

16.1.9.18 mld startup-query-interval

The **mld startup-query-interval** command specifies the interval between the general queries sent by a querier on startup.

When an interface starts running MLD, it can establish the group state quicker by sending query messages at a higher frequency. The **mld startup-query-interval** and **mld startup-query-count** commands define the startup period and the query message transmission frequency during that period.

The **no mld startup-query-count** and **default mld startup-query-interval** commands restore the default startup-query-interval value by removing the corresponding **mld startup-query-interval** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld startup-query-interval period
no mld startup-query-interval
default mld startup-query-interval
```

Parameter

period the startup query interval in seconds. Values range from **1** to **3175**.

Example

This command configures the startup query interval of **100** seconds on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld startup-query-interval 100
```

16.1.9.19 mld static-group

The **mld static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast traffic of the specified group is fast-switched.

The **no mld static-group** and **default mld static-group** commands remove the configuration mode interfaces group membership by removing the corresponding **mld startup-group** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld static-group source_address [group_address | access-list acl_name]
no mld static-group source_address [group_address | access-list acl_name]
default mld static-group source_address [group_address | access-list acl_name]
```

Parameters

- ***source_address*** IP address of the host that originates multicast data packets.
- ***group_address*** IPv6 address of a multicast group.
- ***access-list*** IPv6 access list to use as a static group list.
- ***acl_name*** specifies access-list name

Examples

- This command configures static groups on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld static-group ff30::1 a::1
```

- This command configures multiple static groups using an access list on an **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld static-group access-list testAccessList
```

16.1.9.20 mld

The **mld** command enables multicast listener discovery on an interface which controls the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

The **no mld** and **default mld** commands restore the default behavior by removing the corresponding **mld** command from the **running-config**.

Note: It is possible to change the values of the querier parameters used by MLD.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mld [last-listener-query-count | last-listener-query-interval | query-interval | query-response-interval | robustness | startup-query-count | startup-query-interval | static-group]
```

```
no mld
```

```
default mld
```

Parameters

- **last-listener-query-count** the number of group-specific or group-source-specific queries to send before the router assumes there are no more listeners.
- **last-listener-query-interval** the interval between the last listener queries.
- **query-interval** the interval between the general queries regularly sent by a querier.
- **query-response-interval** the interval that the host has to respond to a general query.
- **robustness** the number of general queries to send before the router assumes there are no more listeners.
- **startup-query-count** the number of queries a router sends at startup.
- **startup-query-interval** the interval between the general queries sent by a querier at startup.
- **static-group** the number of static groups or sources of MLD messages.

Example

This command enables MLD on the **interface Ethernet1**.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# mld
```

16.1.9.21 multipath deterministic

By default, EOS load balances multicast traffic by distributing packets over all ECMP links. The **no multipath deterministic** command performs differently when a new ECMP link appears on the network. No switch-over occurs for the existing multicast flows and remain on the same ECMP path.

The **default multipath deterministic** command restores the default behavior of randomly distributing multicast traffic over all ECMP links. The **multipath deterministic** command re-evaluates all of the existing flows and when locating a new RPF, a switch-over occurs for the traffic.

Command Mode

Router Multicast IPv4 Configuration

Command Syntax

```
multipath deterministic
no multipath deterministic
default multipath deterministic
```

Examples

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# no multipath deterministic
switch(config-router-multicast-ipv4)#{
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic
switch(config-router-multicast-ipv4)#{
```

- These commands configure the switch to load balance multicast traffic by enabling the behavior of RPF selection.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# multipath deterministic router-id
switch(config-router-multicast-ipv4)#{
```

16.1.9.22 multipath none

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The **multipath none** command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The **no multipath none** and **default multipath none** commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the **multipath none** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
multipath none  
no multipath none  
default multipath none
```

Related Commands

The [multipath deterministic](#) commnsnd performs the same function as **no multipath none**

Examples

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)# router multicast  
switch(config-router-multicast)# ipv4  
switch(config-router-multicast-ipv4)# multipath none  
switch(config-router-multicast-ipv4)#{
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)# router multicast  
switch(config-router-multicast)# ipv4  
switch(config-router-multicast-ipv4)# no multipath none  
switch(config-router-multicast-ipv4)#{
```

16.1.9.23 route

The **route** command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The **no route** and **default route** commands remove the specified static multicast route by removing the corresponding **route** command from *running-config*.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
route group_address [source_address] iif interface [oif interface] [cpu] [iifFrr interface] [priority priority_num]
no route group_address
default route group_address
```

Parameters

- ***group_address*** the multicast group address.
- ***source_address*** the optional source address for the multicast route.
- **iif *interface*** specifies an incoming interface for the static route.
- **cpu** optionally mirrors multicast packets to the CPU.
- **oif *interface*** specifies an optional outgoing interface to be included among those on which the multicast traffic is forwarded.
- **iifFrr *interface*** specifies an optional interface for multicast-only fast reroute.
- ***interface*** options include:
 - **Ethernet *ethernet_port*** Ethernet interface.
 - **Null0** drops all traffic.
 - **Port-Channel *lag_no*** port-channel interface or sub-interface; values range from **1-2000** or **1-2000.1-4094**.
 - **Register0** drops all incoming traffic.
 - **Vlan *vlan_no*** VLAN interface.
- **priority *priority_num*** specifies an optional priority for the multicast route. If the same route is present in several multicast routing tables, the priority number is used to select the best available route. Values range from **0** to **255**; PIM routes by default have a priority of **0**, while static multicast routes by default have a priority of **255**.

Example

These commands create a static multicast route in the default VRF. The static route has a group address of **225.3.3.3** and source address of **1.1.1.1**. It uses **Vlan100** as its incoming interface, VLANs **200** and **300** as its outgoing interfaces, and **interface Ethernet2** as its multicast-only fast reroute interface.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# route 225.3.3.3 1.1.1.1 iif Vlan100 oif Vlan200 Vlan300
  iifFrr Ethernet2
switch(config-router-multicast-ipv4) #
```

16.1.9.24 router multicast

The **router multicast** command places the switch in router-multicast configuration mode to configure IPv4 and IPv6 router multicast traffic.

Command Mode

Global Configuration

Command Syntax

```
router multicast
```

Example

The following command places the switch in **router-multicast** configuration mode.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv6
switch(config-router-multicast-ipv6)#routing
```

16.1.9.25 routing

The **routing** command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The **no routing** and **default routing** commands disable multicast routing by removing the **routing** command from *running-config*.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
routing  
no routing  
default routing
```

Example

These commands enable multicast routing on the switch.

```
switch(config)# router multicast  
switch(config-router-multicast)# ipv4  
switch(config-router-multicast-ipv4)# routing  
switch(config-router-multicast-ipv4)#[
```

16.1.9.26 rpf route

The **rpf route** command specifies a candidate for the multicast Reverse Path Forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the Multicast Routing Information Base (MRIB).

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
rpf route {source_prefix | source_address | mask}{rpf_interface | rpf_neighbor} [admin_distance]
no rpf route {source_prefix | source_address | mask}{rpf_interface | rpf_neighbor}
default rpf route {source_prefix | source_address mask}{rpf_interface | rpf_neighbor}
```

Parameters

- **source_prefix** specifies the source prefix.
- **source_address** specifies the source address.
- **mask** specifies the address mask.
- **rpf_interface** specifies the multicast RPF interface.
- **rpf_neighbor** specifies the multicast RPF neighbor.
- **admin_distance** specifies the administrative distance (optional). Values range from **1** to **255**.

Examples

- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)# rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)# rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#

```

- These commands include an administrative distance of **255** on **interface Ethernet 5** with static mroute.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)# rpf route 11.10.1.0/24 Ethernet 5 255
switch(config-router-multicast-ipv4)# rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#

```

16.1.9.27 show ip mfib counters

Use the **show ip mfib counters** command to display per multicast route ingress packet and byte counters.

Command Mode

EXEC

Command Syntax

```
show ip mfib vrf [vrf-name] group_addr source_addr counters
```

Parameters

- **vrf [vrf-name]** VRF name.
- **group_addr** Group address.
- **source_addr** Source address.
- **counters** Counter for bytes/packets.

Example

```
switch# show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
  225.1.2.1 10.46.1.2
    Byte: 1200200
    Packet: 12002
    Ethernet46 (iif)
    Ethernet47
    Activity 0:02:52 ago
```

16.1.9.28 show ip mroute

The **show ip mroute** command displays information from the IP multicast routing table.

- **show ip mroute** displays information for all routes in the table.
- **show ip mroute gp_addr** displays information for the specified multicast group.

Command Mode

EXEC

Command Syntax

```
show ip mroute  
show ip mroute gp_addr
```

Parameter

gp_addr group IP address (dotted decimal notation).

Example

This command displays the IP multicast routing table entry for the multicast group **225.1.1.11**.

```
switch# show ip mroute 225.1.1.1  
PIM Sparse Mode Multicast Routing Table  
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT  
R - RPT bit is set, S - SPT bit is set  
W - Wildcard entry, X - External component interest  
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd  
H - Joining SPT due to policy, D - Joining SPT due to protocol  
Z - Entry marked for deletion  
A - Learned via Anycast RP Router  
225.1.1.1  
172.28.1.100, 5d04h, flags: S  
Incoming interface: Vlan281  
Outgoing interface list:  
Port-Channel999 switch#
```

16.1.9.29 show ip mroute count

The **show ip mroute count** command displays IP multicast routing table statistics.

The **show ip mroute** command displays information from the IP multicast routing table.

Command Mode

EXEC

Command Syntax

```
show ip mroute count
```

Example

This command displays IP multicast routing table statistics.

```
switch# show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1 switch#
```

16.1.9.30 show ip multicast boundary

The **show ip multicast boundary** command displays the summary of all IP multicast boundaries across all interfaces.

Command Mode

EXEC

Command Syntax

```
show ip multicast boundary [group_prefix | group_prefix/length [out] | interface {ethernet e_num | loopback l_num | management m_num | port-channel p_num | vlan v_num} | out]
```

Parameters

- **no parameters** displays the summary of all IP multicast boundaries across all interfaces.
- **group_prefix** displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- **group_prefix/length** displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
 - **out** displays the specified group address IP multicast boundaries whose control plane filtering is enabled.
 - **interface** displays IP multicast boundary of the specified interface. Options include:
 - **ethernet e_num** displays IP multicast boundaries of the specified Ethernet interface.
 - **loopback l_num** displays IP multicast boundaries of the specified Loopback interface.
 - **management m_num** displays IP multicast boundaries of the specified management interface.
 - **port-channel p_num** displays IP multicast boundaries of the specified port channel interface.
 - **vlan v_num** displays IP multicast boundaries of the specified VLAN interface.
 - **out** displays all IP multicast boundaries whose only control plane filtering is enabled.

Examples

- This command displays the summary of all IP multicast boundaries across all interfaces.

```
switch(config-if-Et24) # show ip multicast boundary
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.0/24 Yes
Ethernet1 224.6.6.0/24 Yes
Ethernet2 224.4.4.0/24 Yes
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries matching **224.5.5.0 255.255.255.255**.

```
switch(config-if-Et24) # show ip multicast boundary 224.5.5.0 255.255.255.255
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0 255.255.255.255
Ethernet3 224.5.5.0 255.255.255.255 No
```

- This command displays all IP multicast boundaries matching **224.5.5.0/24**.

```
switch(config-if-Et24) # show ip multicast boundary 224.5.5.0/24
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries of **interface Ethernet1**.

```
switch(config-if-Et24) # show ip multicast boundary interface Ethernet1
```

```
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet1 224.6.6.0/24 No
```

- This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.

```
switch(config-if-Et24) # show ip multicast boundary out
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 No
Ethernet3 224.5.5.0/24 No
```

16.1.9.31 show mld membership

The **show mld membership** command displays MLD group and source membership information on a specific interface.

Command Mode

EXEC

Command Syntax

```
show mld membership [dynamic | group | interface | static]
```

Parameters

- **dynamic** displays MLD information for a dynamic group.
- **group** displays MLD information for a specified multicast group address.
- **interface** displays MLD information for the specified interface.
- **static** displays MLD information for statically configured group.

Example

This command displays MLD group and source information on the Ethernet interfaces **3** and **6**.

```
switch# show mld membership
Interface      Group        Source        Filter Mode
-----        -----
Ethernet3     ff30::1      a::2          include
Ethernet3     ff30::1      a::1          include
Ethernet6     ff30::2      a::2          include
```

16.1.9.32 show mld querier

The **show mld querier** command displays information about the MLD querier and querier parameters.

Command Mode

EXEC

Command Syntax

```
show mld querier [interface | parameters]
```

Parameters

- **interface** displays MLD querier information.
- **parameters** displays MLD querier parameters.

Example

- This command displays MLD querier on the Ethernet interface **Et3** and **Et6**.

| Interface | Querier | General Query Expiry | Other Querier Expiry | Version |
|-----------|-------------------|----------------------|----------------------|---------|
| Et3 | fe80::1:ff:fe01:0 | 0:01:14 | N/A | 2 |
| Et6 | fe80::1:ff:fe01:0 | 0:01:14 | N/A | 2 |

- This command displays MLD querier parameters on the Ethernet interface **Et3** and **Et6**.

| Interface | Robustness | Query Interval | Query Response Interval | Startup Query Interval | Startup Count | Last Listener Query Interval | Last Listener Query Count |
|-----------|------------|----------------|-------------------------|------------------------|---------------|------------------------------|---------------------------|
| Et3 | 2 | 125 | 10 | 31.25 | 2 | 1 | 2 |
| Et6 | 2 | 125 | 10 | 31.25 | 2 | 1 | 2 |

16.1.9.33 show mld snooping

Use the **show mld snooping** command to display the snooping status of the switch.

Command Mode

EXEC

Command Syntax

```
show mld snooping [counters [errors] | groups [A:B:C:D:E:F:G:H | count | detail | local | mlag | user | vlan] | mrouter [detail | vlan] | querier [vlan] | vlan [num]]
```

Parameters

- **counters** MLD counter information.
 - **errors** Error counters.
- **groups** MLD group information.
 - **A:B:C:D:E:F:G:H** IPv6 address.
 - **count** Displays membership count.
 - **detail** Displays a comprehensive output.
 - **local** Displays groups learned locally via MLD.
 - **mlag** Displays groups learned via MLAG peer.
 - **user** Displays groups configured by the user.
 - **vlan** Specifies VLAN.
- **mrouter** MLD multicast router information.
 - **detail** Displays a comprehensive output.
 - **vlan** Specifies VLAN.
- **querier** MLD querier information.
 - **vlan** Specifies VLAN.
- **vlan** Specifies VLAN.
 - **num 1-4094** Identifier for Virtual LAN.

Examples

- Use the **show mld snooping** command to display the MLD snooping status of the switch.

```
switch# show mld snooping
  Global MLD Snooping configuration:
  -----
  MLD snooping          : Enabled
  Robustness variable   : 2

  VLAN 1 :
  -----
  MLD snooping          : Disabled
  MLD max group limit  : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active : False
  Flooding traffic to VLAN : True

  VLAN 100 :
  -----
  MLD snooping          : Enabled
  MLD max group limit  : No limit set
  Recent attempt to exceed limit : No
  MLD snooping pruning active : True
  Flooding traffic to VLAN : False
```

```

switch##show mld snooping vlan 100
    Global MLD Snooping configuration:
-----
MLD snooping          : Enabled
Robustness variable   : 2

VLAN 100 :
-----
MLD snooping          : Enabled
MLD max group limit  : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active : True
Flooding traffic to VLAN   : False

```

- Use the **show mld snooping groups** command to display VLANs by group.

```

switch# show mld snooping groups
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group      Members
-----
100  ff05::2      Cpu, Et4
100  ff08::11     Et1
100  ff08::21     Et2
100  ff08::31     Et3
100  *            Et3, Et4

```

- Use the **show mld snooping groups detail** command to display detailed VLANs information by group.

```

switch(config-mld-snooping-vlan-100)# show mld snooping groups detail
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group      Source      Mode      Uptime      Members
-----
100  ff05::2      *          -         0d00h13m20  Cpu, Et4
100  ff08::11     *          -         0d00h13m17  Et1
100  ff08::21     1::1       IN        0d00h13m20  Et2
100  ff08::31     2::1       EX        0d00h01m31  Et3
100  *            *          -         -           Et3, Et4

```

The **show mld snooping groups** command output can be further filtered to output just the:

- **local** groups, That is groups learned locally using **show mld snooping groups local** command.
- **user** groups, that is groups configured by user using the **show mld snooping groups user** command.
- **mlag** groups, that is groups learned from the MLAG peer using the **show mld snooping groups mlag** command.
- Use the **show mld snooping mrouter** to display MLD multcat router information.

```

switch# show mld snooping mrouter
Vlan  Interface-ports
-----
100   Et3(dynamic), Et4(static)

switch#show mld snooping mrouter detail
Vlan  Intf      Address      FirstHeard      LastHeard      Expires      Type
-----
100   Et3        fe80::200:3ff:fe01:0 0d00h24m30  0d00h00m08  00h00m17 querier
100   Et4        fe80::200:3ff:fe03:0 0d00h24m10  0d00h00m08  00h01m37 pim
100   Et2        0.0.0.0          -             -             -             static

switch##show mld snooping mrouter vlan 100
Vlan  Interface-ports
-----
100   Et2(static), Et3(dynamic), Et4(dynamic)

```

```

switch#show mld snooping querier
Vlan IP Address Version Port
----- 
100 fe80::200:3ff:fe01:0 v2 Et3

```

- Use the **show mld snooping querier** command to display querier information. In the example, the querier information requested for display if for **vlan 100**.

```

switch# show mld snooping querier vlan 100
IP Address : fe80::200:3ff:fe01:0
MLD Version : v2
Port : Et3
Max response time : 10.0

switch#show mld snooping counters

```

The **Switch** interface in the above output can be ignored.

16.1.9.34 show mld statistics

The **show mld statistics** command displays total statistics information of incoming and outgoing MLD messages on a specific interface.

Command Mode

EXEC

Command Syntax

```
show mld statistics version value
```

Parameters

- **version** specifies MLD version.
- **value** specifies the MLD version number. Accepted version values are 1 and 2.

Example

This command displays total MLD statistics on the Ethernet interface **Et3** and **Et6**.

```
switch# show mld statistics
      MLD Total (Version1 + Version2) Statistics
      Received          | Sent
      Received          | Sent
Interface  Queries  Reports  Dones  Others  Errors | Queries
-----
Et3        0         12       0       0       0       12
Et6        0         11       0       0       0       12
```

16.1.9.35 show mld summary

The **show mld summary** command displays MLD summary information.

Command Mode

EXEC

Command Syntax

```
show mld summary
```

Parameter

interface displays MLD summary on a specified interface.

Example

This command displays MLD summary on the interface **Ethernet3** and **Ethernet6**.

```
switch# show mld summary
Interface      IPv6 link-local address      Group Count      Querier State
-----      -----
Ethernet3      fe80::1:ff:fe01:0          2                  querier
Ethernet6      fe80::1:ff:fe01:0          2                  querier

Number of MLD interfaces: 2
Number of total groups joined across all MLD interfaces: 4
```

16.1.9.36 show multicast fib ipv4 software

The **show multicast fib ipv4 software** command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the [show multicast fib ipv4](#) command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

Command Mode

EXEC

Command Syntax

```
show multicast fib ipv4 software [INFO_LEVEL] [ROUTE]
```

Parameters

- **INFO_LEVEL** specifies the type of information displayed. Options include
 - **no parameter** displays packet reception counters.
 - **detail** displays packet reception counters and packet queued/dropped counters.
- **ROUTE** routes displayed, filtered by multicast group and source IP addresses:
 - **no parameter** shows information for all software-forwarded routes in the MFIB.
 - **group_addr** shows information only for the specified multicast group.
 - **group_addr source address** shows information only for the specified group and source.

Examples

- This command displays MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software
239.255.255.250 172.17.41.150
  Vlan3040 (iif)
    Packets Received: 18
    Bytes Received : 9147
    RPF Failures   : 0
239.255.255.250 172.17.41.120
  Vlan3040 (iif)
    Packets Received: 6
    Bytes Received : 966
    RPF Failures   : 0
switch#
```

- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software detail
239.255.255.250 172.17.41.150
  Vlan3040 (iif)
    Packets Received: 18
    Bytes Received: 9147
    RPF Failures: 0
    Packets Queued/Dropped : 0 / 0
239.255.255.250 172.17.41.120
  Vlan3040 (iif)
    Packets Received: 6
    Bytes Received: 966
    RPF Failures: 0
    Packets Queued/Dropped : 0 / 0
switch#
```

16.1.9.37 show multicast fib ipv4

The **show multicast fib ipv4** command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

Command Mode

EXEC

Command Syntax

```
show multicast fib ipv4 [group_address [source_address] | bidirectional | count | counter | df | rpa | software | sparse-mode | static | summary | vrf]
```

Parameters

- no parameters displays information for all hardware-forwarded routes in the MFIB.
- **group_address** displays the information of the specified multicast group address. Options include:
 - **source_address** displays the information of the specified multicast group and source addresses.
 - **count** displays the multicast routes count of the specified group address.
 - **counters** displays the multicast route traffic count of the specified group address.
- **bidirectional** displays the information of bidirectional routes.
- **count** displays the count of multicast routes.
- **counter** displays the count of multicast route traffic in either bytes or packets.
- **df** displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap.
- **rpa** displays the bidirectional PIM Rendezvous Point Address (RPA) index.
- **software** displays the software multicast FIB.
- **sparse-mode** displays the sparse-mode information.
- **static** displays the static multicast information.
- **summary** displays the multicast FIB summary.
- **vrf vrf_name** displays information of the corresponding VRF.

Guidelines

The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

Examples

- This command displays the bidirectional PIM RPA index.

```
switch# show multicast fib ipv4 rpa
Prefix                               Rpa Index
225.0.0.0/8                           1
226.0.0.0/8                           1
```

- This command displays the static multicast route information.

```
switch# show multicast fib ipv4 static count
(S,G) routes: 34
(*,G) routes: 31
Fastdrop routes: 0
Prefix routes: 12
```

- This command displays the multicast routes count of the specified group and source addresses.

```
switch# show multicast fib ipv4 229.0.0.0 10.1.5.101 count
```

```
Activity poll time: 60 seconds
(S,G) routes: 1
Fastdrop routes: 0
```

- This command displays the multicast route traffic count of the specified group and source addresses.

```
switch# show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
Activity poll time: 60 seconds
229.0.0.0 10.1.5.101
  Byte: 46128
  Packet: 93
  Port-Channel100 (iif)
    Activity 0:53:52 ago
```

- This command displays the multicast FIB summary.

```
switch# show multicast fib ipv4 summary
Number of multicast routes: 12
Number of fastdrop routes : 45
```

16.1.9.38 show multicast fib ipv6

The **show multicast fib ipv6** command displays the Multicast Forwarding Information Base (MFIB) table.

Command Mode

EXEC

Command Syntax

```
show multicast fib ipv6
```

Example

The command output displays the Multicast Forwarding Information Base (MFIB) table as shown.

```
switch# show multicast fib ipv6
Activity poll time: 60 seconds
ff33::1:0:0:1 101:1::2
    Ethernet11/1 (iif)
    Ethernet9/1.1
    Ethernet2/1.1
    Ethernet3/1.1
    Ethernet6/1.1
    Ethernet5/1.1
    Ethernet8/1.1
    Ethernet7/1.1
    Ethernet4/1.1
Activity 0:00:35 ago
```

16.1.9.39 show pim ipv6 sparse-mode route

The **show pim ipv6 sparse-mode route** command displays the PIM Sparse Mode Multicast Routing table.

Command Mode

EXEC

Command Syntax

```
show pim ipv6 sparse-mode route
```

Example

The command output displays the PIM Sparse Mode Multicast Routing table as shown.

```
switch# show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
      R - RPT bit is set, S - SPT bit is set, L - Source is attached
      W - Wildcard entry, X - External component interest
      I - SG Include Join alert rcvd, P - (*,G) Programmed in hardware
      H - Joining SPT due to policy, D - Joining SPT due to protocol
      Z - Entry marked for deletion, C - Learned from a DR via a register
      A - Learned via Anycast RP Router, M - Learned via MSDP
      N - May notify MSDP, K - Keepalive timer not running
      T - Switching Incoming Interface, B - Learned via Border Router
RPF route: U - From unicast routing table
           M - From multicast routing table
ff33::1:0:0:1
  101:1::2, 2:03:00, flags: S
    Incoming interface: Ethernet11/1
    RPF route: [U] 101:1::/64 [110/1] via fe80::464c:a8ff:feb7:39e9
    Outgoing interface list:
      Ethernet6/1.1
      Ethernet4/1.1
      Ethernet7/1.1
      Ethernet9/1.1
      Ethernet8/1.1
      Ethernet2/1.1
      Ethernet5/1.1
      Ethernet3/1.1
```

16.1.9.40 show platform fap mroute ipv6

The `show platform fap mroute ipv6` command displays the Platform Hardware Forwarding table.

Command Mode

EXEC

Command Syntax

```
show platform fap mroute ipv6
```

Example

The command output displays the Platform Hardware Forwarding table as shown

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
-----
Location    GroupId    Group          Source
IIF         McId      OIF
        FLP/TT      FLP/TT       TT
        FLP          FLP          FLP
-----
4096/2048   1/1      ff33::1:0:23/128  101:1::2/128
Vlan1357 21504     Vlan1044(Et7/1)  Vlan1123(Et9/1)

Vlan1200(Et8/1)  Vlan1223(Et2/1)

Vlan1226(Et5/1)  Vlan1232(Et3/1)
```

16.1.9.41 unresolved cache-entries max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is **4000** (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of **4000** (S,G) routes by removing the **unresolved cache-entries max** command from **running-config**. See [ip multicast boundary](#) to limit the number of cached packets per S,G.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
unresolved cache-entries max quantity_entries
no unresolved cache-entries max
default unresolved cache-entries max
```

Parameter

quantity_entries maximum buffer size (routes). Value ranges from **10** to **10000000**. Default is **4000**.

Example

This command sets the maximum MFIB unresolved cache-entry buffer size to **6000** routes in the default VRF.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#

```

16.1.9.42 unresolved packet-buffers max

The **unresolved packet-buffers max** command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The **no unresolved packet-buffers max** and **default unresolved packet-buffers max** commands restore the number of unresolved packets that the switch processes to the default value of **3** packets by removing the **unresolved packet-buffers max** command from **running-config**. See [unresolved cache-entries max](#) to limit the number of unresolved routes that are cached.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
unresolved packet-buffers max quantity_packets
no unresolved packet-buffers max
default unresolved packet-buffers max
```

Parameter

quantity_packets packets per unresolved route that the switch processes. Values range from **3** to **10000000**. Default is **3**.

Example

This command programs the switch in the default VRF to process **30** multicast packets from any route regardless of its entry's presence in the multicast routing cache.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)# unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#[/pre]
```

16.2 IGMP and IGMP Snooping

- [IGMP Snooping](#)
- [IGMP Host Proxy Description](#)
- [Supported Features](#)
- [IGMP Protocols](#)
- [Configuring IGMP](#)
- [Configuring IGMP Snooping](#)
- [IGMP Host Proxy](#)
- [IGMP and IGMP Snooping Commands](#)

16.2.1 IGMP Snooping

Internet Group Management Protocol (IGMP) snooping is a Layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouters). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. When the network does not have a router, an IGMP snooping querier performs the multicast router (mrouter) role. After enabling the snooping querier on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When the IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or when it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. After enabling a snooping proxy, the switch periodically sends proxy queries to the downstream hosts, collects the IGMP reports, and updates the local state. Later, when the switch receives an IGMP query from an upstream router, it immediately responds with a report based on its local state.

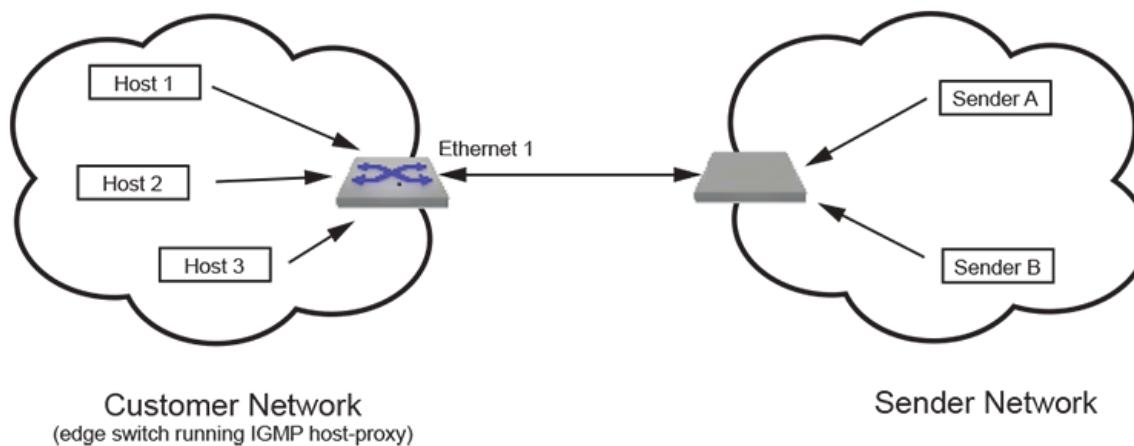

When the IGMP snooping proxy is disabled, the IGMP queries in the VLAN, and the reports from hosts are flooded. Enabling the IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to

every query. It also reduces the number of reports the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

16.2.2 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's **Ethernet 1** interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

Figure 16-2: IP IGMP Host Proxy Implementation

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires, and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM Multicast Border Router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be a rendezvous point (RP - PIM) or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

16.2.3 Supported Features

For a list of the IGMP features that each Arista switch platform supports, refer to the supported features table here: <https://www.arista.com/en/support/product-documentation/supported-features>.

16.2.4 IGMP Protocols

- [IGMP](#)
- [IGMP Snooping](#)

16.2.4.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in [RFC 1112](#). Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in [RFC 2236](#). Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in [RFC 4604](#). Version 3 allows hosts to specify IP addresses within a group from which they receive traffic. Traffic from all other group addresses is blocked from the host.

A multicast router is either a querier or non-querier with respect to each of its attached networks. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table. It discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the **last member query response interval**, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

16.2.5 Configuring IGMP

This section describes the following configuration tasks:

- [Enabling IGMP](#)
- [Configuring IGMP Settings](#)

16.2.5.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

By default, PIM and IGMP are disabled on an interface. Use the [pim ipv4 sparse-mode](#) or [pim ipv4 bidirectional](#) command to enable PIM and IGMP on the configuration mode interface.

Example

This command enables PIM and IGMP on ***interface vlan 8***.

```
switch(config)# interface vlan 8
switch(config-if-V18)# pim ipv4 sparse-mode
switch(config-if-V18)#

```

If, though unlikely, the IGMP agent needs to run on an interface without PIM being enabled, use the [ip igmp](#) command.

Example

This command enables IGMP on ***interface vlan 8*** without enabling PIM.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# ip igmp
switch(config-if-Vl8)#{
```

16.2.5.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter the startup query, last member query, and normal query settings.

IGMP Version

The switch supports IGMP versions 1 through 3. The [ip igmp version](#) command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

Example

This command configures ***IGMP version 3*** on ***interface vlan 4***.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp version 3
switch(config-if-Vl4)#{
```

Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The [ip igmp startup-query-interval](#) command specifies the interval between membership queries that an interface sends immediately after it starts up. The [ip igmp startup-query-count](#) command specifies the number of queries the switches send from the interface at the startup interval rate.

- **Example**

These commands define a startup interval of **15** seconds for the first **10** membership queries sent from ***interface vlan 12***.

```
switch(config)# interface vlan 12
switch(config-if-Vl12)# ip igmp startup-query-interval 150
switch(config-if-Vl12)# ip igmp startup-query-count 10
switch(config-if-Vl12)#{
```

Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **ip igmp query-interval** command configures the frequency at which the active interface sends membership query messages as an IGMP querier.

The **igmp query-max-response-time** command configures the time a host must respond to a membership query.

Example

These commands define a membership query interval of **75** seconds and a query response timer reset value of **45** seconds for queries sent from **interface vlan 15**.

```
switch(config)# interface vlan 15
switch(config-if-V115)# ip igmp query-interval 75
switch(config-if-V115)# igmp query-max-response-time 450
switch(config-if-V115)#{/pre}

```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The **ip igmp last-member-query-count** (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The **ip igmp last-member-query-interval** command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example

These commands program the switch to send **3** query messages, one every **25** seconds, when **interface vlan 15** receives an IGMP leave message.

```
switch(config)# interface vlan 15
switch(config-if-V115)# ip igmp last-member-query-interval 250
switch(config-if-V115)# ip igmp last-member-query-count 3
switch(config-if-V115)#{/pre}

```

Static Groups

The **ip igmp static-group** command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Note: To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the **pim ipv4 dr-priority** command to make it the DR by configuring its PIM DR value to be the highest on the network.

Example

These commands configure **interface vlan 15** as the PIM designated router, then configure it as a static member of the multicast group at address **231.1.1.15** for multicast data packets that originate at **10.1.1.1**.

```
switch(config)# interface vlan 15
switch(config-if-V115)# pim ipv4 dr-priority 5000
switch(config-if-V115)# ip igmp static-group 231.1.1.15 10.1.1.1
switch(config-if-V115)#{/pre}

```

16.2.6 Configuring IGMP Snooping

This section describes the following configuration tasks:

- [Enabling Snooping](#)
- [Configuring Snooping Parameters](#)
- [Snooping Querier](#)
- [IGMP Snooping L2 Report Flooding](#)
- [IGMP Snooping Filters](#)
- [Configuring IGMP Snooping Proxy](#)

16.2.6.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The [ip igmp snooping](#) command controls the global snooping setting, and the [ip igmp snooping vlan](#) command configures snooping on individual VLANs.

Examples

- This command globally enables snooping on the switch.

```
switch(config)# ip igmp snooping  
switch(config)#[/pre]
```

- This command disables snooping on VLANs **2**, **3**, and **4**.

```
switch(config)# no ip igmp snooping vlan 2-4  
switch(config)#[/pre]
```

16.2.6.2 Configuring Snooping Parameters

Specifying a Static Multicast Router Connection

The [ip igmp snooping vlan multicast-router](#) command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

Example

This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)# ip igmp snooping vlan 2 mrouter interface ethernet 3  
switch(config)#[/pre]
```

Adding a Port to a Multicast Group

The [ip igmp snooping vlan member](#) command adds a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.

Example

This command configures the static connection to a multicast group at **237.2.1.4** through **interface ethernet 3**.

```
switch(config)# ip igmp snooping vlan 7 member 237.2.1.4 interface ethernet 3
switch(config) #
```

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries a switch sends before removing the recipient from the group list.

The [ip igmp snooping robustness-variable](#) command configures the robustness variable for all snooping packets sent from the switch. The default value is **2**.

Example

This command sets the robustness-variable value to **3**.

```
switch(config)# ip igmp snooping robustness-variable 3
switch(config) #
```

Configuring Interface Startup Initial Query Times

The [ip igmp snooping interface-restart-query](#) command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of **2000** milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command, making the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at **1000**, **2000**, and **4000** milliseconds (i.e., **1** second, **2** seconds, and **4** seconds) after an interface restart or spanning tree change.

```
switch(config)# ip igmp snooping interface-restart-query 1000 2000 4000
switch(config) #
```

- This command configures interfaces to send a single IGMP query of **5000** milliseconds (**5** seconds) after an interface restart or spanning tree change.

```
switch(config)# ip igmp snooping interface-restart-query 5000
switch(config) #
```

16.2.6.3 Snooping Querier

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch.

Note: If IGMP snooping is enabled, QoS will not apply to IGMP packets.

16.2.6.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires explicitly configuring a global or local querier address for the interface. See [Configuring Snooping Querier Parameters](#).

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The [ip igmp snooping querier](#) command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the [ip igmp snooping vlan querier](#) command.

The [ip igmp snooping vlan querier](#) command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

Example

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs **1-4**, and explicitly enable snooping on VLANs **5-8**.

```
switch(config)# ip igmp snooping querier
switch(config)# no ip igmp snooping vlan 1-4 querier
switch(config)# ip igmp snooping vlan 5-8 querier
switch(config)#

```

- This command removes the querier setting for VLANs **3-6**:

```
switch(config)# default ip igmp snooping vlan 3-6 querier
switch(config)#

```

Globally Set the Snooping Querier Version

The [ip igmp snooping querier version](#) command configures the IGMP snooping querier version. **Version 2** is the default IGMP snooping version.

Example

This command globally configures IGMP snooping querier **version 2**.

```
switch(config)# ip igmp snooping querier version 2
switch(config)#

```

The [ip igmp snooping vlan querier version](#) command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.

Example

This command configures IGMP snooping vlan querier version **vlan 5**.

```
switch(config)# ip igmp snooping vlan 5 querier version 2
switch(config)#

```

16.2.6.3.2 Configuring Snooping Querier Parameters

Querier Address

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The **ip igmp snooping querier address** command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the **ip igmp snooping vlan querier address** command. The default global address is not defined.

The **ip igmp snooping vlan querier address** command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the **ip igmp snooping querier address** for the specified VLAN.

Examples

- This command sets the source IP address for query packets that the switch transmits to **10.1.1.41**.

```
switch(config)# ip igmp snooping querier address 10.1.1.41
switch(config)#

```

- This command sets the source IP address for query packets that **vlan 2** transmits to **10.14.1.1**.

```
switch(config)# ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#

```

Membership Query Interval

The query interval is the period (seconds) between IGMP Membership Query message transmissions. It ranges from **5** to **3600** seconds.

The **ip igmp snooping querier query-interval** command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is **125** seconds.

The **ip igmp snooping vlan querier query-interval** command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

Examples

- This command sets a query interval of **150** seconds for queries transmitted from VLANs for which a query interval is not configured.

```
switch(config)# ip igmp snooping querier query-interval 150
switch(config)#

```

- This command sets the query interval of **240** seconds for queries transmitted from **vlan 2**.

```
switch(config)# ip igmp snooping vlan 2 querier query-interval 240
switch(config)#

```

Membership Query Response Interval

The Max Response Time field in Membership Query messages specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero, and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier max-response-time** command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from **1** to **25** seconds with a default of **10** seconds. VLANs use the global setting unless overwritten with the **ip igmp snooping vlan querier max-response-time** command.

The **ip igmp snooping vlan querier max-response-time** command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.

Examples

- This command sets the maximum response time of **15** seconds for queries transmitted from VLANs for which a maximum response time is not configured.

```
switch(config)# ip igmp snooping querier max-response-time 15  
switch(config)#[/pre]
```

- This command sets a maximum response time of **5** seconds for queries that **vlan 2** transmits.

```
switch(config)# ip igmp snooping vlan 2 querier max-response-time 5  
switch(config)#[/pre]
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The **ip igmp snooping querier last-member-query-interval** command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from **1** to **25** seconds with a global default of one second.

The **ip igmp snooping vlan querier last-member-query-interval** command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

Example

This command sets the global snooping querier last-member-query-interval to **5** seconds and the **vlan 10** last-member-query-interval to **12** seconds.

```
switch(config)# ip igmp snooping querier last-member-query-interval 5  
switch(config)# ip igmp snooping vlan 10 querier last-member-query-interval 12  
switch(config)#[/pre]
```

Interface Restart Query Spoofing

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait **2000** milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the **ip igmp snooping interface-restart-query** command. This setting is applied to all ports.

Example

This command configures the switch to send general IGMP queries at **100** milliseconds, **200** milliseconds, and **300** milliseconds after interface restart or spanning tree status change.

```
switch(config) # ip igmp snooping interface-restart-query 100 200 300
```

16.2.6.4 IGMP Snooping L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can only forward membership reports if configured to handle VLAN traffic, regardless of any report flooding configuration settings.

Enabling L2 Report Flooding

These commands enable L2 report flooding:

- **ip igmp snooping report-flooding** enables report flooding globally.
- **ip igmp snooping vlan report-flooding** enables report flooding on a specified VLAN range.

Example

These commands enable L2 **report-flooding** globally and on VLANs **201-205**.

```
switch(config) # ip igmp snooping report-flooding
switch(config) # ip igmp snooping vlan 201-205 report-flooding
switch(config) #
```

Configuring Forwarding Ports

These commands specify the ports that forward membership report messages:

- **ip igmp snooping report-flooding switch-port** configures ports globally.
- **ip igmp snooping vlan report-flooding switch-port** configures ports for a specified VLAN range.

Example

These commands enable Ethernet ports **5-9** to forward reports on all VLANs and ports **12-15** on VLANs **201-205**.

```
switch(config) # ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config) # ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 12-15
switch(config) #
```

16.2.6.5 IGMP Snooping Filters

IGMP snooping filters assign IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface's accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode and then applied to an interface in interface configuration mode.

The [ip igmp profile](#) command places the switch in IGMP profile configuration mode. The [permit / deny](#) and [range](#) commands specify the profile's filter type and address range. A profile may contain multiple range statements to define a discontinuous address range.

Example

These commands create an IGMP profile named *list_1* by entering IGMP-profile configuration mode, configure the profile to permit multicast groups **231.22.24.0** through **231.22.24.127**, and return the switch to **global** configuration mode.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
switch(config-igmp-profile-list_1)# range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)# exit
switch(config) #
```

The [ip igmp snooping filter](#) command applies an IGMP profile to the configuration mode interface.

Example

These commands apply the *list_1* snooping profile to **interface ethernet 7**.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# ip igmp snooping filter list_1
switch(config-if-Et7) #
```

16.2.6.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping details that are viewable include:

- [show ip igmp snooping](#)
- [show ip igmp snooping counters](#)
- [show igmp snooping querier](#)
- [show igmp snooping querier counters](#)
- [show igmp snooping querier membership](#)

IGMP Snooping Status

The [show ip igmp snooping](#) command displays the switch's IGMP snooping configuration.

Example

This command displays the switch's IGMP snooping configuration.

```
switch> show ip igmp snooping
```

```

Global IGMP Snooping configuration:
-----
IGMP snooping          : Enabled
Robustness variable     : 2

Vlan 1 :
-----
IGMP snooping          : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
-----
IGMP snooping          : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :
switch>

```

IGMP Snooping Counters

The **show ip igmp snooping counters** command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Example

This command displays the number of messages received on each port.

| Port | Input | | | | Output | | | | |
|--------|---------|---------|--------|--------|--------|---------|---------|--------|--------|
| | Queries | Reports | Leaves | Others | Errors | Queries | Reports | Leaves | Others |
| Cpu | 15249 | 106599 | 4 | 269502 | 0 | 30242 | 102812 | 972 | 3625 |
| Et1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Et2 | 0 | 6 | 1 | 26 | 0 | 5415 | 0 | 0 | 731 |
| Et3 | 0 | 10905 | 222 | 1037 | 0 | 15246 | 0 | 0 | 1448 |
| Et4 | 0 | 44475 | 21 | 288 | 0 | 15247 | 0 | 0 | 2199 |
| Et5 | 0 | 355 | 0 | 39 | 0 | 15211 | 0 | 0 | 2446 |
| Et6 | 0 | 475 | 13 | 0 | 0 | 15247 | 0 | 0 | 2487 |
| Et7 | 0 | 0 | 0 | 151 | 0 | 15247 | 0 | 0 | 2336 |
| Et8 | 0 | 578 | 6 | 75 | 0 | 2859 | 0 | 0 | 931 |
| Et9 | 0 | 0 | 0 | 27 | 0 | 15247 | 0 | 0 | 2460 |
| Et10 | 0 | 12523 | 345 | 54 | 0 | 15247 | 0 | 0 | 2433 |
| Et11 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Et12 | 0 | 4509 | 41 | 22 | 0 | 15247 | 0 | 0 | 2465 |
| Et13 | 0 | 392 | 29 | 119 | 0 | 15247 | 0 | 0 | 2368 |
| Et14 | 0 | 88 | 3 | 6 | 0 | 15247 | 0 | 0 | 2481 |
| Et15 | 0 | 16779 | 556 | 72 | 0 | 15117 | 0 | 0 | 66 |
| Et16 | 0 | 2484 | 13 | 66 | 0 | 15247 | 0 | 0 | 2421 |
| Et17 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Et18 | 0 | 20 | 6 | 160 | 0 | 3688 | 0 | 0 | 803 |
| Et19 | 0 | 4110 | 17 | 0 | 0 | 15247 | 0 | 0 | 2487 |
| Et20 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Et21 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Et22 | 0 | 0 | 0 | 52 | 0 | 15247 | 0 | 0 | 2435 |
| Et23 | 0 | 5439 | 181 | 138 | 0 | 15247 | 0 | 0 | 2349 |
| Et24 | 0 | 2251 | 21 | 4 | 0 | 15247 | 0 | 0 | 2483 |
| Po1 | 45360 | 540670 | 8853 | 464900 | 0 | 15249 | 224751 | 618 | 2576 |
| Po2 | 0 | 101399 | 58 | 17 | 0 | 15120 | 0 | 0 | 1121 |
| Switch | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IGMP Snooping Querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. It also provides options to only include specific VLANs.

Example

This command displays the querier IP address, version, and port servicing each VLAN.

```
switch> show igmp snooping querier
```

```

Vlan IP Address Version Port
-----
1 172.17.0.37 v2 Po1
20 172.17.20.1 v2 Po1
26 172.17.26.1 v2 Cpu
2028 172.17.255.29 v2 Po1 switch>

```

IGMP Snooping Querier Counters

The [show igmp snooping querier counters](#) command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

This command displays the counters from the querier.

```

switch> show igmp snooping querier counters
-----
Vlan: 1      IP Addr: 100.0.0.1          Op State: Querier      Version: v3
v1 General Queries Sent      :0
v1 Queries Received        :0
v1 Reports Received        :0
v2 General Queries Sent      :1
v2 Queries Received        :0
v2 Reports Received        :25
v2 Leaves Received         :0
v3 General Queries Sent      :655
v3 GSQ Queries Sent        :0
v3 GSSQ Queries Sent       :8
v3 Queries Received        :654
v3 Reports Received        :2385
Error Packets               :0
Other Packets               :0 switch>

```

IGMP Snooping Querier Membership

The [show igmp snooping querier membership](#) command displays the membership from the querier, as learned through the Internet Group Management Protocol (IGMP).

Example

This command displays the membership from the querier from **vlan 1**.

```

switch> show igmp snooping querier membership
-----
Vlan: 1      Elected: 100.0.0.1          QOI: 125  QRV: 2   QRI: 10   GMI: 260
Groups      Mode Ver Num of Sources
-----
10.0.0.2      EX  v3   0 []
10.0.0.3      IN  v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4      EX  v3   0 []
10.0.0.13     EX  v3   0 []
10.0.0.22     EX  v3   0 []
10.0.0.1      IN  v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>

```

16.2.6.6 Configuring IGMP Snooping Proxy

Use the [ip igmp snooping proxy](#) command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. By default, the IGMP snooping proxy is globally disabled.

Use the [ip igmp snooping proxy](#) command to enable IGMP snooping proxy globally. Use the [no ip igmp snooping vlan proxy](#) command to disable IGMP snooping proxy on specified VLANs.

Examples

- This command globally enables IGMP snooping proxy on the switch.

```
switch(config)# ip igmp snooping proxy
switch(config)#

```

- This command disables IGMP snooping proxy on **vlan 2**, **vlan 3**, and **vlan 4**.

```
switch(config)# no ip igmp snooping proxy vlan 2-4 proxy
switch(config)#

```

16.2.6.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier, use the existing [ip igmp snooping querier](#) commands. For more information on these commands, refer to [IGMP and IGMP Snooping Commands](#).

Note: The proxy querier, by default, uses **0.0.0.0** as the IP address.

Example

In this example, the IGMP snooping proxy is enabled using the [ip igmp snooping proxy](#) command, and it is set to report for all the VLANs except VLANs **100** through **110** using the [ip igmp snooping vlan](#) command. The proxy querier operates in version 3 and sends queries at a **15** second interval; hosts can take up to **5** seconds to respond.

```
switch(config)# ip igmp snooping proxy
switch(config)# no ip igmp snooping vlan 100-110 proxy
switch(config)# ip igmp snooping querier query-interval 15
switch(config)# ip igmp snooping querier max-response-time 5
switch(config)# ip igmp snooping querier version 3
switch(config)# ip igmp snooping querier
switch(config)#

```

16.2.7 IGMP Host Proxy

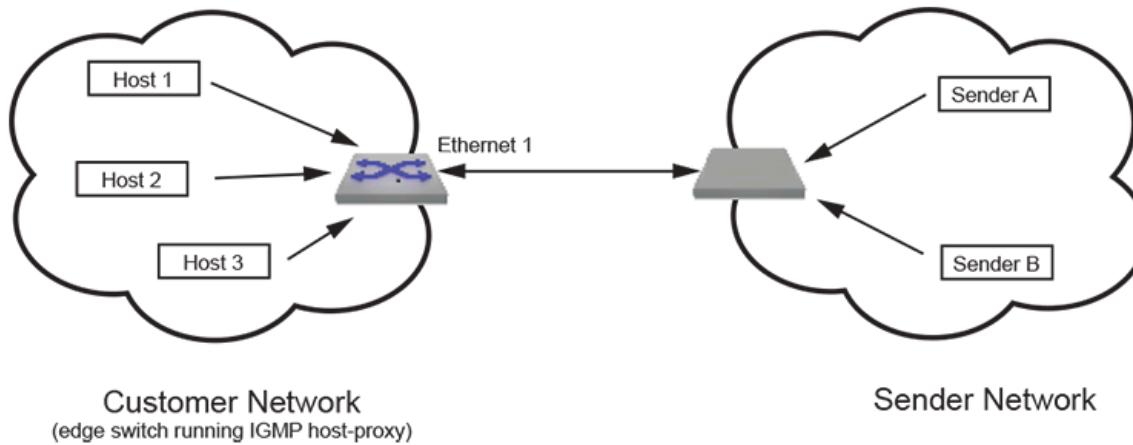

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

- [IGMP Host Proxy Description](#)
- [IGMP Host Proxy Configuration](#)

16.2.7.1 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's **Ethernet 1** interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

Figure 16-3: IP IGMP Host Proxy Implementation

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires, and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM Multicast Border Router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be a rendezvous point (RP - PIM) or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

16.2.7.2 IGMP Host Proxy Configuration

Enabling IGMP Host Proxy

Enable PIM MBR on the interface using the `pim ipv4 border-router` command. Then, configure the IGMP host proxy service on the interface using the `ip igmp host-proxy` command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (*,G) entries, it sends reports only for these. To send reports for a specific group even when there is no (*, G) entry in the mroute table for that group, include the group address in the `ip igmp host-proxy` command. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`.

Host Proxy IGMP Version and Source Filtering

IGMP host proxies can be configured with IGMP versions 1, 2, or 3 and use version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the `ip igmp host-proxy version` command. However, Reports triggered by IGMP queries are

sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the `ip igmp version` command.)

Using ACLs

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Disabling Host Proxy or Removing an Individual Group or Source

The `no igmp host-proxy` command can be entered with group or source parameters to remove the specified group or source from the list. Entering the `no igmp host-proxy` command without specifying group or source disables the forwarding of all IGMP reports on the interface.

Examples

- These commands enable IGMP host proxy on **interface ethernet 17** for all multicast group addresses.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy
switch(config-if-Et17) #
```

- These commands enable IGMP host proxy on **interface ethernet 18** for the multicast group at **231.10.10.1**. The list of source addresses is not restricted.

```
switch(config)# interface ethernet 18
switch(config-if-Et18)# pim ipv4 border-router
switch(config-if-Et18)# ip igmp host-proxy 231.10.10.1
switch(config-if-Et18) #
```

- These commands enable IGMP host proxy on **interface ethernet 19** for the multicast group at **231.10.10.2**. The list of source addresses only excludes **10.4.4.1** and **10.4.5.2**.

```
switch(config)# interface ethernet 19
switch(config-if-Et19)# pim ipv4 border-router
switch(config-if-Et19)# ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)# ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et19) #
```

- These commands enable IGMP host proxy on **interface ethernet 16** for the multicast group at **231.10.10.3**. The list of source address for this group only includes **10.5.5.1** and **10.5.5.2**.

```
switch(config)# interface ethernet 16
switch(config-if-Et16)# pim ipv4 border-router
switch(config-if-Et16)# ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et16)# ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et16) #
```

- These commands configure an IGMP host proxy interval of **5** seconds on **interface port-channel 100**.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy report-interval 5
switch(config-if-Po100) #
```

- These commands enable IGMP host proxy on **interface ethernet 17** for the group address(es) specified in ACL **ac11**.

```
switch(config)# interface ethernet 17
```

```
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy access-list acl1
switch(config-if-Et17) #
```

16.2.8 IGMP and IGMP Snooping Commands

IGMP Configuration Commands (Interface Configuration Mode)

- `igmp query-max-response-time`
- `ip igmp last-member-query-count`
- `ip igmp last-member-query-interval`
- `ip igmp query-interval`
- `ip igmp router-alert`
- `ip igmp startup-query-count`
- `ip igmp startup-query-interval`
- `ip igmp static-group`
- `ip igmp static-group acl`
- `ip igmp static-group range`
- `ip igmp version`

IGMP Clear Commands

- `clear ip igmp group`
- `clear ip igmp statistics`

IGMP Display Commands

- `show ip igmp groups`
- `show ip igmp groups count`
- `show ip igmp interface`
- `show ip igmp static-groups`
- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`
- `show ip igmp statistics`

IGMP Snooping Configuration Commands (Global Configuration Mode)

- `ip igmp`
- `ip igmp profile`
- `ip igmp snooping`
- `ip igmp snooping interface-restart-query`
- `ip igmp snooping proxy`
- `ip igmp snooping querier`
- `ip igmp snooping querier address`
- `ip igmp snooping querier last-member-query-count`
- `ip igmp snooping querier last-member-query-interval`
- `ip igmp snooping querier max-response-time`
- `ip igmp snooping querier query-interval`
- `ip igmp snooping querier startup-query-count`
- `ip igmp snooping querier startup-query-interval`
- `ip igmp snooping querier version`
- `ip igmp snooping report-flooding`
- `ip igmp snooping report-flooding switch-port`
- `ip igmp snooping restart query-interval`

-
- ip igmp snooping robustness-variable
 - ip igmp snooping vlan
 - ip igmp snooping vlan fast-leave
 - ip igmp snooping vlan max-groups
 - ip igmp snooping vlan member
 - ip igmp snooping vlan multicast-router
 - ip igmp snooping vlan proxy
 - ip igmp snooping vlan querier
 - ip igmp snooping vlan querier address
 - ip igmp snooping vlan querier last-member-query-count
 - ip igmp snooping vlan querier last-member-query-interval
 - ip igmp snooping vlan querier max-response-time
 - ip igmp snooping vlan querier query-interval
 - ip igmp snooping vlan querier startup-query-count
 - ip igmp snooping vlan querier startup-query-interval
 - ip igmp snooping vlan querier version
 - ip igmp snooping vlan report-flooding
 - ip igmp snooping vlan report-flooding switch-port

IGMP Configuration Commands (Interface Configuration Mode)

- ip igmp snooping filter

IGMP Snooping Clear Commands

- clear ip igmp snooping counters

IGMP Snooping Display Commands

- show igmp snooping querier
- show igmp snooping querier counters
- show igmp snooping querier membership
- show ip igmp profile
- show ip igmp snooping
- show ip igmp snooping counters
- show ip igmp snooping counters ethdev-pams
- show ip igmp snooping groups
- show ip igmp snooping groups count
- show ip igmp snooping mrouter
- show ip igmp snooping report-flooding

IGMP Profile Configuration Mode Commands

- permit / deny
- range

IGMP Host Proxy Commands

- ip igmp host-proxy
- ip igmp host-proxy report-interval
- ip igmp host-proxy version

- [show ip igmp host-proxy config-sanity](#)
- [show ip igmp host-proxy interface](#)

16.2.8.1 clear ip igmp group

The `clear ip igmp group` command deletes IGMP cache entries as follows:

- `clear ip igmp group` all entries from the IGMP cache.
- `clear ip igmp group gp_addr` all entries for a specified multicast group.
- `clear ip igmp group interface int_id` all entries that include a specified interface.
- `clear ip igmp group gp_addr interface int_id` all entries for a specified interface in a specified group.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip igmp group [gp_addr][ interface INT_ID]
```

Parameters

- **gp_addr** multicast group IP address (dotted decimal notation).
- **INT_ID** interface name. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.

Examples

- This command deletes all IGMP cache entries for the multicast group **231.23.23.14**.

```
switch# clear ip igmp group 231.23.23.14
switch#
```

- This command deletes IGMP cache entries for **interface ethernet 16** in multicast group **226.45.10.45**.

```
switch# clear ip igmp group 226.45.10.45 interface ethernet 16
switch#
```

16.2.8.2 clear ip igmp snooping counters

The **clear ip igmp snooping counters** command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The **show ip igmp snooping counters** command displays the counter contents. See the [show ip igmp snooping counters](#) command description for a list of available snooping counters.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip igmp snooping counters [[INT_NAME]]
```

Parameters

INT_NAME interface name. Formats include:

- **etherent e_num** Ethernet interface specified by **e_num**.
- **port-channel p_num** Port-channel interface specified by **p_num**.
- **switch** virtual interface to an L2 querier.

Example

This command clears the snooping counters for messages received on **interface ethernet 15**.

```
switch(config)# clear ip igmp snooping counters ethernet 15  
switch(config) #
```

16.2.8.3 clear ip igmp statistics

The **clear ip igmp statistics** command resets IGMP transmission statistic counters for the specified interface.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip igmp statistics [[INTF_ID]]
```

Parameters

INTF_ID nterface name. Options include:

- **no parameter** all interfaces.
- **interface ethernet e_num** Ethernet interface specified by **e_num**.
- **interface loopback l_num** Loopback interface specified by **l_num**.
- **interface management m_num** Management interface specified by **m_num**.
- **interface port-channel p_num** Port-channel interface specified by **p_num**.
- **interface vlan v_num** VLAN interface specified by **v_num**.
- **interface xlan vx_num** VXLAN interface specified by **vx_num**.

Example

This command resets IGMP transmission statistic counters on **interface tehernet 1**.

```
switch# clear ip igmp statistics interface ethernet 1  
switch#
```

16.2.8.4 igmp query-max-response-time

The **igmp query-max-response-time** command configures the **query-max-response-time** variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **no igmp query-max-response-time** and **default igmp query-max-response-time** commands restore the default query-max-response-time of **10** seconds for the configuration mode interface by removing the corresponding **igmp query max-response-time** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
igmp query-max-response-time period
no igmp query-max-response-time
default igmp query-max-response-time
```

Parameters

period maximum response time (deciseconds). Values range from **1** to **31744** (**52** minutes, **54** seconds). Default is **100** (**10** seconds).

Example

This command configures the query-max-response-time of 180 decaseconds (18 seconds) for **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# igmp query-max-response-time 180
switch(config-if-Vl4)#

```

16.2.8.5 ip igmp

The **ip igmp** command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The **no ip igmp** command removes the corresponding ip igmp command from ***running-config***.

Command Mode

Interface Configuration

Command Syntax

```
ip igmp  
no ip igmp
```

Example

This command enables IGMP on ***interface ethernet 5/2***.

```
switch(config)# interface ethernet 5/2  
switch(config-if-Et5/2)# ip igmp  
switch(config-if-Et5/2) #
```

16.2.8.6 ip igmp host-proxy

The **ip igmp host-proxy** command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

Note: For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the [pim ipv4 border-router](#) command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through [ip igmp host-proxy report-interval](#).

The **ip igmp host-proxy** command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (*,G) entry in the mroute table for that group. Multiple **ip igmp host-proxy** statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the [ip igmp host-proxy version](#) command, the **ip igmp host-proxy** command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the [ip igmp version](#) command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the **access-list** option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands remove the corresponding **ip igmp host-proxy** command from **running-config**. When these commands do not include a group address, all **ip igmp host-proxy** statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]][[access-list ac]]
no ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
default ip igmp host-proxy [GROUP_ADDRESS [SOURCE_ADDRESS]]
```

Parameters

- **GROUP_ADDRESS** IPv4 address of group address for which host proxy sends reports.
 - **no parameter** only groups for which there is a (*,G) entry in the mroute table.
 - **ipv4_address** IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (*,G) entry in the mroute table.
- **SOURCE_ADDRESS** IP address of a host that originates multicast data packets.
 - **no parameter** Proxy sends report for all received or configured groups regardless of source address.

- **exclude *ipv4_address*** Proxy does not send reports for specified source address.
- **include *ipv4_address*** Proxy always sends reports for specified source address.

Commands that list at least one parameter must specify a group address. Parameters may be listed in any order. When a command specifies include and exclude parameters, the exclude parameter is ignored.

- **access-list *acl*** specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.
- **version *version*** specifies the IGMP version on IGMP host-proxy interface. The value ranges from **1** to **3**. Default value is **3**.

Guidelines

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

- **ip igmp host-proxy**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.
- **ip igmp host-proxy *group_ipv4***: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another **ip igmp host-proxy** command.
- **ip igmp host-proxy *group_ipv4* exclude *source_ipv4***: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.
- **ip igmp host-proxy *group_ipv4* include *source_ipv4***: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.
- **ip igmp host-proxy access-list *acl***: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a **deny all** rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Examples

- These commands enable IGMP host proxy on **interface ethernet 17** for all multicast group addresses.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy
switch(config-if-Et17) #
```

- These commands enable IGMP host proxy on **interface ethernet 17** for the multicast group at **231.10.10.1**. The list of source addresses is not restricted.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.1
switch(config-if-Et17) #
```

- These commands enable IGMP host proxy on **interface ethernet 17** for the multicast group at **231.10.10.2**. The list of source addresses only excludes **10.4.4.1** and **10.4.5.2**.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
```

```
switch(config-if-Et17) #
```

- These commands enable IGMP host proxy on **interface ethernet 17** for the multicast group at **231.10.10.3**. The list of source address for this group only includes **10.5.5.1** and **10.5.5.2**.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)# ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17) #
```

- These commands enable IGMP host proxy on **interface ethernet 17** for the group address(es) specified in ACL **ac11**.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# pim ipv4 border-router
switch(config-if-Et17)# ip igmp host-proxy access-list ac11
switch(config-if-Et17) #
```

16.2.8.7 ip igmp host-proxy report-interval

The **ip igmp host-proxy report-interval** command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*,G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the **ip igmp last-member-query-interval**. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The **no ip igmp host-proxy report-interval** and **default ip igmp host-proxy report-interval** commands reset the query interval to the default value of one second by removing the corresponding **ip igmp host-proxy report-interval** command from running-config. The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands also remove the corresponding **report-interval** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp host-proxy report-interval period
no ip igmp host-proxy report-interval
default ip igmp host-proxy report-interval
```

Parameters

period transmission interval (seconds) between consecutive reports. Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

Example

These commands configures a IGMP host proxy interval of **5** seconds on port channel **100**.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy report-interval 5
switch(config-if-Po100) #
```

16.2.8.8 ip igmp host-proxy version

The **ip igmp host-proxy version** command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the **ip igmp version** command instead.

The **no ip igmp host-proxy version** and **default ip igmp host-proxy version** commands reset the version to the default value of **3**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp host-proxy version version_number
```

```
no ip igmp host-proxy version
```

```
default ip igmp host-proxy version
```

Parameters

version_number values range from **1** to **3**. The default value is **3**.

Example

These commands configure the IGMP host proxy version on port channel interface **100** to **2**.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# ip igmp host-proxy version 2
switch(config-if-Po100) #
```

16.2.8.9 ip igmp last-member-query-count

The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the Last Member Query Count (LMQC) to **1** causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp last-member-query-count number
no ip igmp last-member-query-count
default ip igmp last-member-query-count
```

Parameter

number query message quantity. Values range from **0** to **3**. Default is **2**.

Example

This command configures the last-member-query-count to **3** on *interface vlan 4*.

```
switch(config)# interface vlan 4
switch(config-if-V14)# ip igmp last-member-query-count 3
switch(config-if-V14) #
```

16.2.8.10 ip igmp last-member-query-interval

The `ip igmp last-member-query-interval` command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The `ip igmp startup-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no ip igmp last-member-query-interval` and `default ip igmp last-member-query-interval` commands reset the query interval to the default value of one second by removing the `ip igmp last-member-query-interval` command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp last-member-query-interval period
no ip igmp last-member-query-interval
default ip igmp last-member-query-interval
```

Parameter

period transmission interval (deciseconds) between consecutive group-specific query messages. Value range: **10** (one second) to **317440** (8 hours, 49 minutes, 4 seconds). Default is **10** (one second).

Example

This command configures the last member query interval of **6** seconds for **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-V14)# ip igmp last-member-query-interval 60
switch(config-if-V14) #
```

16.2.8.11 ip igmp profile

The `ip igmp profile` command places the switch in the ***IGMP-profile*** configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

Filter types specify accessibility to the listed address range:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

Address ranges specify a list of addresses and ranges:

- In permit filters, permitted groups are specified by the address range.
- In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
 - No groups are allowed: The report is dropped.
 - All groups are allowed: The report is forwarded to mrouter ports as normal.
 - Some groups are allowed: A revised report is forwarded to mrouter ports.

The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The `no ip igmp profile` and `default ip igmp profile` commands delete the specified IGMP profile from ***running-config***.

The ***IGMP-profile*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The `exit` command returns the switch to ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
ip igmp profile profile_name
no ip igmp profile profile_name
default igmp profile profile_name
```

Parameters

profile_name name of the IGMP profile.

Commands Available in *igmp-profile* Configuration Mode

- `permit / deny`
- `range`

Related Commands

[ip igmp snooping filter](#) applies an IGMP snooping filter to a configuration mode interface.

Example

These commands enter the ***IGMP-profile*** configuration mode and configure the profile as a permit list.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
switch(config-igmp-profile-list_1)#{
```

16.2.8.12 ip igmp query-interval

The **ip igmp query-interval** command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of **125** seconds.

The **no ip igmp query-interval** and **default ip igmp query-interval** commands reset the IGMP query interval to the default value of **125** seconds by removing the **ip igmp query-interval** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp query-interval period
no ip igmp query-interval
default ip igmp query-interval
```

Parameter

period interval (seconds) between IGMP query messages. Values range from **1** to **3175** (52 minutes, 55 seconds). Default is **125**.

Example

This command configures the query-interval of **2** minutes, **30** seconds for **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-V14)# ip igmp query-interval 150
switch(config-if-V14) #
```

16.2.8.13 ip igmp router-alert

The **ip igmp router-alert** command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The **no ip igmp router-alert** and **default ip igmp router-alert** commands reset the default setting of optional connected on the configuration mode interface by removing the corresponding **ip igmp router-alert** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp router-alert **DISPOSITION**

no ip igmp router-alert

default ip igmp router-alert

Parameters

DISPOSITION IGMP packet disposition method. Options include:

- **mandatory** Rejects packets if router-alert is not present.
- **optional** Accepts packets regardless of router-alert presence.
- **optional connected** Accepts packets from same subnet. Other packets require router-alert.

Example

This command configures the switch to accept IGMP packets on **interface ethernet 8** only if the IP header contains router alert.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# ip igmp router-alert mandatory
switch(config-if-Et8)#

```

16.2.8.14 ip igmp snooping

The **ip igmp snooping** command enables snooping globally. By default, global snooping is enabled.

When global snooping is enabled, **ip igmp snooping vlan** enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The **no ip igmp snooping** command disables global snooping. The **default ip igmp snooping** command restores the global snooping default setting of enabled by removing the **ip igmp snooping** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping  
no ip igmp snooping  
default ip igmp snooping
```

Example

This command globally enables snooping on the switch.

```
switch(config)# ip igmp snooping  
switch(config) #
```

16.2.8.15 ip igmp snooping filter

The **ip igmp snooping filter** command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- Filter type: Specifies accessibility to the listed address range:
 - Permit filters define the multicast groups the interface can join.
 - Deny filters define the multicast groups the interface cannot join.
- Address range: Specifies a list of addresses and ranges.
 - In permit filters, the permitted groups are specified by the address range.
 - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode ([ip igmp profile](#)).

The **no ip igmp snooping filter** and **default ip igmp snooping filter** commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding **ip igmp snooping filter** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

```
ip igmp snooping filter profile_name
no ip igmp snooping filter [profile_name]
default ip igmp snooping filter [profile_name]
```

Parameters

profile_name name of profile assigned to interface.

Example

This command applies the ***list_1*** snooping profile to **interface ethernet 7**.

```
switch(config) # interface ethernet 7
switch(config-if-Et7) # ip igmp snooping filter list_1
switch(config-if-Et7) #
```

16.2.8.16 ip igmp snooping interface-restart-query

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The `no ip igmp snooping interface-restart-query` and `default ip igmp snooping interface-restart-query` commands restore the default setting of **2000** milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from **running-config**.

Command Mode

General Configuration

Command Syntax

```
ip igmp snooping interface-restart-query query_time
no ip igmp snooping interface-restart-query
default ip igmp snooping interface-restart-query
```

Parameter

query_time interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from **100** to **50000** milliseconds; default is **2000**.

Example

This command configures interfaces to send IGMP queries at **100**, **200**, and **300** milliseconds after an interface restart or spanning tree change.

```
switch(config)# ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```

16.2.8.17 ip igmp snooping proxy

The **ip igmp snooping proxy** command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no ip igmp snooping proxy** and **default ip igmp snooping proxy** commands disable snooping proxy globally and on individual VLANs by removing the **ip igmp snooping proxy** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping proxy  
no ip igmp snooping proxy  
default ip igmp snooping proxy
```

Examples

- This command globally enables snooping proxy on the switch.

```
switch(config)# ip igmp snooping proxy  
switch(config)#{
```

- This command explicitly disables IGMP snooping proxy on **vlan 20**.

```
switch(config)# no ip igmp snooping vlan 20 proxy  
switch(config)#{
```

16.2.8.18 ip igmp snooping querier

The **ip igmp snooping querier** command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The **ip igmp snooping vlan querier** command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The **no ip igmp snooping querier** and **default ip igmp snooping querier** commands disable the snooping querier globally by removing the **ip igmp snooping querier** statement from **running-config**. The snooping querier is globally disabled by default.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier  
no ip igmp snooping querier  
default ip igmp snooping querier
```

Guidelines

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier IP address is equivalent to establishing a new querier.

Example

This command globally enables the snooping querier on the switch.

```
switch(config)# ip igmp snooping querier  
switch(config)#
```

16.2.8.19 ip igmp snooping querier address

The **ip igmp snooping querier address** command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (**ip igmp snooping vlan querier address**) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The **no ip igmp snooping querier address** and **default ip igmp snooping querier address** commands remove the global querier address command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier address ipv4_address
no ip igmp snooping querier address
default ip igmp snooping querier address
```

Parameter

ipv4_address source IPv4 address.

Example

This command sets the source IP address to **10.1.1.41** for query packets transmitted from the switch.

```
switch(config)# ip igmp snooping querier address 10.1.1.41
switch(config)#End
```

16.2.8.20 ip igmp snooping querier last-member-query-count

The `ip igmp snooping querier last-member-query-count` command configures the global `igmp snooping querier last member query count` (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by `igmp snooping querier last member query count`. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to **1** causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no igmp snooping querier last-member-query-count` and `default igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier last-member-query-count number
no ip igmp snooping querier last-member-query-count
default ip igmp snooping querier last-member-query-count
```

Parameter

number query message quantity. Value ranges from **1** to **3**. Default is set by robustness-variable.

Example

This command configures the global last-member-query-count to **3**.

```
switch(config)# ip igmp snooping querier last-member-query-count 3
switch(config)# show igmp snooping querier status
  Global IGMP Querier status
-----
admin state          : Disabled
source IP address   : 0.0.0.0
query-interval (sec) : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count : 3
startup-query-interval (sec)    : 31.25 (query-interval/4)
startup-query-count        : 2 (robustness)
Vlan Admin IP          Query Interval Response Time Querier Operational Ver
      State           : Interval      Time      Timeout State
-----
1    Disabled 0.0.0.0  125.0    10.0    255.0  Non-Querier v2
100  Disabled 0.0.0.0  125.0    10.0    255.0  Non-Querier v2
101  Disabled 0.0.0.0  125.0    10.0    255.0  Non-Querier v2
switch(config) #
```

16.2.8.21 ip igmp snooping querier last-member-query-interval

The `ip igmp snooping querier last-member-query-interval` command sets the global IGMP snooping last member query interval. The default interval is **1** second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The **last-member-query-interval** determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a **last-member-query-interval** value ([ip igmp snooping vlan querier last-member-query-interval](#)) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier last-member-query-interval` and `default ip igmp snooping querier last-member-query-interval` commands reset the **last-member-query-interval** value the default interval of one second by removing the `ip igmp snooping querier last-member-query-interval` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier last-member-query-interval period
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval
```

Parameter

period last member query interval (seconds). Value ranges from **1** to **25**. Default is **1** second.

Related Commands

[ip igmp snooping vlan querier last-member-query-interval](#) assign a last member query interval value to the specified VLANs.

Example

This command sets the IGMP snooping querier last-member-query-interval to **5** seconds.

```
switch(config)# ip igmp snooping querier last-member-query-interval 5
switch(config)#
```

16.2.8.22 ip igmp snooping querier max-response-time

The `ip igmp snooping querier max-response-time` command specifies the global **max-response-time** value. The switch uses **max-response-time** to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a **max-response-time** value (`ip igmp snooping vlan querier max-response-time`) use the global value. VLAN commands take precedence over the global value.

Values range from **1** to **25** seconds. The default global value is **10** seconds.

The `no ip igmp snooping querier max-response-time` and `default ip igmp snooping querier max-response-time` commands restore the global **max-response-time** default value by removing the `ip igmp snooping querier max-response-time` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier max-response-time resp_sec  
no ip igmp snooping querier max-response-time  
default ip igmp snooping querier max-response-time
```

Parameters

resp_sec max-response-time value (seconds). Values range from **1** to **25**. Default (global) is **10**.

Example

This command sets the global max-response-time to **15** seconds.

```
switch(config)# ip igmp snooping querier max-response-time 15  
switch(config)#End
```

16.2.8.23 ip igmp snooping querier query-interval

The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from **5** to **3600** seconds. The default global value is **125** seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a query interval value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to **125** seconds by removing the `ip igmp snooping querier query-interval` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier query-interval query_sec
no ip igmp snooping querier query-interval
default ip igmp snooping querier query-interval
```

Parameter

query_sec query interval (seconds). Values range from **5** to **3600**. Default (global) is **125**.

Example

This command sets the global query interval to **150** seconds.

```
switch(config)# ip igmp snooping querier query-interval 150
switch(config) #
```

16.2.8.24 ip igmp snooping querier startup-query-count

The `ip igmp snooping querier startup-query-count` command configures the global **startup query count** value. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (`ip igmp snooping querier startup-query-interval`).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query count** value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default startup-query-count value by removing the corresponding `ip igmp snooping querier startup-query-count` command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier startup-query-count number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

Parameter

number global startup query count. Value ranges from **1** to **3**.

Example

These commands configure the global startup query count value of **2**, then displays the status of the snooping querier.

```
switch(config)# ip igmp snooping querier startup-query-count 2
switch(config)# show igmp snooping querier status
    Global IGMP Querier status
-----
admin state          : Disabled
source IP address   : 0.0.0.0
query-interval (sec) : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count      : 2 (robustness)
startup-query-interval (sec)   : 31.25 (query-interval/4)
startup-query-count          : 2

Vlan Admin      IP          Query      Response Querier Operational Ver
      State           Interval Time      Timeout State
-----
1    Disabled 0.0.0.0    125.0     10.0      255.0  Non-Querier v2
100  Disabled 0.0.0.0    125.0     10.0      255.0  Non-Querier v2
101  Disabled 0.0.0.0    125.0     10.0      255.0  Non-Querier v2
switch(config)#

```

16.2.8.25 ip igmp snooping querier startup-query-interval

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query interval** value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-interval`). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four. (`ip igmp snooping querier query-interval`).

The `no ip igmp snooping querier startup-query-interval` and `default ip igmp snooping querier startup-query-interval` commands restore the default method of specifying the startup query interval by removing the corresponding `ip igmp snooping querier startup-query-interval` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier startup-query-interval period
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

Parameter

period startup query interval (seconds). Value ranges from **1** to **3600** (**1** hour).

Example

This command configures the startup query count of one minute for **interface vlan 4**.

```
switch(config)# ip igmp snooping querier startup-query-interval 40
switch(config)# show igmp snooping querier status
  Global IGMP Querier status
-----
admin state          : Enabled
source IP address   : 0.0.0.0
query-interval (sec) : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count : 2 (robustness)
startup-query-interval (sec) : 40.0
startup-query-count      : 2

Vlan Admin      IP          Query      Response Querier Operational Ver
      State           Interval Time        Timeout State
-----
1    Enabled    0.0.0.0     125.0     10.0      255.0 Non-Querier v3
100  Enabled    0.0.0.0     125.0     10.0      255.0 Non-Querier v3
101  Enabled    0.0.0.0     125.0     10.0      255.0 Non-Querier v3
switch(config)#

```

16.2.8.26 ip igmp snooping querier version

The **ip igmp snooping querier version** command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command. The **ig igmp snooping querier version** command does not affect the IGMP enabled status.

The **no ip igmp snooping querier version** and **default ip igmp snooping querier version** commands restore the configuration mode to IGMP version 3 by removing the **ip igmp snooping querier version** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping querier version version_number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

Parameter

version_number IGMP version number. Value ranges from **1** to **3**. Default value is **3**.

Examples

- This command configures IGMP snooping querier version 2.

```
switch(config)# ip igmp snooping querier version 2
switch(config)#
```

- This command restores the IGMP snooping querier to version 3.

```
switch(config)# no ip igmp snooping querier version
switch(config)#
```

16.2.8.27 ip igmp snooping report-flooding

The **ip igmp snooping report-flooding** command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the [ip igmp snooping vlan report-flooding](#) configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The **no ip igmp snooping report-flooding** and **default ip igmp snooping report-flooding** commands disable global L2 report flooding by removing **ip igmp report flooding** from **running-config**. L2 report flooding is disabled by default.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping report-flooding  
no ip igmp snooping report-flooding  
default ip igmp snooping report-flooding
```

Related Command

[ip igmp snooping vlan report-flooding](#) enables L2 report flooding on a specified VLAN range.

Example

This command globally enables the snooping L2 report-flooding.

```
switch(config) # ip igmp snooping report-flooding  
switch(config) #
```

16.2.8.28 ip igmp snooping report-flooding switch-port

The **ip igmp snooping report-flooding switch-port** command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The **ip igmp snooping vlan report-flooding switch-port** command configures a list of forwarding ports for a specified VLAN range.

The **no ip igmp snooping report-flooding switch-port** and **default ip igmp snooping report-flooding switch-port** commands remove the specified ports from the global report flooding port list by deleting the corresponding **ip igmp snooping report-flooding switch-port** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping report-flooding switch-port INTERFACE
no ip igmp snooping report-flooding switch-port INTERFACE
default ip igmp snooping report-flooding switch-port INTERFACE
```

Parameters

INTERFACE Membership report message forwarding is enabled on these ports:

- **ethernet e_range** where **e_range** is the number, range, or list of ethernet ports.
- **port-channel p_range** where **p_range** is the number, range, or list of channel ports.

Related Commands

- **ip igmp snooping report-flooding** globally enables L2 report flooding.
- **ip igmp snooping vlan report-flooding switch-port** specifies a port list for a VLAN range.

Example

This command configures Ethernet ports **7-9** for report message forwarding for any VLAN where L2 report flooding is enabled.

```
switch(config) # ip igmp snooping report-flooding switch-port ethernet 7-9
switch(config) #
```

16.2.8.29 ip igmp snooping restart query-interval

The **ip igmp snooping restart query-interval** command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The **no ip igmp snooping restart query-interval** and **default ip igmp snooping restart query-interval** commands removes the global restart query interval by deleting the **ip igmp snooping restart query-interval** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping restart query-interval query_sec
no ip igmp snooping restart query-interval
default ip igmp snooping restart query-interval
```

Parameter

query_sec query interval (seconds). Values range from **2** to **400**. Default (global) is **125**.

Example

This command sets the global query interval to **35** seconds.

```
switch(config)# ip igmp snooping restart query-interval 35
switch(config)#
```

16.2.8.30 ip igmp snooping robustness-variable

The **ip igmp snooping robustness-variable** command configures the robustness variable for snooping packets sent from any VLAN.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The **no ip igmp snooping robustness-variable** and **default ip igmp snooping robustness-variable** commands reset the robustness variable to 2 by removing the **ip igmp snooping robustness-variable** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping robustness-variable robust_value
no ip igmp snooping robustness-variable
default ip igmp snooping robustness-variable
```

Parameter

robust_value robustness variable. Values range from **1** to **3**. Default is **2**.

Example

This command sets the robustness-variable value to **3**.

```
switch(config)# ip igmp snooping robustness-variable 3
switch(config) #
```

16.2.8.31 ip igmp snooping vlan

The **ip igmp snooping vlan** command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The **ip igmp snooping** command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The **no ip igmp snooping vlan** command disables snooping on the specified VLANs.

The **default ip igmp snooping vlan** command returns the snooping setting for the specified VLANs to enabled by removing the corresponding **ip igmp snooping vlan** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range  
no ip igmp snooping vlan v_range  
default ip igmp snooping vlan v_range
```

Parameter

v_range VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.

Example

This command disables snooping on **vlan 2**, **vlan 3**, and **vlan 4**.

```
switch(config)# no ip igmp snooping vlan 2-4  
switch(config) #
```

16.2.8.32 ip igmp snooping vlan fast-leave

The **ip igmp snooping vlan fast-leave** command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The **no ip igmp snooping vlan fast-leave** command disables fast-leave processing on the specified VLANs. The **default ip igmp snooping vlan fast-leave** command restores fast-leave processing on the specified VLANs by removing the corresponding **no ip igmp snooping vlan fast-leave** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range fast-leave  
no ip igmp snooping vlan v_range fast-leave  
default ip igmp snooping vlan v_range fast-leave
```

Parameter

v_range VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.

Example

This command enables IGMP fast-leave processing on **vlan 10**.

```
switch(config)# ip igmp snooping vlan 10 fast-leave  
switch(config)#{
```

16.2.8.33 ip igmp snooping vlan max-groups

The **ip igmp snooping vlan max-groups** command configures the quantity of multicast groups that the specified VLAN forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The **no ip igmp snooping vlan max-groups** and **default ip igmp snooping vlan max-groups** removes the maximum group limit by deleting the **ip igmp snooping vlan max-groups** statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range max-groups quantity
no ip igmp snooping vlan v_range max-groups
default ip igmp snooping vlan v_range max-groups
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **quantity** maximum number of groups that can access the VLAN. Value ranges from **0** to **65534**.

Examples

- This command limits the number of multicast groups that hosts on **vlan 6** can simultaneously access to **25**.

```
switch(config)# ip igmp snooping vlan 6 max-groups 25
switch(config)#
```

- This command allows each VLAN between **8** and **15** to receive multicast packets from **30** groups.

```
switch(config)# ip igmp snooping vlan 8-15 max-groups 30
switch(config)#
```

- This command removes the maximum group restriction from all VLAN interfaces between **1** and **50**.

```
switch(config)# no ip igmp snooping vlan 1-50 max-groups
switch(config)#
```

16.2.8.34 ip igmp snooping vlan member

The **ip igmp snooping vlan member** command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The **no ip igmp snooping vlan member** and **default ip igmp snooping vlan member** commands remove the specified ports from the multicast group by deleting the corresponding ip igmp snooping member statements from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT  
no ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT  
default ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

Parameters

- **v_num** VLAN number. Value ranges from **1** to **4094**.
- **ipv4_addr** multicast group IPv4 address.
- **STATIC_INT** interface the command configures as the static group member. Options include:
 - **ethernet e_range**, where **e_range** is the number, range, or list of Ethernet ports.
 - **port-channel p_range**, where **p_range** is the number, range, or list of channel ports.

Example

This command configures the static connection to a multicast group at **237.2.1.4** through **interface ethernet 3**.

```
switch(config)# ip igmp snooping vlan 7 member 237.2.1.4 interface ethernet 3  
switch(config)#End
```

16.2.8.35 ip igmp snooping vlan multicast-router

The `ip igmp snooping vlan multicast-router` command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The `no ip igmp snooping vlan multicast-router` and `default ip igmp snooping vlan multicast-router` commands remove the specified static port configuration by deleting the corresponding `ip igmp snooping vlan multicast-router` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range multicast-router interface STATIC_INT
no ip igmp snooping vlan v_range multicast-router interface STATIC_INT
default ip igmp snooping vlan v_range multicast-router interface STATIC_INT
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **STATIC_INT** interface the command configures as a static port. Selection options include:
 - **ethernet e_range** where **e_range** is the number, range, or list of ethernet ports.
 - **port-channel p_range** where **p_range** is the number, range, or list of channel ports.
- The **STATIC_INT** interface must route traffic through a VLAN specified within **v_range**.

Example

This command configures the static connection to a multicast router through *interface ethernet 3*.

```
switch(config)# ip igmp snooping vlan 2 multicast-router interface ethernet 3
switch(config) #
```

16.2.8.36 ip igmp snooping vlan proxy

The `ip igmp snooping vlan proxy` command enables snooping proxy on individual VLAN. To enable or disable IGMP snooping vlan proxy globally, use the `ip igmp snooping proxy` command.

Note: The `ip igmp snooping proxy` command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The `no` and `default` form of `ip igmp snooping vlan proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping vlan proxy` command from the `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan [ID | range]proxy  
no ip igmp snooping vlan [ID | range] proxy  
default ip igmp snooping vlan [ID | range] proxy
```

Parameters

- `ID` specifies a individual VLAN ID. Numbers range from **1** to **4094**.
- `range` specifies the range of VLAN IDs. Numbers range from **1** to **4094**.

Examples

- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.

```
switch(config)# ip igmp snooping proxy  
switch(config)#[/pre>
```

- This command enables IGMP snooping proxy on **vlan 20**.

```
switch(config)# ip igmp snooping vlan 20 proxy  
switch(config)#[/pre>
```

- This command disables IGMP snooping proxy on **vlan 20**.

```
switch(config)# no ip igmp snooping vlan 20 proxy  
switch(config)#[/pre>
```

16.2.8.37 ip igmp snooping vlan querier

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The `ip igmp snooping querier` controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The `default ip igmp snooping vlan querier` command restores the usage of the global setting for the specified VLAN by removing the corresponding `ip igmp snooping vlan querier` or `no ip igmp snooping vlan querier` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier
no ip igmp snooping vlan v_range querier
default ip igmp snooping vlan v_range querier
```

Parameter

v_range VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.

Examples

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs **1-3**, and explicitly enable snooping on VLANs **4-6**.

```
switch(config)# ip igmp snooping querier
switch(config)# no ip igmp snooping vlan 1-3 querier
switch(config)# ip igmp snooping vlan 4-6 querier
```

After running these commands, the *running-config* file contains these lines, which indicate that the snooping querier is enabled on VLANs **4-6**.

```
switch(config)# show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
no ip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
```

```
ip igmp snooping vlan 6 querier  
ip igmp snooping querier  
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

- This command removes the querier setting for VLANs **2-5**:

```
switch(config)# default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs **1-2**, enabled implicitly on VLANs **3-6**, and enabled explicitly on VLANs **7-8**, as shown by **running-config**:

```
<-----OUTPUT OMITTED FROM EXAMPLE----->  
no ip igmp snooping vlan 1 querier  
ip igmp snooping vlan 6 querier  
ip igmp snooping querier  
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

- This command sets the global snooping querier to disabled by removing the global querier setting from **running-config**:

```
switch(config)# no ip igmp snooping querier  
switch(config) #
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs **1-2**, disabled implicitly on VLANs **3-6** and enabled explicitly on VLANs **7-8**, as shown by **running-config**:

```
<-----OUTPUT OMITTED FROM EXAMPLE----->  
no ip igmp snooping vlan 1 querier  
ip igmp snooping vlan 6 querier  
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

16.2.8.38 ip igmp snooping vlan querier address

The **ip igmp snooping vlan querier address** command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (**ip igmp snooping querier address**). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier VLAN.

The **no ip igmp vlan snooping querier address** and **default ip igmp snooping vlan querier address** commands reset the specified VLAN to use the global address by removing the corresponding **ip igmp snooping vlan querier address** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier address ipv4_address
no ip igmp snooping vlan v_range querier address
default ip igmp snooping vlan v_range querier address
```

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- ***ipv4_address*** source IPv4 address.

Example

This command sets the source IPv4 address of **10.14.1.1** for query packets transmitted from **vlan 2**.

```
switch(config)# ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config) #
```

16.2.8.39 ip igmp snooping vlan querier last-member-query-count

The **ip igmp snooping vlan querier last-member-query-count** command specifies an **IGMP snooping querier last-member-query-count** (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value ([ip igmp snooping querier last-member-query-count](#)). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to **1** causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by [ip igmp snooping querier query-interval 1](#).

The **no igmp snooping vlan querier last-member-query-count** and **default igmp snooping vlan querier last-member-query-count** commands reset the specified VLAN to use the global LMQC by removing the corresponding **ip igmp snooping vlan querier last-member-query-count** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier last-member-query-count number  
no ip igmp snooping vlan v_range querier address  
default ip igmp snooping vlan v_range querier address
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **number** query message quantity. Value ranges from **1** to **3**.

Example

This command configures the last-member-query-count to **1** on **vlan 3**.

```
switch(config)# ip igmp snooping vlan 3 querier last-member-query-count 1  
switch(config)#End
```

16.2.8.40 ip igmp snooping vlan querier last-member-query-interval

The `ip igmp snooping vlan querier last-member-query-interval` command configures **last-member-query-interval** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier last-member-query-interval`). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

The `no ip igmp snooping vlan querier last-member-query-interval` and `default ip igmp snooping vlan querier last-member-query-interval` commands reset the specified VLAN to use the global **last-member-query-interval** by removing the corresponding `ip igmp snooping vlan querier last-member-query-interval` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier last-member-query-interval period
no ip igmp snooping vlan v_range querier last-member-query-interval
default ip igmp snooping vlan v_range querier last-member-query-interval
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **period** last member query interval (seconds). Value ranges from **1** to **25**.

Example

This command sets the last-member-query-interval for **vlan 10** to **12** seconds.

```
switch(config)# ip igmp snooping vlan 10 querier last-member-query-interval 12
switch(config) #
```

16.2.8.41 ip igmp snooping vlan querier max-response-time

The `ip igmp snooping vlan querier max-response-time` command configures **max-response-time** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting ([ip igmp snooping querier max-response-time](#)). VLAN commands take precedence over the global value. The global default is **10** seconds.

Switches use **max-response-time** to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The `no ip igmp snooping vlan querier max-response-time` and `default ip igmp snooping vlan querier max-response-time` commands reset the specified VLAN to use the global **max-response-time** by removing the corresponding `ip igmp snooping vlan querier max-response-time` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier max-response-time resp_sec
no ip igmp snooping vlan v_range querier max-response-time
default ip igmp snooping vlan v_range querier max-response-time
```

Parameters

- **v_range** VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **resp_sec max-response-time** value (seconds). Values range from **1** to **25**.

Example

This command sets the max-response-time for **vlan 2** to **5** seconds.

```
switch(config)# ip igmp snooping vlan 2 querier max-response-time 5
switch(config) #
```

16.2.8.42 ip igmp snooping vlan querier query-interval

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier query-interval query_sec
no ip igmp snooping vlan v_range querier query-interval
default ip igmp snooping vlan v_range querier query-interval
```

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- ***query_sec*** query interval (seconds). Values range from **5** to **3600**. Default (global) is **125**.

Example

This command sets the query interval for **vlan 10** to **240** seconds.

```
switch(config)# ip igmp snooping vlan 10 querier query-interval 240
switch(config)#
```

16.2.8.43 ip igmp snooping vlan querier startup-query-count

The `ip igmp snooping vlan querier startup-query-count` command specifies the startup query count value for the specified VLANs. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (`ip igmp snooping vlan querier startup-query-interval`).

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a **startup query count** value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-count` and `default ip igmp snooping vlan querier startup-query-count` commands restore the default condition of using the global **startup query count** value by removing the corresponding `ip igmp snooping vlan querier startup-query-count` command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier startup-query-count number
no ip igmp snooping vlan v_range querier startup-query-count
default ip igmp snooping vlan v_range querier startup-query-count
```

Parameters

- ***v_range*** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- ***number*** startup query count. Value ranges from **1** to **3**.

Example

This command configures the startup query count of **3** for **vlan 100**.

```
switch(config)# ip igmp snooping vlan 100 querier startup-query-count 3
switch(config) #
```

16.2.8.44 ip igmp snooping vlan querier startup-query-interval

The `ip igmp snooping vlan querier startup-query-interval` command specifies the **startup query interval** value for the specified VLANs. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a **startup query interval** value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-interval` and `default ip igmp snooping vlan querier startup-query-interval` commands restore the default condition of using the global **startup query interval** value by removing the corresponding `ip igmp snooping vlan querier startup-query-interval` command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier startup-query-interval period
no ip igmp snooping vlan v_range querier startup-query-interval
default ip igmp snooping vlan v_range querier startup-query-interval
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **period** startup query interval (seconds). Value ranges from **1** to **3600** (1 hour). Default is **31**.

Example

This command configures the startup query count of **60** seconds for **vlan 100**.

```
switch(config)# ip igmp snooping vlan 100 querier startup-query-interval 60
switch(config) #
```

16.2.8.45 ip igmp snooping vlan querier version

The `ip igmp snooping vlan querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp snooping vlan querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping vlan querier version` and `default ip igmp snooping vlan querier version` commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the `ip igmp snooping vlan querier version` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range querier version version_number  
no ip igmp snooping vlan v_range querier version  
default ip igmp snooping vlan v_range querier version
```

Parameters

- **v_range** VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **version_number** IGMP version number. Value ranges from **1** to **3**. Default value is **3**.

Example

- The example sets the querier to **version 2** on **vlan 5**.

```
switch(config)# ip igmp snooping vlan 5 querier version 2  
switch(config)#
```

- This command restores IGMP snooping querier **version 3** to **vlan 5**.

```
switch(config)# no ip igmp snooping vlan 5 querier version  
switch(config)#
```

16.2.8.46 ip igmp snooping vlan report-flooding

The `ip igmp snooping vlan report-flooding` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:

- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan report-flooding` and `default ip igmp snooping vlan report-flooding` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan report-flooding` statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

Parameters

v_range VLAN IDs Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.

Related Commands

`ip igmp snooping report-flooding` globally enables L2 report flooding.

Example

These commands enable L2 report flooding globally and on VLANs **201** through **205**.

```
switch(config)# ip igmp snooping report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding
switch(config) #
```

16.2.8.47 ip igmp snooping vlan report-flooding switch-port

The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

Parameters

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- **INTERFACE** Membership report message forwarding is enabled on these ports:
 - **ethernet e_range** where **e_range** is the number, range, or list of ethernet ports.
 - **port-channel p_range** where **p_range** is the number, range, or list of channel ports.

Related Commands

- [ip igmp snooping report-flooding](#) globally enables L2 report flooding.
- [ip igmp snooping vlan report-flooding switch-port](#) specifies a port list for a VLAN range.
- [ip igmp snooping report-flooding switch-port](#) specifies a port list for all VLANs.

Example

These commands globally enable L2 report flooding, enable flooding on VLANs **201** through **205**, and specify Ethernet ports **8-10** as the report flooding port list for VLANS **201-205**.

```
switch(config)# ip igmp snooping report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding
switch(config)# ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 8-10
switch(config) #
```

16.2.8.48 ip igmp startup-query-count

The **ip igmp startup-query-count** command specifies the number of query messages that an interface sends during the startup interval defined by **ip igmp startup-query-interval**.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

The **no ip igmp startup-query-count** and **default ip igmp startup-query-count** commands restore the default **startup-query-count** value of **2** for the configuration mode interface by removing the corresponding **ip igmp startup-query-count** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp startup-query-count number
no ip igmp startup-query-count
default ip igmp startup-query-count
```

Parameter

number quantity of queries. Values range from **1** to **65535**. Default is **2**.

Example

This command configures the startup query count of **10** for **vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp startup-query-count 10
switch(config-if-Vl4) #
```

16.2.8.49 ip igmp startup-query-interval

The **ip igmp startup-query-interval** command specifies the configuration mode interface IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The **startup-query-interval** and **startup-query-count** parameters define the startup period and the query message transmission frequency during that period.

The **no ip igmp startup-query-interval** and **default ip igmp startup-query-interval** commands restore the configuration mode interface default IGMP startup-query-interval of **31** seconds by removing the corresponding **ip igmp startup-query-interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp startup-query-interval period
no ip igmp startup-query-interval
default ip igmp startup-query-interval
```

Parameter

period startup query interval, in deciseconds. Value ranges from **10** (one second) to **317440** (8 hours, 49 minutes, 4 seconds). Default is **31** seconds.

Example

This command configures the startup query count of **600** deciseconds for **vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp startup-query-interval 600
switch(config-if-Vl4) #
```

16.2.8.50 ip igmp static-group

The **ip igmp static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

Note: To become a static member of a multicast group, the switch must be the PIM Designated Router (DR) for the network. If it is not, you can use the [pim ipv4 dr-priority](#) command to make it the DR by configuring its PIM DR value to be the highest on the network.

The **no ip igmp static-group** and **default ip igmp static-group** commands remove the configuration mode interface group membership by removing the corresponding **ip igmp static-group** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp static-group group_address [SOURCE_ADDRESS]
no ip igmp static-group group_address [SOURCE_ADDRESS]
default ip igmp static-group group_address [SOURCE_ADDRESS]
```

Parameters

- **group_address** IPv4 address of multicast group for which the interface fast-switches packets.
- **SOURCE_ADDRESS** IP address of host that originates multicast data packets.
 - **no parameter** all multicast messages of the specified group are fast-switched.
 - **ipv4_address** source IP address (dotted decimal notation).

Related Commands

- [ip igmp static-group acl](#) configures the configuration mode interface as a static member of the multicast groups specified by an IP Access Control List (ACL).
- [ip igmp static-group range](#) configures the configuration mode interface as a static member of multicast groups specified by an address range.

One **ip igmp static-group range** command is equivalent to multiple **ip igmp static-group** commands.

Example

These commands configure **interface vlan 15** as the PIM designated router, then configure it as a static member of the multicast group at address **231.1.1.15** for multicast data packets that originate at **10.1.1.1**.

```
switch(config)# interface vlan 15
switch(config-if-Vl15)# pim ipv4 dr-priority 5000
switch(config-if-Vl15)# ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#{
```

16.2.8.51 ip igmp static-group acl

The `ip igmp static-group acl` command configures the configuration mode interface as a static member of the multicast groups specified by an IP Access Control List (ACL). This command is a variant of the `ip igmp static-group` command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- `permit <protocol><source><destination>`, where
 - `<protocol>` has no effect on the static group.
 - `<source>` address of host originating multicast data packets. Must be a host address.
 - `<destination>` multicast group IP address or subnet. Must be a valid multicast.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The `show ip igmp static-groups acl` displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The `no ip igmp static-group acl` and `default ip igmp static-group acl` commands remove the specified static group ACL command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp static-group acl list_name
no ip igmp static-group acl
default ip igmp static-group acl
```

Parameter

list_name ACL that specifies multicast group addresses for which interface fast-switches packets.

Example

This command configures **vlan 4** as a static member of the multicast group specified by the ACL named **LIST_1**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp static-group acl LIST_1
switch(config-if-Vl4) #
```

16.2.8.52 ip igmp static-group range

The **ip igmp static-group range** command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the **ip igmp static-group** command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single **ip igmp static-group range** command is the equivalent of multiple **ip igmp static-group** commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of **ip igmp static-group** commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The **no ip igmp static-group range** and **default ip igmp static-group range** commands remove the specified range of static group statements from **running-config**. The **no ip igmp static-group** and **default ip igmp static-group** commands can remove an individual static-group command that was initially added to **running-config** by an **ip igmp static-group range** command.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
no ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
default ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
```

Parameters

- **GROUP_ADDR** address of multicast group for which the interface fast-switches packets.
 - **gp_ipv4_addr** multicast group IPv4 address.
 - **gp_ipv4_subnet** IPv4 subnet address of multicast groups (CIDR or address-mask).
- **SOURCE_ADDR** IP address of a host range that originates multicast data packets.
 - **no parameter** all multicast messages of the specified range are fast-switched.
 - **source sr_ipv4_address** source IPv4 address (dotted decimal notation).
 - **source sr_ip4_subnet** IPv4 subnet address of source hosts (CIDR or address- mask).

Note: A command cannot specify a subnet address for both multicast group and source.

Examples

- This command configures **interface vlan 4** as a static member of the multicast group range **241.1.4.1/24** for data packets that originate at **10.1.1.1**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp static-group range 239.1.4.1/24 source 10.1.1.1
switch(config-if-Vl4)#

```

- This command attempts to configure **interface vlan 4** as a static member of the multicast group range **241.1.4.1/24** for data packets that originate at the **10.1.1.1/29** subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-V14)# ip igmp static-group range 239.1.1.1/29 source 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-V14)#

```

16.2.8.53 ip igmp version

The **ip igmp version** command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the **pim ipv4 sparse-mode** or **pim ipv4 bidirectional** command. The **ig igmp version** command does not affect the IGMP enabled status.

The **no ip igmp version** and **default ip igmp version** commands restore the configuration mode interface to IGMP version 3 by removing the **ip igmp version** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip igmp version *version_number*

no ip igmp version

default ip igmp version

Parameter

version_number IGMP version number. Value ranges from **1** to **3**.

Example

This command configures IGMP version 3 on **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# ip igmp version 3
switch(config-if-Vl4)#{
```

16.2.8.54 permit / deny

The **permit** command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The **deny** command restores the IGMP list to its default type by removing the corresponding **permit** statement from **running-config**.

The **range** command adds and removes address ranges from the configuration mode profile.

Command Mode

IGMP-profile Configuration

Command Syntax

permit

deny

Related Commands

ip igmp profile places the switch in **igmp-profile** configuration mode.

Example

These commands enter **igmp-profile** configuration mode and configure the profile as permit **list_1**.

```
switch(config)# ip igmp profile list_1
switch(config-igmp-profile-list_1)# permit
switch(config-igmp-profile-list_1)#

```

16.2.8.55 range

The **range** command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The **permit / deny** command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The **no range** and **default range** commands remove the specified address range from a previous specified list.

Command Mode

igmp-profile Configuration

Command Syntax

```
range init_address [UPPER_RANGE]  
no range init_address [UPPER_RANGE]  
default range init_address [UPPER_RANGE]
```

Parameters

- **init_address** IP address of lower boundary of the address range (dotted decimal notation).
- **UPPER_RANGE** sets the upper boundary of the address range. Options include:
 - **no parameter** upper boundary is equal to lower boundary: range consists of one address.
 - **range_address** IP address of upper boundary.

All addresses must be multicast addresses (**10.0.0.0** to **239.255.255.255**).

Related Commands

[ip igmp profile](#) places the switch in the **igmp-profile** configuration mode.

Example

These commands enter the **igmp-profile** configuration mode, configure the profile as a permit list, and define the permit address list of **232.1.1.0** to **232.1.1.255** and **233.1.1.10**.

```
switch(config)# ip igmp profile list_1  
switch(config-igmp-profile-list_1)# permit  
switch(config-igmp-profile-list_1)# 232.1.1.0 232.1.1.255  
switch(config-igmp-profile-list_1)# 233.1.1.10  
switch(config-igmp-profile-list_1)# ip igmp profile
```

16.2.8.56 show igmp snooping querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

Command Mode

EXEC

Command Syntax

```
show igmp snooping querier [STATUS][VLAN_ID][DATA]
```

Parameters

- **STATUS** specifies the type of information displayed. Options include:
 - **no parameter** querier IP address, port, and IGMP version.
 - **status** querier configuration parameters.
- **VLAN_ID** specifies VLANs for which command displays information. Options include:
 - **no parameter** all VLANs.
 - **vlan v_num** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** displays VLAN number and port-list for each group.
 - **detail** displays port-specific data for each group; includes transmission times and expiration.

Examples

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch> show igmp snooping querier
Vlan   IP Address      Version  Port
-----
1     172.17.0.37      v2       Po1
20    172.17.20.1      v2       Po1
26    172.17.26.1      v2       Cpu
2028  172.17.255.29   v2       Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch> show igmp snooping querier status
          Global IGMP Querier status
-----
admin state        : Enabled
source IP address : 0.0.0.0
query-interval (sec) : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 130.0

Vlan Admin      IP                  Query      Response Querier Operational
      State           State            Interval Time      Timeout State
-----
1   Enabled  0.0.0.0        125.0    10.0    130.0 Non-Querier
4   Enabled  0.0.0.0        125.0    10.0    130.0 Non-Querier
20  Enabled  0.0.0.0        125.0    10.0    130.0 Non-Querier
22  Enabled  0.0.0.0        125.0    10.0    130.0 Non-Querier
28  Enabled  0.0.0.0        125.0    10.0    130.0 Non-Querier
```

16.2.8.57 show igmp snooping querier counters

The **show igmp snooping querier counters** command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode

EXEC

Command Syntax

```
show igmp snooping querier counters [VLAN_ID]
```

Parameters

VLAN_ID specifies VLANs for which command displays information. Options include:

- **no parameter** displays information for all VLANs.
- **vlan v_num** displays information for specified VLAN.

Example

This command displays the counters from the querier.

```
switch> show igmp snooping querier counters
-----
Vlan: 1      IP Addr: 100.0.0.1      Op State: Querier      Version: v3
v1 General Queries Sent      :0
v1 Queries Received        :0
v1 Reports Received        :0
v2 General Queries Sent      :1
v2 Queries Received        :0
v2 Reports Received        :25
v2 Leaves Received         :0
v3 General Queries Sent      :655
v3 GSQ Queries Sent        :0
v3 GSSQ Queries Sent       :8
v3 Queries Received        :654
v3 Reports Received        :2385
Error Packets               :0
Other Packets               :0
switch>
```

16.2.8.58 show igmp snooping querier membership

The **show igmp snooping querier membership** command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode

EXEC

Command Syntax

show igmp snooping querier membership [VLAN_ID [GROUP_LIST]]

Parameters

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
 - **no parameter** displays information for all VLANs.
 - **vlan v_num** displays information for specified VLAN.
- **GROUP_LIST** list of groups for which the command displays information. Options include:
 - **no parameter** all multicast groups within specified VLAN.
 - **group ipv4_addr** single multicast group address (dotted decimal notation).

Example

This command displays the membership from the querier for **vlan 1**.

```
switch> show igmp snooping querier membership
-----
Vlan: 1    Elected: 10.0.0.1        QOI: 125   QRV: 2   QRI: 10   GMI: 260
Groups          Mode  Ver  Num of Sources
-----
10.0.0.2      EX    v3   0 []
10.0.0.3      IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4      EX    v3   0 []
10.0.0.13     EX    v3   0 []
10.0.0.22     EX    v3   0 []
10.0.0.1      IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

16.2.8.59 show ip igmp groups

The **show ip igmp groups** command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- **show ip igmp groups** all multicast groups.
- **show ip igmp groups *group_addr*** listed multicast group.
- **show ip igmp groups interface *int_name*** all multicast groups on specified interfaces
- **show ip igmp groups *group_addr* interface *int_name*** listed multicast group on specified interface.

Command Mode

EXEC

Command Syntax

show ip igmp groups *GROUP_LIST [DATA]*

Parameters

- **GROUP_LIST** list of groups for which the command displays information. Options include:
 - **no parameter** all multicast groups.
 - **group_addr** single multicast group address (dotted decimal notation).
 - **interface ethernet *e_num*** all multicast groups on specified Ethernet interface.
 - **interface loopback *l_num*** all multicast groups on specified Loopback interface.
 - **interface management *m_num*** all multicast groups on specified Management interface.
 - **interface port-channel *p_num*** all multicast groups on specified Port-Channel Interface.
 - **interface vlan *v_num*** all multicast groups on specified VLAN interface.
 - **interface VXLAN *vx_num*** all multicast groups on specified VXLAN interface.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** provides uptime, expiration, and address of reporter.
 - **detail** also include group mode and group source list.

Example

This command displays multicast groups with receivers directly connected to the switch.

```
switch> show ip igmp groups
NOTE: static-group information not shown below. Use the
      'show ip igmp static-groups' command.
IGMP Connected Group Membership
Group Address      Interface          Uptime    Expires   Last Reporter
10.12.1.1          Vlan162           11d01h   00:02:57  172.17.2.110
10.12.1.2          Vlan162           11d01h   00:02:57  172.17.2.110
10.12.1.3          Vlan162           11d01h   00:02:57  172.17.2.110
10.12.1.4          Vlan162           11d01h   00:02:57  172.17.2.110
10.12.1.5          Vlan162           11d01h   00:02:57  172.17.2.110
switch>
```

16.2.8.60 show ip igmp groups count

The `show ip igmp groups count` command displays the number of multicast groups that are joined across the specified interfaces.

Command Mode

EXEC

Command Syntax

```
show ip igmp groups [GROUP_LIST] count
```

Parameters

- **INTERF** Specifies the interface for which the command displays information. Options include:
 - **no parameter** all IGMP interfaces.
 - **interface ethernet e_num** Ethernet interface.
 - **interface loopback l_num** Loopback interface.
 - **interface management m_num** Management interface.
 - **interface port-channel p_num** Port-Channel Interface.
 - **interface vlan v_num** VLAN interface.
 - **interface VXLAN vx_num** VXLAN interface.

Examples

- This command displays the number of multicast groups joined across all interfaces.

```
switch> show ip igmp groups count
Number of total groups joined across all IGMP interfaces: 5 switch>
```

- This command displays the number of multicast groups joined on **interface ethernet 3/4**.

```
switch> show ip igmp groups interface ethernet 3/4 count
Number of groups joined on Ethernet3/4: 2 switch>
```

16.2.8.61 show ip igmp host-proxy config-sanity

The **show ip igmp host-proxy config-sanity** command displays diagnostic information about an IGMP host proxy configuration.

Command Mode

EXEC

Command Syntax

```
show ip igmp host-proxy config-sanity
```

Example

This command displays IGMP host proxy configuration diagnostic information.

```
switch> show ip igmp host-proxy config-sanity
Below are hints of potential IGMP Host-Proxy misconfigurations
IGMP host-proxy configured on interface Test3:
Access-lists having "deny ip any any" rule:
acl1
acl2
Groups with overlapping permit and deny configurations:
192.168.1.1/32
192.168.2.2/32
192.168.4.4/32
Groups with source filters configured with IGMP Host-Proxy set to version 2 :
192.168.2.2/32
192.168.3.0/24
192.168.3.3/32
192.168.8.8/32
switch>
```

16.2.8.62 show ip igmp host-proxy interface

The **show ip igmp host-proxy interface** command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

Command Mode

EXEC

Command Syntax

```
show ip igmp host-proxy interface [interface] [detail]
```

Parameters

- **interface** optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **port-channel p_num** port-channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
- **detail** use this optional keyword to include packet counter statistics in the display.

Examples

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

```
switch> show ip igmp host-proxy interface
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2

```

16.2.8.63 show ip igmp interface

The `show ip igmp interface` command displays multicast information about the specified interface.

Command Mode

EXEC

Command Syntax

```
show ip igmp interface [INT_NAME]
```

Parameters

INT_NAME Interface type and number. Values include:

- ***no parameter*** Displays information for all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *p_num*** VLAN interface specified by ***p_num***.
- **VXLAN *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command displays multicast related information about **vlan 26**.

```
switch> show ip igmp interface vlan 26
Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined:
    239.255.255.250 switch>
```

16.2.8.64 show ip igmp profile

The **show ip igmp profile** command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

Command Mode

EXEC

Command Syntax

show ip igmp profile [PROFILES]

Parameters

PROFILES IGMP profiles for which command displays contents. Options include:

- ***no parameter*** displays all IGMP profiles.
- ***profile_name*** displays specified profile.

Example

This command displays the IGMP profiles configured on the switch.

```
switch> show ip igmp profile
IGMP Profile list_1
permit
range 229.1.24.0 229.1.25.255
IGMP Profile list_2
deny
range 234.1.1.0 234.1.255.255 switch>
```

16.2.8.65 show ip igmp snooping

The **show ip igmp snooping** command displays the switch IGMP snooping configuration.

Command Mode

EXEC

Command Syntax

show ip igmp snooping [VLAN_ID]

Parameters

VLAN_ID specifies VLANs for which command displays information. Options include:

- **no parameter** displays information for all VLANs.
- **vlan v_num** displays information for specified VLAN.

Example

This command displays the switch IGMP snooping configuration.

```
switch> show ip igmp snooping
      Global IGMP Snooping configuration:
-----
      IGMP snooping          : Enabled
      Robustness variable     : 2

      Vlan 1 :
-----
      IGMP snooping          : Enabled
      Multicast router learning mode : pim-dvmrp

      Vlan 20 :
-----
      IGMP snooping          : Enabled
      Multicast router learning mode : pim-dvmrp

      Vlan 26 :
-----
      IGMP snooping          : Enabled
      Multicast router learning mode : pim-dvmrp

      Vlan 2028 :
-----
      IGMP snooping          : Enabled
      Multicast router learning mode : pim-dvmrp
switch>
```

16.2.8.66 show ip igmp snooping counters

The **show ip igmp snooping counters** command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Command Mode

EXEC

Command Syntax

show ip igmp snooping counters [DATA_TYPE][DATA_LEVEL]

Parameters

- **DATA_TYPE** Information displayed by the command. Options include:
 - **no parameter** displays transmission counters.
 - **errors** displays error counters.
- **DATA_LEVEL** specifies the type of information displayed. Options include:
 - **no parameter** number of packets on physical ports.
 - **detail** number of packets on physical ports.

Example

This command displays the number of messages received on each port.

| Port | Input | | | | Errors | Output | | | |
|--------|---------|---------|--------|--------|--------|---------|---------|--------|--------|
| | Queries | Reports | Leaves | Others | | Queries | Reports | Leaves | Others |

16.2.8.67 show ip igmp snooping counters ethdev-pams

The **show ip igmp snooping counters** command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

Command Mode

EXEC

Command Syntax

```
show ip igmp snooping counters ethdev-pams
```

Example

This command displays the number of messages dropped at the kernel level.

```
switch> show ip igmp snooping counters ethdev-pams
  IntfName    rxErrors    txErrors    txDrops
    et9          1          0          0

    cpu          1          0          0
    et13         1          0          0
                                         0  switch>
```

16.2.8.68 show ip igmp snooping groups

The **show ip igmp snooping groups** command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

Command Mode

EXEC

Command Syntax

```
show ip igmp snooping groups proxy [VLAN_ID][PORT_INT][GROUPS][DATA local]
```

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
 - **no parameter** displays information for all VLANs.
 - **vlan v_num** displays information for VLAN **v_num (1 to 4094)**.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
 - **no parameter** displays information for all physical ports.
 - **interface ethernet e_range**, where **e_range** is the number, range, or list of Ethernet ports.
 - **interface port-channel p_range**, where **p_range** is the number, range, or list of channel ports.
- **GROUPS** specifies the multicast groups. Options include:
 - **no parameter** all multicast groups on all specified ports.
 - **mgroup_address** multicast group specified by IPv4 address (dotted decimal notation).
 - **dynamic** multicast groups learned through IGMP.
 - **user** multicast groups manually added.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** VLAN number and port-list for each group.
 - **detail** port-specific information for each group, including transmission times and expiration.
- **proxy** displays IGMP snooping proxy information.
- **local** displays the overlay with locally attached receivers.

Examples

- This command displays the port lists for all multicast groups.

```
switch> show ip igmp snooping groups
Vlan  Group          Type    Version     Port-List
-----
-
1    239.255.255.250  -        -          Po1, Po2

16.2.8.69 show ip igmp snooping groups count

The **show ip igmp snooping groups count** command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

Command Mode

EXEC

Command Syntax

```
show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]
```

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
 - **no parameter** all VLANs.
 - **vlan v_num** specified VLAN.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
 - **no parameter** all physical ports.
 - **interface ethernet e_range** specified Ethernet ports.
 - **interface port-channel p_range** specified port channels.Valid **e_range** and **p_range** formats include number, number range, or comma-delimited list of numbers and ranges.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** number of multicast group on specified VLAN and ports.
 - **detail** number of multicast group on specified VLAN and ports.

Example

This command displays the number of multicast groups on the switch.

```
switch> show ip igmp snooping groups count
Total number of multicast groups: 2 switch>
```

16.2.8.70 show ip igmp snooping mrouter

The **show ip igmp snooping mrouter** command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

Command Mode

EXEC

Command Syntax

```
show ip igmp snooping mrouter [VLAN_ID][DATA]
```

Parameters

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
 - **no parameter** all VLANs.
 - **vlan v_num** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** displays VLAN number and port-list for each group.
 - **detail** displays port-specific data for each group; includes transmission times and expiration.

Examples

- This command displays port information of each multicast router on all VLANs.

```
switch> show ip igmp snooping mrouter
Vlan      Interface-ports
-----
1          Po1 (dynamic)
20         Po1 (dynamic)
26         Cpu (dynamic)
2028       Cpu (dynamic), Po1 (dynamic)
switch>
```

- This command displays multicast router information for each port.

```
switch> show ip igmp snooping mrouter detail
Vlan      Intf      Address           FirstHeard  LastHeard   Expires    Type
-----
1          Po1      172.17.0.37     31549:12   0:12        1:33       pim
20         Po1      172.17.20.1     7066:51    0:19        1:26       pim
26         Cpu      172.17.26.1     31549:16   0:28        1:17       pim
2028       Po1      172.17.255.29   31549:10   0:18        1:27       pim
2028       Cpu      172.17.255.30   31549:14   0:28        1:17       pim
switch>
```

16.2.8.71 show ip igmp snooping report-flooding

The **show ip igmp snooping report-flooding** command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

Command Mode

EXEC

Command Syntax

```
show ip igmp snooping report-flooding [VLAN_ID][DATA]
```

Parameters

- **VLAN_ID** specifies VLANs for which command displays information. Options include:
 - **no parameter** all VLANs.
 - **vlan v_num** specified VLAN.
- **DATA** specifies the type of information displayed. Options include:
 - **no parameter** displays VLAN number and port-list for each group.
 - **detail** displays port-specific data for each group; includes transmission times and expiration.

16.2.8.72 show ip igmp static-groups

The **show ip igmp static-groups** command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the **ip igmp static-group** command.

Command Mode

EXEC

Command Syntax

```
show ip igmp static-groups [INFO_LEVEL][[interface INT_NAME]]
```

Parameters

- **INFO_LEVEL** specifies the type of information displayed. Options include:
 - **no parameter** VLAN number and port-list for each group.
 - **detail** port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include:
 - **no parameter** static groups on all interfaces.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-Channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.

Related Commands

- [show ip igmp static-groups acl](#)
- [show ip igmp static-groups group](#)

Examples

- This command displays information about all multicast static groups.

```
switch> show ip igmp static-groups
Interface Vlan281:
    Manually configured groups:
Interface Port-Channel1999:
    Manually configured groups:
switch>
```

- This command displays information about the multicast static groups on **interface vlan 21**.

```
switch> show ip igmp static-groups interface vlan 21
Interface Vlan281:
    Manually configured groups:
switch>
```

16.2.8.73 show ip igmp static-groups acl

The **show ip igmp static-groups acl** command displays information about the IGMP multicast static groups that are configured by the specified Access Control List (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

Command Mode

EXEC

Command Syntax

```
show ip igmp static-groups acl
```

Examples

- The following **show ip igmp static-group acl** command example references these ACLs:

```
ip access-list 1
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp host 10.1.1.2 10.1.1.0/29
!
ip access-list 2
  10 permit igmp 10.1.1.0/29 host 10.1.1.1
!
ip access-list 3
  10 deny igmp host 10.1.1.1 255.1.1.0/29
!
ip access-list 4
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```
switch> show ip igmp static-group acl 1
acl 1
  ( 10.1.1.1, 10.1.1.0/29 )
  ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
  Ethernet12
switch> show ip igmp static-group acl 2
acl 2
  Seq no 30: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:

  Seq no 20: source address must be a single host or *, not a range
Interfaces using this ACL for static groups:
  none
switch>
```

16.2.8.74 show ip igmp static-groups group

The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the [ip igmp static-group](#) command.

Command Mode

EXEC

Command Syntax

```
show ip igmp static-groups group [GROUP_LIST]
```

Parameters

GROUP LIST Groups for which command displays information:

- **no parameter** all multicast groups.
- **group_address** single multicast group address (dotted decimal notation).

Related Commands

[show ip igmp static-groups](#)

16.2.8.75 show ip igmp statistics

The **show ip igmp statistics** command displays IGMP transmission statistics for the specified interface.

Command Mode

EXEC

Command Syntax

```
show ip igmp statistics [INTERFACE_ID]
```

Parameters

INTERFACE_ID Specifies interface for which command returns data. Options include:

- **no parameter** all interfaces.
- **interface ethernet e_num** Ethernet interface specified by **e_num**.
- **interface loopback l_num** Loopback interface specified by **l_num**.
- **interface management m_num** Management interface specified by **m_num**.
- **interface port-channel p_num** Port-Channel Interface specified by **p_num**.
- **interface vlan v_num** VLAN interface specified by **v_num**.
- **interface VXLAN vx_num** VXLAN interface specified by **vx_num**.

Example

This command displays IGMP transmission statistics for **interface ethernet 1**.

```
switch> show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3

  V2 queries received: 0
  V3 queries received: 0
  V1 reports received: 0
  V2 reports received: 0
  V3 reports received: 14
  V2 leaves received: 0
  Error Packets received: 0
  Other Packets received: 0
switch>
```

16.3 Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:

- [Introduction](#)
- [Overview](#)
- [Configuring PIM](#)
- [Multicast Example](#)
- [PIM Commands](#)

16.3.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in *RFC 4601*, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in *RFC 5015*, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

16.3.2 Overview

PIM builds and maintains multicast routing trees using Reverse Path Forwarding (RPF) on a unicast routing table. PIM is protocol-independent and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the Rendezvous Point (RP).

PIM uses a Multicast Routing Information Base (MRIB) populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet, which determines the next-hop neighbor for sending PIM join or prune messages.

16.3.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a Designated Router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. After sufficient traffic flows on a route, it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

16.3.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver's DR sends a PIM (*,G) Join message toward the multicast group's RP. As the message travels towards the RP, it instantiates the multicast (*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR periodically resends Join messages while it has a receiver in the group to prevent state timeout expiry in the routers along the path. When all receivers on a DR's subnet leave a group, the DR sends a (*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

16.3.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each router in the path, which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the source's DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.

16.3.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers.

When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the source's subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the Shortest Path Tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message (S,G,rpt) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

16.3.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on (*,G) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic toward the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

16.3.2.3 Rendezvous Point (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast groups distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree, and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- **Static:** RPs are statically configured through a CLI statement.
- **Dynamic:** RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

[Rendezvous Points \(RPs\)](#) describes the configuration of rendezvous points.

16.3.3 Configuring PIM

This section describes the following configuration tasks:

- [Enabling PIM IPv4 Sparse Mode](#)
- [Enabling PIM IPv6 Sparse Mode](#)
- [Enabling the S,G Expiry Timer Interval](#)
- [Enabling PIM Bidirectional](#)
- [Rendezvous Points \(RPs\)](#)
- [Hello Messages](#)
- [Hello Hold Time](#)
- [Designated Router Election](#)
- [Designated Forwarder Election](#)
- [Join-Prune Messages](#)
- [Legacy PIM Configuration in Global Configuration Mode](#)
- [Configuring PIM in a Non-default VRF](#)

16.3.3.1 Enabling PIM IPv4 Sparse Mode

By default, IPv4 PIM is disabled on an interface. The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

Example

This command enables IPv4 PIM-SM and IGMP on *interface vlan 8*.

```
switch(config)# interface vlan 8
switch(config-if-V18)# pim ipv4 sparse-mode
switch(config-if-V18)#

```

16.3.3.2 Enabling PIM IPv6 Sparse Mode

By default, EOS disables IPv6 PIM disabled on an interface. The `pim ipv6 sparse-mode` command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

Example

This command enables IPv6 PIM-SM on *interface ethernet 15*.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# pim ipv6 sparse-mode
switch(config-if-Et15)#

```

16.3.3.3 Enabling the S,G Expiry Timer Interval

The `sg-expiry-timer` command enables the expiry timer interval for the PIM-SM multicast routes. This command is issued in the Router-Multicast Configuration mode under the default VRF. If no multicast traffic activity occurs during the specified time interval, the system prunes the (S,G) route.

Example

This command configures **150** seconds as the (S,G) expiry timer interval in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#{/pre>
```

16.3.3.4 Enabling PIM Bidirectional

By default, PIM is disabled on an interface. The [pim ipv4 bidirectional](#) command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.

Example

These commands enable Bidir-PIM and IGMP on **interface vlan 9**.

```
switch(config)# interface vlan 9
switch(config-if-V19)# pim ipv4 bidirectional
switch(config-if-V19)#{/pre>
```

16.3.3.5 Rendezvous Points (RPs)

The switch supports dynamic RPs, static RPs, and anycast RPs.

Configuring Static RPs

The [rp address](#) command configures a static RP, providing an option to override dynamic RPs.

Examples

- This command creates a static RP at **10.17.255.83** in the default VRF that maps to all multicast groups (**224/4**) and overrides dynamic RPs.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.17.255.83 override
switch(config-router-pim-sparse-ipv4)#{/pre>
```

- This command creates a static RP at **10.21.18.23** in the default VRF that maps to the multicast groups at **238.1.12.0/24**.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.21.18.23 238.1.12.0/24
switch(config-router-pim-sparse-ipv4)#{/pre>
```

Configuring Dynamic RPs

Dynamic RP selection is implemented through a BootStrap Router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as Candidate BootStrap Routers (C-BSRs). Through the exchange of BootStrap Messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

The BSR holdtime defines the timeout period that an elected BSR remains valid after receiving a BSM. It is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as Candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. After receiving this set, each PIM router uses a standard algorithm defined in [RFC 6226](#) to select one RP per multicast group.

The [candidate](#) command configures the switch as a Candidate BSR router (C-BSR). Command parameters specify the switch's BSR address, the interval between BSM transmissions, and its BSR priority rating. Priority ratings range from **0** to **255**, with a default of **64**. Higher numbers denote higher priority during BSR elections.

Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to **vlan interface 24** as its BSR address. The BSM transmission interval is set to **30** seconds, and the priority is **192**.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#{
```

The [holdtime](#) command specifies the value the switch inserts in the **holdtime** field of BootStrap Messages (BSMs) that it sends. If the switch is elected as the BSR, this value becomes the hold time for the PIM domain.

Example

These commands specify **75** seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# holdtime 75
switch(config-router-pim-bsr-ipv4)#{
```

The [rp candidate](#) command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast group's dynamic RP set from the list of C-RPs. The command parameters specify the switch's RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

Running-config may contain multiple [rp candidate](#) statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.
- **Running-config** stores the **interval** setting in a separate statement that applies to all [rp candidate](#) statements. Commands that specify an interval that differs from the previously configured value place the new value in **running-config**. This new value applies to all [rp candidate](#) statements.

Example

These commands configure a switch as a candidate RP for the multicast group **235.1.1.0/24**, with a priority of **48** and a RP advertisement interval of **45** seconds in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#{
```

By default, the switch transmits BootStrap router Messages (BSMs) over all PIM-enabled interfaces. The [pim bsr ipv4 border](#) command prevents the switch from transmitting BSMs over the configuration mode interface.

Example

This command prevents the switch from sending BSMs from *interface vlan 10*.

```
switch(config)# interface vlan 10
switch(config-if-V110)# pim bsr ipv4 border
switch(config-if-V110)#[/pre]
```

Anycast Rendezvous Points

A PIM anycast Rendezvous Point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing and supports all multicast groups.

The [anycast-rp](#) command configures the switch as a member of an anycast-RP set and establishes a communication link with another set member.

Example

These commands configure a switch (IP address **10.1.1.14**) into an anycast-RP set with an RP address of **10.17.255.2** in the default VRF. The anycast-RP set contains three other routers located at **10.1.2.14**, **10.1.3.14**, and **10.1.4.14**. It sets the number of unacknowledged register messages it sends to each router at **15**.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.1.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.2.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.3.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.4.14 register-count 15
switch(config-router-pim-sparse-ipv4)#[/pre]
```

16.3.3.6 Hello Messages

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a Designated Router (DR) for each subnet. The DR then sends registration messages to the RP.

The [pim ipv4 hello interval](#) command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

Example

This command configures **45** second intervals between hello messages originating from *interface vlan 4*.

```
switch(config)# interface vlan 4
switch(config-if-V14)# pim ipv4 hello interval 45
switch(config-if-V14)#[/pre]
```

16.3.3.7 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval or setting a higher hello count using the [pim ipv4 hello count](#) command. The hello count specifies how many hello messages can be missed before the neighbor is considered down; the hold time is the hello interval multiplied by the hello count.

Examples

This command configures the PIM hold time on ***interface vlan2925*** to **225** seconds (7.5 times the 30-second hello interval).

```
switch(config)# interface vlan2925
switch(config-if-Vl2925)# pim ipv4 hello count 7.5
```

This command displays the hold time on ***interface vlan2925***.

```
switch# show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <===== New Hold Time ( = 7.5 * 30 )
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds switch#
```

16.3.3.8 Designated Router Election

PIM-SM uses these criteria for electing a Designated Router (DR):

- If at least one router does not advertise a DR priority value, PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, PIM-SM elects the router with the highest DR priority value as the DR.

The **group-expiry-timer** command sets the DR priority value that the switch advertises. If **running-config** does not contain a **pim ipv4 dr-priority** statement, the switch does not advertise a DR priority value.

Examples

- This command configures a DR priority value of **15** on ***interface vlan 4***.

```
switch(config-if-Vl4)# pim ipv4 dr-priority 15
switch(config-if-Vl4) #
```

- This command removes the DR priority from ***interface vlan 4***.

```
switch(config-if-Vl4)# no pim ipv4 dr-priority
switch(config-if-Vl4) #
```

16.3.3.9 Designated Forwarder Election

Designated Forwarders (DFs) are elected based on route metrics in the unicast routing table; no configuration options affect their selection.

16.3.3.10 Join-Prune Messages

Join/prune messages are sent by the PIM-SM Designated Router (DR) or the Bdir-PIM Designated Forwarder (DF) toward the Rendezvous Point (RP). These messages inform other PIM routers about clients who want to become receivers (join) or stop being receivers (prune) for the groups.

The `pim ipv4 join-prune interval` command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

Example

This command configures **75** second intervals between join/prune messages originating from `interface vlan 4`.

```
switch(config-if-V14)# pim ipv4 join-prune interval 75  
switch(config-if-V14) #
```

16.3.3.11 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configurations from Global Configuration Mode. Legacy configurations retain these global commands in ***running-config*** after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in ***global*** configuration mode, which can be applied to either PIM-SM or Bdir-PIM will be applied to PIM-SM. If any commands are added to ***running-config*** using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

Important: Multicast configuration commands issued in ***global*** configuration mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., ***Router-Multicast*** Configuration, ***Router-PIM Sparse-mode*** Configuration, ***Router-PIM Bidirectional*** Configuration, ***Router-PIM BSR*** Configuration, or ***Router-MSDP*** Configuration).

16.3.3.12 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. After this is accomplished, configure VRF-global PIM parameters using the `vrf` command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.

Interface-specific PIM parameters are configured in the ***interface-configuration*** mode for the VRF-member interface.

Legacy multicast routing commands issued in ***global*** configuration mode are applied to the default VRF but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in ***running-config*** will be replaced with their updated equivalents and applied to the default VRF.

16.3.3.12.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

1. Enable unicast routing in the default VRF.

```
switch(config)# ip routing vrf default
```

2. Create the non-default VRF if not already created.

```
switch(config) # vrf instance purple
```

3. Enable enable unicast routing on the new VRF.

```
switch(config-vrf-purple) # exit
switch(config) # ip routing vrf purple
```

4. Add participating routed ports to the new VRF.

```
switch(config) # interface ethernet 9/2-9/4
switch(config-if-Et9/2-4) # no switchport
switch(config-if-Et9/2-4) # vrf purple
switch(config-if-Et9/2-4) # exit
```

5. Enable multicast routing on the new VRF.

```
switch(config) # router multicast
switch(config-router-multicast) # vrf purple
switch(config-router-multicast-vrf-purple) # ipv4
switch(config-router-multicast-vrf-purple-ipv4) # routing
```

16.3.3.12.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

Example

These commands configure a switch as a candidate RP for the multicast group **235.1.1.0/24**, with a priority of **48** and a RP advertisement interval of **45** seconds, in VRF **purple**.

```
switch(config) # router pim sparse-mode
switch(config-router-pim-sparse) # vrf purple
switch(config-router-pim-sparse) # ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4) # rp candidate vlan 24 235.1.1.0/24 priority 48
    interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4) #
```

16.3.3.12.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF in the **interface-configuration** mode for the interface.

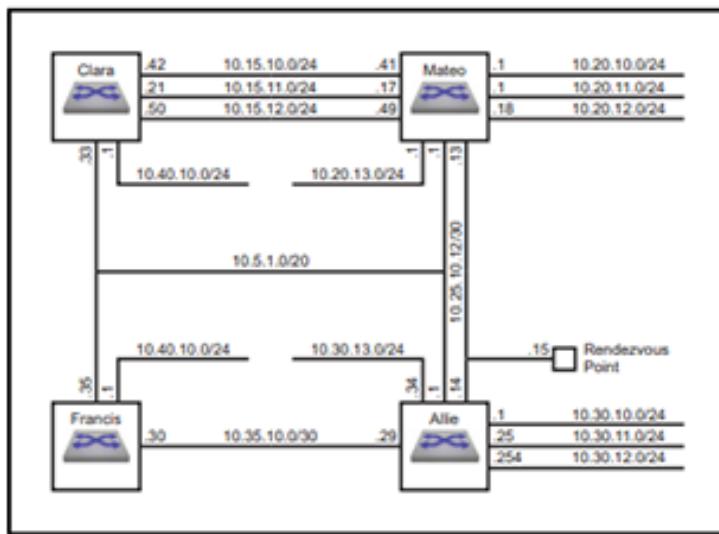

16.3.4 Multicast Example

This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

16.3.4.1 Diagram

Figure 16-4: Multicast Example displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

Figure 16-4: Multicast Example

The example multicast network implements these multicast parameters:

Rendezvous Point Address: 10.25.10.15

Switch Clara

- IGMP Snooping: disabled
- Subnet Summary:
 - 10.40.10.0/24: *vlan 11*
 - 10.15.10.0/24: *vlan 12*
 - 10.15.11.0/24: *vlan 13*
 - 10.15.12.0/24: *vlan 14*
 - 10.5.1.0/20: *vlan 10*

Switch Mateo

- IGMP Snooping: disabled
- Subnet Summary:
 - 10.20.13.0/24: *vlan 18*
 - 10.20.10.0/24: *vlan 15*
 - 10.20.11.0/24: *vlan 16*
 - 10.20.12.0/24: *vlan 17*
 - 10.15.10.0/24: *vlan 12*
 - 10.15.11.0/24: *vlan 13*
 - 10.15.12.0/24: *vlan 14*
 - 10.25.10.12/30: *vlan 19*
 - 10.5.1.0/20: *vlan 10*

Switch Allie

- IGMP Snooping: enabled
- Multicast Routing: enabled
- Querier: enabled
- Rendezvous Point Address: **10.25.10.15**
- MFIB activity polling interval: **5** second
- Subnet Summary:
 - **10.30.13.0/24: vlan 23**
 - **10.30.10.0/24: vlan 20** PIM-SM enabled
 - **10.30.11.0/24: vlan 21** PIM-SM enabled
 - **10.30.12.0/24: vlan 22**
 - **10.25.10.12/30: vlan 19**
 - **10.35.10.0/30: vlan 24** PIM-SM enabled
 - **10.5.1.0/20: vlan 10** PIM-SM enabled

Switch Francis

- IGMP Snooping: enabled
- Multicast Routing: enabled
- Subnet Summary:
 - **10.40.10.0/24: vlan 25** PIM-SM enabled
 - **10.35.10.0/30: vlan 24** PIM-SM enabled
 - **10.5.1.0/20: vlan 10**

16.3.4.2 Example

This example configures PIM-SM.

1. Configure the interface addresses.

- a. Router Clara interfaces.

```
Clara(config)# interface vlan 11
Clara(config-if-vl11)# ip address 10.40.10.1/24
Clara(config-if-vl11)# interface vlan 12
Clara(config-if-vl12)# ip address 10.15.10.42/24
Clara(config-if-vl12)# interface vlan 13
Clara(config-if-vl13)# ip address 10.15.11.21/24
Clara(config-if-vl13)# interface vlan 14
Clara(config-if-vl14)# ip address 10.15.12.50/24
Clara(config-if-vl14)# interface vlan 10
Clara(config-if-vl10)# ip address 10.5.1.33/20
Clara(config-if-vl10)# router ospf 1
Clara(config-router-ospf)# redistribute static
```

- b. Router Mateo interfaces.

```
Mateo(config)# interface vlan 18
Mateo(config-if-vl18)# ip address 10.20.13.1/24
Mateo(config-if-vl18)# interface vlan 15
Mateo(config-if-vl15)# ip address 10.20.10.1/24
Mateo(config-if-vl15)# interface vlan 16
Mateo(config-if-vl16)# ip address 10.20.11.1/24
Mateo(config-if-vl16)# interface vlan 17
Mateo(config-if-vl17)# ip address 10.20.12.16/24
Mateo(config-if-vl17)# interface vlan 12
Mateo(config-if-vl12)# ip address 10.15.10.41/24
Mateo(config-if-vl12)# interface vlan 13
```

```

Mateo(config-if-vl13)# ip address 10.15.11.17/24
Mateo(config-if-vl13)# interface vlan 14
Mateo(config-if-vl14)# ip address 10.15.12.49/24
Mateo(config-if-vl14)# interface vlan 19
Mateo(config-if-vl19)# ip address 10.25.10.13/30
Mateo(config-if-vl19)# interface vlan 10
Mateo(config-if-vl10)# ip address 10.5.1.1/20
Mateo(config-if-vl10)# router ospf 1
Mateo(config-router-ospf)# redistribute static

```

c. Router Allie interfaces.

```

Allie(config)# interface vlan 23
Allie(config-if-vl23)# ip address 10.30.13.34/24
Allie(config-if-vl23)# interface vlan 20
Allie(config-if-vl20)# ip address 10.30.10.1/24
Allie(config-if-vl20)# interface vlan 21
Allie(config-if-vl21)# ip address 10.30.11.25/24
Allie(config-if-vl21)# interface vlan 22
Allie(config-if-vl22)# ip address 10.30.12.254/24
Allie(config-if-vl22)# interface vlan 19
Allie(config-if-vl19)# ip address 10.25.10.14/30
Allie(config-if-vl19)# interface vlan 24
Allie(config-if-vl24)# ip address 10.35.10.29/30
Allie(config-if-vl24)# interface vlan 10
Allie(config-if-vl10)# ip address 10.5.1.1/20
Allie(config-if-vl10)# router ospf 1
Allie(config-router-ospf)# redistribute static

```

d. Router Francis interfaces.

```

Francis(config)# interface vlan 25
Francis(config-if-vl25)# ip address 10.40.10.1/24
Francis(config-if-vl25)# interface vlan 24
Francis(config-if-vl24)# ip address 10.35.10.30/24
Francis(config-if-vl24)# interface vlan 10
Francis(config-if-vl10)# ip address 10.5.1.35/24
Francis(config-if-vl10)# router ospf 1
Francis(config-router-ospf)# redistribute static

```

2. Configure the interface multicast parameters.

a. Router Allie interfaces.

```

Allie(config-router-ospf)# interface vlan 20
Allie(config-if-vl20)# pim ipv4 sparse-mode
Allie(config-if-vl20)# interface vlan 21
Allie(config-if-vl21)# pim ipv4 sparse-mode
Allie(config-if-vl21)# interface vlan 24
Allie(config-if-vl24)# pim ipv4 sparse-mode
Allie(config-if-vl24)# interface vlan 10
Allie(config-if-vl10)# pim ipv4 sparse-mode

```

b. Router Francis interfaces.

```

Francis(config-router-ospf)# interface vlan 25
Francis(config-if-vl25)# pim ipv4 sparse-mode
Francis(config-if-vl25)# interface vlan 24
Francis(config-if-vl24)# pim ipv4 sparse-mode

```

3. Configure the router multicast parameters.

a. Router Clara parameters.

```

Clara(config-router-ospf)# exit
Clara(config)# no ip igrp snooping

```

b. Router Mateo router.

```

Mateo(config-router-ospf)# exit

```

```
Mateo(config)# no ip igmp snooping
```

c. Router Allie router.

```
Allie(config-if-vl10)# exit
Allie(config)# router multicast
Allie(config-router-multicast)# ipv4
Allie(config-router-multicast-ipv4)# routing
Allie(config-router-multicast-ipv4)# activity polling-interval 5
Allie(config-router-multicast-ipv4)# router pim sparse-mode
Allie(config-router-pim-sparse)# ipv4
Allie(config-router-pim-sparse-ipv4)# rp address 10.25.10.15
```

d. Router Francis router.

```
Francis(config-if-vl24)# exit
Francis(config)# router multicast
Francis(config-router-multicast)# ipv4
Francis(config-router-multicast-ipv4)# routing
Francis(config-router-multicast-ipv4)# router pim sparse-mode
Francis(config-router-pim-sparse)# ipv4
Francis(config-router-pim-sparse-ipv4)# rp address 10.25.10.15
```

16.3.5 PIM Commands

PIM Configuration Commands (Global)

- `anycast-rp`
- `candidate`
- `fast-reroute`
- `group-expiry-timer`
- `holdtime`
- `ip pim dr-notify-delay`
- `log neighbors`
- `register local-interface`
- `router pim bidirectional`
- `router pim bsr`
- `router pim sparse-mode`
- `rp address`
- `rp allow`
- `rp candidate`
- `rp-candidate advertisement-filter`
- `rp hash algorithm modulo`
- `sg-expiry-timer`
- `spt threshold`
- `ssm range`

PIM Configuration Commands (Interface)

- `ipv4`
- `pim bsr ipv4 border`
- `pim ipv4 bidirectional`
- `pim ipv4 border-router`
- `pim ipv4 dr-priority`
- `pim ipv4 hello count`
- `pim ipv4 hello interval`
- `pim ipv4 join-prune count`
- `pim ipv4 join-prune interval`
- `pim ipv4 neighbor-filter`
- `pim ipv4 sparse-mode`
- `pim ipv6 sparse-mode`
- `sztimeout`

PIM Display Commands

- `show ip pim bsr`
- `show ip pim config-sanity`
- `show ip pim interface`
- `show ip pim neighbor`
- `show ip pim protocol counters`
- `show ip pim register-source`
- `show ip pim rp`
- `show ip pim rp-candidate`

- show ip pim rp-hash
- show ip pim upstream joins

16.3.5.1 anycast-rp

The **anycast-rp** command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in **router-multicast ipv4** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast **router-multicast ipv4** configuration mode.

The **no anycast-rp** and **default anycast-rp** commands remove the corresponding **anycast-rp** command from **running-config**. When the **no** and **default** commands do not include a peer address, all commands for the specified RP address are removed.

Command Mode

Router-Multicast IPv4 Configuration

Router-Multicast VRF IPv4 Configuration

Command Syntax

```
anycast-rp rp_addr peer_addr [REGISTER]
```

```
no anycast-rp rp_addr [peer_addr]
```

```
default anycast-rp rp_addr [peer_addr]
```

Parameters

- **rp_addr** Rendezvous point IP address (dotted decimal notation).
- **peer_addr** IP address of another anycast-RP set member (dotted decimal notation). Note, the peer-addr for a local anycast RP must be a /32 address configured under a loopback interface. To enable anycast RP on the router, each RP requires one local peer address. Use the **show ip pim anycast-rp [vrf <vrfName>]** command to verify the configured local and remote peers.
- **REGISTER** Number of unacknowledged register messages the switch sends to the peer router.
 - **no parameter** register count is set to default value of **10**.
 - **register-count r_num** where **r_num** is an integer that ranges from **1** to **4294967295**.
 - **register-count infinity**

Example

These commands configure a switch (IP address **10.1.1.14**) into an anycast-RP set with an RP address of **10.17.255.2** in the default VRF. The anycast-RP set contains three other routers, located at **10.1.2.14**, **10.1.3.14**, and **10.1.4.14**. It sets the number of unacknowledged register messages it sends to each router at **15**.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.1.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.2.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.3.14 register-count 15
switch(config-router-pim-sparse-ipv4)# anycast-rp 10.17.255.2 10.1.4.14 register-count 15
```

16.3.5.2 candidate

The **candidate** command configures the switch as a Candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange BootStrap Messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as Candidate BootStrap Routers (C-BSRs). Through the exchange of BootStrap Messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switch's BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an **candidate** command replaces any previously configured **candidate** command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in **running-config**.

When the command is issued in the **router-pim bsr ipv4** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in **router-pim bsr vrf ipv4** configuration mode for the appropriate VRF.

The **no candidate** and **default candidate** commands remove the corresponding **candidate** commands from **running-config**. The **no** and **default** commands restore the priority, hash mask length, and interval parameters to their default values.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

```
candidate INTERFACE [HASHMASK_LENGTH][INTERVAL_PERIOD][PRIORITY_NUM]
no candidate [priority][interval]
default candidate[priority][interval]
```

Parameters

- **INTERFACE** Switch uses IP address of specified interface as its BSR address. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-Channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
 - **no parameter** hash mask remains unchanged from previous setting.
 - **hashmask 0 - 32** hash mask length (in bits). Default value is **30**.
- **INTERVAL_PERIOD** Period between the transmission of BSMs (seconds). Default value is **60**.
 - **no parameter** interval remains unchanged from previous setting.
 - **interval 10 - 536870906** transmission interval in seconds.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is **64**.
 - **no parameter** priority remains unchanged from previous setting.

-
- **priority 0 - 255** priority rating.

Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to **interface vlan 24** as its BSR address. The BSM transmission interval is set to **30** seconds and the priority is set to **192**.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#{
```

16.3.5.3 fast-reroute

The **fast-reroute** command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The `no fast-reroute` and `default fast-reroute` commands disable MoFRR by removing the corresponding fast-reroute command from *running-config*.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

fast-reroute *acl_name*

```
no fast-reroute acl_name
```

default :

Parameter

dot_name

- Examples** [View](#) [Edit](#) [Delete](#)

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# fast-reroute acl2
```

- These commands enable fast reroute for ACL `ac12` in `vrf red` under the IPv4 configuration.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# vrf red
switch(config-router-pim-sparse-vrf-red)# ipv4
switch(config-router-pim-sparse-vrf-red-ipv4)# fast-reroute acl12
switch(config-router-pim-sparse-vrf-red-ipv4)#
```

16.3.5.4 group-expiry-timer

The **group-expiry-timer** command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM Rendezvous Point (RP) tree.

When the command is configured in the **global** configuration mode, the configuration is applied globally on the switch. To apply the configuration only in the **bidir-pim** mode, the command is configured in the Router-PIM Bidirectional configuration mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional configuration mode. Use the [pim ipv4 bidirectional](#) command to enter Router-PIM Bidirectional Configuration Mode.

The **no group-expiry-timer** and **default group-expiry-timer** applies the system default configuration and removes the corresponding **group-expiry-timer** command from **running-config**.

Command Mode

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

```
group-expiry-timer value  
no group-expiry-timer value  
default group-expiry-timer value
```

Parameter

value specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from **1** to **210**. There is no default value.

Examples

- This command configures PIM expiry-timer of **40** seconds in **pim-bidirectional** sub-mode.

```
switch(config)# router pim bidirectional  
switch(config-router-pim-bidir)# ipv4  
switch(config-router-pim-bidir-ipv4)# group-expiry-timer 40
```

- This command configures PIM expiry-timer of **120** seconds for **vrf v1**.

```
switch(config)# router pim bidirectional  
switch(config-router-pim-bidir)# vrf v1  
switch(config-router-pim-bidir-vrf-v1)# ipv4  
switch(config-router-pim-bidir-vrf-v1-ipv4)# group-expiry-timer 120
```

16.3.5.5 holdtime

The **holdtime** command specifies the value the switch inserts in the **holdtime** parameter field in BootStrap Messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in **router-pim bsr ipv4** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in **router-pim bsr vrf ipv4** configuration mode for the appropriate VRF.

The **no holdtime** and **default holdtime** commands restore the default holdtime parameter field insertion value of **130** seconds by removing the **holdtime** statement from **running-config**.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

holdtime period

no holdtime

default holdtime

Parameter

period BSR holdtime (seconds). Value ranges from **12** to **1073741823** (1.073 billion seconds, approximately 34 years). Default is **130**.

Example

These commands specify **75** seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# holdtime 75
switch(config-router-pim-bsr-ipv4)#

```

16.3.5.6 ip pim dr-notify-delay

The **ip pim dr-notify-delay** command configures the designated router (DR) notification delay time. (This is equivalent to issuing the **dr-notify-delay** command in Router-PIM Sparse-mode Configuration Mode.) The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than 1.

The **no ip pim dr-notify-delay** and **default ip pim dr-notify-delay** commands remove the previously configured DR notification delay time.

Note: while this command is VRF-aware, delay time is not configurable per-VRF. The configuration will apply to all VRFs configured with PIM.

Command Mode

Global Configuration

Command Syntax

```
ip pim dr-notify-delay notify_delay_time
no ip pim dr-notify-delay
default ip pim dr-notify-delay
```

Parameter

notify_delay_time The PIM designated router notify delay time in seconds. Values range from -32767 to 32768.

Guidelines

The notification delay time can be configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of 1). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is first configured on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of 1 until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

Example

This command configures a DR notification delay time of 2 seconds.

```
switch(config)# ip pim dr-notify-delay 2
switch(config)#
```

16.3.5.7 ipv4

The **ipv4** command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

Command Mode

Router Multicast Configuration

Router-PIM Bidirectional Configuration

Router-PIM BSR Configuration

Router-PIM Sparse-mode Configuration

Command Syntax

```
ipv4
```

Examples

- These commands place the switch in the **router multicast ipv4** configuration mode.

```
switch(config)# router multicast
switch(config-router-multicast)# ipv4
switch(config-router-multicast-ipv4)#{/pre>
```

- These commands place the switch in the **router-pim bidirectional ipv4** configuration mode.

```
switch(config)# router pim bidirectional
switch(config-router-pim-bidir)# ipv4
switch(config-router-pim-bidir-ipv4)#{/pre>
```

- These commands place the switch in the **router-pim bsr ipv4** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)#{/pre>
```

- These commands place the switch in the **router-pim sparse-mode ipv4** configuration mode.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)#{/pre>
```

16.3.5.8 log neighbors

The **log neighbors** command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The **no log neighbors** command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the **running-config**. The **log neighbors** and **default log neighbors** commands restore the default setting of generating log messages by deleting the **no log neighbors** statement from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

```
log neighbors  
no log neighbors  
default log neighbors
```

Examples

- These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

```
switch(config)# router pim sparse-mode  
switch(config-router-pim-sparse)# ipv4  
switch(config-router-pim-sparse-ipv4)# no log neighbors  
switch(config-router-pim-sparse-ipv4) #
```

- These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

```
switch(config)# router pim sparse-mode  
switch(config-router-pim-sparse)# ipv4  
switch(config-router-pim-sparse-ipv4)# log neighbors  
switch(config-router-pim-sparse-ipv4) #
```

16.3.5.9 pim bsr ipv4 border

The **pim bsr ipv4 border** command prevents the switch from sending BootStrap router Messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The **no pim bsr ipv4 border** and **default pim bsr ipv4 border** commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding **pim bsr ipv4 border** statement from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim bsr ipv4 border  
no pim bsr ipv4 border  
default pim bsr ipv4 border
```

Example

This command prevents the switch from sending BSMs from *interface vlan 10*.

```
switch(config)# interface vlan 10  
switch(config-if-V110)# pim bsr ipv4 border  
switch(config-if-V110)#{
```

16.3.5.10 pim ipv4 bidirectional

The **pim ipv4 bidirectional** command enables PIM bidirectional and IGMP (router mode) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv4 bidirectional**, **no pim ipv4 default pim ipv4 bidirectional**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv4 bidirectional** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 bidirectional  
no pim ipv4  
no pim ipv4 bidirectional  
default pim ipv4  
default pim ipv4 bidirectional
```

Example

This command enables PIM bidirectional on **interface vlan 4**.

```
switch(config)# interface vlan 4  
switch(config-if-Vl4)# pim ipv4 bidirectional  
switch(config-if-Vl4) #
```

16.3.5.11 pim ipv4 border-router

The **pim ipv4 border-router** command configures the configuration mode interface as a PIM Multicast Border Router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface.

Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

Note: Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the **pim ipv4 sparse-mode** command on the interface before issuing this command.

The **no pim ipv4 border-router** and **default pim ipv4 border-router** commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding **pim ipv4 border-router** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 border-router
no pim ipv4 border-router
default pim ipv4 border-router
```

Example

These commands configure **interface vlan 200** as a PIM MBR, then display its status.

```
switch(config)# interface vlan 200
switch(config-if-VL200)# ip address 10.44.2.1/24
switch(config-if-VL200)# no pim ipv4 sparse-mode
switch(config-if-VL200)# pim ipv4 border-router
switch(config-if-VL200)# show active
interface Vlan200
ip address 10.44.2.1/24
pim ipv4 border-router
switch(config-if-VL200)#exit
switch(config)# show ip pim interface
AddressInterfaceModeNeighborHello DRDR
AddressPktsQedPktsDropped
CountIntvl Pri
10.44.2.1Vlan200mbr030110.44.2.100
switch(config) #
```

16.3.5.12 pim ipv4 dr-priority

PIM-SM uses these criteria for electing a Designated Router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The **pim ipv4 dr-priority** command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The **no pim ipv4 dr-priority** and **default pim ipv4 dr-priority** commands force the use of IP addresses to elect the designated router by removing the corresponding **pim ipv4 dr-priority** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 dr-priority level
no pim ipv4 dr-priority [level]
default pim ipv4 dr-priority [level]
```

Parameter

level DR selection priority rating. Value ranges from **0** to **4294967295**.

Examples

- This command configures the dr-priority value of **15** on **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 dr-priority 15
switch(config-if-Vl4) #
```

- This command force the use of IP addresses to elect the designated router.

```
switch(config-if-Vl4)# no pim ipv4 dr-priority
switch(config-if-Vl4) #
```

16.3.5.13 pim ipv4 hello count

The **pim ipv4 hello count** command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The **no pim ipv4 hello count** command removes the corresponding **pim ipv4 hello count** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 hello count [multiple]
no pim ipv4 hello count [multiple]
```

Parameter

multiple hello count multiplier. Value ranges from **1.5** to **65535**. The hello hold time is the configured hello interval multiplied by the hello count.

Examples

- This command configures a hold time interval of **225** seconds on **interface vlan2925** by multiplying the default **30**-second hello interval by a hello count of **7.5**.

```
switch(config)# interface vlan2925
switch(config-if-V12925)# pim ipv4 hello count 7.5
switch(config-if-V12925) #
```

- This show command displays the hold time and other configuration details on **interface vlan2925**.

```
switch# show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <===== New Hold Time (= 7.5 * 30)
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds mrtr1#
```

16.3.5.14 pim ipv4 hello interval

The **pim ipv4 hello interval** command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The **no pim ipv4 hello interval** and **default pim ipv4 hello interval** commands restore the default query interval of **30** seconds for the configuration mode interface by removing the corresponding **pim ipv4 hello interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 hello interval period
no pim ipv4 hello interval [period]
default pim ipv4 hello interval [period]
```

Parameter

period query interval (seconds). Value ranges from **1** to **1000000** (1 million). Default is **30**.

Example

This command configures **45** second intervals between hello messages originating from **interface vlan 4**.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 hello interval 45
switch(config-if-Vl4) #
```

16.3.5.15 pim ipv4 join-prune count

The **pim ipv4 join-prune count** command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for **pim ipv4 join-prune interval**, and modify the **pim ipv4 join-prune count** to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is **65535**.

The **no pim ipv4 join-prune count** and **default pim ipv4 join-prune count** commands restore the default join or prune count for the configuration mode interface by removing the corresponding **pim ipv4 join-prune count** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 join-prune count count_value
no pim ipv4 join-prune count count_value
default pim ipv4 join-prune count count_value
```

Parameter

count_value The number of missed join or prune after which the route expires. Value ranges from **1.5** to **65535**.

Example

This command indicates the number of times a join or prune messages can be missed.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# pim ipv4 join-prune count 5
switch(config-if-Et1/1) #
```

16.3.5.16 pim ipv4 join-prune interval

The **pim ipv4 join-prune interval** command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The **no pim ipv4 join-prune interval** and **default pim ipv4 join-prune interval** commands restores the default join or prune interval to **60** seconds for the configuration mode interface by removing the corresponding **pim ipv4 join-prune interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 join-prune interval [period]  
no pim ipv4 join-prune interval [period]  
default pim ipv4 join-prune interval [period]
```

Parameter

period join or prune interval (seconds). Value ranges from **1** to **18724**. Default is **60**.

Example

This command configures **75**-second intervals between join or prune messages originating from **interface vlan 4**.

```
switch(config)# interface vlan 4  
switch(config-if-V14)# pim ipv4 join-prune interval 75  
switch(config-if-V14)#[/pre]
```

16.3.5.17 pim ipv4 neighbor-filter

The **pim ipv4 neighbor-filter** command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The **no pim ipv4 neighbor-filter** and **default pim ipv4 neighbor-filter** commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding **ip pim ipv4 neighbor-filter** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 neighbor-filter access_list
no pim ipv4 neighbor-filter
default pim ipv4 neighbor-filter
```

Parameter

access_list name of the standard IP access list.

Example

This command configures the IP access list named **filter_1** to filter neighbor PIM control messages for **interface vlan 4**.

```
switch(config)# ip access-list standard filter_1
switch(config-std-acl-filter_1)# permit 10.13.24.9/24
switch(config-std-acl-filter_1)# exit
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv4 neighbor-filter filter_1
switch(config-if-Vl4)#

```

16.3.5.18 pim ipv4 sparse-mode

The **pim ipv4 sparse-mode** command enables PIM IPv4 Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv4 sparse-mode**, **no pim ipv4**, **default pim ipv4 sparse-mode**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv4 sparse-mode** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv4 sparse-mode  
no pim ipv4  
no pim ipv4 sparse-mode  
default pim ipv4  
default pim ipv4 sparse-mode
```

Example

This command enables PIM sparse mode on **interface vlan 4** interface.

```
switch(config)# interface vlan 4  
switch(config-if-Vl4)# pim ipv4 sparse-mode  
switch(config-if-Vl4) #
```

16.3.5.19 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

Note: PIM and Multicast Border Router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode**, **no pim ipv6**, **default pim ipv6 sparse-mode**, and **default pim ipv6** commands restore the default PIM settings of **disabled** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
pim ipv6 sparse-mode  
no pim ipv6  
no pim ipv6 sparse-mode  
default pim ipv6  
default pim ipv6 sparse-mode
```

Example

This command enables IPv6 PIM sparse mode on **interface vlan 8**.

```
switch(config)# interface vlan 8  
switch(config-if-V18)# pim ipv6 sparse-mode  
switch(config-if-V18)#[/pre]
```

16.3.5.20 register checksum

The **register checksum** command in the Router PIM Sparse-Mode IPv6 Configuration Mode configures a checksum to use for PIM IPv6 register messages. The **no** | **default** versions of the command restores the default method of filling the register packet source field by removing the statement from the **running-config**.

Command Mode

Router PIM Sparse-Mode IPv6 Configuration Mode

Command Syntax

```
register checksum [full | header]
```

Parameters

- **full** - Compute the checksum on the entire register message.
- **header** - Compute the checksum on the first eight (8) bytes of the register message.

Example

Use the following commands to configure the checksum as **full**:

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv6
switch(config-router-pim-sparse-ipv6)# register checksum full
```

16.3.5.21 register local-interface

The **register local-interface** command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 ConfigurationMode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The **no register local-interface** and **default register local-interface** commands restore the default method of filling the register packet source field by removing the **ip register local-interface** statement from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
register local-interface INT_NAME
no register local-interface
default register local-interface
```

Parameters

INT_NAME Interface type and number. Values include:

- **ethernet e_num** Ethernet interface specified by **e_num**.
- **loopback l_num** Loopback interface specified by **l_num**.
- **management m_num** Management interface specified by **m_num**.
- **port-channel p_num** Port channel interface specified by **p_num**.
- **vlan v_num** VLAN interface specified by **v_num**.

Example

These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of **interface loopback 2**.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# register local-interface loopback 2
switch(config-router-pim-sparse-ipv4)#

```

16.3.5.22 router pim bidirectional

The **router pim bidirectional** command places the switch in the ***router-pim bidirectional*** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router pim bidirectional
```

Example

This command places the switch in the ***router-pim bidirectional*** configuration mode.

```
switch(config)# router pim bidirectional  
switch(config-router-pim-bidir)#End
```

16.3.5.23 router pim bsr

The **router pim bsr** command places the switch in the ***router-pim bsr*** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router pim bsr
```

Example

This command places the switch in the ***router-pim bsr*** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)#
```

16.3.5.24 router pim sparse-mode

The **router pim sparse-mode** command places the switch in the ***router-pim sparse-mode*** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router pim sparse-mode
```

Example

This command places the switch in the ***router-pim sparse-mode*** configuration mode.

```
switch(config)# router pim sparse-mode  
switch(config-router-pim-sparse)#
```

16.3.5.25 rp address

The **rp address** command configures the address of a Protocol Independent Multicast (PIM) static Rendezvous Point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (**224/4**). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **rp address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **rp address** commands, the group's RP address is selected by comparing the commands' multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in the **router-mcast** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the **router-mcast vrf** configuration mode.

The **no rp address** and **default rp address** commands remove the corresponding **rp address** command from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
rp address rp_addr [MULTICAST_SUBNET][HASHMASK_LENGTH][BSR_OVERRIDE][PRIORITY_NUM]
no rp address rp_addr [MULTICAST_SUBNET]
default rp address rp_addr [MULTICAST_SUBNET]
```

Parameters

- **rp_addr** Rendezvous point IP address (dotted decimal notation).
- **MULTICAST_SUBNET** Multicast IP address space (CIDR or address-mask).
 - **no parameter** Default multicast group IP address of **224/4**.
 - **gp_addr** Multicast group IP address (CIDR or address-mask).
 - **access-list acl_name** Standard access control list that specifies the multicast group address.
 - **acl_name** Standard access control list that specifies the multicast group address.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
 - **no parameter** hash mask remains unchanged from previous setting.
 - **hashmask 0 - 32** hash mask length (in bits). Default value is **30**.
- **BSR_OVERRIDE** Configures priority relative to dynamic RPs selected by BSR.
 - **no parameter** Dynamic RPs have priority over specified RP.
 - **override** RP has priority over dynamic RPs.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
 - **no parameter** priority remains unchanged from previous setting.
 - **priority 0 - 255** priority rating.

Example

These commands configures **10.17.255.2** as a static RP for all multicast groups in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp address 10.17.255.2
switch(config-router-pim-sparse-ipv4)#{
```

16.3.5.26 rp allow

The **rp allow** command accepts and allows PIM (*,G) join message with an RP address that is different from the configured RPs for that particular (*,G).

The **no rp allow** and **default rp allow** commands disable this behavior by removing the corresponding **rp allow** command from *running-config*.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
rp allow
no rp allow
default rp allow
```

Examples

- These commands configure the switch to accept PIM (*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp allow
```

- These commands configure the switch to accept PIM (*,G) join messages in VRF blue that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# vrf blue
switch(config-router-pim-sparse-vrf-blue)# ipv4
switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
```

16.3.5.27 rp candidate

The **rp candidate** command configures the switch as a Candidate Rendezvous Point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

Running-config supports multiple multicast groups through multiple **rp candidate** statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.
- The **running-config** stores the **interval** setting in a separate statement that applies to all **rp candidate** statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured **rp candidate** statements. The default **interval** value is **60** seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the **router-multicast vrf** configuration mode.

The **no rp candidate** and **default rp candidate** commands remove **rp candidate** from **running-config** for the specified group. When these commands do not specify a multicast group, all **rp candidate** statements are removed from **running-config**.

The **no rp candidate interval** and **default rp candidate interval** commands restore the interval setting to the default value of **60** seconds. The **no rp candidate priority** and **default rp candidate priority** commands restore the priority setting to the default value of **192**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

Note: The **INTERFACE** parameter is always listed first. All other parameters can be placed in any order.

```
rp candidate INTERFACE [GROUP_ADDR][PRIORITY_NUM][INTERVAL_PERIOD]
no rp candidate [INTERFACE][GROUP_ADDR]
no rp candidate [INTERFACE] interval
no rp candidate [INTERFACE] priority
default rp candidate [INTERFACE][GROUP_ADDR]
default rp candidate [INTERFACE] interval
default rp candidate [INTERFACE] priority
```

Parameters

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.

- **loopback *I_num*** Loopback interface specified by *I_num*.
- **management *m_num*** Management interface specified by *m_num*.
- **port-channel *p_num*** Port-Channel Interface specified by *p_num*.
- **vlan *v_num*** VLAN interface specified by *v_num*.
- **VXLAN *vx_num*** VXLAN interface specified by *vx_num*.
- **GROUP_ADDR** address of multicast group for which candidate is configured. Options include:
 - **no parameter** default multicast group (**224.0.0.0/4**).
 - **net_addr** multicast IPv4 subnet address (CIDR or address mask).
 - **access-list *acl_name*** standard access control list that specifies the multicast group address.
- **PRIORITY_NUM** RP selection priority rating. Smaller numbers denote higher priority.
 - **no parameter** priority rating is set to the default value of **192**.
 - **priority 0 - 255** priority rating.
- **INTERVAL_PERIOD** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured **rp candidate** statements.
 - **no parameter** interval remains unchanged from previous setting.
 - **interval 10 - 16383** transmission interval.

Example

These commands configure a switch as a candidate RP for the multicast group **235.1.1.0/24** with a priority of **48** and an RP advertisement interval of **45** seconds in the default VRF. The switch advertises the IP address assigned to **vlan 24** as its RP address.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#

```

16.3.5.28 rp hash algorithm modulo

The **rp hash algorithm modulo** command configures the load-balancing scheme across available Rendezvous Points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The **no rp hash algorithm modulo** and **default rp hash algorithm modulo** commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Sparse-mode IPv6 Configuration

Router-PIM Sparse-mode VRF IPv6 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

```
rp hash algorithm modulo  
no rp hash algorithm modulo  
default rp hash algorithm modulo
```

Examples

- These commands configures the hash algorithm module for a VRF named **blue** in the **router-pim sparse-mode ipv4** configuration mode.

```
switch(config)# router pim sparse-mode  
switch(config-router-pim-sparse)# ipv4  
switch(config-router-pim-sparse-ipv4)# vrf red  
switch(config-router-pim-sparse-vrf-red-ipv4)# rp hash algorithm modulo
```

- These commands configures the hash algorithm module for a VRF named **blue** in the **router-pim bidirectional-mode vrf ipv4** configuration mode.

```
switch(config)# router pim bidirectional  
switch(config-router-pim-bidir)# ipv4  
switch(config-router-pim-bidir-ipv4)# vrf red  
switch(config-router-pim-bidir-vrf-red-ipv4)# rp hash algorithm modulo
```

16.3.5.29 rp-candidate advertisement-filter

The **rp-candidate advertisement-filter** command filters the RP candidate advertisements from certain IP addresses. When **rp-candidate advertisement-filter** command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The **no rp-candidate advertisement-filter** and **default rp-candidate advertisement-filter** commands removes **rp-candidate advertisement-filter** from **running-config** for the specified group.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

```
rp-candidate advertisement-filter access-list access-list_name
no rp-candidate advertisement-filter access-list access-list_name
default rp-candidate advertisement-filter access-list access-list_name
```

Parameter

access-list_name Standard access control list that specifies the multicast group address.

Example

These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

```
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# rp-candidate advertisement-filter access-list test1
switch(config-router-pim-bsr-vrf-red-ipv4)# rp-candidate advertisement-filter access-list test2
```

16.3.5.30 sg-expiry-timer

The **sg-expiry-timer** command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

When the command is issued in the **router-mcast** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the **router-mcast vrf** configuration mode.

The **no sg-expiry-timer** and **default sg-expiry-timer** commands restore the default setting of **210** seconds by removing the **sg-expiry-timer** statement from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
sg-expiry-timer period
no sg-expiry-timer
default sg-expiry-timer
```

Parameter

period expiry timer interval (seconds). Value ranges from **120** to **65535** seconds. The default value is **210** seconds.

Example

These commands configure **150** seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#{
```

16.3.5.31 show ip pim bsr

The **show ip pim bsr** command displays the switch's BootStrap Router (BSR) information.

Command Mode

EXEC

Command Syntax

```
show ip pim bsr [GROUP_FILTER]
```

Parameters

GROUP_FILTER specifies groups for which command displays information.

- **no parameter** Displays data for all groups.
- **net_addr** Displays message for specified group address. (CIDR or address mask).

Example

This command configures the switch's BSR information.

```
switch> show ip pim bsr
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
BSR address: 10.1.1.1
Uptime: 00:14:42, BSR Priority: 0, Hash mask length: 30
Next bootstrap message in 00:00:05
```

16.3.5.32 show ip pim config-sanity

The **show ip pim config-sanity** command displays diagnostic information about the switch's PIM configuration.

Command Mode

EXEC

Command Syntax

```
show ip pim config-sanity
```

Example

This command displays PIM configuration diagnostic information.

```
switch> show ip pim config-sanity
DISCLAIMER: Below are only hints of potential PIM misconfiguration.
They do not necessarily imply that there is a real problem.

The interfaces with PIM which are down: V14 switch>
```

16.3.5.33 show ip pim interface

The **show ip pim interface** command displays information about interfaces configured for PIM.

Command Mode

EXEC

Command Syntax

```
show ip pim interface [INT_NAME][INFO_LEVEL]
```

Parameters

- **INT_NAME** Interface type and number. Values include:
 - **no parameter** displays information for all interfaces.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **port-channel p_num** Port-Channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **INFO_LEVEL** specifies level of information detail provided by the command.
 - **no parameter** table of basic configuration information.
 - **detail** list of complete configuration information.

Examples

- This command displays information about all interfaces on which PIM is enabled.

```
switch> show ip pim interface
Address InterfaceModeNeighbor Hello DR DR Address   PktsQed   PktsDropped Count   Intvl Pri
10.17.254.30  Vlan3910      sparse1    30          1       10.17.254.30  0        0         0
10.17.254.162 Vlan3925      sparse2    30          1       10.17.254.163 0        0         0

10.17.254.137 Ethernet12   sparse1    30          1       10.17.254.138 0        0         0
switch>
```

- This command displays detailed PIM information for **interface vlan 26**.

```
switch> show ip pim interface vlan 26 detail
Interface address is 172.17.26.1
Vif number is 1
PIM: enabled
  PIM version: 2, mode: sparse
  PIM DR: 172.17.26.1 (this system)
  PIM DR Priority: 1
  PIM neighbor count: 0
  PIM Hello Interval: 30 seconds
  PIM Hello Priority: 1
  PIM Hello Lan Delay: 500 milliseconds
  PIM Hello Override Interval: 2500 milliseconds
  PIM Hello Lan Prune Delay in use
  PIM Hello Generation ID: 0x4a05aa0
  PIM Hello Generation ID is not required
  PIM Triggered Hello Delay: 5 seconds
  PIM Join-Prune Interval: 60 seconds
  PIM State-Refresh processing: disabled
  PIM State-Refresh Interval: unknown seconds
  PIM Graft Retry Interval: unknown seconds
  PIM domain border: disabled
switch>
```

16.3.5.34 show ip pim neighbor

The **show ip pim neighbor** command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

Command Mode

EXEC

Command Syntax

```
show ip pim neighbor [INT_NAME][BFD_DATA]
```

Parameters

- **INT_NAME** Interface type and number. Values include:
 - **no parameter** displays information for all interfaces.
 - **ethernet e_num** Ethernet interface specified by *e_num*.
 - **loopback l_num** Loopback interface specified by *l_num*.
 - **management m_num** Management interface specified by *m_num*.
 - **port-channel p_num** Port-Channel Interface specified by *p_num*.
 - **vlan v_num** VLAN interface specified by *v_num*.
 - **VXLAN vx_num** VXLAN interface specified by *vx_num*.
- **BFD_DATA** Specifies inclusion of BFD data.
 - **no parameter** BFD data is not displayed.
 - **bfd** BFD data is displayed.

Examples

- This command displays information about neighbor PIM routers.

```
switch> show ip pim neighbor
PIM Neighbor Table
Neighbor Address      Interface      Uptime      Expires      Mode
10.17.255.2          Vlan2028      21d22h     00:01:31    sparse switch>
```

- This command displays information about neighbor PIM routers and the status of BFD.

```
switch> show ip pim neighbor bfd
PIM Neighbor Table
Flags: U - BFD is enabled and is UP
       I - BFD is enabled and is INIT
       D - BFD is enabled and is DOWN
       N - Not running BFD

Neighbor Address      Interface      Uptime      Expires      ModeFlags
10.17.255.2          Vlan2028      21d22h     00:01:31    sparseU switch>
```

16.3.5.35 show ip pim protocol counters

The **show ip pim protocol** command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

Command Mode

EXEC

Command Syntax

```
show ip pim protocol counters [INT_NAME]
```

Parameters

INT_NAME Interface type and number. Values include:

- **no parameter** displays information for all interfaces.
- **ethernet e_num** Ethernet interface specified by **e_num**.
- **loopback l_num** Loopback interface specified by **l_num**.
- **management m_num** Management interface specified by **m_num**.
- **port-channel p_num** Port-Channel Interface specified by **p_num**.
- **vlan v_num** VLAN interface specified by **v_num**.
- **VXLAN vx_num** VXLAN interface specified by **vx_num**.

Example

This command displays statistics about inbound and outbound PIM control messages.

| | Received | Sent | Invalid |
|-------------------|----------|--------|---------|
| Assert | 0 | 37 | 0 |
| Bootstrap Router | 0 | 0 | 0 |
| CRP Advertisement | 0 | 0 | 0 |
| Graft | 0 | 0 | 0 |
| Graft Ack | 0 | 0 | 0 |
| Hello | 63168 | 126355 | 0 |
| J/P | 275714 | 143958 | 0 |
| Join | 0 | 0 | 0 |
| Prune | 0 | 0 | 0 |
| Register | 0 | 13643 | 0 |
| Register Stop | 11839 | 0 | 0 |
| State Refresh | 0 | 0 | 0 |

16.3.5.36 show ip pim register-source

The **show ip pim register-source** command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The [register local-interface](#) command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The **show ip pim register-source** command does not return a value when the source field is filled with the default value.

Command Mode

EXEC

Command Syntax

```
show ip pim register-source
```

Example

This command displays the register-source interface.

```
switch> show ip pim register-source
Ethernet22
```

16.3.5.37 show ip pim rp

The **show ip pim rp** command displays the status and multicast group of each cached Rendezvous Point (RP).

Command Mode

EXEC

Command Syntax

```
show ip pim rp
```

Example

This command displays the cached RPs.

```
switch> show ip pim rp
show ip pim rp
The PIM RP Set
Group: 224.0.0.0/4
RP: 10.1.2.3
Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
```

16.3.5.38 show ip pim rp-candidate

The **show ip pim rp-candidate** command displays the Rendezvous Point (RP) that is used for a specified multicast group.

Command Mode

EXEC

Command Syntax

```
show ip pim rp-candidate
```

Example

This command displays the switch's candidate-RP information.

```
switch> show ip pim rp-candidate
Candidate RP information
Candidate RP Address: 10.0.12.2
CRP Holdtime: 150 seconds
Group 224.2.0.0/16 Priority 2
```

16.3.5.39 show ip pim rp-hash

The **show ip pim rp-hash** displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

Command Mode

EXEC

Command Syntax

```
show ip pim rp-hash ipv4_addr [INFO_LEVEL]
```

Parameters

- ***ipv4_addr*** multicast group IPv4 address.
- **INFO_LEVEL** specifies level of information detail provided by the command.
 - **no parameter** RP-hash map and list of candidate RPs.
 - **detail** includes data about the selected RP.

Example

This command displays the RP that the switch uses for multicast group **224.1.0.0**.

```
switch> show ip pim rp-hash 224.1.0.0
RP 10.1.2.3
```

16.3.5.40 show ip pim upstream joins

The **show ip pim upstream joins** command displays the join messages that the switch is scheduled to send.

Command Mode

EXEC

Command Syntax

```
show ip pim upstream joins [JOIN_ADDRESSES] [NEIGHBOR_FILTER]
```

Parameters

- **JOIN_ADDRESSES** Filters messages by source and group addresses.
 - **no parameter** displays all join messages.
 - **source_addr** displays all join messages for specified source group IPv4 address.
 - **group_addr** displays all join messages for specified multicast IPv4 address.
 - **source_addr group_addr** displays join message with specified source and group addresses.
 - **group_addr source_addr** displays join message with specified group and source addresses.
group_addr must be a valid multicast IPv4 address.
- **NEIGHBOR_FILTER** specifies neighbors for which command provides data.
 - **no parameter** Displays messages for all neighbors.
 - **neighbor *neighbor_addr*** Displays message for specified neighbor address.

Example

This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch> show ip pim upstream joins
----- show ip pim upstream joins -----
Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
  Group: 10.10.10.3
    Joins:
      10.25.1.1/32 SPT
    Prunes:
      No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
  Group: 10.14.1.69
    Joins:
      10.105.14.3/32 SPT
    Prunes:
      No prunes included
switch>
```

16.3.5.41 spt threshold

The **spt threshold** command configures Shortest Path Tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified Access Control List (ACL), use the **match list** option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides the **global** configuration.

- When **running-config** does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When **running-config** lists this command with a value of infinity, the switch never joins the SPT.

The **no spt threshold** and **default spt threshold** commands remove the corresponding **spt threshold** command from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
spt threshold {0 | infinity}[match list acl_name]
no spt threshold {0 | infinity}[match list acl_name]
default spt threshold{0 | infinity} [match list acl_name]
```

Parameters

- **0** The switch immediately joins the SPT. This is the default value.
- **infinity** The switch never joins the SPT.
- **acl_name** name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

Example

This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the **ACL group-1**.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# spt threshold 0 match list group-1
switch(config-router-pim-sparse-ipv4) #
```

16.3.5.42 ssm range

The **ssm range** command defines the Source Specific Multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (*,G) join for applicable multicast groups. Source-specific multicast differs from Any-Source Multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in the **router-pim sparse-mode ipv4** configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in the **router-pim sparse-mode vrf ipv4** configuration mode.

The **no ssm range** and **default ssm range** commands remove the SSM IP multicast address range by deleting the **ssm range** statement from **running-config**.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
ssm range {acl_name | standard}
```

```
no ssm range
```

```
default ssm range
```

Parameters

- **acl_name** sets the SSM range to address set specified by the standard ACL.
- **standard** sets the SSM range to **232/8**.

Examples

- These commands configure the SSM address range to **232/8** in the default VRF.

```
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# ssm range standard
switch(config-router-pim-sparse-ipv4)#

```

- These commands configure the SSM address range to those permitted by the **LIST_1** standard ACL in the default VRF. The ACL permits the subnet address range **233.0.0.0/24**.

```
switch(config)# ip access-list standard LIST_1
switch(config-std-acl-LIST_1)# permit 233.0.0.0/24
switch(config-std-acl-LIST_1)# exit
switch(config)# router pim sparse-mode
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# ssm range LIST_1
switch(config-router-pim-sparse-ipv4)#

```

16.3.5.43 sztimeout

The **sztimeout** command configures the maximum span of active scope-zone.

The **no sztimeout** and **default sztimeout** commands delete the current scope zoned timeout configuration.

Command Modes

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Syntax

```
sztimeout timeout
no sztimeout
default sztimeout
```

Parameter

timeout Maximum span of active scope-zone in seconds. The value ranges from **120** to **4294967295**. The default value is **1300**.

Guideline

The scope zoned timeout must contain a minimum value of **10** times of configured holdtime; else the system displays a warning message.

Examples

- This command configures **600** seconds as the maximum of active scope-zone in the **router-pim bsr ipv4** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# ipv4
switch(config-router-pim-bsr-ipv4)# sztimeout 600
switch(config-router-pim-bsr-ipv4)#{
```

- This command configures **2200** seconds as the maximum of active scope-zone in the **router-pim bsr vrf ipv4** configuration mode.

```
switch(config)# router pim bsr
switch(config-router-pim-bsr)# vrf vrf01
switch(config-router-pim-bsr-vrf-vrf01)# ipv4
switch(config-router-pim-bsr-vrf-vrf01-ipv4)# sztimeout 2200
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#{
```

16.4 Multicast Source Discovery Protocol (MSDP)

Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- [MSDP Introduction](#)
- [MSDP Description](#)
- [MSDP Configuration](#)
- [MSDP Commands](#)

16.4.1 MSDP Introduction

Arista switches support the following MSDP features:

- Basic MSDP speaker functions
- MSDP peer configuration - description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Displaying peer status.
- Displaying filtered SA messages received from MSDP peers.

MSDP does not support the following:

- Configuring PIM-SM Anycast-RP ([RFC4610](#)) and MSDP on the same platform. Instead, choose either MSDP Anycast RP **or** PIM-SM Anycast-RP as the implementation on your network.

16.4.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains.

MSDP provides inter-domain access to multicast sources in all domains by enabling all Rendezvous Points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

- [MSDP Speakers](#)
- [Network Configuration](#)
- [MSDP Exchange Processes](#)

16.4.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages originating at the local domain's RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree.

[MSDP Speaker Configuration](#) describes the process of configuring MSDP speakers.

16.4.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP-specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

- [Source Active Messages](#)
- [Reverse Path Forwarding](#)
- [Default MSDP Peers](#)

16.4.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs intending to originate or receive SA messages must establish MSDP peering with other RPs directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in response to register messages it receives from the DR. It does not originate SAs for directly connected sources in its domain.

SA messages contain the following fields:

- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages the MSDP speaker receives. The switch always stores received SA messages. [Managing the SA Cache](#) describes procedures that limit the size of the SA cache and options for displaying the cache.

16.4.2.2.2 Reverse Path Forwarding

Reverse Path Forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding using a router's unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in [RFC 3618](#).

Packet forwarding is based on the packet's unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.

When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet's source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes the use of symmetric forward and reverse paths between the router and sender. RPF fails on uni-directional links.

[Displaying RPF Peers](#) describes commands that display RPF peers.

16.4.2.2.3 Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured, the switch uses the first default peer to appear in the [**running-config**](#). Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When the ***running-config*** contains multiple default peers with prefix lists, an SA is accepted from the first default peer in the ***running-config*** whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

Configuring the Default Peer describes commands that configure default peers.

16.4.2.3 MSDP Exchange Processes

- [Control Information Exchange](#)
- [MSDP Data Exchange](#)

16.4.2.3.1 Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while their registered sources send data to maintain messages in the SA caches of their MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with their peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- SA Advertisement Time: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. The SA advertisement time is **60** seconds.
- Keepalive Time: Period between the transmission of consecutive keepalive messages. The default keepalive time is **60** seconds. The minimum keepalive time is one second.
- Hold Timer: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. The default time is **75** seconds. The minimum hold time is three seconds.

16.4.2.3.2 MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

1. When the first hop router registers a source's first data packet, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.
2. The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP's address or originator ID.
3. Upon receiving the SA message, an MSDP peer, which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
4. After the RP on another domain joins the PIM Designated Router (DR) in the first domain, multicast data traffic flows natively over the multicast tree to the second domain's RP.
5. If the source times out, this process repeats when the source goes active again.

16.4.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- [MSDP Speaker Configuration](#)
- [Establishing MSDP Peers](#)
- [MSDP Network Configuration](#)
- [Managing the SA Cache](#)
- [Configuring MSDP in a non-default VRF](#)

MSDP requires that TCP **port 639** (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

16.4.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. [Configuring an MSDP Peer](#) describes the process of configuring an MSDP peer.

Source Address (SA) messages that an MSDP speaker originates contain the speaker's Rendezvous Point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The [originator-id local-interface](#) command configures the switch to set the RP address to the specified interface's IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for their registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.

Example

These commands configure the switch to use the IP address assigned to ***interface loopback 100*** as the RP address in SA messages that it originates.

```
switch(config)# router msdp
switch (config-router-msdp)# originator-id local-interface loopback 100
switch (config-router-msdp) #
```

16.4.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- [Configuring an MSDP Peer](#)
- [Mesh Groups](#)
- [Filtering SA Messages](#)
- [Keep-alive, Hold Time, and Reset Time Configuration](#)
- [Displaying Peer Information](#)

16.4.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The [peer](#) command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the specified network is established over a TCP connection. Use the [local-interface](#) command to specify an interface through which the switch establishes the TCP session. When no interface is specified, the connection is established through an interface determined by existing routing algorithms.

To display MSDP peer information, enter [show ip msdp peer](#).

Example

These commands assign an IP address to ***loopback interface 100***, then configure ***10.4.4.12*** as an MSDP peer and establish the TCP peer session through the loopback.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.6.8.6/24
switch(config-if-Lo100)# exit
```

```

switch(config) # router msdp
switch(config-router-msdp) # peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12) # show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #

```

To associate descriptive text with the specified MSDP peer, use the [description \(MSDP\)](#) command.

Example

These commands associate the string **NORTH** with the MSDP peer located at **10.4.4.12**.

```

switch(config) # router msdp
switch(config-router-msdp) # peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # description NORTH
switch(config-router-msdp-peer-10.4.4.12) # show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #

```

To close the peering session with the specified MSDP peer, use the [disabled \(MSDP\)](#) command. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the **disabled** command from **running-config**.

Examples

This command closes the peering session with the MSDP peer at **10.4.4.12**.

```

switch(config) # router msdp
switch(config-router-msdp) # peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # disabled
switch(config-router-msdp-peer-10.4.4.12) # show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Disbled
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #

```

This command reopens the peering session with the peer at **10.4.4.12**.

```

switch(config) # router msdp
switch(config-router-msdp) # peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # no disabled
switch(config-router-msdp-peer-10.4.4.12) # show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0

```

```
Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #
```

16.4.3.2.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

Use the **mesh-group** command to configure an MSDP peer connection as an MSDP mesh group member. An MSDP peer can be assigned to multiple mesh groups and multiple peer connections can be assigned to the same mesh group.

Note: Peer-specific mesh-group configuration is performed in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode. To remove all configured connections from a mesh group, use the **no mesh-group** command in Router MSDP Configuration Mode.

To display the mesh group membership of configured MSDP peers, enter **show msdp mesh-group**.

Example

These commands configure the MSDP peer connection to **10.1.1.14** as a member of the **AREA-1** mesh group and display the mesh group members to which the configured MSDP peers belong.

```
switch(config) # router msdp
switch(config-router-msdp) # peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14) # mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14) # show msdp mesh-group
Mesh Group: AREA-1
    10.1.1.14
Mesh Group: tier_01
    10.24.18.13
Mesh Group: tier_02
    10.26.101.18
switch(config-router-msdp-peer-10.1.1.14) #
```

16.4.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with Access Control Lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filters an SA message on its multicast source address.

The **sa-filter in** command assigns an ACL to filter inbound SA messages from the MSDP peer connection being configured. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent **sa-filter in** commands for a peer replace the existing command.

The **sa-filter out** command assigns an ACL as a filter for outbound SA messages to the MSDP peer connection being configured. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent **sa-filter out** commands for a peer replace the existing command.

Example

These commands assign the IP ACLs named **LIST-IN** as the inbound SA message filter and **LIST-OUT** as the outbound SA message filter for the MSDP peer connection to **10.4.4.12**.

```
switch(config) # router msdp
```

```

switch(config-router-msdp) # peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12) # sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12) # show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
  Input Filter: LIST-IN
  Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12) #

```

16.4.3.2.4 Keep-alive, Hold Time, and Reset Time Configuration

To configure the MSDP keep-alive and hold time intervals for a specified MSDP peer connection, use the **keepalive (MSDP)** command.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is **60** seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is **75** seconds.

The hold time interval must be longer than or equal to the keep-alive time interval.

Example

This command sets the keep-alive time to **45** seconds and the hold time to **80** seconds for the MSDP peer connection to **10.4.4.12**.

```

switch(config) # router msdp
switch(config-router-msdp) #peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12) # keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12) #

```

Enter the**connection retry interval** command to specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish it. The default period is **30** seconds.

Example

This command configures the switch to wait **45** seconds after an MSDP peering session is reset before attempting to reestablish the session.

```

switch(config) # router msdp
switch(config-router-msdp) # connection retry interval 45
switch(config-router-msdp) #

```

To enable the encapsulation of multicast data packets on the sending MSDP peer and the decapsulation and forwarding of register packets on the receiving MSDP peer, use the **forward register-packets** command. The default is to not forward the data encapsulated in PIM register messages.

Example

This command enables the forwarding of encapsulated register packets.

```

switch(config) #router msdp
switch(config-router-msdp) #forward register-packets
switch(config-router-msdp) #

```

16.4.3.2.5 Displaying Peer Information

To display the MSDP peers, enter **show ip msdp summary**. The command also displays each peer's operational status and the number of messages from the peers in the SA cache.

Example

This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

```
switch(config) # show ip msdp summary
MSDP Peer Status Summary
Peer Address      State   SA Count
192.168.3.18     Up      0
192.168.3.16     Up      0
192.168.3.37     Listen  0
192.168.3.46     Up      0
192.168.3.47     Up      0
```

16.4.3.3 MSDP Network Configuration

- [Displaying RPF Peers](#)
- [Configuring the Default Peer](#)

16.4.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the Reverse Path Forwarding (RPF) peer. The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers and rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified Rendezvous Point (RP), enter **show msdp rpf-peer**.

Example

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at **10.5.29.4**.

```
switch(config) # show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

16.4.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from which the speaker accepts SA messages.

The switch can designate multiple default peers:

- The switch defines one peer. A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- The switch defines one default peer (no prefix list) and it accepts all SA messages from only that peer.
- The switch defines multiple default peers (no prefix lists). The switch accepts all SA messages from only the first default peer listed in ***running-config***. Other listed default peers take effect only if the peer named in the first default-peer statement is inaccessible.

- The first default-peer statement includes a prefix list. The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. Subsequent **default-peer** statements determine the disposition of SA messages originating from other RPs.

Use the **default-peer** command to configure the specified MSDP peer connection as the switch's default peer. The default peer address must be a previously configured MSDP peer (configured using the **peer** command).

Example

These commands configure an MSDP default peer.

```
switch(config) # router msdp
switch(config-router-msdp) # peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2) # default-peer
switch(config-router-msdp-peer-10.5.2.2) #
```

16.4.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

SA messages have an expiration period of **90** seconds and remain in the SA cache until they expire. A peer's SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

- [Limiting SA Cache Contents](#)
- [Displaying SA Cache Contents](#)
- [Verifying Consistency Between the SA Cache and the Routing Table](#)

16.4.3.4.1 Limiting SA Cache Contents

Use the **sa-limit** command to configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache. The default limit of SA messages that the switch can store from a specified peer is **40000**.

Example

This command sets the SA limit of **500** for the MSDP peer at **10.1.1.5**.

```
switch(config) # router msdp
switch(config-router-msdp) # peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5) # sa-limit 500
switch(config-router-msdp-peer-10.1.1.5) #
```

The **group-limit** command configures the maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address. The default limit of SA messages that the switch can store from a specified group is **40000**.

Example

This command sets the maximum number of 1000 SAs for multicast group **225.13.15.8/29**.

```
switch(config) # router msdp
switch(config-router-msdp) # group-limit 1000 source 225.13.15.8/29
```

The **ip msdp rejected-limit** command configures the maximum number of rejected SA messages that the switch can store in the SA cache. The default limit of rejected SA messages that the switch can store is **40000**.

Example

This command sets **5000** as the maximum number of rejected SAs the SA cache can contain.

```
switch(config) # router msdp
switch(config-router-msdp) # ip msdp rejected-limit 5000
```

The **clear ip msdp sa-cache** command removes the contents of the SA message cache. The command provides options for removing all cache contents or only the contents of a specific multicast group.

Example

This command deletes all SA message cache contents.

```
switch(config) # router msdp
switch(config-router-msdp) # clear ip msdp sa-cache
```

16.4.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the **show ip msdp sa-cache** command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters, or cache limit exceeded conditions.

Example

This command displays the contents of the SA message cache.

```
switch(config) # show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

Information about specified MSDP peers, including SAs accepted from the peer, is displayed by the **show ip msdp peer** command.

Example

This command displays data for the peer at **10.2.42.4**, including SAs accepted from the peer.

```
switch(config) # show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 (10.2.43.4)
SA Filtering:
  Input Filter: allow-multicast-for-msdp
  Output Filter: allow-multicast-for-msdp
SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
```

```
(10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

The SA cache for the local PIM domain is displayed by the **show ip msdp pim sa-cache** command.

Example

This command displays the SA cache for the local PIM domain.

```
switch(config)# show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

16.4.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter **show ip msdp sanity**. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Example

This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
  4.1), RP 10.2.42.4
```

16.4.3.5 Configuring MSDP in a non-default VRF

The MSDP can also be configured in a non-default VRF when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

Example

These commands configure MSDP peer **1.1.1.1** in a non-default VRF **blue**.

```
switch(config)# router msdp
switch(config-router-msdp)# vrf blue
switch(config-router-msdp-vrf-blue)# peer 1.1.1.1
```

16.4.4 MSDP Commands

MSDP Configuration Commands (Global)

- connection retry interval
- forward register-packets (MSDP)
- group-limit
- ip msdp rejected-limit
- originator-id local-interface
- peer
- router msdp

MSDP Peer Configuration Commands

- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

MSDP SA Cache Commands

- clear ip msdp sa-cache

MSDP Display Commands

- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
- show msdp mesh-group
- show msdp rpf-peer

16.4.4.1 clear ip msdp sa-cache

The **clear ip msdp sa-cache** command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address.
- all cache contents.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

Parameters

ADDRESS_FILTER IPv4 address used to select table entries for removal.

- **no parameter** All SA messages.
- **grp_addr** Multicast group address (IPv4 address). The **grp_addr** must be a valid multicast address.

Example

This command deletes all SA message cache contents.

```
switch(config) # router msdp
switch(config-router-msdp) # clear ip msdp sa-cache
```

16.4.4.2 connection retry interval

The **connection retry interval** command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is **30** seconds.

The **no connection retry interval** and **default connection retry interval** commands reset the timer interval to the default period of **30** seconds by removing the **connection retry interval** command from **running-config**.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

```
connection retry interval connect_retry
no connection retry interval connect_retry
default connection retry interval connect_retry
```

Parameter

connect_retry Reconnect period (seconds). Value ranges from **1** to **65535**. Default is **30**.

Example

This command configures the switch to wait **45** seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config) # router msdp
switch(config-router-msdp) # connection retry interval 45
```

16.4.4.3 default-peer

The **default-peer** command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a **prefix list** parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the **peer** command).

Default peers provide an alternative to Reverse Packet Forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in **running-config**. Other listed default peers are used only when peers listed before them in **running-config** are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent **default-peer** statements.

The **no default-peer** and **default default-peer** commands remove the corresponding **default-peer** command from **running-config**.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
default-peer [PREFIX]
no default-peer
default default-peer
```

Parameters

PREFIX List of RPs from the SA messages originate for which the default peer is valid.

- **no parameter** default peer is valid for SAs from all originating RPs.
- **prefix-list *list_name*** name of the prefix list that defines affected originating RP prefixes.

Example

These commands configure two MSDP peers and configure the peer at **10.5.2.2** as the default peer.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)# exit
switch(config-router-msdp)# peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)# default-peer
switch(config-router-msdp-peer-10.5.2.2)#

```

16.4.4.4 description (MSDP)

The **description** command associates descriptive text with the configuration-mode MSDP peer.

The **no description** and **default description** commands remove the text association from the specified peer.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
description description_string
no description
default description
```

Parameters

description_string text string that is associated with the peer.

Example

These commands associate the string **NORTH** with the MSDP peer located at **10.4.4.12**.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# description NORTH
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #
```

16.4.4.5 disabled (MSDP)

The **disabled** command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from *running-config*.

The **no disabled** and **default disabled** commands establish an MSDP peering session with the specified peer by removing the corresponding **disabled** command from *running-config*.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
disabled
```

```
no disabled
```

```
default disabled
```

Examples

- This command closes the peering session with the MSDP peer at **10.4.4.12**.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
    State: Disbled
    Resets: 0
    Connection Source: Loopback100 ( 10.6.8.6 )
    SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#

```

- This command reopens the peering session with the peer at **10.4.4.12**.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# no disabled
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
    State: Connect
    Resets: 0
    Connection Source: Loopback100 ( 10.6.8.6 )
    SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#

```

16.4.4.6 forward register-packets (MSDP)

The **forward register-packets** command enables the encapsulation of multicast data packets on the sending MSDP peer and the decapsulation and forwarding on a receiving MSDP peer.

The **no forward register-packets** and **default forward register-packets** commands disable this feature.

Command Mode

Router MSDP Configuration

Command Syntax

```
forward register-packets  
no forward register-packets  
default forward register-packets
```

Example

This command enables the encapsulation and forwarding of MSDP data packets.

```
switch(config) #router msdp  
switch(config-router-msdp) #forward register-packets  
switch(config-router-msdp) #
```

16.4.4.7 group-limit

The **group-limit** command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of **90** seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The **no group-limit** and **default group-limit** command removes the maximum group limit for the specified prefix by removing the corresponding **group-limit** statement from **running-config**.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

```
group-limit quantity source src_subnet
no group-limit quantity source src_subnet
default group-limit quantity source src_subnet
```

Parameters

- **quantity** maximum number of groups that can access the interface. Value ranges from **1** to **40000**.
- **src_subnet** Source IPv4 subnet (CIDR or address-mask notation).

Example

This command sets the maximum number of **1000** SAs for multicast group **10.13.15.8/29**.

```
switch(config)# router msdp
switch(config-router-msdp)# group-limit 1000 source 10.13.15.8/29
```

16.4.4.8 ip msdp rejected-limit

The **ip msdp rejected-limit** command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of **90** seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is **40000**.

The **no ip msdp rejected-limit** and **default ip msdp rejected-limit** commands restore the rejected SA limit of **40000** by removing the **ip msdp rejected-limit** statement from **running-config**.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

```
ip msdp rejected-limit quantity
no ip msdp rejected-limit
default ip msdp rejected-limit
```

Parameter

quantity maximum rejected SA messages the SA cache can store. Value ranges from **0** to **40000**.

Example

This command sets **5000** as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config) # router msdp
switch(config-router-msdp) # ip msdp rejected-limit 5000
```

16.4.4.9 keepalive (MSDP)

The **keepalive** command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is **60** seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is **75** seconds.

The **no keepalive** and **default keepalive** commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding **keepalive** command from *running-config*.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
keepalive keep_alive hold_time  
no keepalive  
default keepalive
```

Parameters

- **keep_alive** keep-alive period in seconds. Value ranges from **1** to **65535**. Default value is **60**.
- **hold_time** hold time in seconds. Value ranges from **1** to **65535**. Default value is **75**.

Note: The hold time interval must be longer than or equal to the keep-alive time interval.

Example

This command sets the keep-alive time to **45** seconds and the hold time to **80** seconds for the connection with the MSDP peer at **10.4.4.12**.

```
switch(config)# router msdp  
switch(config-router-msdp)# peer 10.4.4.12  
switch(config-router-msdp-peer-10.4.4.12)# keepalive 45 80  
switch(config-router-msdp-peer-10.4.4.12)#{
```

16.4.4.10 local-interface

MSDP peering sessions are established over a TCP connection. The **local-interface** command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the **local-interface** command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **no local-interface** and **default local-interface** commands remove the corresponding **local-interface** command from **running-config**, returning selection of the connecting interface to the routing algorithm.

Command Mode

Router MSDP Peer Configuration

Router MSDP VRF Peer Configuration

Command Syntax

```
local-interface interface
no local-interface
default local-interface
```

Parameters

interface local interface through which the TCP connection is established. Options include:

- **ethernet e_num** Ethernet interface.
- **loopback l_num** Loopback interface.
- **management m_num** Management interface.
- **port-channel p_num** Port-Channel Interface.
- **vlan v_num** VLAN interface.
- **VXLAN vx_num** VXLAN interface.

Example

These commands assign an IP address to **interface loopback 100**, then establish the TCP peer session to the MSDP peer at **10.4.4.12** through the loopback in the default VRF.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.6.8.6/24
switch(config-if-Lo100)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12) #
```

16.4.4.11 mesh-group

The **mesh-group** command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The **no mesh-group** and **default mesh-group** commands delete the configuration-mode peer connection from a mesh group by removing the corresponding **mesh-group** command from **running-config** when issued in the **router msdp peer** configuration or the **router msdp peer vrf** configuration mode.

Note: To delete all configured connections from a specified mesh group, use the **no mesh-group** command in Router MSDP Configuration mode.

Command Mode

Router MSDP Configuration

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
mesh-group group_name
no mesh-group group_name
default mesh-group group_name
```

Parameters

group_name name of mesh group.

Related Command

[show msdp mesh-group](#).

Examples

- These commands configure the MSDP peer connection to **10.1.1.14** as a member of the **AREA-1** mesh group, then display members of mesh groups to which configured MSDP peers belong.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)# mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)# show msdp mesh-group
Mesh Group: AREA-1
    10.1.1.14
Mesh Group: tier_01
    10.24.18.13
Mesh Group: tier_02
    10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#

```

- These commands delete all configured connections from the **AREA-1** mesh group.

```
switch(config)# router msdp
switch(config-router-msdp)# no mesh-group AREA-1
switch(config-router-msdp)#

```

16.4.4.12 **originator-id local-interface**

The **originator-id local-interface** command configures an originator ID to replace the Rendezvous Point (RP) address in Source-Address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker's rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface's IP address as the RP address in SA messages that it originates.

The **no originator-id local-interface** and **default originator-id local-interface** commands configure the switch to use its RP address in SA messages that it sends by removing the **originator-id local-interface** command from *running-config*.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

originator-id local-interface **INTERFACE**

no originator-id local-interface **INTERFACE**

default originator-id local-interface **INTERFACE**

Parameters

INTERFACE Specifies the interface from which the IP address is derived. Options include:

- **ethernet e_num** Ethernet interface.
- **loopback l_num** Loopback interface.
- **management m_num** Management interface.
- **port-channel p_num** Port-Channel Interface.
- **vlan v_num** VLAN interface.
- **VXLAN vx_num** VXLAN interface.

Example

These commands configure the switch to use the IP address assigned to **interface loopback 100** as the RP address in SA messages that it originates.

```
switch(config)# router msdp
switch (config-router-msdp)# originator-id local-interface loopback 100
switch (config-router-msdp) #
```

16.4.4.13 peer

The **peer** command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The [local-interface](#) command can specify an interface through which the TCP connection is established. When the [local-interface](#) command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **no peer** and **default peer** commands remove the specified MSDP peer configuration by deleting the corresponding **peer** command from **running-config**. MSDP is disabled when the last **peer** command is removed.

Command Mode

Router MSDP Configuration

Command Syntax

peer ip_address

Parameters

ip_address IP address of the MSDP peer to be configured.

Commands Available in Router MSDP Peer Configuration Mode

- [default-peer](#)
- [description \(MSDP\)](#)
- [disabled \(MSDP\)](#)
- [keepalive \(MSDP\)](#)
- [local-interface](#)
- [mesh-group](#)
- [sa-filter in](#)
- [sa-filter out](#)
- [sa-limit](#)

Example

These commands establish an MSDP peer relationship with the peer at **192.168.3.17** and place the switch in the **router msdp peer** configuration mode for that peer.

```
switch(config) # router msdp
switch(config-router-msdp) # peer 192.168.3.17
switch(config-router-msdp-peer-192.168.3.17) #
```

16.4.4.14 router msdp

The **router msdp** command places the switch in the **router msdp** configuration mode, and allows to configure the **global** IP configuration commands and VRF commands in this mode.

The **no router msdp** and **default router msdp** commands removes the corresponding **router msdp** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
router msdp  
no router msdp  
default router msdp
```

Related Commands

- [connection retry interval](#)
- [default-peer](#)
- [description \(MSDP\)](#)
- [disabled \(MSDP\)](#)
- [group-limit](#)
- [ip msdp rejected-limit](#)
- [keepalive \(MSDP\)](#)
- [mesh-group](#)
- [originator-id local-interface](#)
- [peer](#)
- [sa-filter in](#)
- [sa-filter out](#)
- [sa-limit](#)

Example

This command places the switch in the **router msdp** configuration mode.

```
switch(config) # router msdp  
switch(config-router-msdp) #
```

16.4.4.15 sa-filter in

The **sa-filter in** command assigns an IP Access Control List (ACL) as a filter for inbound Source-Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent **sa-filter in** commands for the peer replace the existing command.

The **no sa-filter in** and **default sa-filter in** commands remove the ACL assignment as an inbound filter by removing the corresponding **sa-filter in** command from **running-config**.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
sa-filter in list list_name
```

```
no sa-filter in
```

```
default sa-filter in
```

Parameters

- **peer_id** MSDP peer address (IPv4 address).
- **list_name** name of ACL that filters SA messages.

Related Command

[sa-filter out](#)

Guideline

The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA message on its group address.

Example

These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to **10.4.4.12**. The ACL permits SAs from the multicast group **239.14.4.2/28**.

```
switch(config)# ip access-list LIST-IN
switch(config-acl-LIST-IN)# permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
    State: Listen
    Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
Input Filter: LIST-IN
```

16.4.4.16 sa-filter out

The **sa-filter out** command assigns an IP Access Control List (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the permit statement allows matching SAs to be advertised outbound to the peer. The **deny any/deny ip any any** at the end of an ACL statement filters any other SAs not matching explicit permit statements. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent **sa-filter out** commands for the peer replace the existing command.

The **no sa-filter out** and **default sa-filter out** commands remove the ACL assignment as an outbound filter by removing the corresponding **sa-filter out** command from **running-config**.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
sa-filter out list list_name
no sa-filter out
default sa-filter out
```

Parameters

- **peer_id** MSDP peer address (IPv4 address).
- **list_name** name of ACL that filters SA messages.

Related Command

[sa-filter in](#) assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

Guidelines

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its multicast stream source address.

Example

These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to **10.4.4.12**.

```
switch(config)# router msdp
switch(config-router-msdp)# ip access-list LIST-OUT
switch(config-acl-LIST-OUT)# permit ip any 239.14.4.2/28
switch(config-acl-LIST-OUT)# exit
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering:
Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12) #
```

16.4.4.17 sa-limit

The **sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of **90** seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer's SA limit is reached. By default, The limit to the number of SA messages that the switch can store from a specified peer is **40000**, by default.

The **no sa-limit** and **default sa-limit** commands restore the SA limit of **40000** for the specified MSDP peer by removing the corresponding **sa-limit** statement from **running-config**.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

sa-limit quantity

no sa-limit

default sa-limit

Parameters

- **peer_id** MSDP peer (IPv4 address).
- **quantity** maximum number of SA messages that the switch can store. Value ranges from **0** to **40000**.

Example

This command sets the SA limit of **500** for the MSDP peer at **10.1.1.5**.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)# sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#

```

16.4.4.18 show ip msdp peer

The **show ip msdp peer** command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

Command Mode

EXEC

Command Syntax

```
show ip msdp peer [PEER_ADDR][SA_ACCEPT]
```

Parameters

- **PEER_ADDR** Peers for which command displays information.
 - **no parameter** All peers configured on the switch.
 - **ipv4_addr** Address of specified MSDP peer.
- **SA_ACCEPT** Command displays SAs accepted from the specified peers.
 - **no parameter** Accepted SAs are not displayed.
 - **accepted-sas** Accepted SAs are displayed.

Example

This command displays MSDP information concerning the peer located at **10.2.42.4**, including SAs that the switch accepted from this peer.

```
switch(config)# show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
(10.62.79.30, 234.1.4.2), RP 10.2.42.4
(10.61.79.29, 234.1.4.1), RP 10.2.42.4
(10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

16.4.4.19 show ip msdp pim sa-cache

The **show ip msdp pim sa-cache** command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

Command Mode

EXEC

Command Syntax

```
show ip msdp pim sa-cache
```

Example

This command displays the SA cache for the local PIM domain.

```
switch(config)# show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

16.4.4.20 show ip msdp sa-cache

The **show ip msdp sa-cache** command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

Command Mode

EXEC

Command Syntax

show ip msdp sa-cache [ADDRESS_FILTER][CONTENTS]

Parameters

- **ADDRESS_FILTER** IPv4 address used to filter SA messages.
 - **no parameter** All SA messages.
 - **grp_addr** Multicast group address (IPv4 address).
 - **src_addr grp_addr** Source and multicast group addresses (two IPv4 addresses).
- **grp_addr** must be a valid multicast address.
 - **no parameter** Displays contents of SA Cache.
 - **rejected** Displays rejected SAs in addition to the SA cache contents.
- **CONTENTS** type of SAs that the command displays.

Example

This command displays the contents of the SA message cache.

```
switch(config)# show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4

```

16.4.4.21 show ip msdp sanity

The **show ip msdp sanity** command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Command Mode

EXEC

Command Syntax

```
show ip msdp sanity
```

Examples

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
```

- This command displays inconsistencies between the SA cache and the multicast routing table.

```
switch(config)# show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.19, 224.1.246.1)
(192.168.3.17, 224.1.204.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
(192.168.3.26, 224.1.198.1)
(192.168.3.33, 224.1.195.1)
(192.168.3.4, 224.1.246.1)
(192.168.3.37, 224.1.188.1)
(192.168.3.12, 224.1.245.1)
(192.168.3.31, 224.1.206.1)
(192.168.3.35, 224.1.178.1)
(192.168.3.6, 224.1.155.1)
May-Notify-MSDP entries not in the PIM SA cache
  (need not be an error condition)
4.1), RP 10.2.42.4
```

16.4.4.22 show ip msdp summary

The **show ip msdp summary** command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

Command Mode

EXEC

Command Syntax

```
show ip msdp summary
```

Example

This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)# show ip msdp summary
MSDP Peer Status Summary
Peer Address      State   SA Count
192.168.3.18     Up      0
192.168.3.16     Up      0
192.168.3.37     Listen   0
192.168.3.46     Up      0
192.168.3.47     Up      0
```

16.4.4.23 show msdp mesh-group

The **show msdp mesh-group** command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

Command Mode

EXEC

Command Syntax

```
show msdp mesh-group
```

Related Command

[mesh-group](#) configures the MSDP peer connection as an MSDP mesh group member.

Example

This command displays the mesh group membership of configured MSDP peers.

```
switch(config)# show msdp mesh-group
Mesh Group: tier_01
    10.24.18.13
Mesh Group: tier_02
    10.26.101.18
```

16.4.4.24 show msdp rpf-peer

The **show msdp rpf-peer** command displays MSDP information for the peer from which the switch accepts SA messages for a specified Rendezvous Point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the Reverse Path Forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

Command Mode

EXEC

Command Syntax

```
show msdp rpf-peer rp_addr
```

Parameter

rp_addr PIM RP IPv4 address.

Example

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at **10.5.29.4**.

```
switch(config)# show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

16.5 Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This section describes AVB concepts and the implementation of associated protocols.

Topics in this section include:

- [AVB Overview](#)
- [AVB Protocols](#)
- [AVB Configuration](#)
- [AVB Commands](#)

16.5.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:

- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:

- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP
- Traffic classes 2 and 3 for AVB traffic
- Traffic shaping on egress ports

These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

16.5.2 AVB Protocols

This section describes supported AVB protocols:

- [gPTP](#)
- [MVRP](#)
- [MSRP](#)
- [MRP](#)

16.5.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards.

Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

16.5.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of **INFO** for each message.

- **MVRP_VLAN_JOIN**

MVRP VLAN Join received/transmitted on an interface.

- **MVRP_VLAN_LV**

MVRP VLAN Leave received/transmitted on an interface.

- **MVRP_ERROR**

MVRP Join was discarded due to an error.

16.5.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of **INFO** for each message.

- **MSRP_SR_CLASS_TRANSITION**

MSRP SR Class state transition occurred on an interface.

- **MSRP_TALKER_ADV_JOIN**

Talker Advertise Join message for a stream was transmitted/received on an interface.

- **MSRP_TALKER_FAIL_JOIN**

Talker Failed Join message for a stream was transmitted/received on an interface.

-
- **MSRP_LISTENER_JOIN**
Listener Join message for a stream was transmitted/received on an interface.
 - **MSRP_DOMAIN_JOIN**
Domain Join message was transmitted/received on an interface.
 - **MSRP_TALKER_ADV_LV**
Talker Advertise Leave message for a stream was transmitted/received on an interface.
 - **MSRP_TALKER_FAIL_LV**
Talker Failed Leave message for a stream was transmitted/received on an interface.
 - **MSRP_LISTENER_LV**
Listener Leave message for a stream was transmitted/received on an interface.
 - **MSRP_DOMAIN_LV**
Domain Leave message was transmitted/received on an interface.
 - **MSRP_BW_ALLOC_SUCCESS**
MSRP Bandwidth was allocated for a listener on an interface.
 - **MSRP_BW_ALLOC_FAIL**
MSRP Bandwidth could not be allocated for a listener on an interface.
 - **MSRP_BW DEALLOC**
MSRP Bandwidth was de-allocated for a listener on an interface.
 - **MSRP_ERROR**
MSRP Join was discarded because of an error.

16.5.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).

16.5.3 AVB Configuration

This section describes the AVB configuration:

- [Enabling gPTP](#)
- [Enabling MSRP](#)
- [Displaying MSRP Configuration and Status](#)
- [Enabling MVRP](#)
- [Displaying MVRP Configuration and Status](#)

16.5.3.1 Enabling gPTP

Configure gPTP on the switch though the `ptp mode gptp` command. PTP is enabled on individual interfaces with the `ptp enable` command.

Example

These commands configure gPTP on the switch and enable PTP on interface ethernet **41-45**.

```

switch(config)# ptp mode gptp
switch(config)# interface ethernet 41-45
switch(config-if-Et41-45)# ptp enable
switch(config)# show running-config
    <-----OUTPUT OMITTED FROM EXAMPLE----->
!
ptp mode gptp
!
    <-----OUTPUT OMITTED FROM EXAMPLE----->
end
switch(config-if-Et41-45)#show active
interface Ethernet41
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet42
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet43
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet44
    speed forced 10000full
    ptp enable
interface Ethernet45
    ptp enable
switch(config-if-Et41-45)#

```

16.5.3.2 Enabling MSRP

MSRP is enabled on an interface with the **msrp** command.

Example

These commands enable MSRP on interface ethernet **41-43**.

```

switch(config)# interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
    speed forced 10000full
    msrp
interface Ethernet42
    speed forced 10000full
    msrp
interface Ethernet43
    speed forced 10000full
    msrp
switch(config-if-Et41-43)#

```

16.5.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the **show msrp** command.

Example

This command displays the MSRP status for interfaces ethernet **41-43**.

```

switch(config)# show msrp interfaces ethernet 41-43
MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

```

```

          Delta

switch(config)#

```

Stream data is available for the talker and listener. The [show msrp interfaces](#) command displays the status and configuration information for each stream.

Examples

- This command displays data for listener station streams on interfaces ethernet 1-2.

```

switch(config)# show msrp interfaces ethernet 1-2
MSRP Global Status : Enabled
  Max Frame Size : 1522
  Max Fan-In Ports : No limit

          Delta

```

```
switch(config) #
```

16.5.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the [mvrp](#) command. MVRP is enabled globally if it is enabled on at least one interface.

Example

These commands enable MVRP on *interface ethernet 34*.

```
switch(config) # interface ethernet 34
switch(config-if-Et34) # mvrp
switch(config-if-Et34) #
```

16.5.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the [show mvrp](#) command.

Example

This command displays the MVRP status for interfaces Ethernet **30-40**.

```
switch(config) # show mvrp interfaces Ethernet 30-40

MVRP Global Status : Enabled

Port      Admin State   Registered Vlans      Declared Vlans

Et34      Active
Et35      Disabled
Et36      Disabled
Et37      Disabled
Et38      Disabled
Et39      Disabled
Et40      Disabled
switch(config) #
```

16.5.4 AVB Commands

MSRP Commands

- [msrp](#)
- [msrp streams load-file](#)
- [show msrp](#)
- [show msrp interfaces](#)
- [show msrp streams](#)

MRP Commands

- [mrp leave-all-timer](#)
- [mrp leave-timer](#)

MVRP Commands

- [show mvrp](#)

16.5.4.1 mrp leave-all-timer

The **mrp leave-all-timer** command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from **10** to **15** seconds. Under normal conditions, this value should not be adjusted.

The **no mrp leave-all-timer** and **default mrp leave-all-timer** commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding **mrp leave-all-timer** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mrp leave-all-timer period
mrp leave-all-timer
default mrp leave-all-timer
no mrp leave-all-timer
```

Parameter

period leave all timer interval (seconds). Values range from **10** to **60**. Default value is a randomly selected value from **10** to **15**.

Example

This command sets the MRP leave-all timer interval on **interface ethernet 17** to **12** seconds.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# mrp leave-all-timer 12
switch(config-if-Et17) #
```

16.5.4.2 mrp leave-timer

The leave-timer controls the de-registration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it does not receive Join messages for the attributes before the Leave-timer expires.

The **mrp leave-timer** command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is **0.6** seconds. Under normal operation conditions, this value should not be adjusted.

The **no mrp leave-timer** and **default mrp leave-timer** commands restore the default leave-timer interval of **0.6** seconds on the configuration mode interface by removing the corresponding **mrp leave-timer** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
mrp leave-timer period
no mrp leave-timer
default mrp leave-timer
```

Parameter

period leave all timer interval (seconds). Values range from **10** to **60**. Default value is a randomly selected value from **10** to **15**.

Example

This command sets the MRP leave timer interval on **interface ethernet 17** to **0.8** seconds.

```
switch(config)# interface ethernet 17
switch(config-if-Et17)# mrp leave-timer 12
switch(config-if-Et17) #
```

16.5.4.3 msrp

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The **msrp** command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The **no msrp** and **default msrp** commands disable MSRP on the configuration mode interface, and removes the corresponding **msrp** command from **running-config**. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
msrp
no msrp
default msrp
```

Examples

- These commands enable MSRP on **interface ethernet 3/3/3**. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

```
switch(config)# interface ethernet 3/3/3
switch(config-if-Et3/3/3)# msrp
Launching MSRP Agent
switch(config-if-Et3/3/3)# show active
  interface Ethernet3/3/3
  msrp
switch(config-if-Et3/3/3) #
```

- These commands disable the MSRP agent on **interface ethernet 3/3/3**. Because it is not enabled on any other interface, the command stops the MSRP agent.

```
switch(config-if-Et3/3/3)# no msrp
Stopping MSRP agent
switch(config-if-Et3/3/3)# show active
  interface Ethernet3/3/3
switch(config-if-Et3/3/3) # msrp
```

16.5.4.4 msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The **msrp streams load-file** command allows users to include a line in the file (example: **0102.0304.0506 XYZW4** or **0102.0304 XYZW5**) that causes the bytes to be replaced with the accompanying string in [show msrp streams](#) commands.

The **no msrp streams load-file** and **default msrp streams load-file** commands remove the alias assignment by removing the corresponding **msrp streams load-file** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
msrp streams load-file [FILE TYPE]
```

```
no msrp streams load-file
```

```
default msrp streams load-file
```

Parameters

FILE TYPE The options include:

- **certificate**: device name, directory, or file name
- **extension**: device name, directory, or file name
- **file**: device name, directory, or file name
- **flash**: device name, directory, or file name
- **ftp**: device name, directory, or file name
- **http**: device name, directory, or file name
- **https**: device name, directory, or file name
- **scp**: device name, directory, or file name
- **sftp**: device name, directory, or file name
- **sslkey**: device name, directory, or file name
- **system**: device name, directory, or file name
- **terminal**: device name, directory, or file name
- **tftp**: device name, directory, or file name
- **usb1**: device name, directory, or file name

Example

This command indicates that the file named **file1** contains the alias names that is used in MSRP stream names.

```
switch(config)# msrp streams load-file file1  
switch(config) #
```

16.5.4.5 show msrp

The **show msrp** command displays MSRP operational information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show msrp [INTERFACE_NAME]

Parameters

INTERFACE_NAME Interface type and number. Values include:

- **no parameter** all Ethernet interfaces.
- **interfaces ethernet e_range** Ethernet interface list.
- Valid **e_range** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command displays the MSRP status for interfaces ethernet **41-43**.

```
switch(config)# show msrp interfaces ethernet 41-43

MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

16.5.4.6 show msrp interfaces

The **show msrp interfaces** command displays station stream information for the specified station type, interfaces and streams.

Command Mode

EXEC

Command Syntax

```
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]
```

Parameters

- **INTERFACE_NAME** Interface type and number. Values include:
 - **no parameter** all Ethernet interfaces.
 - **ethernet e_range** Ethernet interface list.
 - **STATION_TYPE** Endpoint type. Values include:
 - **talker** Command displays data for talker station streams.
 - **listeners** Command displays data for listener station streams.
 - **streams** Command displays data for talker and listener station streams.
- **STREAMS** Streams for which command displays information. Options include:
 - **no parameter** all streams.
 - **stream-id hex_string** specifies the stream command for which command displays information.
 - Valid **e_range** formats include number, range, or comma-delimited list of numbers and ranges.
 - Valid **hex_string** formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from **0** to **FFFF**.

Examples

- This command displays data for listener station streams on interfaces ethernet **1** and **2**.

```
switch(config)# show msrp interfaces ethernet 1-2 listeners
Legend
-----
AskFail : Listener Asking Failed      Rdy      : Listener Ready
RdyFail : Listener Ready Failed

                                         Listeners

16.5.4.7 show msrp streams

The **show msrp streams** command displays configuration and status information on the specified MSRP streams.

Command Mode

EXEC

Command Syntax

```
show msrp streams [STREAM_NAME] [INFO_LEVEL]
```

Parameters

- **STREAMS** Streams for which command displays information. Options include:
 - **no parameter** all streams.
 - **stream-id hex_string** specifies the stream command for which command displays information.
 - Valid **hex_string** formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from **0** to **FFFF**.
- **INFO_LEVEL** type of information that the command displays. Options include:
 - **no parameter** command displays stream identification information.
 - **detail** command displays identification and transmission characteristics.
 - **propagation** command displays ingress and egress port information.

Examples

- This command displays stream identification information.

```
switch(config)# show msrp interfaces streams

16.5.4.8 show mvrp

The **show mvrp** command displays MVRP operational information for the specified interfaces.

Command Mode

EXEC

Command Syntax

```
show mvrp [INTERFACE_NAME]
```

Parameters

INTERFACE_NAME Interface type and number. Values include:

- **no parameter** all Ethernet interfaces.
- **interfaces ethernet e_range** Ethernet interface list.
- Valid **e_range** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command displays the MVRP status for interfaces Ethernet **30-40**.

```
switch(config)# show mvrp interfaces Ethernet 30-40

Virtual Extensible LANs (VXLNs)

This chapter describes Arista's Virtual Extensible LAN (VXLAN) implementation. Sections in this chapter include:

- [VXLAN Introduction](#)
- [VXLAN Description](#)
- [VXLAN Configuration](#)
- [VXLAN Commands](#)

17.1 VXLAN Introduction

Virtual Extensible LAN (VXLAN) is a networking technology that encapsulates MAC-based Layer 2 Ethernet frames within Layer 3 UDP packets to aggregate and tunnel multiple Layer 2 networks across a Layer 3 infrastructure. VXLAN scales up to 16 million logical networks and supports Layer 2 adjacency across IP networks. Multicast transmission architecture is used for broadcast, multicast, and unknown unicast traffic.

For a list of VXLAN feature support in a specific EOS release, consult the appropriate release notes here: <https://www.arista.com/en/support/software-download>.

For a list of VXLAN feature support by platform in the latest EOS release, see <https://www.arista.com/en/support/product-documentation/supported-features>.

Note: VXLAN and NAT cannot co-exist.

17.2 VXLAN Description

These sections describe VXLAN architecture, the data objects that comprise a VXLAN network, and process of bridging packets through a VXLAN network.

- [VXLAN Architecture](#)
- [VXLAN Gateway](#)
- [VXLAN Processes](#)
- [Multicast and Broadcast over VXLAN](#)
- [VXLAN and MLAG](#)
- [VXLAN Bridging and Routing Support](#)
- [Data Structures](#)

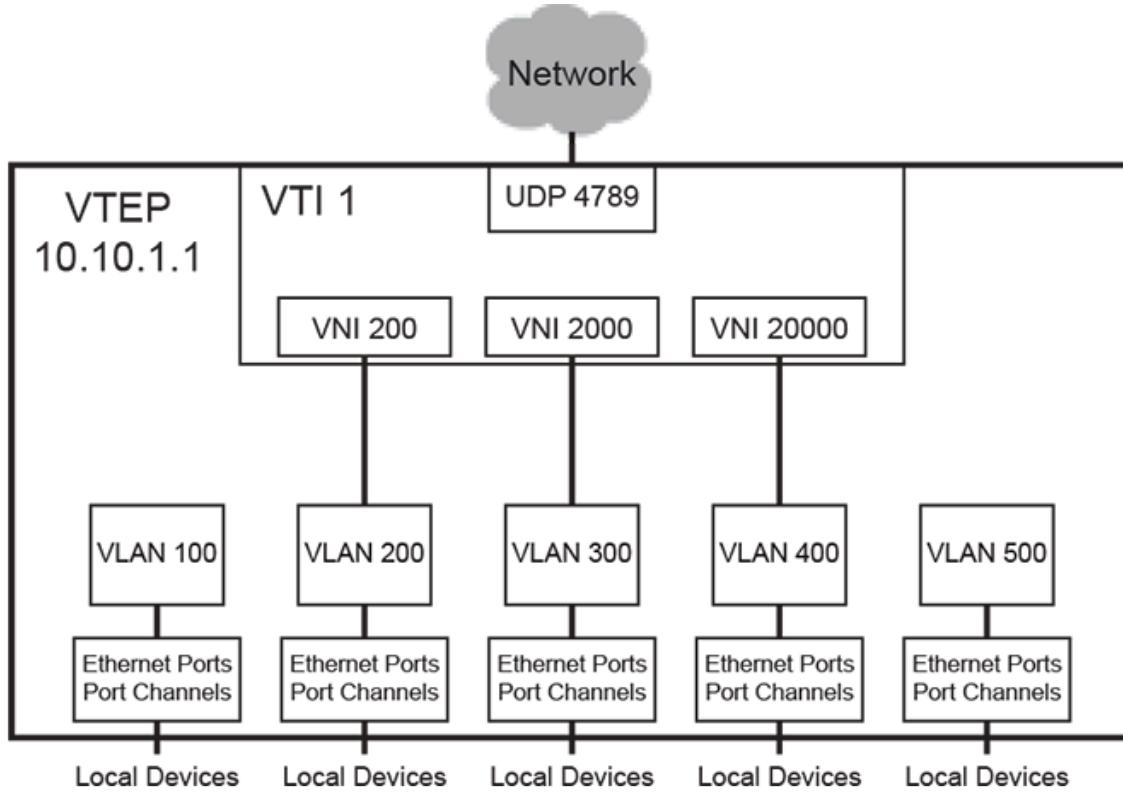

17.2.1 VXLAN Architecture

The VXLAN architecture extends a Layer 2 network by connecting VLANs from multiple hosts through UDP tunnels called VXLAN segments. VXLAN segments are identified by a 24-bit Virtual Network Identifier

(VNI). Within a host, each VLAN whose network is extended to other hosts is associated with a VNI. An extended Layer 2 network comprises the devices attached to VLANs from all hosts that are on VLANs that are associated with the same VNI.

The following figure displays the data objects that comprise a VXLAN implementation on a local host.

Figure 17-1: VXLAN Architecture

- **VXLAN Tunnel End Point (VTEP)**: a host with at least one VXLAN Tunnel Interface (VTI).
- **VXLAN Tunnel Interface (VTI)**: a switchport linked to a UDP socket that is shared with VLANs on various hosts. Packets bridged from a VLAN to the VTI are sent out the UDP socket with a VXLAN header. Packets arriving on the VTI through the UDP socket are demuxed to VLANs for bridging.
- **Virtual Network Identifier (VNI)**: a 24-bit number that distinguishes between the VLANs carried on a VTI. It facilitates the multiplexing of several VLANs over a single VTI.

VNIs can be expressed in digital or dotted decimal formats. VNI values range from **1** to **16777215** or from **0.0.1** to **255.255.255**.

The network in the figure above has the following assignments:

- VTEP IP address of **10.10.1.1**.
- UDP port of **4789**.
- One VTI that supports three VXLAN segments (UDP tunnels): **VNI 200**, **VNI 2000**, and **VNI 20000**
- Five VLANs, of which three VLANs can communicate with remote devices over Layer 2.

17.2.2 VXLAN Gateway

A VXLAN gateway is a service that exchanges VXLAN data and packets with devices connected to different network segments. VXLAN traffic must pass through a VXLAN gateway to access services on physical devices in a distant network.

A VXLAN gateway requires the following information:

- An IP address that is designated as the VXLAN interface source.
- VLAN to VNI mapping.
- VTEP list for each VNI.
- A method for handling broadcast, unknown unicast, and multicast (BUM) packets.

Arista switches manually perform VXLAN gateway services. The switch connects to VXLAN gateways that serve other network segments. MAC address learning is performed in hardware from inbound VXLAN packets.

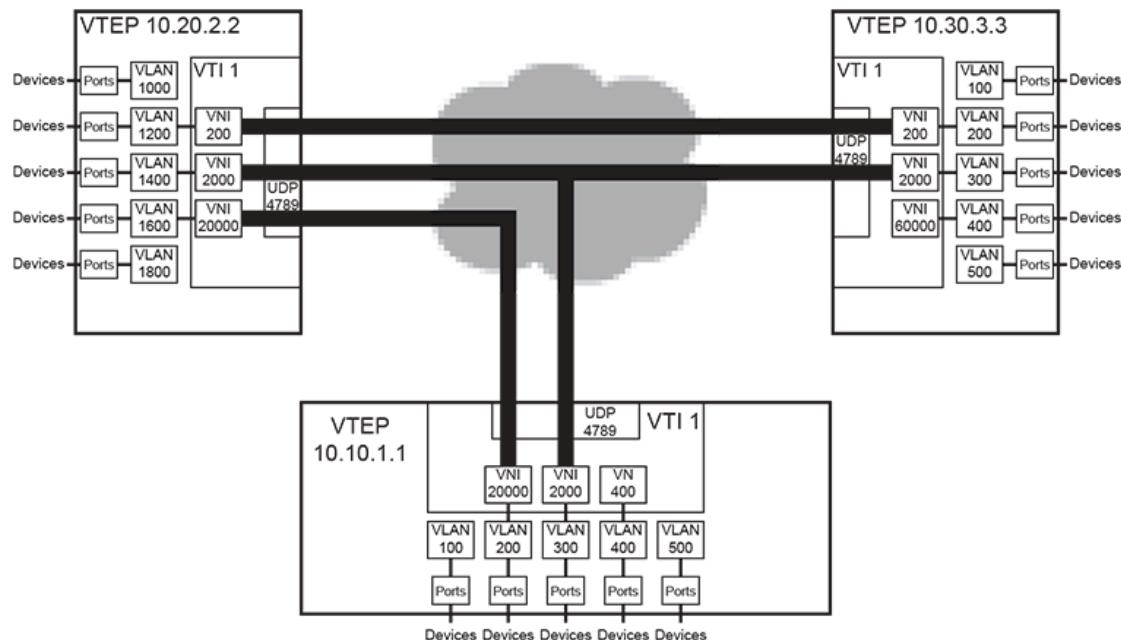

17.2.3 VXLAN Processes

When a packet enters a VLAN from a member (ingress) port, the VLAN learns the source address by adding an entry to the MAC address table that associates the source to the ingress-port. The VLAN then searches the table for destination address. If the MAC address table lists the address, the packet is sent out the corresponding port. If the MAC address table does not list the address, the packet is flooded to all ports except the ingress port.

VXLANs extend VLANs through the addition of a VXLAN address table that correlates remote MAC addresses to their port and resident host IP address. Packets that are destined to a remote device are sent to the VXLAN tunnel interface (VTI), which is the switchport that is linked to the UDP socket. The packet is encapsulated with a VXLAN header which includes the VNI associated with the VLAN and the IP mapping of the destination host. The packet is sent through a UDP socket to the destination VTEP IP. The VTI on the remote host extracts the original packet and bridges it to the VLAN associated with the VNI on the remote host.

UDP port 4789 is recognized as the VXLAN socket and listed as the destination port on the UDP packets. The UDP source port field is filled with a hash of the inner header to facilitate load balancing.

Figure 17-2: VXLAN Implementation

The figure above displays a configuration that includes three VTEPs. The VXLAN defines three inter-host L2 networks. The VLANs that comprise the networks include:

- **VNI 200: VTEP 10.20.2.2: VLAN 1200 and VTEP 10.30.3.3: VLAN 200**

-
- **VNI 2000: VTEP 10.10.1.1: VLAN 300, VTEP 10.20.2.2: VLAN 1400, and VTEP 10.30.3.3: VLAN 300**
 - **VNI 20000: VTEP 10.10.1.1: VLAN 200, and VTEP 10.20.2.2: VLAN 1600**

VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface on the VXLAN-enabled VLAN and assigning an IP address to the VLAN interface. The IP address serves as VXLAN gateway for devices that are accessible from the VXLAN-enabled VLAN.

17.2.4 Multicast and Broadcast over VXLAN

These sections describe multicast and broadcast over VXLANs. Multicast packet flooding describes broadcast and multicast transmission by associating a multicast group to a VTI through a configuration command.

Head-end Replication (HER) optimizes flooding of inter VTEP broadcast, unknown unicast and broadcast (BUM) traffic by using hardware and flood lists to perform replication on the supported platform.

- [Multicast Packet Flooding](#)
- [Head-end Replication](#)

17.2.4.1 Multicast Packet Flooding

Multicast packet flooding is supported with VXLAN bridging without MLAG. A VTI is associated with a multicast group through a configuration command.

VXLAN and Broadcast

When a VLAN receives or sends a broadcast packet the VTI is treated as a bridging domain L2 interface. The packet is sent from this interface on the multicast group associated with the VTI. The VTIs on remote VTEPs that receive this packet extract the original packet, which is then handled by the VLAN associated with the packet's VNI. The VLAN floods the packet, excluding the VTI. When the broadcast results in a response, the resulting packet can be unicast back to the originating VTEP because the VXLAN address table obtained the host MAC to VTEP association from the broadcast packet.

VXLAN and Multicast

A VTI is treated as an L2 interface in the VLAN for handling multicast traffic, which is mapped from the VLAN to the multicast group associated with the VTI. All VTEPs join the configured multicast group for inter-VTEP communication within a VXLAN segment; this multicast group is independent of any other multicast groups that the hosts in the VLAN join.

The IP address space for the inter-host VXLAN communication may be sourced from a different VRF than the address space of the hosts in the VLAN. The multicast group for inter-VTEP transmissions must not be used for other purposes by any device in the VXLAN segment space.

17.2.4.2 Head-end Replication

Head-end replication uses a flood list to support broadcast, unknown unicast, and multicast (BUM) traffic over VXLAN. The flood list specifies a list of remote VTEPs. The switch replicates BUM data locally for bridging across the remote VTEPs specified by the flood list. This data flooding facilitates remote MAC address learning by forwarding data with unknown MAC addresses.

Head-end replication is required for VXLAN routing and to support VXLANs over MLAG.

17.2.5 VXLAN and MLAG

VXLAN over MLAG provides redundancy in hardware VTEPs. VTI configuration must be identical on each MLAG peer for them to act as a single VTEP. This also prevents the remote MAC from flapping between the remote VTEPs by ensuring that the rest of the network sees a host that is connected to the MLAG interface as residing behind a single VTEP.

Differences between VXLAN bridging and routing implementations over MLAG are applicable for the DCS-7050X series platform.

- VXLAN routing recirculates a packet twice, with the first iteration performing the routing action involving an L2 header rewrite, and the second recirculation performing VXLAN encap and decap operations. Recirculation is achieved by MAC loopback on dedicated loopback interfaces.
- The configuration for VXLAN routing on an MLAG VTEP includes separate Recirc-Channel configuration on both peers. The virtual IP, virtual MAC, and virtual VARP VTEP IP addresses are identical on both peers.

The following VTI elements must be configured identically on both MLAG peers:

- VLAN-VNI mappings.
- VTEP IP address of the source loopback interface.
- Flood VTEP list used for head-end replication.

If OSPF is also in use, configure the OSPF router ID manually to prevent the switch from using the common VTEP IP address as the router ID.

The following rules are observed by MLAG switches so that they behave as a single VXLAN VTEP:

- Only the MLAG peer that receives a packet performs VXLAN encapsulation on it.
- Packets are not VXLAN encapsulated if they are received from the peer link.
- If a packet is decapsulated and sent over the peer link, it should not be flooded to active MLAG interfaces.
- If a packet is sent over the peer link to the CPU, it is not head-end replicated to other remote VTEPs.
- If a packet's destination is the VTEP IP address, it is terminated by the MLAG peer that receives it.

Examples

- These commands complete the configuration required for a VXLAN routing deployment.

```

switch(config)# interface VXLAN1
switch(config-if-Vx1)# vxlan source-interface Loopback0
switch(config-if-Vx1)# vxlan udp-port 4789
switch(config-if-Vx1)# vxlan vlan 2417 vni 8358534

```

There are 2 remote VTEPs configured **1.0.2.1**, and **1.0.3.1**. The remote **VTEP 1.0.2.1** is reachable through **Ethernet54/1.4095** and remote **VTEP 1.0.3.1** is reachable through **port-channel1.4095**.

Configuring Unconnected Ethernet Interfaces for Recirculation

On systems where bandwidth is not fully used by the front panel ports, unused bandwidth is used for recirculation.

The following example is applicable to the DCS-7050X series platform.

Example

These commands expose unconnected Ethernet interfaces which are used for recirculation, in order to use them to replace or use along with front panel Ethernet interfaces.

```

switch(config)# service interface unconnected expose
switch(config)# interface UnconnectedEthernet 2
switch(config-if-Ue2)# traffic-loopback source system device mac
switch(config-if-Ue2)# channel-group recirculation 627

```

The following example enables display of the inactive interfaces using the show command.

Running a show command generates the following output:

```

switch(config)# show int et21/1-4 stat
Port     Name   Status   Vlan   Duplex  Speed   Type      Flags Encapsulation
Et21/1   connected 1       full    100G   100GBASE-CR4
Et21/2   inactive  1       full    25G    100GBASE-CR4
Et21/3   inactive  1       full    25G    100GBASE-CR4

```

| | | | | | |
|--------|----------|---|------|-----|--------------|
| Et21/4 | inactive | 1 | full | 25G | 100GBASE-CR4 |
|--------|----------|---|------|-----|--------------|

On previous releases, Ethernet 21/2, 21/4 do not exist and the output would be the following:

```
switch(config) # show int et21/1-4 stat
Port      Name    Status   Vlan Duplex Speed Type      Flags Encapsulation
Et21/1    connected 1     full   100G  100GBASE-CR4
Et21/3    inactive  1     full   25G   100GBASE-CR4
```

17.2.6 VXLAN Bridging and Routing Support

Describes the support of VXLAN Bridging and Routing on the R3 series of DCS 7280, 7500, and 7800 Arista switches.

17.2.6.1 Differences with DCS-7500R2 Implementation

The following are notable differences with respect to implementation of VXLAN on the R3 Series of switches.

- There is no need to configure the VXLAN-routing TCAM profile to enable VXLAN routing on the R3 Series switches. The command is still accepted for backward compatibility reasons.
- CPU bound traffic after VXLAN decapsulation (such as routing protocol packets) use the same CoPP queues used by the non VXLAN decapsulated packets. This is an improvement over the R2 series behavior where the CPU bound traffic after VXLAN decapsulation took a different CoPP queue that was shared with other IP Unicast packets.

17.2.6.2 Limitations

There is no EVPN VXLAN Multicast (Type 6/7/8 NLRI) support.

17.2.7 Data Structures

VXLAN implementation requires two VXLAN tables and a MAC address table accommodation.

17.2.7.1 MAC Address Table VXLAN Support

MAC address table entries correlate MAC addresses with the port upon which packets arrive. In addition to Ethernet and port channels, the port column may specify a VTI for packets that arrive on a VLAN from a remote port through the VXLAN segment.

17.2.7.2 VTEP-MAC Address Table

VTEP-MAC address table entries correlate MAC address with the IP address of the VTEP from where packets bearing the MAC address arrive. The VTI uses this table to determine the destination address for packets that are sent to remote hosts.

17.2.7.3 VNI-VLAN Map

The VNI-VLAN map displays the one-to-one correspondence between the VNIs assigned on the switch and the VLANs to which they are assigned. Each VNI can be assigned to only one VLAN; each VLAN can be assigned a maximum of one VNI. Each VNI-VLAN assignment constitutes a VXLAN segment.

17.3 VXLAN Configuration

These sections describe VXLAN configuration tasks:

- Configuring the VTI
- Head End Replication Configuration
- VXLAN Routing Configuration
- Configuring VXLAN Routing with Overlay VRFs
- Configuring VXLAN over MLAG
- Configuring VXLAN Control Service

17.3.1 Configuring the VTI

Configuring the VTI enables VXLAN bridging and is a requirement for VXLAN Routing. The following sections describe the steps required to enabling VXLAN bridging by bringing up the VXLAN line protocol. [VXLAN Routing Configuration](#) describes the additional steps required to enable VXLAN routing.

Instantiating the VTI and VXLAN Configuration Mode

The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN Tunnel Interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Example

These commands create VXLAN tunnel interface **1**, place the switch in VXLAN-interface configuration mode, and display parameters of the new VTI.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

Assigning an IP address to the VTEP

The `vxlan source-interface` command specifies the loopback interface from which the VTEP derives the source address (IP) that it uses when exchanging VXLAN frames. This address is used by UDP headers to specify source and destination addresses of hosts that send or receive VXLAN encapsulated packets.

There is no default source interface assignment. A valid VXLAN configuration requires the assignment of a loopback interface to the VTEP and the assignment of a valid IP address to the specified interface.

Example

These commands configure VTI 1 to use IP address **10.25.25.3** (*interface loopback 15*) as the source interface in the encapsulation fields of outbound VXLAN frames.

```
switch(config)# interface loopback 15
switch(config-if-Lo15)# ip address 10.25.25.3/24
switch(config-if-Lo15)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 15
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan source-interface Loopback15
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

Assigning a UDP Port to the VTEP

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header, then sent through a pre-configured UDP port. Packets that arrive through this port are assumed to be VXLAN encapsulated and sent to the bridging domain of the recipient VLAN as determined by the VNI in the VXLAN header and the VNI-VLAN map.

The **vxlan udp-port** command associates a UDP port with the configuration mode VXLAN Interface (VTI). By default, UDP **port 4789** is associated with the VTI.

Note: UDP **port 4789** is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Examples

- This command associates UDP **port 5500** with *interface vxlan 1*.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan udp-port 5500
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 5500
switch(config-if-Vx1)#

```

- This command resets the *interface vxlan 1* UDP port association of **4789**.

```
switch(config-if-Vx1)# no vxlan udp-port
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

Assigning a VNI to a VLAN

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace existing VLAN assignment statements in **running-config**. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The **vxlan vlan vni** command associates a VLAN ID with a Virtual Network Identifier (VNI).

Example

These commands associate **vlan 100** to **vni 100** and **vlan 200** to **vni 10.10.200**.

```
switch(config)# interface vxlan 1
```

```
switch(config-if-Vx1)# vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 200 vni 658120
    vxlan vlan 100 vni 100
switch(config-if-Vx1)# vxlan vni notation dotted
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 100 vni 0.0.100
    vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#

```

Verifying the VXLAN Configuration

The **show interface vxlan 1** displays the configuration and connection status of the VXLAN.

Example

This command indicates that the VXLAN line protocol status is ***up***.

```
switch(config-if-Vx1)# show interface vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is vxlan
  Source interface is Loopback15 and is active with 10.25.25.3
  Static vlan to vni mapping is
    [100, 0.0.100]      [200, 10.10.200]
switch(config-if-Vx1)#

```

17.3.2 Head End Replication Configuration

Head-end replication is a data distribution method that supports broadcast, unknown unicast traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs specified by a flood list. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MAC addresses.

Each `vxlan flood vtep` statement in ***running-config*** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.

The VTEP flood list is created and modified through the `vxlan flood vtep` command.

Examples

- These commands create a default vxlan head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)# show active
  interface Vxlan1
    vxlan flood vtep 10.1.1.1 10.1.1.2
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through **vlan 101** and **vlan 102**.

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
```

```
switch(config-if-Vx1) #
```

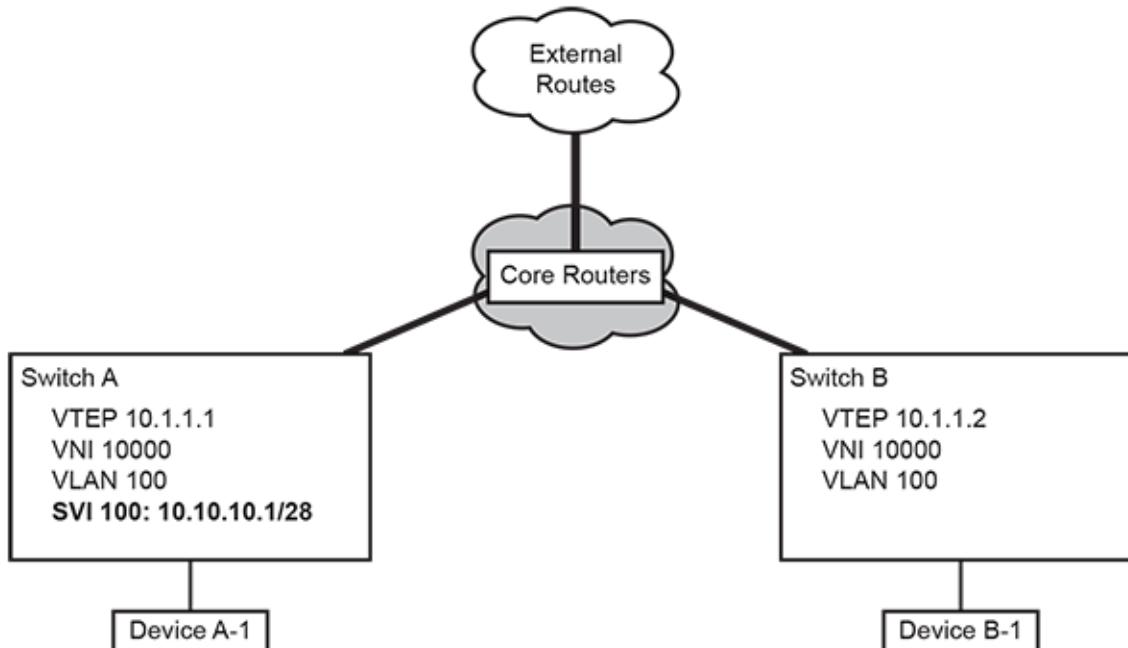

17.3.3 VXLAN Routing Configuration

- Implementing VXLAN Routing
- Configuring Direct VXLAN Routing
- Configuring VXLAN VTEP counters
- VXLAN Auto Flood-List Construction

17.3.3.1 Implementing VXLAN Routing

VXLAN routing is enabled by creating a VLAN Interface (SVI) on a VLAN that is associated to a VNI. In the figure below, VXLAN routing is enabled on **Switch A** by configuring a VLAN interface with an IP address of **10.10.10.1**. Packets from Devices **A-1** and **B-2** that have destinations other than **10.10.10.0/28** are VXLAN-bridged to the default gateway (**10.10.10.1**), then routed from **Switch A**.

Figure 17-3: Implementing VXLAN Routing

Note: For R and R2 series Arista platforms, VXLAN routing must be enabled in hardware with the **hardware tcam profile vxlan-routing** command. This command will cause a brief data-plane interruption. It should be run while the switch is in maintenance mode, or in an interval when a brief data-plane interruption is acceptable.

```
switch(config)# hardware tcam profile vxlan-routing
switch(config) #
```

Note: For Trident2 and some Tomahawk platforms, VXLAN routing requires that recirculation channels be configured with the command **channel-group recirculation**.

```
switch(config)#channel-group recirculation 1
```

```
switch(config) #
```

Example

These commands configure **Switch A** to perform VXLAN routing. The example includes OSPF routing that is used for underlay routing.

```
switch-A(config) # route-map VXLANvlan permit 10
switch-A(config-route-map-VXLANvlan) # match interface loopb5
switch-A(config-route-map-VXLANvlan) # exit
switch-A(config) # route-map VXLANvlan permit 20
switch-A(config-route-map-VXLANvlan) # match interface vlan 100
switch-A(config-route-map-VXLANvlan) # exit
switch-A(config) # router ospf 1
switch-A(config-router-ospf) # redistribute connected route-map VXLANvlan
switch-A(config-router-ospf) # exit
switch-A(config) # interface loopback 5
switch-A(config-if-Lo5) # ip address 10.25.25.3/24
switch-A(config-if-Lo5) # exit
switch-A(config) # interface vxlan 1
switch-A(config-if-Vx1) # vxlan source-interface loopback 5
switch-A(config-if-Vx1) # vxlan vlan 100 vni 10000
switch-A(config) # interface vlan 100
switch-A(config-if-Vl100) # ip address 10.10.10.1/28
switch-A(config-if-Vl100) # exit
```

17.3.3.2 Configuring Direct VXLAN Routing

Figure [Implementing VXLAN Routing](#), VXLAN routing is enabled on **Switch A** only; **Switch B** supports VXLAN bridging. Traffic from **Switch B** devices to the external routes must go through the core route twice: once as they are bridged to is VXLAN gateway and once when routed to its next hop device.

Direct VXLAN routing with VXLAN enabled addresses this issue by configuring each VTEP with all VLANs. This allows packets to be VXLAN-bridged to a local VTEP and routed to remote VTEPs. Indirect routing scales well but is complex to engineer efficiently, and naked routing provides the same scalability to indirect routing. Direct routing leads to the most efficient traffic flows, with the number of virtual subnets or virtual machines increasing at scale, and is thereby optimal from a data plane viewpoint.

The following sections describe conventions required to implement Direct VXLAN Routing, then presents a direct VXLAN routing implementation.

Configuring VARP addresses

For direct routing, an anycast IP address is used as the gateway address on the SVI for a VLAN on all hardware VTEPs associated with that VLAN.

Examples

- These commands configure an IP virtual-router and virtual MAC address.

```
switch(config) # interface Vlan2417
switch(config-if-Vl2417) # ip address 1.0.4.50/24
switch(config-if-Vl2417) # ip virtual-router address 1.0.4.1
switch(config-if-Vl2417) # ip virtual-router mac-address 00:00:11:11:22:22
switch(config) #
```

- These commands configure an IP virtual address (instead of IP virtual-router address) for the VLAN SVI, and a secondary address on the loopback interface for the virtual VTEP IP. The virtual VTEP IP is the logical VTEP hosting the virtual MAC address.

```
switch(config) # interface Vlan2417
switch(config-if-Vl2417) # ip address virtual 1.0.4.1/24
```

```
switch(config-if-V12417) # exit
switch(config) # interface Loopback0
switch(config-if-Lo0) # ip address 1.0.1.1/32
switch(config-if-Lo0) # ip address 1.0.1.2/32 secondary
switch(config-if-Lo0) # ip virtual-router mac-address 00:00:11:11:22:22
switch(config) #
```

Virtual IP and MAC Addresses

Virtual-router IP addresses can be configured on VLAN interfaces in addition to a primary address. All VTEPs in a direct VXLAN network can be configured with the same virtual router address. This allows devices to use a common IP address as their VXLAN gateway.

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. This results in the virtual MAC address (`ip virtual-router mac-address`) assignment to the VLAN interface. In large VXLAN networks, using distinct primary IP addresses for each VTEP limits the number addresses on its subnet for connected hosts. Defining a common virtual IP address for all VTEPs and using that their primary addresses conserves subnet addresses

Example

These commands specify a virtual router address of **00:00:00:00:00:48** for the switch and, for **vlan 100**, a primary address of **10.10.10.10/28** and a virtual IP address of **10.10.10.10**.

```
switch(config) # ip virtual-router mac-address 00:00:00:00:00:48
switch(config) # interface vlan 100
switch(config-if-Vl100) # ip address virtual 10.10.10.10/28
switch(config-if-Vl100) # show active
  interface Vlan100
    ip address virtual 10.10.10.10/28
switch(config-if-Vl100) #
```

Virtual VTEP Configuration

A virtual VTEP address is specified by configuring a secondary address on the loopback interface designated as the VXLAN's source interface. All VTEPs in the direct routing topology share the same virtual VTEP address.

You must also configure the secondary VTEP IP on the flood-list of the downstream VXLAN VTEPS as shown below.

Example

These commands specify a primary (10.1.1.1) and virtual VTEP address (10.2.2.2).

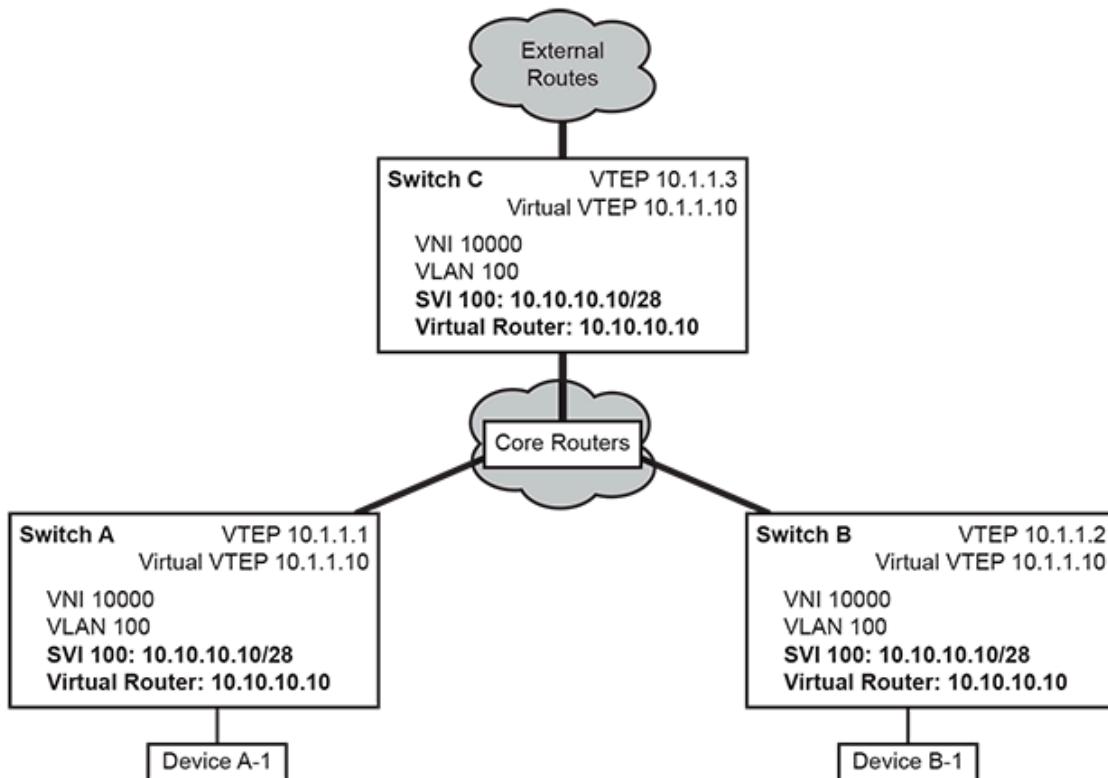

```
switch1
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# show active
  interface Loopback5
    ip address 10.1.1.1/24
    ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)# show active
  interface Vxlan1
    vxlan source-interface Loopback5
    vxlan udp-port 4789
    vxlan vlan 100 vni 10000
switch(config-if-Vx1)#
switch2
switch(config)# interface Vxlan1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1
```

```
switch(config-if-Vx1)# vxlan flood vtep 10.2.2.2
```

Direct VXLAN Topology

The following figure displays a direct VXLAN topology, where each VTEP is configured with the same set of VNIs, VLAN interfaces, and virtual VTEP address.

Figure 17-4: Direct VXLAN Routing

Example

These commands configure VXLAN parameters for **Switch-A**.

```
switch-A(config)# route-map VXLANvlan permit 10
switch-A(config-route-map-VXLANvlan)# match interface loopb5
switch-A(config-route-map-VXLANvlan)# exit
switch-A(config)# route-map VXLANvlan permit 20
switch-A(config-route-map-VXLANvlan)# match interface vlan 100
switch-A(config-route-map-VXLANvlan)# exit
switch-A(config)# router ospf 1
switch-A(config-router-ospf)# redistribute connected route-map VXLANvlan
switch-A(config-router-ospf)# exit
switch-A(config)# ip virtual-router mac-address 00:00:00:00:00:48
switch-A(config)# interface loopback 5
switch-A(config-if-Lo5)# ip address 10.1.1.3/24
switch-A(config-if-Lo5)# ip address 10.1.1.10/24 secondary
switch-A(config-if-Lo5)# exit
switch-A(config)# interface vxlan 1
switch-A(config-if-Vx1)# vxlan source-interface loopback 5
switch-A(config-if-Vx1)# vxlan vlan 100 vni 10000
switch-A(config)# interface vlan 100
switch-A(config-if-Vl100)# ip address virtual 10.10.10.10/28
switch-A(config-if-Vl100)# exit
```

17.3.3.3 Configuring VXLAN VTEP Counters

The VXLAN VTEP counters feature enables a device to count VXLAN packets received and sent by the device on a per VTEP basis. Specifically, it enables the device to count bytes and packets that are getting encapsulated and decapsulated as they are passing through.

The counters are logically split up in the two VXLAN directions. Encapsulated on the device and directed to the core, “encap” counters count packets coming from the edge. Decapsulated on the device and heading towards the edge, “decap” counters count packets coming from the core.

To be able to count VXLAN packets the device has to support VXLAN and have a VXLAN interface correctly configured.

Examples

- This command configures the enabling of VXLAN VTEP counters for encaps.

```
switch(config)# hardware counter feature vtep encaps
switch(config) #
```

- This command configures the disabling of VXLAN VTEP counters for encaps.

```
switch(config)# no hardware counter feature vtep encaps
switch(config) #
```

- This command configures the enabling of VXLAN VTEP counters for decaps.

```
switch(config)# hardware counter feature vtep decaps
switch(config) #
```

- This command configures the disabling of VXLAN VTEP counters for decaps.

```
switch(config)# no hardware counter feature vtep decaps
switch(config) #
```

17.3.3.4 VXLAN Auto Flood-List Construction

With the introduction of wireless Access Points (APs), VXLAN flood-lists learned from the data-plane is added to or removed from the flood-lists created in the control-plane. When a VXLAN packet is received on a new VNI from a VTEP, it is added to the dynamic flood-list for that VNI and the flood-list is merged with flood-lists from other sources. When all MACs behind a remote VTEP have been removed through aging, for example, the remote VTEP is removed from all dynamic VXLAN flood-lists.

To restrict VTEPs from being added to dynamic flood-lists, when VXLAN traffic is received from untrusted sources, use the `vxlan learn-restrict` command. MAC learning is disabled from the specified IP ranges. The learning restrictions is placed on all platforms including APs.

VXLAN Configuration for Learning Data-plane Flood-lists

The following example is applicable to all platforms.

These commands enable VXLAN flood-lists learning from data-plane.

```
switch(config)# interface VXLAN1
switch(config-if-Vx1)# vxlan flood vtep learned data-plane
```

The following example restricts learning from VTEPs not in a prefix range.

```
switch(config-if-Vx1)# vxlan learn-restrict vtep <prefixes>
```

The following example restricts learning to VTEPs with IP in range.

```
switch(config-if-Vx1) # vxlan learn-restrict vtep 1.1.1.1/24
```

The following command shows the VXLAN flood-lists programmed in hardware.

```
switch(config) # switch(config)#show vxlan flood vtep
```

The following command shows the dynamic VXLAN flood-lists.

```
switch(config) # switch(config)#show l2Rib input vxlan-dynamic
```

The following command shows the VXLAN flood-lists sent to platform.

```
switch(config) # switch(config)#show l2Rib output floodset
```

The following command shows the VXLAN learning restrictions for all VLANs.

```
switch(config) # switch(config)#show vxlan learn-restrict vtep
```

The following command shows the VXLAN learning counters for all VLANs.

```
switch(config) # switch(config)#show vxlan counters learn-restrict all
```

17.3.4 Configuring VXLAN Routing with Overlay VRFs

VXLAN SVIs configured in non-default VRFs are supported with VXLAN routing using overlay VRFs. Overlay SVIs are configured in non-default VRFs but underlay SVIs, which provide IP connectivity between VTEPs, must remain in the default VRF. VXLAN routing is deployable by allowing users to configure separate overlay routing domains using VRFs per tenant, thereby allowing support for overlapping IP addresses in the overlay. This provides separation between overlay and underlay traffic, including simpler and cleaner protocol configuration, without using complicated route-maps to control distribution of prefixes to peers in the overlay VRFs and underlay SVIs. IPv4 based VXLAN routing is currently supported.

17.3.5 Configuring VXLAN over MLAG

VTI configuration must be identical on each MLAG peer for them to act as a single VTEP.

The following VTI elements must be configured identically on both MLAG peers:

VLAN-VNI Mappings

Configure identical VLAN to VNI mappings on both MLAG peers using the `vxlan vlan vni` command.

Example

These commands associate **vlan 100** to **vni 100** and **vlan 200** to **vni 10.10.200**.

```
switch(config) # interface vxlan 1
switch(config-if-Vx1) # vxlan vlan 100 vni 100
switch(config-if-Vx1) # vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1) #
```

VTEP IP Address of the Source Loopback Interface

Configure the same VTEP IP address for the source loopback interface on both MLAG peers using the [vxlan source-interface](#) command.

Example

These commands configure a primary VTEP address.

```
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)#+
```

Flood VTEP List

Configure the same VTEP flood list on both MLAG peers using the [vxlan flood vtep](#) command.

Example

These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)#+
```

OSPF Configuration

If OSPF is in use, configure the OSPF router ID using the [router-id \(OSPFv2\)](#) command to prevent the switch from using the common VTEP IP address as the router ID.

Example

These commands assign **10.0.0.1** as the OSPFv2 router ID.

```
switch(config)# router ospf 100
switch(config-router-ospf)# router-id 10.0.0.1
switch(config-router-ospf)#+
```

17.3.6 Configuring VXLAN Control Service

The VXLAN Control Service (VCS) provides a mechanism by which hardware VTEPs share states between each other in order to establish VXLAN tunnels, without the need for a multicast control plane. This feature enables the use of a VCS client.

Examples

- These commands connect a switch to the VCS running on CVX. The server host IP address is the management IP address of the CVX controller or the IP address that CVX is listening on for client connections.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# server host 172.27.6.248
switch(config-mgmt-cvx)# no shutdown
switch(config-mgmt-cvx)#+
```

- These commands configure the VXLAN interface, except for the multicast group configuration, in order to learn from the controller.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan controller-client
switch(config-if-Vx1)#{
```

17.3.7 Configuring VXLAN Multicast Decapsulation

VXLAN multicast decapsulation enables VTEPs that support Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

Examples

- These commands enable VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#{
```

- These commands disable VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# no vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#{
```

17.3.8 VXLAN Decapsulation for interface with multiple VRFs

Please refer to the following security advisory after the EOS software upgrade for a network that leverages VXLAN decapsulation on an interface that carries traffic for multiple VRFs.

<https://www.arista.com/en/support/advisories-notices/security-advisory/11995-security-advisory-55>

17.3.9 VXLAN Rules Support for Mirror ACLs Configuration

VXLAN rules support for mirror ACLs configuration permit VXLAN deep inspection rules to be specified in the mirroring ACLs when the switch is operating in normal mode.

Examples

The following are examples of VXLAN rules specified in mirroring ACLs.

- These commands permit all VXLAN traffic (udp protocol and destination **port 4789**).

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit VXLAN any any
switch(config-acl-miracl)#{
```

- These commands permit VXLAN traffic with **vni 1001** only.

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit vxlan any any vni 1001 0x000000
switch(config-acl-miracl)#{
```

- These commands deny VXLAN traffic with **vni 0x1000** through **0x100f**.

```
switch(config)# ip access-list miracl
switch(config-acl-miracl)# permit vxlan any any vni 0x1000 0x100f
switch(config-acl-miracl)#

```

17.3.10 Configuring EVPN VXLAN

Supported Configurations

- Static EVPN VXLAN Configuration
- VXLAN Bridging and Routing Configuration
- EVPN VXLAN All Active Multihoming
- EVPN VXLAN Single-Active Multihoming
- VARP and Virtual VTEP with VXLAN Routing
- Overlay Multicast using VXLAN Underlay Multicast Tree
- Bridging Over EVPN IPv6 VXLAN Underlay

17.3.10.1 Static EVPN VXLAN Configuration

```
switch(config)# service routing protocols model multi-agent
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 172.16.1.1/32
!
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 4789
switch(config-if-Vx1)# VXLAN vrf test vni 12345
!
switch(config)# ip routing vrf test
switch(config)# Ipv6 unicast-routing vrf test
!
switch(config)# ip route vrf test 192.168.1.0/24 vtep 10.1.1.2 vni 20000 router-mac-address
 00:00:78:01:00:00
switch(config)# ipv6 route vrf test 1:0:5::0/64 vtep 10.1.1.2 vni 30000 router-mac-address
 00:00:80:01:00:00

```

17.3.10.2 VXLAN Bridging and Routing Configuration

```
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 172.16.1.1/32
!
switch(config)# ip virtual-router mac-address 00:02:03:04:05:06
!

switch(config)# ip routing
!
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 65330
switch(config-if-Vx1)# VXLAN vlan 300 vni 945438
switch(config-if-Vx1)# VXLAN vlan 200 vni 654677
switch(config-if-Vx1)# VXLAN flood vtep 172.16.1.2 172.16.1.3 172.16.1.1

```

17.3.10.3 EVPN VXLAN All Active Multi-homing

Activate Multi-homing in an EVPN environment by assigning an Ethernet segment identifier to the participating Ethernet or Port Channel interfaces.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 00aa:bbbb:cccc:ddd:eeee
switch(config-evpn-es)# route-target import 12:23:34:45:56:67
```

The optional **designated-forwarder election hold-time** command configures a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise the EVPN Ethernet segment (type 4) routes. The default hold time is three (3) seconds, as specified in section 8.5 of *RFC7432* [1].

Section 7.6 of *RFC7432* [1] describes the ES import route target configured in the example. It can be set to any MAC address, but for each Ethernet segment every participating interface in the network must use the same ES import route target. A suggested value is the MAC address of the CE connected to the multi-homing PEs through this interface.

A VXLAN has awareness of the STP state. When an interface used as an Ethernet segment does not have a forwarding state, EOS considers the interface to be inactive. For a VLAN-based service, the port must be in a forwarding state on that VLAN. For a VLAN-aware bundle service, if the interface does not forward traffic on any VLAN in a bundle, EVPN discards every VLAN in the bundle. EOS enables this feature by default.

Auto-generating ESIs for the PE Router

The feature, Auto Type 1 ESI, supports auto-generating of the ESI for the PE router based on the multi-homing CE LACP system MAC and LACP port key. All routes with the ESI use the auto-generated value when linking the multi-homing CE and PE using LACP to connect to the same ES.

The feature, Auto ES-Import RT provides the capability to automatically derive the ES-Import RT value used for Type 4 Ethernet Segment Route advertisement from the upper six (6) octets within the nine (9) octets in the associated ESI.

Configuring an Auto ES Identifier

Use the following commands to add the capability to auto-derive the Type 1 ESI:

```
switch(config)# interface Po1
switch(config-Po1)# evpn ethernet-segment
switch(config-evpn-es)# identifier auto lacp
```

Configuring an Auto ES-Import RT

Use the following commands to add this feature to the switch configuration:

```
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# route type ethernet-segment route-
target auto
```

The ES-Import RT now automatically generates all Ethernet Segments based on the upper six (6) octets within the ESI nine (9) octets value.

17.3.10.4 EVPN VXLAN Single-Active Multihoming

Multi-homing allows in an EVPN environment by assigning an Ethernet segment identifier or a single Customer Edge (CE) to the participating multiple Provider Edge (PE). The default mode of operation is All-

active. Introduced in the *EOS 4.26.0F* for VXLAN, single-active is another mode of operation in which only one PE per VLAN accepts traffic for that Ethernet segment.

Single-active multihoming is useful for:

- Manually controlled traffic flows
- Prioritizing links over others
- Connecting separate CE devices to a single Ethernet segment
- Connecting a CE that does not support link aggregation to multiple PEs.

To configure single-active multi-homing, use the **redundancy single-active** command on a physical Ethernet or aggregate Port-channel interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0123:0123:0123:0123:0123
switch(config-evpn-es)# route-target import 12:34:12:34:12:34
switch(config-evpn-es)# redundancy single-active
```

When **don't preempt** mode is enabled, a flag bit is included with preference value. Each VLAN specifies **high/low** rule with preference-based DF election. The default election rule is **high** and the default preference is **32767** from **0** to **65535**.

```
interface Port-Channel1
    switchport mode trunk
    switchport trunk allowed vlan 100-200
    evpn ethernet-segment
        identifier 0123:0123:0123:0123:0123
        route-target import 12:34:12:34:12:34
        redundancy single-active
        designated-forwarder election algorithm preference 10000 [dont-preempt]

router bgp 10
    vlan 100
        designated-forwarder election preference rule low
    ...
    vlan-aware-bundle red
        designated-forwarder election preference rule low
    vlan 120-140
    ...
```

Show commands

show bgp evpn instance command takes the name of a configured EVPN instance to limit the output for that instance.

```
switch# show bgp evpn instance vlan 10
EVPN instance: VLAN 10
  Route distinguisher: 10.255.0.0:10
  Route target import: Route-Target-AS:64500:10
  Route target export: Route-Target-AS:64500:10
  Service interface: VLAN-based
  Local IP address: 10.255.0.0
  Encapsulation type: VXLAN
  Local ethernet segment:
    ESI: 0011:1111:1111:1111:1111
    Interface: Ethernet6
    Mode: single-active
    State: up
    ES-Import RT: 00:01:00:01:00:01
    DF election algorithm: preference
    Designated forwarder: 10.255.0.0
    Non-Designated forwarder: 10.255.0.1
```

Each Ethernet segment shows the modes, single-active or all-active, the DF election algorithm, the elected designated forwarder and all other candidate forwarders.

When a port/VLAN is inactive, it is not shown by **show vlan** command. It is possible to see configured but inactive VLANs in **show vlan configured** command.

```
switch# show vlan configured
VLAN Name Status Ports
-----
1 default active Et1, Et2, Et4, Et5, Et6
10 VLAN0010 active Et6, Vx1
11 VLAN0011 active Et6#, Vx1

# indicates a port on which traffic is currently being blocked
```

show bgp evpn detail command shows the EVPN routes contributing to the multihoming state of a device with **route-type ethernet-segment** and any other appropriate filters.

```
switch# show bgp evpn route-type ethernet-segment esi 0011:1111:1111:1111:1111 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300

DF Election: Preference 200
BGP routing table entry for ethernet-segment 0011:1111:1111:1111:1111 10.255.0.1, Route
Distinguisher: 10.255.0.1:1
Paths: 1 available
 303 301
 10.255.0.1 from 10.0.0.2 (0.0.1.1)
    Origin IGP, metric -, localpref 100, weight 0, valid, external, best
    Extended Community: TunnelEncap:tunnelTypeVXLAN EvpnEsImportRt:00:01:00:01:00:01
DF Election: Preference 100
```

Limitations

- Single-active multihoming with MPLS is not supported.
- Single-active redundancy is currently only supported on trunk ports. Access ports will not drop traffic when inactive.
- Designated forwarder can not be reset in non-revertive mode.

17.3.10.5 VARP and Virtual VTEP with VXLAN Routing

```
interface Loopback0
  ip address 172.16.1.1/32
  ip address 20.0.0.1/32 secondary
!
ip virtual-router mac-address 00:02:03:04:05:06
!
ip routing
!
interface Vlan200
  ipv6 address 2000:0:0:41::2/64
  ip address virtual 1.0.7.1/24
  ipv6 virtual-router address 2000:0:0:41::1
!
interface VXLAN1
  VXLAN source-interface Loopback0
  VXLAN udp-port 65330
  VXLAN vlan 300 vni 945438
  VXLAN vlan 200 vni 654677
  VXLAN flood vtep 172.16.1.2 172.16.1.3 172.16.1.1 20.0.0.1
```

17.3.10.6 Overlay Multicast using VXLAN Underlay Multicast Tree

To inject a source route, configure the `ip multicast source route export` command on the incoming interface.

```
switch(config)# interface Vlan10
switch(config-Vl10)# ip pim sparse-mode
switch(config-Vl10)# ip multicast source route export
```

To redistribute the source routes in the MRIB via BGP while running multi-agent protocol model, configure the `redistribute attached-host` command for the IPv4 multicast address-family. Activate the neighbor to establish a BGP connection.

```
switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# neighbor 3.0.0.2 activate
switch(config-router-bgp-af)# redistribute attached-host
```

To redistribute the source routes in the URIB via BGP while running ribd protocol model, configure the `redistribute attached-host` command under the `router bgp` mode.

```
switch(config-router-bgp)# redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using multi-agent protocol model.

```
switch(config)# service routing protocol model multi-agent
switch(config)# ip pim rp-address 15.15.15.15 225.1.1.1/32
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 1.1.1.1/32
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN vlan10 vni 10000
! Interface to the underlay
switch(config)# interface Ethernet1
switch(config-if-Et1)# ip address 3.0.0.1/24
switch(config-if-Et1)# ip pim sparse-mode
switch(config)# interface vlan10
switch(config-if-Vl10)# ip address 10.1.1.1/24
switch(config-if-Vl10)# ip pim sparse-mode
switch(config-if-Vl10)# ip multicast source route export
switch(config)# router bgp 10
switch(config-router-bgp)# router-id 0.0.0.2
switch(config-router-bgp)# address-family ipv4 multicast
switch(config-router-bgp-af)# neighbor 3.0.0.2 activate
switch(config-router-bgp-af)# redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using the ribd protocol model.

```
switch(config)# service routing protocol model ribd
switch(config)# ip pim rp-address 15.15.15.15 225.1.1.1/32
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 1.1.1.1/32
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN vlan10 vni 10000
! Interface to the underlay
switch(config)# interface Ethernet1
```

```

switch(config-if-Et1)# ip address 3.0.0.1/24
switch(config-if-Et1)# ip pim sparse-mode

switch(config)# interface vlan10
switch(config-if-Vl11)# ip address 10.1.1.1/24
switch(config-if-Vl11)# ip pim sparse-mode
switch(config-if-Vl11)# ip multicast source route export

switch(config)# router bgp 10
switch(config-router-bgp)# router-id 0.0.0.2
switch(config-router-bgp)# redistribute attached-host

```

17.3.10.7 Bridging Over EVPN IPv6 VXLAN Underlay

The following example configuration is for VXLAN bridging over EVPN IPv6 VXLAN underlay.

```

switch(config)# interface loopback 0
switch(config-if-Lo0)# ip address 20001::100/128
!
switch(config)# vlan 10
switch(config-vlan-10)#
switch(config)# vlan 20
switch(config-vlan-20)#
!
switch(config)# hardware tcam
switch(config-tcam)# system profile VXLAN-v6-underlay
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport access vlan 10
switch(config)# interface Ethernet2
switch(config-if-Et2) #switchport access vlan 20
!
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 0
switch(config-if-Vx1)# vxlan encapsulation ipv6
switch(config-if-Vx1)# vxlan vlan 10 vni 10
switch(config-if-Vx1)# vxlan vlan 20 vni 20
!
```

17.3.11 Displaying VXLAN Configuration

The following section describes the commands that control the display format of VNIs and the commands that list VXLAN configuration and transmission information.

Configuring VNI Display Format

The [vxlan vni notation dotted](#) command configures the switch to display VNIs in dotted decimal notation. VNI values range from **1** to **16777215** in decimal notation and from **0.0.1** to **255.255.255** in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notion regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```

switch(config)# vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1

```

```

vxlan udp-port 4789
vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#

```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a VNI setting.

```

switch(config)# no vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 197637
switch(config-if-Vx1)#

```

MAC Address Table

The MAC address table indicates a MAC address from a device on a remote host by indicating Vx interface as the port that corresponds to the address.

Example

The [show mac address-table](#) command displays a MAC address table that includes entries of devices from remote hosts by specifying Vx1 as the corresponding port.

```

switch> show mac address-table
      Mac Address Table
-----
Vlan     Mac Address        Type      Ports      Moves   Last Move
----  -----
  1      0050.5682.6725  DYNAMIC    Et16       1      0:02:01 ago
  1      0050.568e.58e9  DYNAMIC    Et23       2      0:08:53 ago
  1      0050.56a0.474a  DYNAMIC    Et16       1      0:18:04 ago
  51     0000.0051.0004  DYNAMIC    Et5        1      12 days, 1:02:44 ago

```

VXLAN MAC Address Table

VXLAN MAC address table entries correlate MAC addresses accessible through remote VTEPs with the local VLAN and the IP address of the VTEP through which the addressed device is accessed. The VTI uses this table when constructing the VXLAN encapsulation to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

The [show vxlan address-table](#) command displays the VXLAN MAC address table.

Example

This command displays the VXLAN address table.

```

switch> show vxlan address-table
      vxlan Mac Address Table
-----
Vlan     Mac Address        Type      Prt      Vtep      Moves   Last Move
----  -----
  51     0000.0051.0101  DYNAMIC   Vx1    10.25.2.12      1      4 days, 0:37:14 ago

```

```

51 0000.0051.0102 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
51 0000.0051.0103 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
51 0000.0051.0104 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
51 0000.0051.0105 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
61 0000.0061.0103 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
61 0000.0061.0104 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago
61 0000.0061.0105 DYNAMIC Vx1 10.25.2.12    1    4 days, 0:37:14 ago switch>

```

VXLAN MAC Address Table

The [show vxlan vtep](#) command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```

switch> show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps: 1 switch>

```

VXLAN Counters

The [clear vxlan counters](#) command resets the VXLAN counters. The [show vxlan counters](#) command displays the VXLAN counters.

Example

This command displays the VXLAN counters

```

switch> show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:45128
decap_bytes_filter:5908326
decap_discard_vxhdr:0
decap_discard_vlan_map:2214730
decap_timeout:0
decap_sock_err:1 switch>

```

17.3.12 Displaying VXLAN Bridging and Routing Support

All show commands applicable to prior VXLAN implementations on R2 series are also available on R3 series for VXLAN debugging.

The [show interfaces VXLAN](#) command displays operational status and configuration information of the specified VXLAN.

```

switch(config)# show interfaces VXLAN 1
VXLN1 is up, line protocol is up (connected)
  Hardware is VXLAN
  Source interface is Loopback0 and is active with 172.16.1.1

```

```

Replication/Flood Mode is headend with Flood List Source: CLI
Remote MAC learning via Datapath
VNI mapping to VLANs
Static VLAN to VNI mapping is
[100, 100]
Note: All Dynamic VLANs used by VCS are internal VLANs.
      Use 'show VXLAN vni' for details.
Static VRF to VNI mapping is not configured
Headend replication flood vtep list is:
  100 172.16.1.2 10.1.1.1
MLAG Shared Router MAC is 0000.0000.0000
VTEP address mask is Non

```

The **show arp** command displays all ARP tables on the configured VXLAN.

```

switch(config)# show arp interface VXLAN 1
Address          Age (sec)  Hardware Addr   Interface
192.168.10.1     -          0000.abab.abab  Vlan100, VXLAN1

```

The **show arp interface summary** command displays a summary of all ARP tables on the configured VXLAN.

```

switch(config)# show arp interface VXLAN 1 summary
Total: 1
Static: 1
Dynamic: 0
Not learned: 0

```

The **show VXLAN counters software** command displays the VXLAN software counters.

```

switch(config)# show VXLAN counters software
Rx bytes for encapsulation : 0
Rx pkts for encapsulation : 0
Rx high priority bytes for encapsulation : 0
Rx high priority pkts for encapsulation : 0
Rx low priority bytes for encapsulation : 0
Rx low priority pkts for encapsulation : 0
.....

```

```

switch(config)# show VXLAN vni
VNI to VLAN Mapping for VXLAN1
VNI    VLAN   Source      Interface      802.1Q Tag
-----  -----  -----
100     100    static     Ethernet2/1    untagged
                                VXLAN1           100

```

Note: * indicates a Dynamic VLAN

The **show VXLAN vtep** command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

```

switch(config)# show VXLAN vtep
Remote VTEPS for VXLAN1:
10.1.1.1

```

17.4 VXLAN Commands

VXLAN Global Configuration Commands

- `interface vxlan`
- `ip address virtual`
- `vxlan vni notation dotted`

VXLAN Interface Configuration Commands

- `vxlan flood vtep`
- `vxlan multicast-group decap`
- `vxlan source-interface`
- `vxlan udp-port`
- `vxlan vlan vni`

VXLAN Bridging and Routing Commands

- `designated-forwarder election hold-time`
- `redistribute attached-host`

VXLAN Display and Clear Commands

- `clear vxlan counters`
- `show arp`
- `show interfaces VXLAN`
- `show service vxlan`
- `show vxlan address-table`
- `show vxlan counters`
- `show vxlan flood vtep`
- `show vxlan vtep`

17.4.1 clear vxlan counters

The **clear vxlan counters** command resets the VXLAN counters.

Command Mode

Privileged EXEC

Command Syntax

```
clear vxlan counters ROUTE_TYPE
```

Parameters

ROUTE_TYPE Specifies the type of VXLAN counter reset by the command.

- **software** Command resets software counters.
- **varp** Command resets virtual-ARP counters.

Related Command

[show vxlan counters](#) displays the VXLAN counters.

Example

This command resets the VXLAN counters

```
switch# clear vxlan counters software
switch# show vxlan counters software
encap_bytes:0
encap_pkts:0
encap_read_err:0
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:0
decap_bytes_total:0
decap_pkts_total:0
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:0
decap_bytes_filter:0
decap_discard_vxhdr:0
decap_discard_vlan_map:0
decap_timeout:0
decap_sock_err:0 switch#
```

17.4.2 designated-forwarder election hold-time

The optional **designated-forwarder election hold-time** command can configure a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise their EVPN Ethernet segment (type 4) routes. The **no** and **default** forms of the command removes the election hold time.

Command Mode

EVPN Ethernet segment identifier configuration mode

Command Syntax

```
designated-forwarder election hold-time sec  
no designated-forwarder election hold-time sec  
default designated-forwarder election hold-time sec
```

Parameter

sec Number of seconds for the timer waiting to receive updates from other PE. Range **0-1800**.

Example

```
switch(config)# interface Ethernet1  
switch(config-if-Et1)# evpn ethernet-segment  
switch(config-evpn-es)# designated-forwarder election hold-time 20
```

17.4.3 interface vxlan

The **interface vxlan** command places the switch in **vxlan-interface** configuration mode for modifying the specified VXLAN Tunnel Interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no interface vxlan** deletes the specified VTI interface, including its configuration statements, from **running-config**. The **default interface vxlan** command removes all configuration statements for the specified VTI from **running-config** without deleting the interfaces.

Command Mode

Global Configuration

Command Syntax

```
interface vxlan vx_range  
no interface vxlan vx_range  
default interface vxlan vx_range
```

Parameter

vx_range VXLAN interface number. The only permitted value is **1**.

Commands Available in link-flap Configuration Mode

- [vxlan source-interface](#)
- [vxlan udp-port](#)
- [vxlan vlan vni](#)

Examples

- These commands create **interface vxlan 1**, place the switch in **vxlan-interface** configuration mode, then display parameters of the new VTI.

```
switch(config)# interface vxlan 1  
switch(config-if-Vx1)# show active  
interface Vxlan1  
    vxlan udp-port 4789  
switch(config-if-Vx1)#[/pre]
```

- This command exits **vxlan-interface** configuration mode, placing the switch in **global** configuration mode.

```
switch(config-if-Vx1)# exit  
switch(config)#[/pre]
```

17.4.4 ip address virtual

The **ip address virtual** command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. The address resolves to the virtual MAC address configured through the **ip virtual-router mac-address** command. The command includes a subnet designation that is required in primary IP address assignments.

This command is typically used in VXLAN routing configurations as an alternative to assigning a unique IP address to each VTEP. All existing IPv4 addresses must be removed from the interface before executing this command.

The **no ip address virtual** and **default ip address virtual** commands remove the IPv4 address and virtual IP assignment from the configuration mode interface by deleting the **ip address virtual** command from **running-config**.

Removing the IPv4 address assignments from an interface disables IPv4 processing on that port.

Command Mode

Interface-VLAN Configuration

Command Syntax

```
ip address virtual [ipv4_subnet | secondary]
no ip address virtual
default ip address virtual
```

Parameters

- **ipv4_subnet** IPv4 and subnet address (CIDR or address-mask notation).
- **secondary** Configures a secondary address on the loopback interface designated as the VXLAN's source interface.

Related Commands

- **ip address**
- **ip virtual-router mac-address**

Examples

- This command configures **10.10.10.1** as the IPv4 address and virtual address for **vlan 100**.

```
switch(config-if-Vl100)# show active
  interface Vlan100
    ip address virtual 10.10.10.1/28
switch(config-if-Vl100)#

```

- These commands configure **10.1.1.1** as the primary address and **10.2.2.2** as the virtual VTEP address.

```
switch1
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.1.1.1/24
switch(config-if-Lo5)# ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# show active
  interface Loopback5
    ip address 10.1.1.1/24
    ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 5
switch(config-if-Vx1)# show active
  interface Vxlan1
    vxlan source-interface Loopback5
```

```
vxlan udp-port 4789
vxlan vlan 100 vni 10000
switch(config-if-Vx1)#

switch2
switch(config)# interface vxlan1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)# vxlan flood vtep 10.2.2.2
```

17.4.5 redistribute attached-host

Use the **redistribute attached-host** to redistribute the source routes in the MRIB via BGP while running multi-agent protocol model for the IPv4 multicast address-family. Thus activates the neighbor to establish a BGP connection.

Command Mode

BGP router address-family configuration mode

Command Syntax

```
redistribute attached-host route-map name
no redistribute attached-host route-map name
default redistribute attached-host route-map name
```

Parameter

route-map *name* Name of the route map.

Example

```
switch(config-router-bgp) # address-family ipv4 multicast
switch(config-router-bgp-af) # neighbor 3.0.0.2 activate
switch(config-router-bgp-af) # redistribute attached-host
```

17.4.6 show arp

Use the **show arp** command to display and modify entries in the Address Resolution Protocol (ARP) cache.

Command Mode

EXEC

Command Syntax

```
show arp [agent [ipv4 | ipv6] | host name | A.B.C.D [host | interface | mac-address | summary] | interface  
[Ethernet | Fabric | Loopback | Management | Port-Channel | Switch | Tunnel | Vlan | VXLAN] | mac-address  
H.H.H | monitor [summary | vrf] | remote vlan | resolve [host | interface | mac-address | A.B.C.D] | summary  
total | vrf [word | all]]
```

Parameters

- **agent** ARP Agent information.
 - **ipv4** Details related to IPv4.
 - **ipv6** Details related to IPv6.
- **host *name*** Hostname filter name.
- ***A.B.C.D*** IP address filter.
 - **host** Hostname filter.
 - **interface** Interface selector.
 - **mac-address** MAC address filter.
 - **summary** Displays a summary of ARP entries.
- **interface** Interface selector.
 - **Ethernet** Ethernet interface.
 - **Fabric** Fabric interface.
 - **Loopback** Hardware interface used in looping packets.
 - **Management** Management interface.
 - **Port-Channel** Port-Channel sub interface.
 - **Switch** Switch interface.
 - **Tunnel** Tunnel interface.
 - **Vlan** Logical interface into a VLAN.
 - **VXLAN** VXLAN tunnel interface.
- **mac-address *H.H.H*** MAC address filter Ethernet address.
- **monitor** Monitored IP/IPv6 addresses.
 - **summary** Displays a summary of monitored IP/IPv6 addresses.
 - **vrf** Displays monitored IP/IPv6 addresses in a VRF.
- **remote vlan** Remote host bindings displaying information about the specified VLAN.
- **resolve** Resolves host names.
 - **host** Hostname filter.
 - **interface** Interface selector.
 - **mac-address** MAC address filter.
 - ***A.B.C.D*** IP address filter.
- **summary** Displays a summary of the ARP entries.
 - **total** Displays a count of the total ARP entries.

- **vrf** Displays ARP entries in a VRF.
 - **word** The VRF name.
 - **all** All virtual routing and forwarding instances.

Examples

- The **show interfaces VXLAN** command displays operational status and configuration information of the specified VXLAN.

```
switch(config)# show interfaces VXLAN 1
VXLAN1 is up, line protocol is up (connected)
  Hardware is VXLAN
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show VXLAN vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
    100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```

- The **show arp** command displays all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface VXLAN 1
Address          Age (sec)  Hardware Addr  Interface
192.168.10.1           -  0000.abab.abab  Vlan100, VXLAN1
```

- The **show arp interface summary** command displays a summary of all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface VXLAN 1 summary
Total: 1
Static: 1
Dynamic: 0
Not learned: 0
```

17.4.7 show interfaces VXLAN

Use the **show interfaces VXLAN** command to display the operational status and configuration information of the specified VXLAN.

Command Mode

EXEC

Command Syntax

show interfaces VXLAN *num*

Parameter

num VXLAN tunnel interface number. Range **1-1**.

Example

```
switch(config)# show interfaces VXLAN 1
VXLAN1 is up, line protocol is up (connected)
  Hardware is VXLAN
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show VXLAN vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
    100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```

17.4.8 show service vxlan

The **show service vxlan** command displays the status of the VXLAN Control Service (VCS) and the received (from all connected VTEPs) and advertised (to all connected VTEPs) MAC address reachability information.

Command Mode

EXEC

Command Syntax

```
show service vxlan [status | switch [SWITCH_TYPE] | vni [VNI_INFO]]
```

Parameters

- **SWITCH_TYPE** displayed by switch type. Options include:
 - **word** hostname, IP address, or ID of the switch.
 - **all** all switches.
- **VNI_INFO** displayed with VNI information. Options include:
 - **advertised** advertised MAC addresses.
 - **received** received MAC addresses.

Example

This command displays the status of the VCS.

```
switch(config)# show service vxlan status
Vxlan Controller Service is : stopped
Mac learning : Control plane
Resync period : 300 seconds
Resync in progress : No
Capability : VXLAN v4 overlay routing
                  VXLAN v4 overlay indirect routing
fm319(config-if-Vx1)#show service vxlan status
Vxlan Controller Service is : stopped
Mac learning : Control plane
Resync period : 300 seconds
Resync in progress : No
Capability : VXLAN v4 overlay routing
                  VXLAN v4 overlay indirect routing

switch(config) #
```

17.4.9 show vxlan address-table

The **show vxlan address-table** command displays the vxlan address table. Entries are created by extracting information from packets received from remote VTEPs.

The VXLAN address table correlates MAC addresses that are accessible through remote VTEPs with the local VLAN and the IP address of the VTP through which the addressed device is accessible. The VTI uses this table when constructing the VXLAN encapsulation fields to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

Command Mode

EXEC

Command Syntax

```
show vxlan address-table [ENTRY_TYPE] [MAC_ADDR] [VLANS] [REMOTE_VTEP]
```

Parameters

- **ENTRY_TYPE** command filters display by entry type. Options include:
 - **no parameter** all table entries.
 - **configured** static entries; includes unconfigured VLAN entries.
 - **dynamic** entries learned through packet receipts.
 - **static** entries entered by CLI commands.
 - **unicast** entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
 - **no parameter** all MAC addresses table entries.
 - **address mac_address** displays entries with specified address (dotted hex notation – H.H.H).
- **VLANS** command filters display by VLAN.
 - **no parameter** all VLANs.
 - **vlan v_num** VLAN specified by **v_num**.
- **REMOTE_VTEP** Filters entries by IP address of the remote VTEPs. Options include:
 - **no parameter** all items.
 - **vtep ipaddr_1 [ipaddr_2...ipaddr_n]** Identifies VTEPs by their IP address.

Example

This command displays the VXLAN address table.

```
switch> show vxlan address-table
          Vxlan Mac Address Table
-----
Vlan  Mac Address      Type     Prt   Vtep           Moves   Last Move
----  -----  -----
  51  0000.0051.0101  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  51  0000.0051.0102  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  51  0000.0051.0103  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  51  0000.0051.0104  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  51  0000.0051.0105  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  61  0000.0061.0102  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  61  0000.0061.0103  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  61  0000.0061.0104  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
  61  0000.0061.0105  DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
```

17.4.10 show vxlan counters

The **show vxlan counters** command displays the VXLAN counters.

Command Mode

EXEC

Command Syntax

show vxlan counters ROUTE_TYPE

Parameters

- **ROUTE_TYPE** Specifies the type of VXLAN counter displayed by the command.
 - **software** Command displays software routers.
 - **varp** Command displays virtual-ARP counters.
- **vtep** Command displays counters for VTEPs which are identified by their IP address. An optional keyword allows the user to view a single direction of the counters:
 - **encap** “encap” counters count packets coming from the edge, encapsulated on the device and directed to the core.
 - **decap** “decap” counters count packets coming from the core, decapsulated on the device and heading towards the edge.

Related Command

[clear vxlan counters](#) resets the VXLAN counters.

Examples

- This command displays the VXLAN counters for software routers.

```
switch> show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:45128
decap_bytes_filter:5908326
decap_discard_vxhdr:0
decap_discard_vlan_map:2214730
decap_timeout:0
decap_sock_err:1 switch>
```

- This command displays the VXLAN counters for VTEPs.

| VTEP | Decap Bytes | Decap Known Unicast Packets | Decap BUM Packets | Decap Drop or Exception Packets | |
|----------|-------------|-----------------------------|-------------------|---------------------------------|--------------|
| | | | | Drop | or Exception |
| 1.0.14.1 | 62526968000 | 312632701 | 312636979 | 2 | |
| 1.0.16.1 | 800 | 2 | 6 | 312279633 | |
| 1.0.23.1 | 800 | 2 | 6 | 2 | |

|----------|-------------|---------------|-------------------|
| 1.0.14.1 | 30579308814 | 268239551 | 2 |
| 1.0.16.1 | 1140 | 10 | 2 |
| 1.0.23.1 | 0 | 0 | 0 switch> |

17.4.11 show vxlan flood vtep

The **show vxlan flood vtep** command displays the flood list that the switch is using to perform head-end replication. Head-end replication is a data distribution method that supports Broadcast, Unknown unicast, and Multicast (BUM) traffic over VXLANS by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. The command displays the VLAN ID that references the configured VNIs (**vxlan vlan vni**).

The flood list is determined by the **vxlan flood vtep** command.

Command Mode

EXEC

Command Syntax

```
show vxlan flood vtep [VLANS]
```

Parameters

VLANS command filters display by the reference VLAN.

- **no parameter** all VLANs.
- **vlan v_range** VLANs specified by **v_range**.

Valid **v_range** formats include number, range, or comma-delimited list of numbers and ranges.

Guidelines

The command displays flood list contents only when the VLAN line protocol status is **up**.

Related Command

vxlan flood vtep configures the flood list.

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan flood vtep vlan 100-102
          Vxlan Flood Vtep Table
-----
Vlan    Ip Address
-----
100    3.3.3.3
101    11.1.1.1      11.1.1.2      11.1.1.3
102    11.1.1.1      11.1.1.2      11.1.1.3
                  12.1.1.1
```

17.4.12 show vxlan vtep

The **show vxlan vtep** command displays information about remote VTEPs discovered by the configured VTI and exchanged packets.

Command Mode

EXEC

Command Syntax

```
show vxlan vtep [detail | summary] [type {ecmp | flood | multicast | unicast}]
```

Parameters

- **detail** - Displays details about the VXLAN VTEP.
- **summary** - Displays a summary of the VXLAN VTEP information.
- **type** - Displays the type of tunnel.
 - **ecmp** - Designates an ECMP tunnel.
 - **flood** - Designates a flood list tunnel.
 - **multicast** - Designates a multicast tunnel.
 - **unicast** - Designates a unicast tunnel.

Note: A tunnel may have more than one type listed in the output.

Examples

- Use the following command to display the VTEPs exchanging data with the configured VTI.

```
switch# show vxlan vtep
Remote vteps for Vxlan1:
VTEP      Tunnel Type(s)
-----
1.1.1.1   flood, unicast
2.2.2.2   flood
3.3.3.3   flood, ECMP
4.4.4.4   multicast
Total number of remote VTEPS: 4
```

- Use the following command to display detailed information about the VTEPs exchanging data with the configured VTI:

```
switch# show vxlan vtep detail
          Remote VTEPs for Vxlan1:
VTEP      Learned Via      MAC Address Learning      Tunnel Type(s)
-----
1.1.1.1   data plane     datapath                flood, unicast
2.2.2.2   control plane  control plane           flood
3.3.3.3   data plane     datapath                flood, ECMP
4.4.4.4   control plane  datapath                multicast
Total number of remote VTEPS: 4
```

17.4.13 vxlan flood vtep

The **vxlan flood vtep** command supports VXLAN head-end replication by creating or modifying a list that specifies remote VTEPs to which the switch bridges replicated traffic. Head-end replication is a data distribution method that supports Broadcast, Unknown unicast, and Multicast (BUM) traffic over VXLANS by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MACs.

Each **vxlan flood vtep** statement in ***running-config*** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.

The **vxlan flood vtep** command is available in the following formats to create or modify corresponding ***running-config*** statements:

- **vxlan flood vtep** creates a statement for a specified VNI and replaces existing statements for that VNI.
- **vxlan flood vtep add** modifies an existing flood statement by adding the specified VTEPs. This statement creates a list if it references a VNI that has no flood statement.
- **vxlan flood vtep remove** modifies an existing flood statement by deleting the specified VTEPs. This statement has no effect if it references a VNI that has no flood statement.

The **vxlan flood vtep** command specifies a VNI by referencing its associated VLAN ID (**vxlan vlan vni**). The command provides these options for specifying the reference VLANs:

- **a single VLAN**: creates or modifies a single statement referenced by the command.
- **a range of VLANs**: creates or modifies all statements referenced by the VLAN range.
- **no VLAN**: creates or modifies the default list.

The **no vxlan flood vtep** and **default vxlan flood vtep** commands remove the specified flood list by deleting the corresponding **vxlan flood vtep** statements from ***running-config***. Commands that specify a VLAN range remove all corresponding statements.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan [ ACCESS_VNI] flood vtep] MODIFY] VTEP_1 [VTEP_2]...[VTEP_N]
no vxlan [ACCESS_VNI] flood vtep
default vxlan [ACCESS_VNI] flood vtep
```

Parameters

- **ACCESS_VNI** VLAN ID associated to the flood list's target VNI. Value ranges from **1** to **4094**.
 - **no parameter** default list.
 - **vlan vlan_range** List of VLANs. (Number, range, comma-delimited list of numbers and ranges). Numbers range from **1** to **4094**.
- **MODIFY** Statement modification method. Options include:
 - **no parameter** creates new list for specified VLANs. Current list is overwritten.
 - **add** specified VTEPs are added to existing list.
 - **remove** specified VTEPs are deleted from existing list.
- **VTEP_X** IPv4 address of VTEPs that are added or removed from the list.

Examples

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan flood vtep 10.1.1.1 10.1.1.2
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through **vlan101** and **vlan 102**.

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan flood vtep 10.1.1.1 10.1.1.2
    vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
    vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

- These commands add two VTEPs for the VNI access through **vlan 102**.

```
switch(config-if-Vx1)# vxlan vlan 102 flood vtep add 12.1.1.1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan flood vtep 10.1.1.1 10.1.1.2
    vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
    vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3 12.1.1.1
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

17.4.14 vxlan multicast-group decap

The **vxlan multicast-group decap** command enables VXLAN multicast decapsulation.

VTEPs are enabled by VXLAN multicast decapsulation, supporting Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

The **no vxlan multicast-group decap** and **default vxlan multicast-group decap** commands disable VXLAN multicast decapsulation.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan multicast-group decap group_addr
no vxlan multicast-group decap
default vxlan multicast-group decap
```

Parameter

group_addr IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

Examples

- This command enables VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

- This command disables VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1
switch(config-config-if-Vx1)# no vxlan multicast-group decap 230.1.1.1
switch(config-config-if-Vx1)#
```

17.4.15 vxlan source-interface

The **vxlan source-interface** command specifies the interface from which the configuration mode VXLAN Interface (VTI) derives the source address (IP) that it uses when exchanging VXLAN frames. There is no default source interface assignment.

The **no vxlan source-interface** and **default vxlan source-interface** commands remove the source interface assignment from the **interface-vxlan** configuration mode by deleting the corresponding **ip vxlan source-interface** command from **running-config**.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan source-interface INT_NAME
no vxlan source-interface
default vxlan source-interface
```

Parameters

INT_NAME Interface type and number. Options include:

- **loopback *I_num*** Loopback interface specified by *I_num*.

Guidelines

A VXLAN interface is inoperable without the source-interface assignment.

Related Command

[interface vxlan](#) places the switch in VXLAN interface configuration mode.

Example

These commands configure VTI 1 to use the IP address **10.25.25.3** as the source address of outbound VXLAN frames.

```
switch(config)# interface loopback 15
switch(config-if-Lo15)# ip address 10.25.25.3/24
switch(config-if-Lo15)# exit
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan source-interface loopback 15
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan source-interface Loopback15
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

17.4.16 vxlan udp-port

The **vxlan udp-port** command associates a UDP port with the configuration mode VXLAN Interface (VTI). By default, UDP **port 4789** is associated with the VTI.

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header that includes the VNI associated with the VLAN and the IP address of the VTEP that connects to the recipient, then sent through the UDP port. Packets that arrive through the UDP port are sent to the bridging domain of the recipient VLAN as determined by the VNI number in the VXLAN header and the interface's VNI-VLAN map.

The **no vxlan udp-port** and **default vxlan udp-port** command restores the default UDP port association (**4789**) on the configuration mode interface by deleting the corresponding **vxlan udp-port** command from **running-config**.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan udp-port port_id
no vxlan udp-port
default vxlan udp-port
```

Parameter

port_id UDP port number. Value ranges from **1024** to **65535**.

Guidelines

UDP **port 4789** is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Related Commands

[interface vxlan](#) places the switch in **interface-vxlan** configuration mode.

Examples

- This command associates UDP **port 5500** with **interface vxlan 1**.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan udp-port 5500
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 5500
switch(config-if-Vx1)#

```

- This command resets the **interface vxlan 1** UDP port association of **4789**.

```
switch(config-if-Vx1)# no vxlan udp-port
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#

```

17.4.17 vxlan vlan vni

The **vxlan vlan vni** command associates a VLAN ID with a virtual network identifier (VNI). A VNI is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN Tunnel Interface (VTI). VNI values range from **1** to **16777215** in decimal notation and from **0.0.1** to **255.255.255** in dotted decimal notation.

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI that is associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace the existing VLAN assignment statement in **running-config**. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The **no vxlan vlan vni** and **default vxlan vlan vni** commands remove the specified VLAN-VNI association from the configuration mode interface by deleting the corresponding **vxlan vlan** command from **running-config**.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan vlan vlan_id vni [vni_id]  
no vxlan vlan vlan_id vni [vni_id]  
default vxlan vlan vlan_id vni [vni_id]
```

Parameters

- ***vlan_id*** number of access VLAN. Value ranges from **1** to **4094**.
- ***vni_id*** VNI number. Valid formats: decimal **1** to **16777215** or dotted decimal **0.0.1** to **255.255.255**.

Example

These commands associate **vlan 100** to **vni 100** and **vlan 200** to **vni 10.10.200**.

```
switch(config)# interface vxlan 1  
switch(config-if-Vx1)# vxlan vlan 100 vni 100  
switch(config-if-Vx1)# vxlan vlan 200 vni 10.10.200  
switch(config-if-Vx1)# show active  
interface Vxlani  
    vxlan udp-port 4789  
    vxlan vlan 200 vni 658120  
    vxlan vlan 100 vni 100  
switch(config-if-Vx1)# vxlan vni notation dotted  
switch(config-if-Vx1)# show active  
interface Vxlani  
    vxlan udp-port 4789  
    vxlan vlan 200 vni 10.10.200  
    vxlan vlan 100 vni 0.0.100  
switch(config-if-Vx1)#[/pre>
```

17.4.18 vxlan vni notation dotted

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. A Virtual Network Identifier (VNI) is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface. VNI values range from **1** to **16777215** in decimal notation and from **0.0.1** to **255.255.255** in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notion regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

The **no vxlan vni notation dotted** and **default vxlan vni notation dotted** commands restore the default setting of displaying vni numbers in decimal notation by deleting the **vxlan vni notation dotted** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
vxlan vni notation dotted
no vxlan vni notation dotted
default vxlan vni notation dotted
```

Examples

- These commands configure the switch to display VNI numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1) #
```

- These commands configure the switch to display VNI numbers in decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)# no vxlan vni notation dotted
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 197637
switch(config-if-Vx1) #
```

Ethernet VPN (EVPN)

This chapter describes the Arista EVPN implementation. Sections in this chapter include the following topics:

- EVPN Overview
- EVPN Layer 3 Core Operations
- Integrated Routing and Bridging
- VPN MPLS Transport Options
- EVPN Type-5 Routes: IP Prefix Advertisement
- BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures
- VXLAN DSCP Mapping
- EVPN E-Tree for MPLS and VXLAN
- EVPN IGP Cost for VTEP Reachability
- EVPN VXLAN Single-Gateway Centralized Routing
- Inter-VRF Local Route Leaking
- EVPN Multicast VRF Leaking
- Static Inter-VRF Route
- VCS to EVPN Hitless Migration
- Configuring EVPN
- Sharing Equivalence Class entry across multiple VRF
- Sample Configurations
- EVPN and VCS Commands

18.1 EVPN Overview

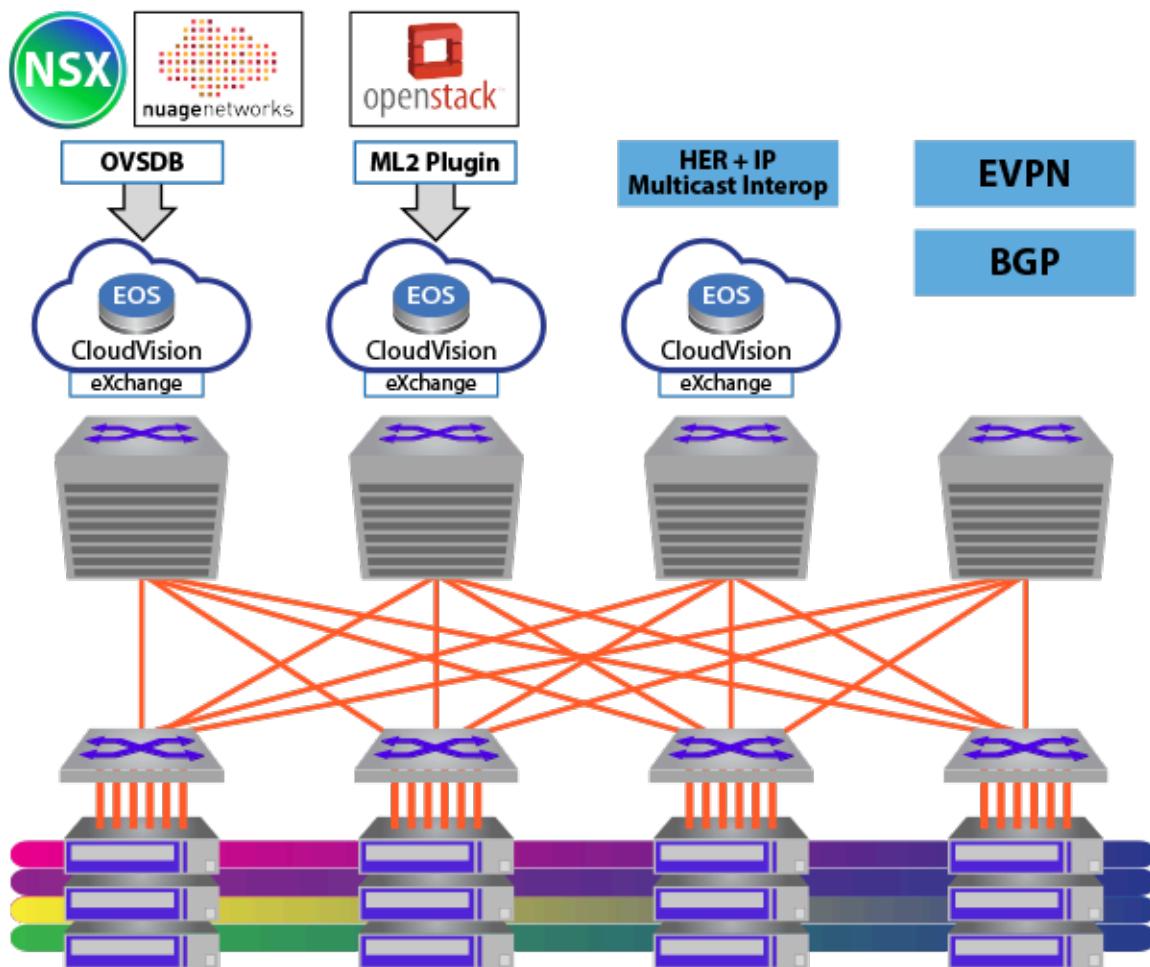

Ethernet VPN (EVPN) is a standards-based BGP control plane to advertise MAC addresses, MAC and IP bindings and IP Prefixes. This document focuses on EVPN and its operation with a VXLAN data plane for building overlay networks in the data center.

A number of control planes exist today for VXLAN, based on specific use cases, whether it be a requirement to integrate with an SDN overlay controller, or operate in a standards based flood and learn control plane model.

Current flood and learn models operate either with a multicast control plane, or ingress replication, where the operator manually configures the remote VTEPs in the flood list. Both of these are data-plane driven, that is, MAC's are learned via flooding. In the IP multicast model MAC's are learned in the underlay via flooding to an IP multicast group, while ingress replication (HER) floods to configured VTEP endpoints and no IP Multicast is required in the underlay.

The controller based solution with Cloud Vision eXchange (CVX), locally learned MAC's are published to a centralized controller and these MAC's are then programmed to all participating VTEPs.

Figure 18-1: Different VXLAN Control Planes

A controller-less BGP EVPN MAC learning is a standards-based control-plane (MP-BGP) is used to discover remote VTEPs and advertise MAC address and MAC/IP bindings in the VXLAN overlay, thus eliminating the flood and learn paradigms of the previously mentioned (multicast or HER) controller-less approaches. As a standards-based approach, the discovery and therefore the advertisement of the EVPN service models can inter-operate amongst multiple vendors.

This highlights an important and powerful advantage of BGP EVPN; that being, it is a single control plane for multiple data-plane encapsulations and defines both Layer 2 and Layer 3 VPN services. As network operators drive toward simplicity and automation, having one control plane protocol and address family for all data-planes and VPN services will prove extremely powerful.

Figure 18-2: VXLAN Control Plane and Data-plane Definitions

The initial EVPN standard is *RFC 7432* defined the BGP EVPN control plane and specifies an MPLS data-plane. The control plane with an MPLS data plane was extended to consider additional data plane encapsulations models including VXLAN, NVGRE, and MPLS over GRE.

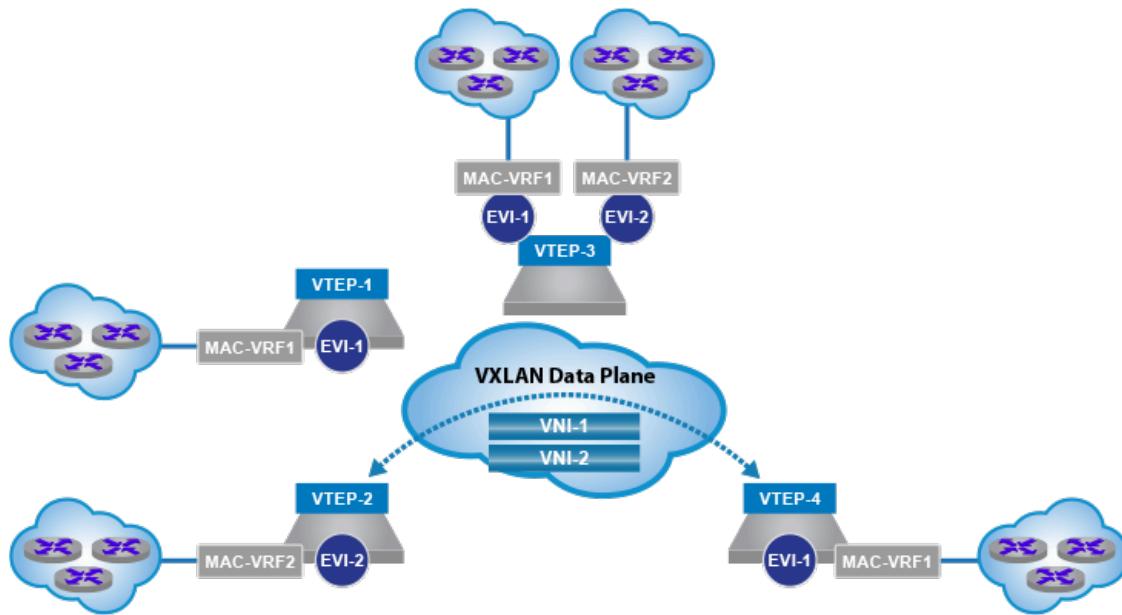

18.1.1 EVPN Terminology

The EVPN standard, in the context of an NVO environment, defines the functionality for delivering multi-tenant Layer 2/3 VPN services using either VXLAN, NVGRE, or MPLS over GRE encapsulation across a common physical IP infrastructure. The standard introduces new terminology specific to a NVO environment, which is summarized below in relation to VXLAN encapsulation.

Network Virtualization Overlay (NVO): The overlay network used to deliver the Layer 2 and Layer 3 VPN services. For VXLAN encapsulation, this would define a VXLAN domain, which would include one or more VNIs, for the transportation of tenant traffic over a common IP underlay infrastructure.

- **Network Virtualization End-Point (NVE):** The provider edge node within the NVO environment is responsible for the encapsulation of tenant traffic into the overlay network. For a VXLAN data plane, this defines the Virtual Tunnel End-Point (VTEP).
- **Virtual Network Identifier (VNI):** The label identifier within the VXLAN encapsulated frame, defining a Layer 2 domain in the overlay network.
- **EVPN instance (EVI):** A logical switch within the EVPN domain that spans and interconnects multiple VTEPs to provide tenant Layer 2 and Layer 3 connectivity.
- **MAC-VRF:** A Virtual Routing and Forwarding table for storing Media Access Control (MAC) addresses on a VTEP for a specific tenant.

Figure 18-3: EVPN Terminology for a VXLAN Data Plane

The new EVPN Network Layer Reachability Information (NLRI) is carried in BGP using Multi-protocol BGP Extensions with a newly defined Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI).

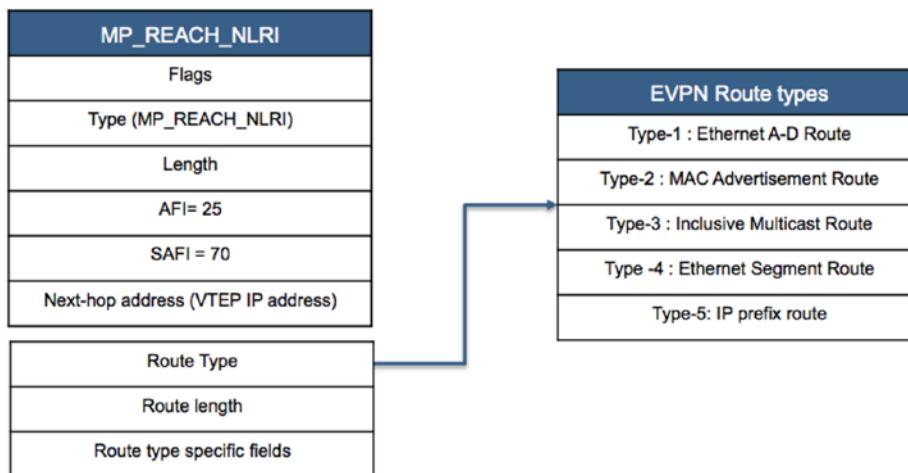

To provide multi-tenancy, the standard uses the above traditional VPN methods to control the import and export of routes and provide support for overlapping IP address between tenants.

Multi-protocol BGP for EVPN: A new AFI and SAFI have been defined for EVPN. These are AFI=25 (Layer 2 VPN) and SAFI = 70 (EVPN).

- **EVPN Layer 2/Layer 3 tenant segmentation:** Similar to standard MPLS VPN configurations Route Distinguisher's (RD's) and Route Targets (RT's) are defined for the VPN.
- **Route Target (RT):** To control the import and export of routes across VRFs, EVPN routes are advertised with Route-Target (RT) (BGP extended communities). The RT can be auto-derived to simplify the rule configuration; typically, this is based on the AS number and the VNI of the MAC-VRF.
- **Route Distinguisher (RD):** Unique number prepended to the advertised address within the VRF, ensuring support for overlapping IPs and MACs across different tenants.

The format of the MP_REACH_NLRI/MP_UNREACH_NLRI attribute, holding the new EVPN NLRI is illustrated below, where the next-hop address within the NLRI is the IP address of the VTEP advertising the EVPN route.

Figure 18-4: EVPN NLRI Route Format

As illustrated, the original *MPLS RFC (7348)* and subsequent IP prefix draft ([EVPN Terminology](#)), introduce five unique EVPN route types.

Type-1 Route: Ethernet A-D route

Ethernet A-D route per ESI route, announces the reachability of a multi-homed Ethernet Segment. The route type is used for fast convergence (ie: 'mass withdraw') functions, as well as split horizon filtering used for active-active multi-homing.

Ethernet A-D route per EVI route, is used to implement the Aliasing and Backup Path features of EVPN associated with active-active multi-homing.

Type-2 Route: Host advertisement Route

Used to advertise the reachability of a MAC address, or optionally a MAC and IP binding as learned by a specific EVI. With the advertisement of the optional IP address of the host, EVPN provides the ability for VTEPs to perform ARP suppression and ARP proxy to reduce flooding within the Layer 2 VPN.

Type-3 Route: Inclusive Multicast route

The type-3 route is used to advertise the membership of a specific Layer 2 domain (VNI within the VXLAN domain), allowing the dynamic discovery of remote VTEPs in a specific VNI and the population of a VTEP ingress flood list for the forwarding of Broadcast Unknown unicast and Multicast (BUM) traffic.

Type-4 Route: Ethernet Segment Route

The type-4 route is specific to VTEPs supporting the EVPN multi-homing model, for active-active and active-standby forwarding. The route is used to discover VTEPs which are attached to the same shared Ethernet Segment. Additionally, this route type is used in the Designated Forwarder (DF) election process.

Type-5 Route: IP-prefix route advertisement

The type-5 route is used to advertise IP prefixes rather than MAC and IP hosts addresses of the type-2 route. This advertisement of prefixes into the EVPN domain provides the ability to build classic Layer 3 VPN topologies.

A detailed understanding of the function of each of these route types in the operation of EVPN to provide multi-tenant Layer 2 and 3 VPN services, is defined in Section 4 of this document.

While this guide focuses on EVPN with VXLAN data-plane encapsulation, it's important to note that, in addition to the new routes type, a BGP encapsulated extended community is included in all advertisements to determine the data-plane encapsulation.

The Encapsulation extended community is defined in *RFC 5512*. The different IANA registered tunnel types for an NVO environment are summarized in the table below.

Figure 18-5: Defined Data-Plane Encapsulations

| Extended Community Value | Name | Reference |
|--------------------------|----------|---|
| 8 | VXLAN | draft-ietf-bess-evpn-overlay-08 |
| 9 | NVGRE | draft-ietf-bess-evpn-overlay-08 |
| 10 | MPLS | RFC 7342 |
| 11 | MPLSoGRE | draft-ietf-bess-evpn-overlay-08 |

18.1.2 EVPN Service Models

An EVPN Instance (EVI), can contain, one or more Layer 2 broadcast domains (VLANs).

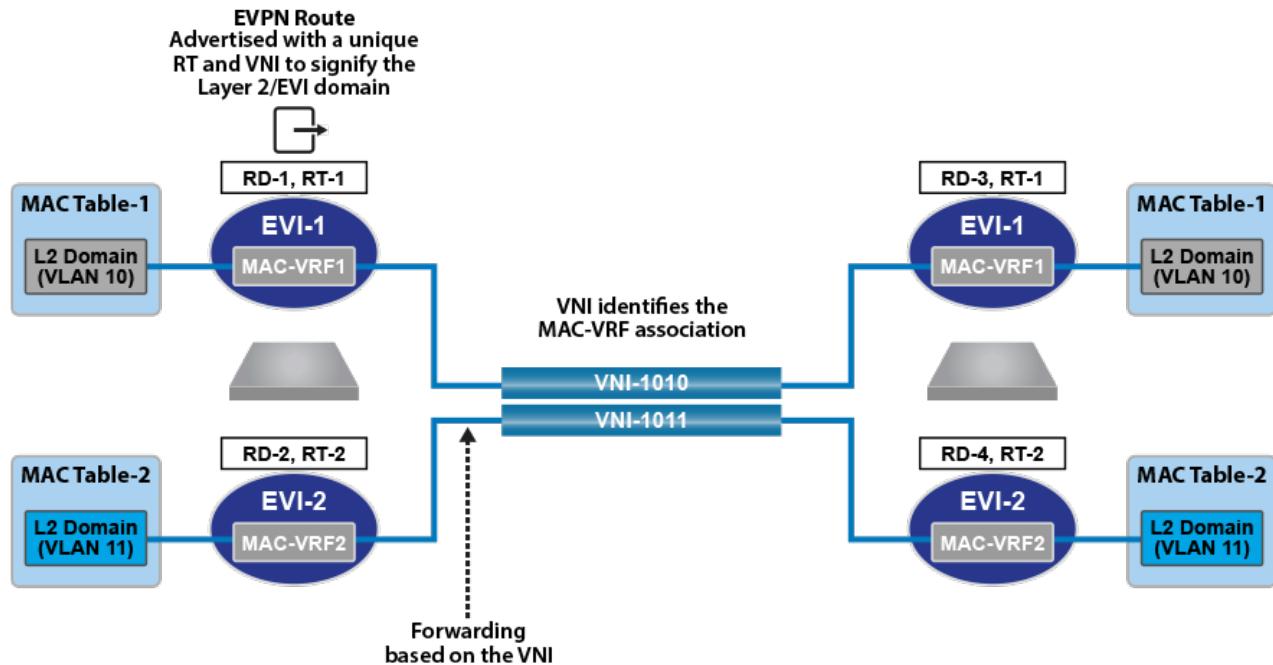

Three EVPN service models—VLAN-based, VLAN bundle, and VLAN aware bundle—define the association of VLAN IDs to a specific EVI instance and how a VLAN tag can be transported within the EVI if required.

18.1.2.1 VLAN Based Service Interface

In the VLAN-based service there is a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVPN instance. With the MAC-VRF mapping directly to the associated VLAN, there will be a single bridge

table within the MAC-VRF. The VLAN tag is not carried in any route update and the VNI label in the route advertisement is used to uniquely identify the bridge domain of the MAC-VRF in the VXLAN forwarding plane.

Figure 18-6: VLAN-Based Service Interface

With a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVI instance, the EVI will represent an individual tenant subnet/VLAN in the overlay. The one-to-one mapping also means the route-target associated with the MAC-VRF, uniquely identifies the tenant's subnet/VLAN, providing granular importing of MAC routes on a per VLAN basis on each VTEP.

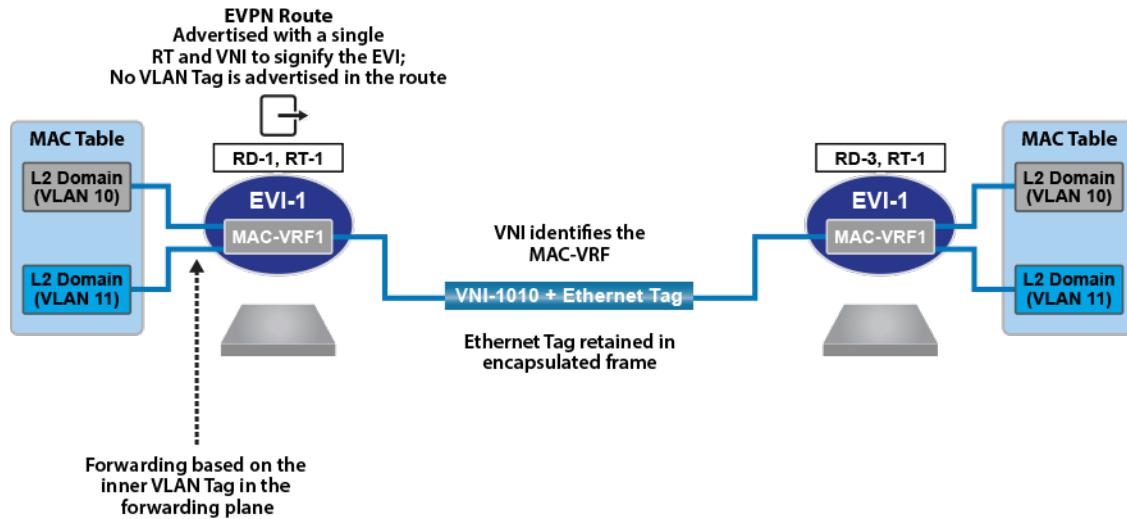

In this service, the associated MAC-VRF table is identified by the Route-Target in the control plane and by the VNI in the data plane and the MAC-VRF table corresponds to a single VLAN bridge domain.

18.1.2.2 VLAN Bundle Service Interface

In the VLAN bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. The MAC-VRF, however, only contains a single Layer 2 bridge table and VNI label. Thus MAC addresses must be unique across all associated VLANs.

With the MAC-VRF containing a single Layer 2 bridge table and a single VNI, the original VLAN tag has no significance in the control plane and is not carried in any EVPN route update. The original Ethernet tag and the VNI label are carried in the VXLAN data plane, to allow forwarding to the correct tenant VLAN.

Figure 18-7: VLAN Bundle Service Interface

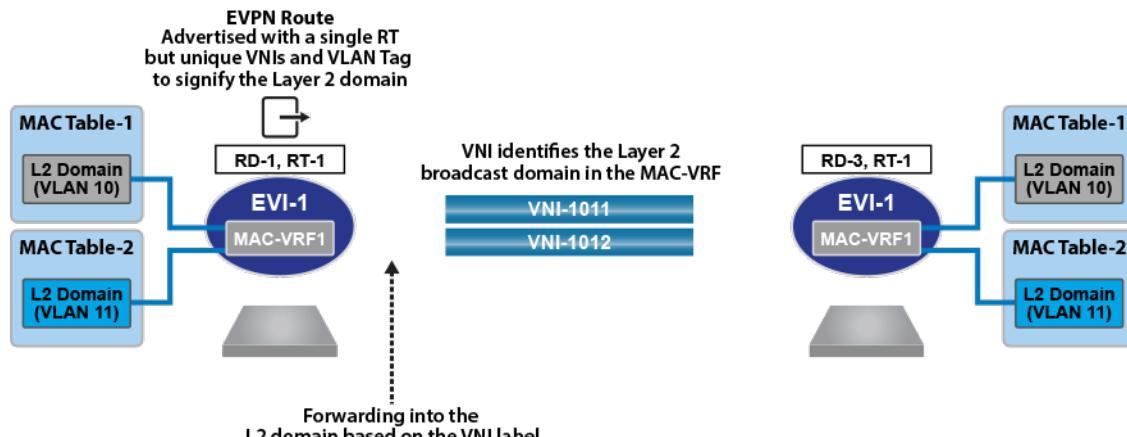

In this service, the Route-Target associated with the MAC-VRF identifies the tenant rather than an individual subnet/VLAN of a tenant. This means all MAC routes for the tenant will be imported on the VTEP regardless of whether or not the specific tenant VLAN exists. The MAC-VRF table is identified by the Route-Target in the control plane, and forwarding to the appropriate tenant VLAN is achieved via a combination of the VNI and Ethernet tag in the VXLAN data plane.

18.1.2.3 VLAN Aware Bundle Service Interface

In the VLAN aware bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. However, the MAC-VRF contains a unique Layer 2 bridge table for each associated VLAN-ID and a unique VNI label for each bridge domain.

With the MAC-VRF containing multiple Layer 2 bridge tables, the VLAN tag is carried in any EVPN route update to allow mapping to the correct tenant bridge table within the MAC-VRF. Only the unique VNI label is carried in the VXLAN data plane, to allow forwarding to the correct VLAN with the MAC-VRF.

Figure 18-8: VLAN Aware Bundle Service

In this service, the MAC-VRF of the EVI instance represents multiple subnet/VLANs of the tenant. The Layer 2 bridge table of the MAC-VRF is identified by a combination of the Route-Target and the Ethernet tag in the control plane and by the unique VNI in the VXLAN data plane.

This service type is a common DCI/WAN deployment, where a tenant's VLANs are bundled into single EVI instance. At the same time, VLAN "awareness" can be retained in the EVPN service as the VNI tag is advertised in the MAC-IP route (which now identifies the VLAN within the EVI). Bundling into a service like this reduces the number of EVI's that need to be configured, reducing complexity and the control-plane signalling between PE's.

18.1.3 VCS and EVPN in DCI

When VXLAN Control Services (VCS) is enabled on a CloudVision eXchange (CVX) of a Data Center (DC), each VXLAN Tunnel End Point (VTEP) connects to the corresponding CVX to share the Layer 2 bridging information of its attached hosts. In turn, CVX advertises this information to all VTEPs within the DC.

In a topology consisting of multiple DCs where each DC runs its own CVX instance, as shown below, a federation of CVXs can be created by using BGP-EVPN. In such Data Center Interconnect (DCI) topologies, CVX in each DC performs the following functions to advertise the Layer 2 bridging information (MAC-VTEP bindings) to all VTEPs in different DCs:

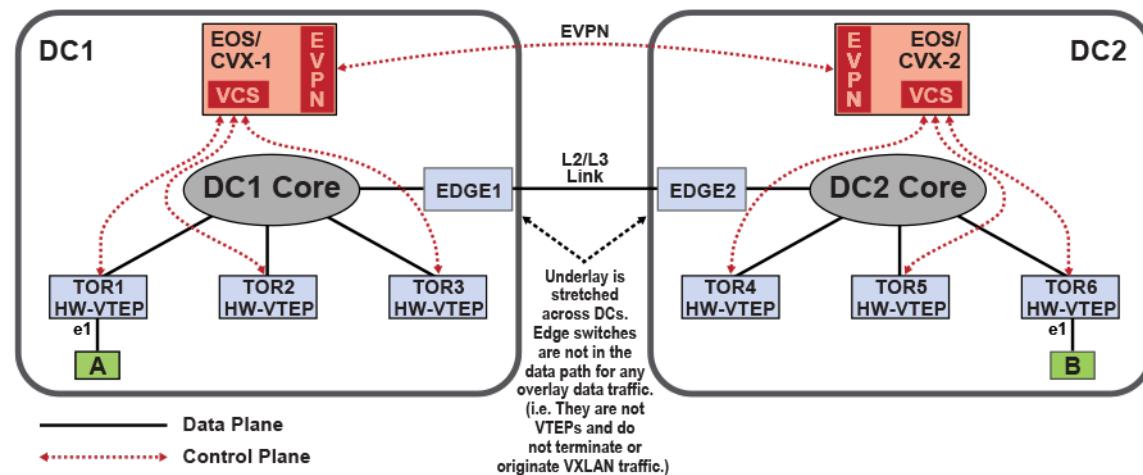

- Receives the local Layer 2 bridging information in CVX control plane format from all VTEPs within the DC, and advertises it to remote CVXs in the BGP-EVPN NLRI format.
- Receives the Layer 2 bridging information in BGP-EVPN NLRI format from remote CVXs, and advertises it to local VTEPs in the CVX control plane format.

Note: The distribution of Layer 2 bridging information as described above, allows a Layer 2 overlay network to be stretched across multiple DCs without additional VTEP configurations.

The following graphic illustrates the federation of CVX across multiple DCs.

Figure 18-9: CVX Connected from Multiple DCs

18.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)

Ethernet VPN (EVPN) is an extension of the BGP protocol introducing a new address family: Layer 2 VPN (address family number 25) / EVPN (subsequent address family number 70). It is used to exchange overlay MAC and IP address reachability information between BGP peers using type-2 routes. Additionally, EVPN supports the exchange of layer 3 IP overlay routes through the extensions described in (type 5 EVPN routes).

An IP VRF is used on a PE router for each Layer 3 overlay. VRF IP routes are exported into the EVPN BGP table and advertised to remote VTEPs as type 5 routes. The exported EVPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

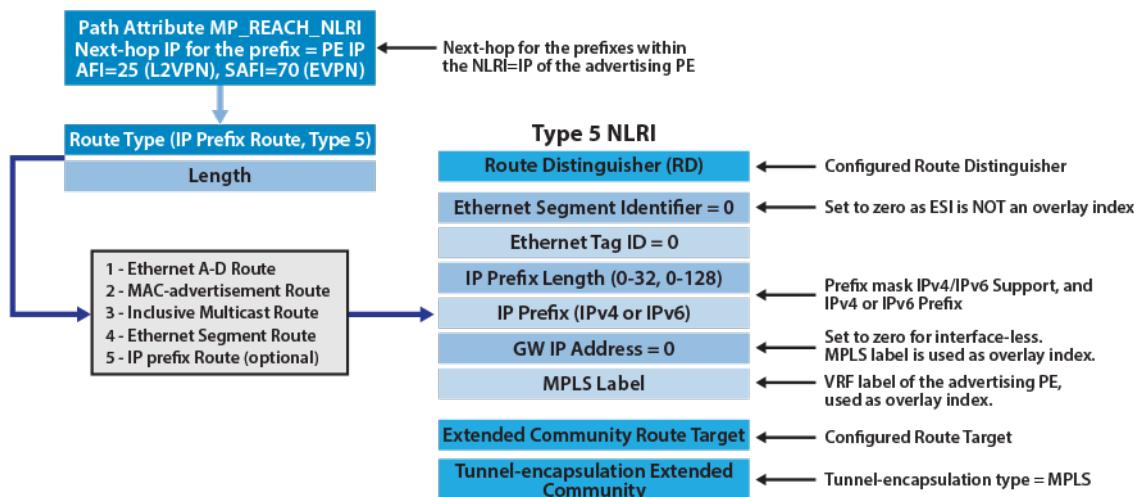

The RTs carried by the EVPN type 5 routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IP table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the Layer 3 (type 5) EVPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by an IP backbone.

The type-5 routes allows you to decouple the advertisement of an IP prefix from any specific MAC address, support floating IP addresses, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The format of the new type-5 IP-prefix route is illustrated in the figure below. Unlike VXLAN, which is used as a transport, BGP route update for MPLS does not specify the router-mac extended community and sets the tunnel encapsulation to MPLS. Unlike with VXLAN encapsulation, which uses the VNI as the overlay index, the MPLS Type-5 route uses the MPLS label.

Figure 18-10: EVPN Route Type-5, for Advertisement of IP-Prefixes over MPLS

The following example offers a more detailed view of the route as displayed on a PE router.

Figure 18-11: EVPN Route Type-5 as Shown on PE

```
dml-261sw24-backbone1.22:22:54#sh bgp evpn route-type ip-prefix ipv4 rd 6.6.6.6:64512 detail

```

As shown in the example, the route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the extended communities of tunnel type (MPLS), MPLS Label value and route-target.

Note: You require **Release EOS 4.21.1F** and later versions with Jericho/Jericho+ platforms.

18.1.5 EVPN VXLAN IPv6 Overlay

Beginning with *EOS Release 4.22.0F*, the EVPN VXLAN L3 Gateway using EVPN IRB supports routing traffic from one IPv6 host to another IPv6 host on a stretched VXLAN VLAN.

18.1.6 iBGP as PE-CE Protocol for BGP and EVPN L3 VPNs

EOS supports iBGP as the Provider Edge (PE) - Customer Edge (CE) as an extension to BGP EVPN Layer 3 (L3) VPNs. The feature provides a method to isolate your network BGP attributes from a Service Provider (SP) backbone attributes by saving the your network BGP attributes into a special attribute called **ATTR_SET, code 128**. This separation introduces a route server model that allows your BGP attributes to be stored in the SP backbone along with the VPN IPv4 and IPv6 paths.

The configuration requires the Autonomous Systems (AS) numbers of the PE Virtual Router Forwarding (VRF) and the CE to match regardless of the VPN AS number on the default VPN. This causes the exported paths by the PE to carry your original attributes through the SP backbone in a new attribute, **ATTR_SET, code 128**. Any CE at a different site sees only your attributes except the next-hop. For better loop prevention and detection, EOS requires any iBGP-configured CE to be configured as a route-reflector client of the PE.

EOS does not restrict exporting and importing VRFs from different sites to sharing the same AS number. When configuring iBGP on the CE, this means that each CE has the same AS number as the VRF in the respective PE, and the AS numbers may be different. To address this issue, a peering relationship exists between exporting and importing VRFs in the SP network. The **ATTR_SET, code 128** carries the AS number of the VRF that exported the paths and the relationship between the origin AS number and the AS number assigned to the VRF importing the paths controls the restoration of the original CE attributes. If the AS numbers do not match, EOS removes the iBGP-specific attributes and prepends the AS-path with the origin AS number, just as eBGP peering does.

The configuration also affects the application of route-maps as follows:

- For export points, route-maps match your attributes and also applies them to the SP-VPN attributes.
- For import points, route maps match the SP-VPN attributes and applies them to the your restored attributes.

18.2 EVPN Layer 3 Core Operations

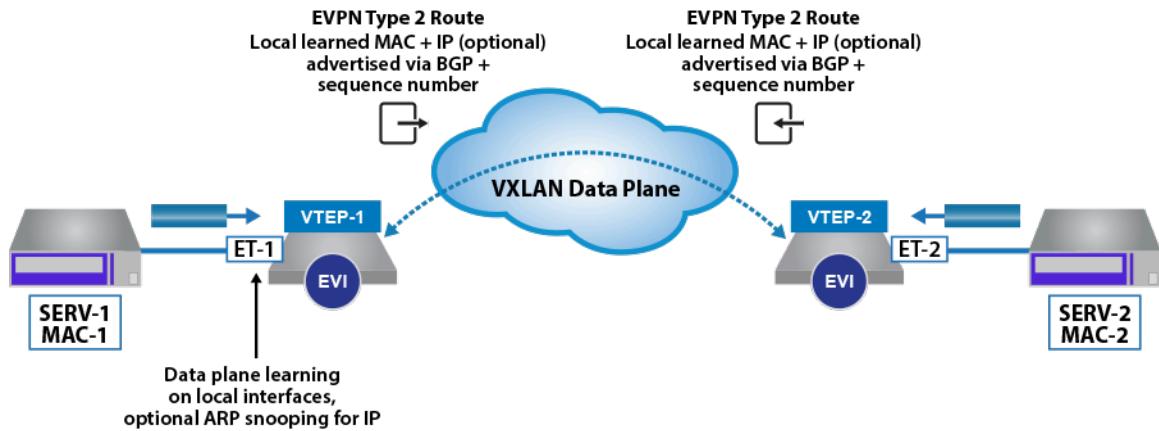

The EVPN standard defines a number of operations and functionality to allow the dynamic learning of MAC and IP bindings, management of MAC moves (VM/host mobility), ARP suppression, automated discovery of remote VTEPs and multi-homing to support active-active topologies.

18.2.1 MAC Address Learning

MAC address learning on the local interface of a VTEP is flow-based learning. However once the MAC addresses are learned locally, they are advertised to BGP peers within the EVI via an EVPN route update. The next hop of the update is set to IP of the advertising VTEP. In the case of EVPN VXLAN the advertised

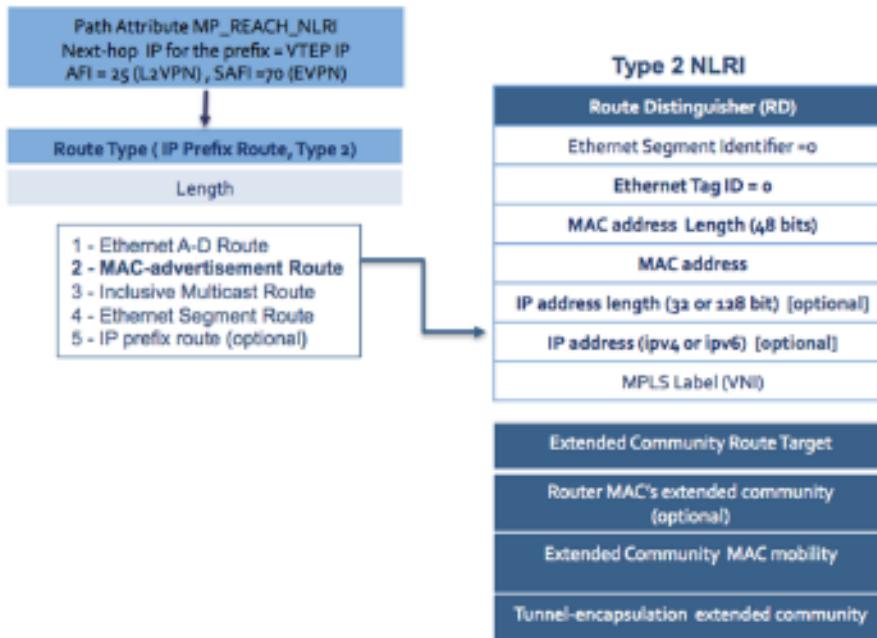

label in the update is the VNI, which identifies the MAC-VRF in the case of a VLAN Based service, or the EVI for a VLAN aware bundle service.

Figure 18-12: EVPN Type 2 Route Announcement

The route advertisements are EVPN type-2 routes, which can advertise just the MAC address of the host, or optionally the MAC and IP address of the host. The format of the type-2 route is illustrated in the figure below, along with the mandatory, and optional extended community attached to the route.

Figure 18-13: EVPN Type 2 MAC and IP Route Format

Notable fields:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.

- Ethernet Segment Identifier (ESI), this field is populated when the VTEP participating in a multi-homed topology. This is discussed in the following sections.
- Ethernet tag ID that will be 0 for VLAN-based service, and the customer VLAN ID in a VLAN-aware bundle service.
- The IP address of the host, which is associated with advertised MAC address. The advertisement of the Host's IP address is optional.
- Label in the context of a VXLAN forwarding plane is the VNI associated with the MAC-VRF/Layer 2 domain the advertised MAC address has been learned on.
- Route Target associated with the MAC-VRF advertised with route to allow the control of the import and export of routes.

The MAC mobility extended community, as discussed in the following section is used during MAC moves to update all VTEPs of the new location of the host.

18.2.2 ARP Suppression

Address Resolution Protocol (ARP) suppression can be supported on the remote VTEPs, providing the option to advertise the MAC and IP binding in the type-2 route. The MAC to IP binding can be learned locally via ARP snooping or DHCP traffic on the VTEP. After the MAC and IP binding has been learned, it is advertised to the remote VTEPs as a type-2 route. This allows remote VTEPs to respond to any ARP requests for the host locally, thus reducing the amount of ARP traffic across the EVI.

Importantly, the optional MAC and IP route can be advertised separately from the MAC-only type-2 route. This is done so that if the MAC and IP route is cleared, i.e., ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC-only route will still exist.

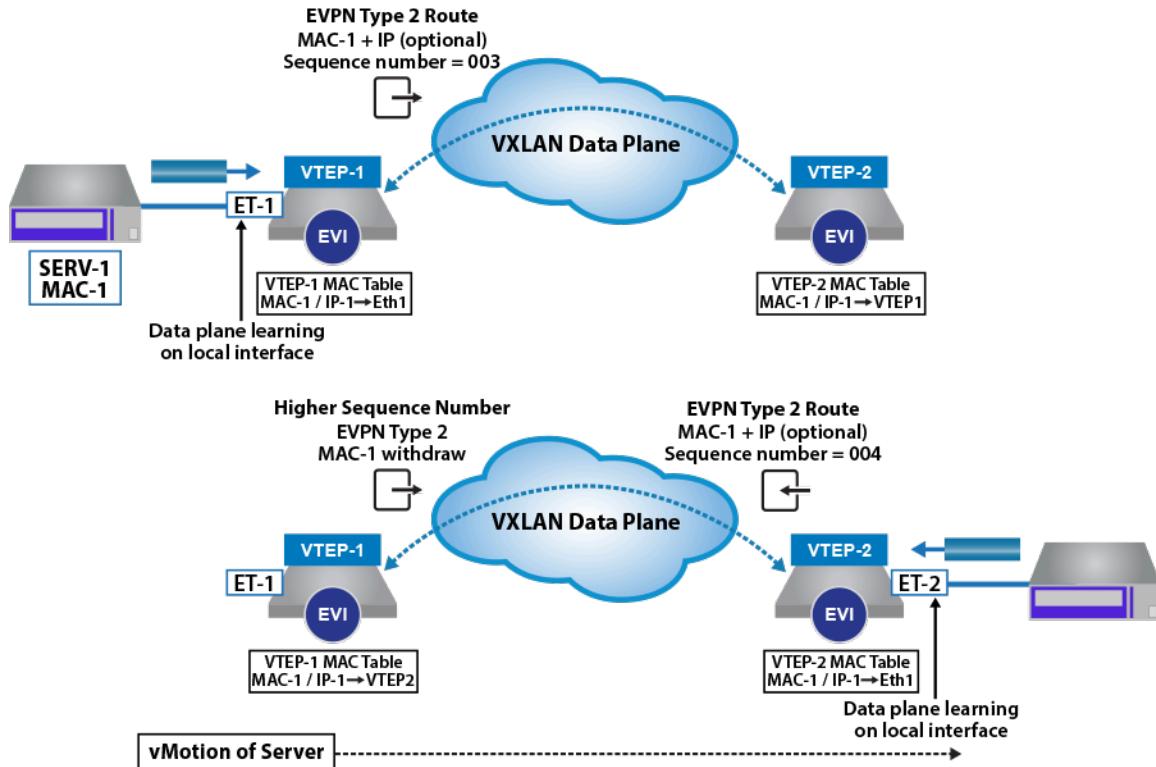

Note: It is best practice to configure the MAC timeout to be greater than the ARP timeout.

18.2.3 MAC Mobility

A common scenario in a data center environment is Virtual Machines (VMs) moving between physical servers, for maintenance or performance reasons. This will result in the MAC of the VM being learned and advertised by a new VTEP.

To cater to this situation, a sequence number is attached to the new MAC advertisement, ensuring an EVI wide refresh of the MAC table, with VTEPs updating their forwarding tables to point to the advertising VTEP as the new next-hop for MAC address.

Figure 18-14: EVPN type-2 MAC Mobility Behavior

When a MAC address is learned and advertised for the first time, it is advertised without a sequence number and the receiving VTEP assume the sequence to be zero. On detection of a MAC move, such as a MAC is learned locally when the same MAC route is active via a type-2 advertisement, then the sequence number is incremented by one, and the MAC route is advertised to the remote peers. The original advertising VTEP, receives the MAC route with a now higher sequence number and withdraws its own local MAC route. All other VTEPs flush the original MAC route, and update their tables with the new higher sequence number route.

18.2.4 MAC Address Damping

In addition to MAC mobility, EVPN defines a protection mechanism to detect and prevent MAC routes from flapping between VTEPs, which can occur during network instability or when hosts have been misconfigured with the same (duplicate) MAC address.

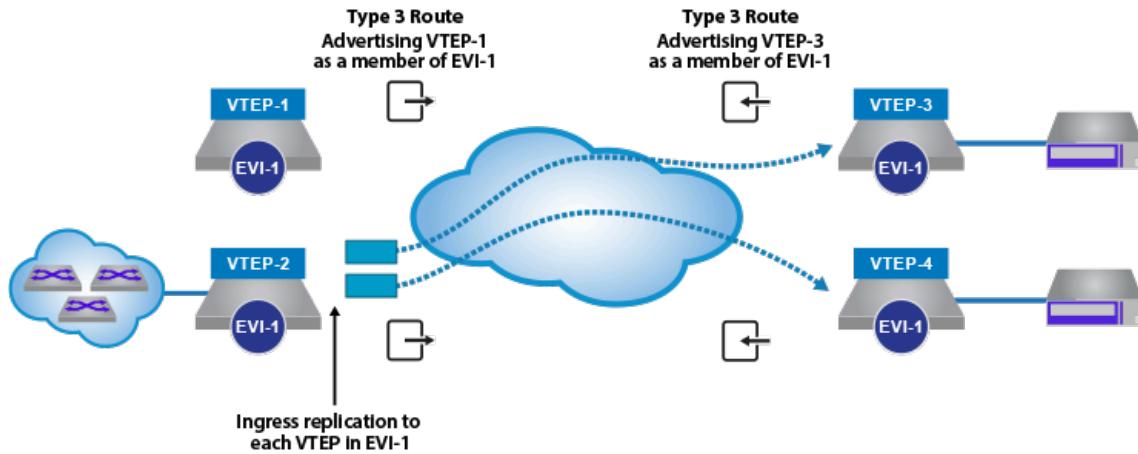

When advertising a locally learned MAC, the VTEP will start a M-second counter (default is 180s), if the VTEP detects N MAC moves (default is 5) for the route within the M-second window, it will generate a syslog message and stops sending and processing any further updates for the route.

18.2.5 Broadcast and Multicast Traffic

Broadcast, Unknown unicast and Multicast (BUM) traffic is handled within the EVPN forwarding model using ingress replication. Where the BUM frame is replicated on the ingress VTEP to each of the remote VTEPs in the associated EVI/VNI. The VTEP replication list for the EVI, is dynamically populated based on Type-3 route

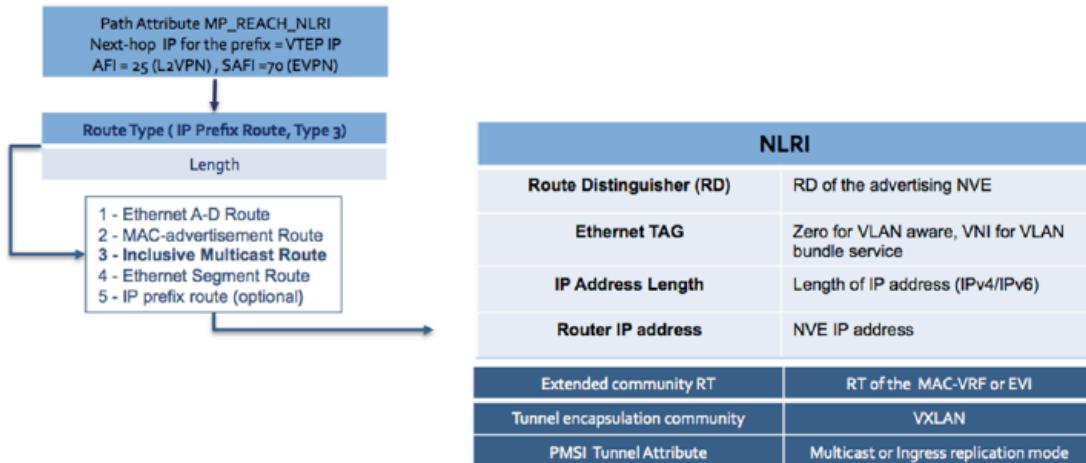

advertisements (Inclusive Multicast Ethernet Tag Route), where VTEPs advertise type-3 routes for each EVI they are members.

Figure 18-15: EVPN type-3 IMET Route Behavior for Ingress Replication

The format of the type-3 route is illustrated below.

Figure 18-16: EVPN Type-3 IMET Route Format

Notable fields of the type-3 route:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.
- Ethernet tag that will be 0 for VLAN-based service, and the MAC-VRF VNI for a VLAN-aware bundle service.
- IP address of the VTEP advertising the type 3 route.
- Route Target associated with the MAC-VRF or the EVI in a VLAN-aware bundle service.
- PMSI Tunnel Attribute, to advertise the replication model the VTEP is supporting. The supported options defined within the standard are ingress replication and IP multicast.

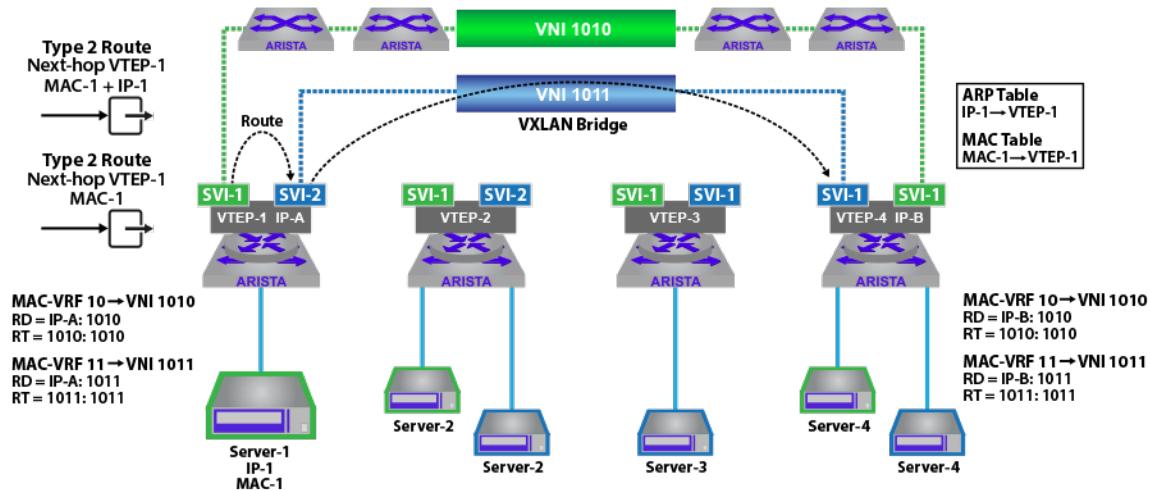

18.3 Integrated Routing and Bridging

In traditional data center design, inter-subnet forwarding is provided by a centralized router, where traffic traverses across the network to a centralized routing node and back again to its final destination. In a large multi-tenant data center environment this operational model can lead to inefficient use of bandwidth and sub-optimal forwarding.

To provide a more optimal forwarding model and avoid traffic tromboning, the IETF draft [Integrated Routing and Bridging in EVPN](#) proposes integrating routing and bridging functionality directly onto the VTEP, thereby allowing the routing operation to occur as close to the end host as possible. The draft proposes two forwarding models for the Integrated Routing and Bridging (IRB) functionality, which are termed asymmetric IRB and symmetric IRB. These two models are described in the following sections.

In the asymmetric IRB model, the inter-subnet routing functionality is performed by the ingress VTEP, with the packet after the routing action being VXLAN bridged to the destination VTEP. The egress VTEP only then needs to remove the VXLAN header and forward the packet onto the local Layer 2 domain based on the VNI to VLAN mapping. In the return path, the routing functionality is reversed with the destination VTEP now performing the ingress routing and VXLAN bridging operation, hence the term asymmetric IRB.

Figure 18-17: EVPN Asymmetric IRB

To provide inter-subnet routing on all VTEPs for all subnets, an anycast IP address is utilized for each subnet and configured on each VTEP. The anycast IP acts as the default gateway for the hosts; therefore, regardless of where the host resides, the directly attached VTEPs can act as the host's default gateway. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisement from remote VTEPs.

In a typical implementation, the optional MAC and IP, type-2 route is advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, for example the ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

The format of the two advertised type-2 routes for Server-1 are illustrated below, where the **RD IP-A:1010** and route-target **1010:1010** are used to distinguish the uniqueness of the route and allow the route to be imported into the correct remote MAC-VRF based on the route-target import policy of the VTEP.

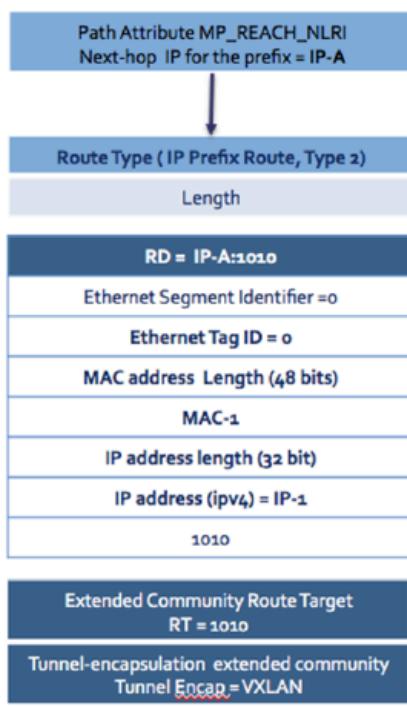

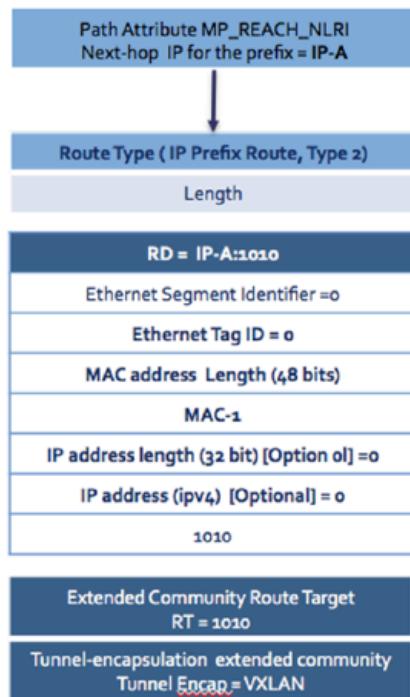

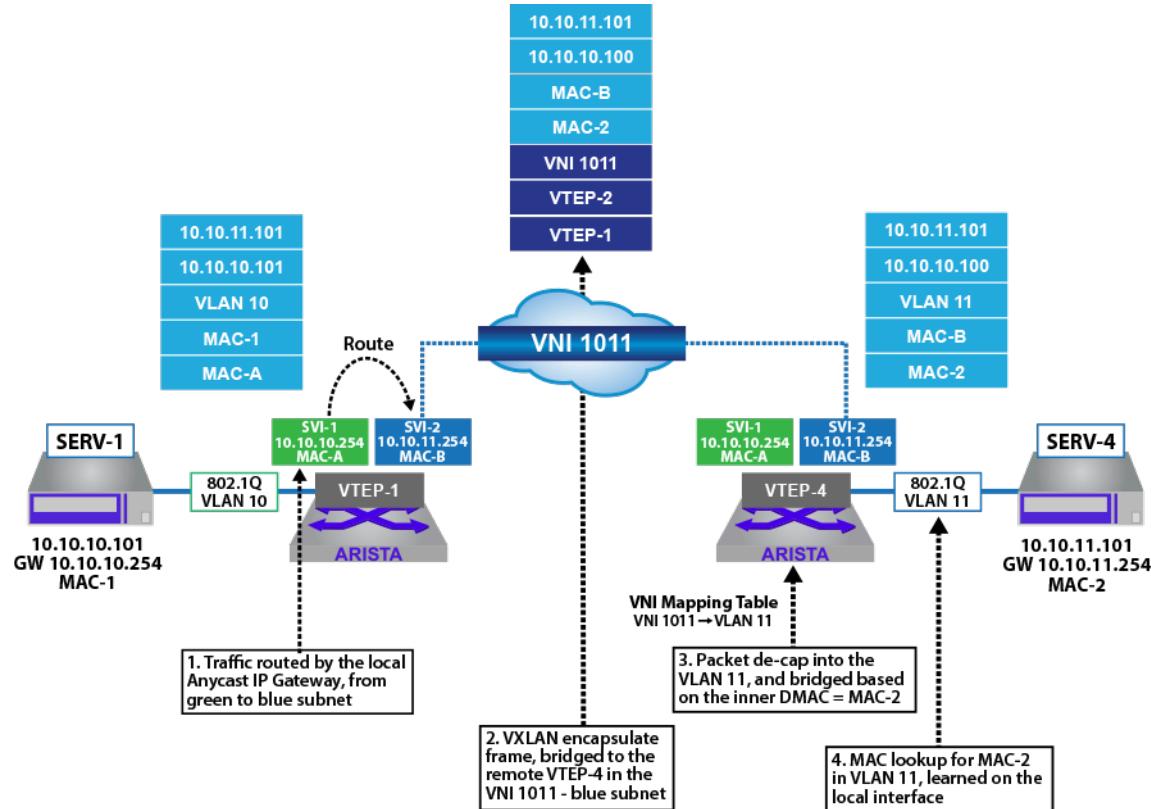

Type 2 MAC and IP for Server-1**Type 2 MAC only for Server-1**

Figure 18-18: EVPN Comparison of MAC & MAC+IP Type 2 Route in Asymmetric IRB

For the traffic flow between **Server-1** in **subnet-10** and **Server-4** in **subnet-11**, the ingress VTEP (**VTEP-1**) locally routes the packet into **subnet-11/VNI 1011** and then VXLAN bridges the frame, inserting the **VNI 1011** into the VXLAN header with an inner DMAC equal to the destination host, **Server-4**. This requires the

receiving VTEP (**VTEP-4**) to only perform a local Layer 2 lookup, based on the VNI to VLAN mapping, for the DMAC of **Server-4**.

Figure 18-19: EVPN Asymmetric IRB VXLAN Data-plane Forwarding Detail

For the asymmetric model to operate the sending VTEP needs the information for all the tenant's hosts (MAC and MAC to IP binding), to route and bridge the packet. This means the VTEP needs to be member of all the tenant's subnets/VNI and have an associated SVI with anycast IP for all the subnets, and this will be required on all VTEPs participating in the routing functionality for the tenant. This introduces scaling issues on multiple fronts.

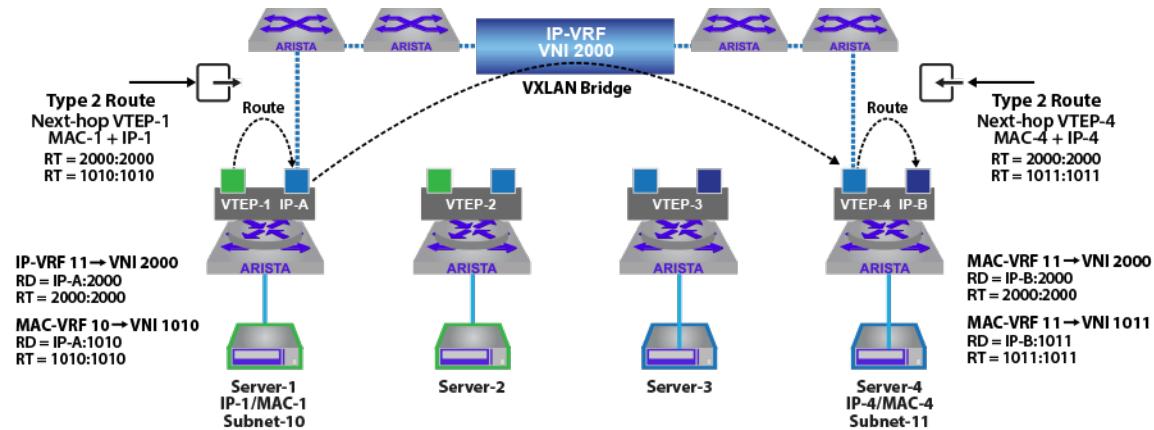

- **VNI Scaling:** The number of VNIs supported on a hardware VTEP will be finite, so not all VNIs can reside on all VTEPs. This is especially true in data-center deployments, where the TOR's have traditionally been more resource constrained than chassis-based edge systems.
- **Forwarding memory scaling:** The VTEPs needs to store all host MACs and ARP entries for all subnets in the network, on leaf switch this is hardware resource which again will be a finite resource defined by the specific hardware platform deployed at the leaf.

Symmetric IRB

To address the scale issues of the asymmetric model, in the symmetric model the VTEP is only configured with the subnets that are present on the directly attached hosts. Connectivity to non-local subnets on a remote VTEP is achieved through an intermediate IP-VRF. The subsequent forwarding model for symmetric IRB is illustrated in the figure below, for traffic between **Server-1** on **subnet-10** (Green) and **Server-4** on the remote **subnet-11** (Blue). In this model, the ingress VTEP routes the traffic between the local **subnet-10** and the IP-VRF, which both VTEPs are a member of, the egress VTEP then routes the frame from the IP-VRF to

the destination subnet. The forwarding model results in both VTEPs performing a routing function, hence the term symmetric IRB.

Figure 18-20: EVPN Symmetric IRB

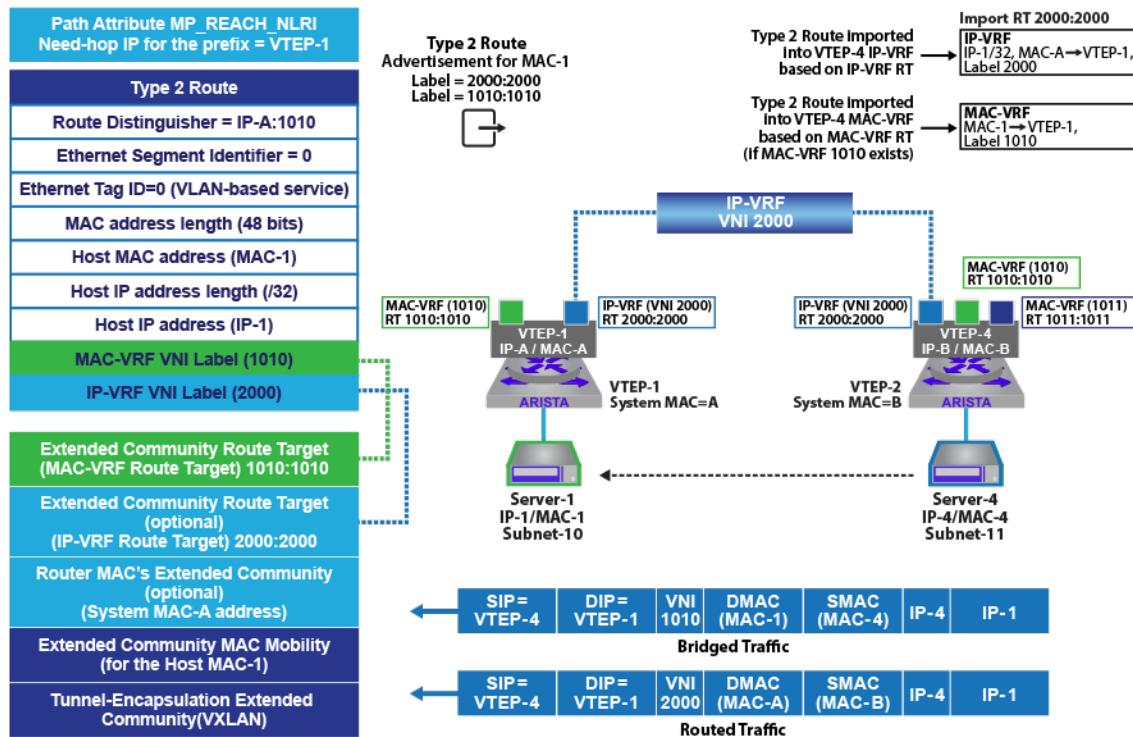

To provide the inter-subnet routing, when the subnet is stretched across multiple VTEPs, an anycast IP address is utilized for each subnet, but only configured on the VTEP's where the subnet exists. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisements.

For the symmetric IRB model the type-2 (MAC and IP) route is advertised with two labels and two route-targets corresponding to the MAC-VRF the MAC address is learned on and the IP-VRF. Remote VTEP's receiving the route, import the IP host route into the corresponding IP-VRF based on the IP-VRF route-target and if the corresponding MAC-VRF exists on the VTEP the MAC address is imported into the local MAC-VRF based on the MAC-VRF's Route-Target. The import behavior for the type-2 route is illustrated in the diagrams below for the host Server-1.

If the MAC-VRF exists locally on the receiving router, both the IP host route will be installed in the IP-VRF, and the MAC address will be installed in the MAC-VRF. With both a MAC route in the MAC-VRF and an IP

host route in the IP-VRF, the VNI used in the data-path will depend on whether the traffic is being VXLAN bridged between hosts in the same VNI (**1010**) or VXLAN routed (**VNI 2000**).

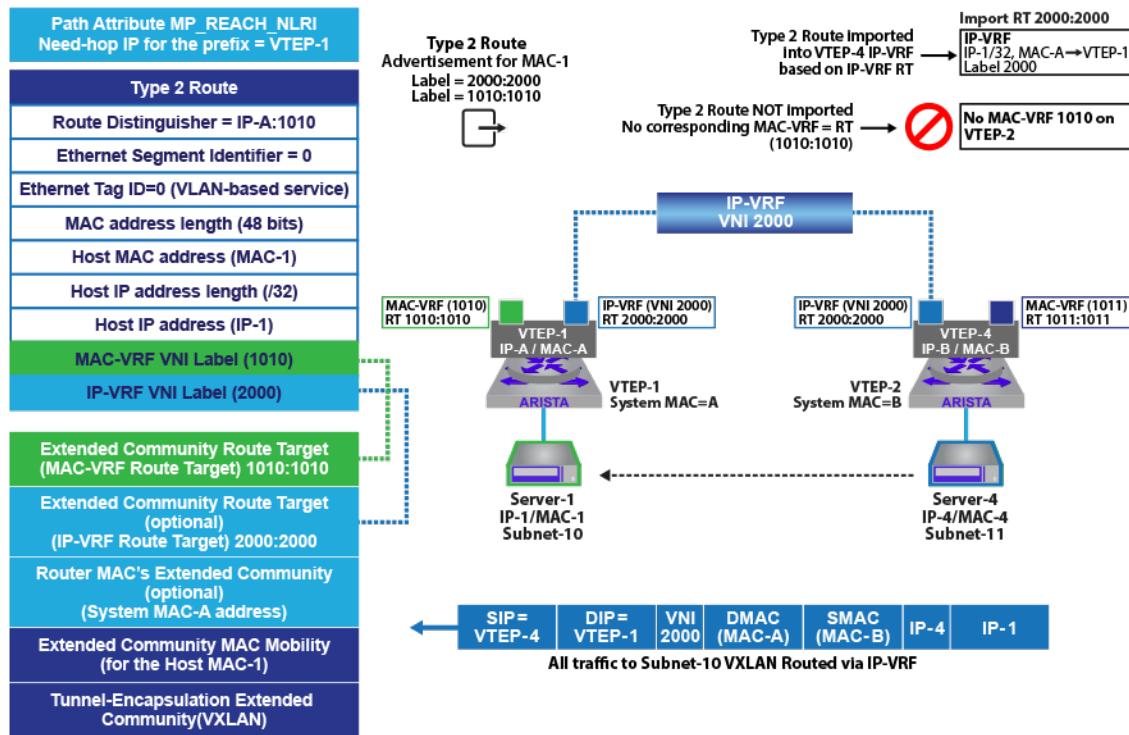

Figure 18-21: EVPN Type 2 Route in Symmetric IRB - MAC-VRF on Both VTEPs

Compare this to the figure below, where the MAC-VRF does not exist on the receiving VTEP (**VTEP-2**). In this case, the MAC route is not installed and ignored, as there is no corresponding Route Target on the VTEP.

In this scenario, only the IP-VRF host route is installed on **VTEP-2**. Traffic from **VTEP-2** destined to hosts on **subnet-10**, are therefore always VXLAN routed via the IP-VRF, **VNI 2000**.

Figure 18-22: EVPN Type 2 Route in Symmetric IRB - MAC-VRF Only Exists on Sending VTEP

The symmetric IRB type-2 route contains a number of additional extended community attributes over the asymmetric IRB type-2 route; the salient fields of the route are summarized below.

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF. For **Server-1** in the example above, this would be **IPA:1010**.
- MAC address field contains the 48-bit MAC address of the host being advertised. For **Server-1** in the example above, this would be **MAC-1**.
- IP address and length fields contain the IP address and 32-bit mask for the host being advertised. For **Server-1** in the example above, this would be **IP-1**.
- MAC-VRF label, this contains the VNI number (label) corresponding to the local Layer 2 domain/MAC-VRF the host MAC was learned on. For **Server-1** in the example above, this would be **VNI 1010**.
- IP-VRF label, this contains the VNI number (label) corresponding to the MAC-VRF's associated IP-VRF. For **MAC-VRF 10** in the example above, this would be **IP-VRF 2000**.
- Extended community Route Target for the IP-VRF. This contains the route-target of the IP-VRF associated with the learned MAC address.
- Extended community Router MAC. This field advertises the system MAC of the advertising VTEP and is used as the DMAC for any packet sent to the VTEP via the IP-VRF.
- Extended community Route Target for the MAC-VRF. This contains the route-target of the MAC-VRF associated with the learned MAC address.

18.3.1 IP VPN

RFC 4364 allows Service Providers and Enterprises to use their backbone infrastructure to provide services to multiple customers, or internal departments, while performing the following functions:

- Maintaining privacy.
- Allowing for IP address overlap amongst customers.
- Constraining route distribution - so that only the service provider routers that need the routes have them.

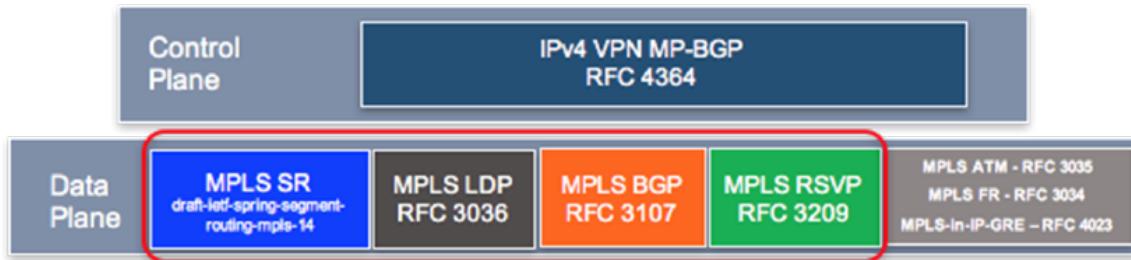

This is achieved through the usage of VRFs, Route Distinguishers and Route-Targets

The IPv4/IPv6 VPN Standard RFC 4364 does the following:

- Specifies an BGP IPv4 VPN control plane with a MPLS data plane.
- BGP control plane, new address family to advertise IP VPN prefixes.
- This RFC obsoleted the original *RFC 2547*.
- MPLS data-plane defined in multiple RFCs and drafts.

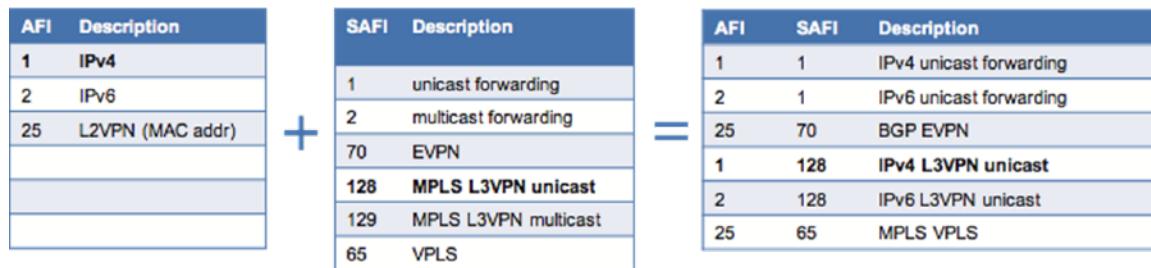

The RED circle in the figure below highlights the main Drafts and RFCs used today for an MPLS data-plane.

Figure 18-23: MPLS Data-Plane

IPv4 VPN and IPv6 VPN are an extensions of the BGP protocol introducing new address families: IPv4 (address family number **1**), IPv6 (address family number **2**), and a subsequent address family number **128**: MPLS Layer 3 VPN unicast. They are used to exchange overlay IP prefix reachability information between MP-BGP peers.

Figure 18-24: IPv4 VPN and IPv6 VPN

IPv4 VPN defines two route types:

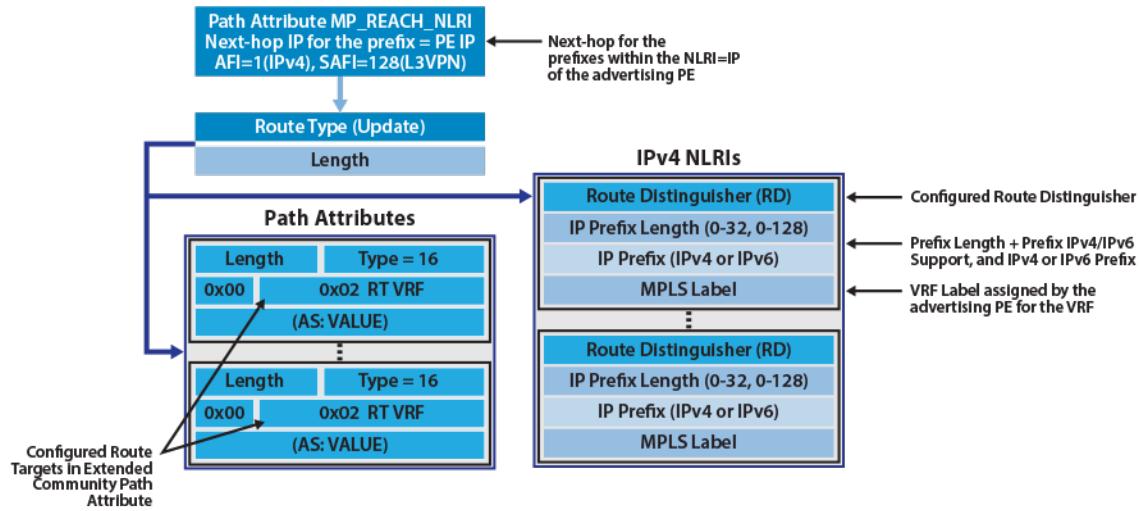

- Update
- Withdrawal

Each route type has its own NLRI prefix format and each route type advertises its own set of prefixes to update/withdraw.

The format of the IPv4 VPN prefix update route is illustrated in the following figure. As detailed, the update route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along

with the MPLS Label, along with a number of path attributes (where the RT extended communities are defined), which are associated with these IPv4 NLRLs.

Figure 18-25: IPv4 and IPv6 VPN Update Route Detail

The output in IPv4 VPN route as shown on PE, and the IPv6 VPN route as shown on PE offers a more detailed view of the route as displayed on a PE router.

Figure 18-26: IPv4 VPN Route as Shown on PE

- Route-target [64512:4364], encapsulation [MPLS] label for the VPN route (965242)

The following is an illustration of a basic MPLS Layer 3 VPN topology.

Figure 18-28: MPLS Layer 3 VPN Topology

An IP VRF is used on a PE router for each customer (Layer 3 overlay). VRF IP routes are exported into the MP-BGP table and advertised to remote PEs as VPN routes. The exported VPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the VPN routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IPv4 or IPv6 table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the VPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by a backbone.

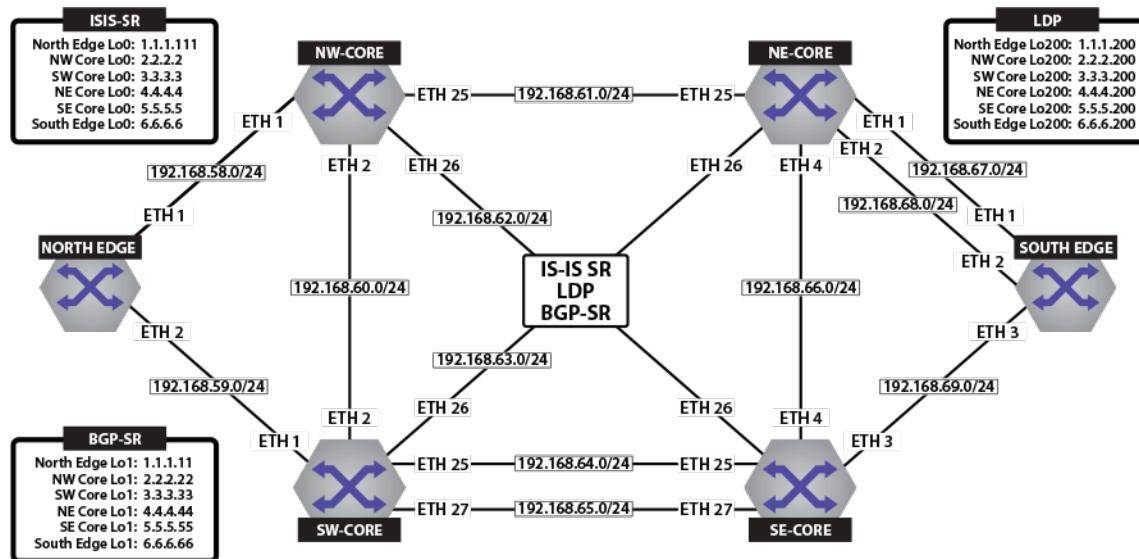

Note: You require Release EOS 4.21.1F and later versions with Jericho/Jericho+ platforms.

18.4 VPN MPLS Transport Options

EVPN-MPLS and IP-VPN sample topologies illustrate co-existing LDP, BGP-SR, and ISIS-SR on the core.

Figure 18-29: Physical Topology For ISIS-SR, LDP and BGP-SR Transport

LDP, ISIS-SR, and BGP-LU (BGP-SR) demonstrate the corresponding Label Switched Paths (LSPs) as the MPLS transport LSPs for Layer 3 EVPN and IP VPN services.

EVPN Sample Topology

In the figures below **Tenant-A DCI** and **Tenant-B DCI**, the prefixes from each DC are transported over the WAN/DCI domain, maintaining the Layer 3 multi-tenancy in tenant-a and tenant-b.

Figure 18-30: Tenant-A DCI

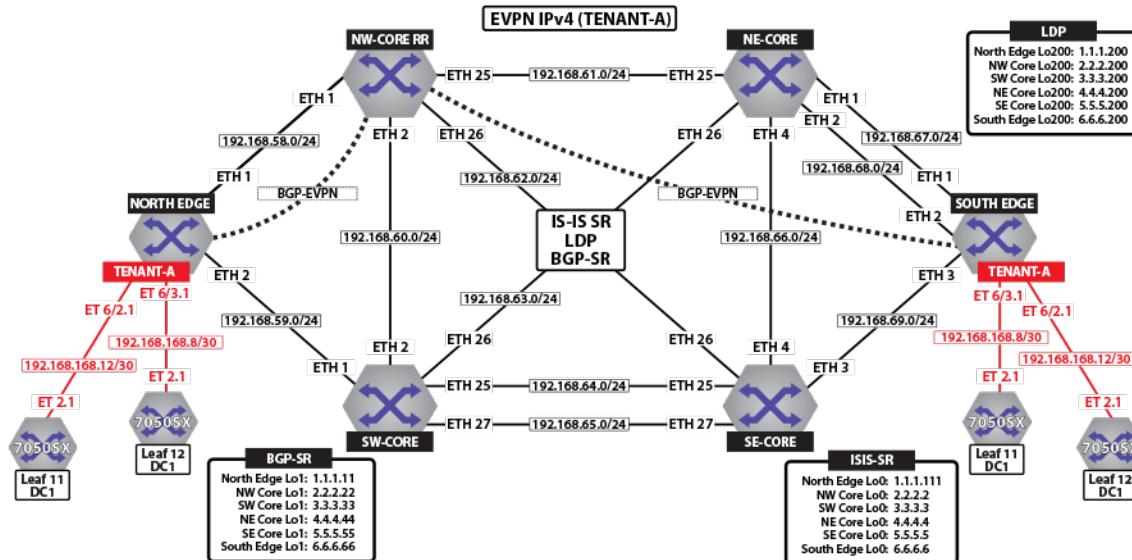

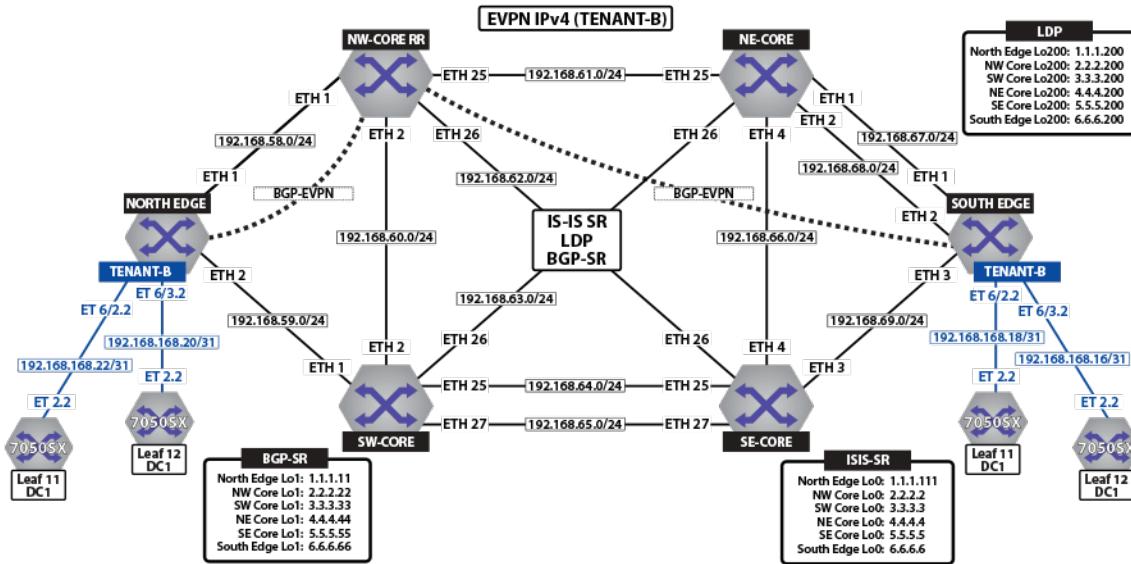

Figure 18-31: Tenant-B DCI

To provide external connectivity from the DC into the MPLS domain, leaf-11 and leaf-12 are eBGP peering via the tenants VRFs with the border routers. Both core routers are advertise external prefixes for Internet and any remote site connectivity (default route and ip-prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (leaf-21 and leaf-2) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising PE.

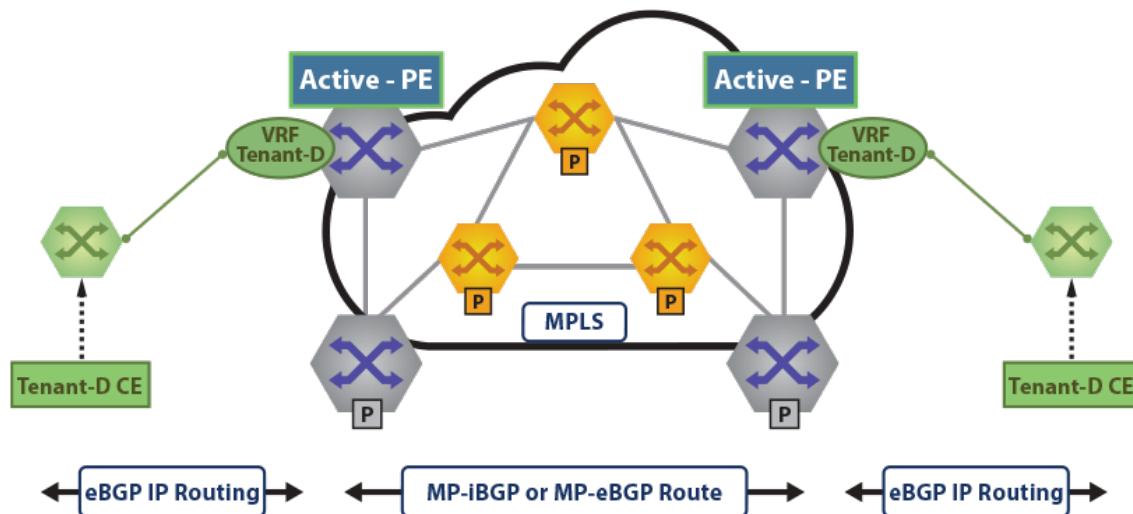

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.

[EVPN MPLS Sample Configuration](#) displays BGP route updates and how the tenant VRF is transported over these transport LSPs.

IP VPN Sample Topology

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.

Figure 18-32: IPv4 & IPv6 VPN Sample Topology

In the figures, **Tenant-D IPv4 VPN** and **Tenant-D IPv6 VPN**, the prefixes for VRF tenant-d are transported over the MPLS WAN between North Edge and South Edge routers.

Figure 18-33: Tenant-D IPv4 VPN

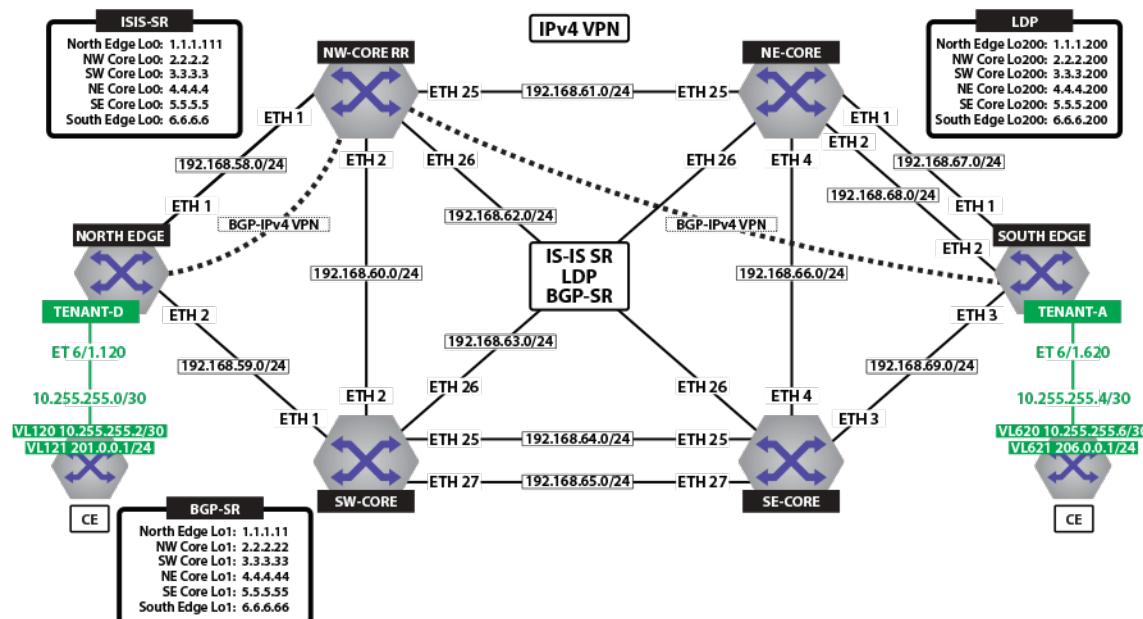

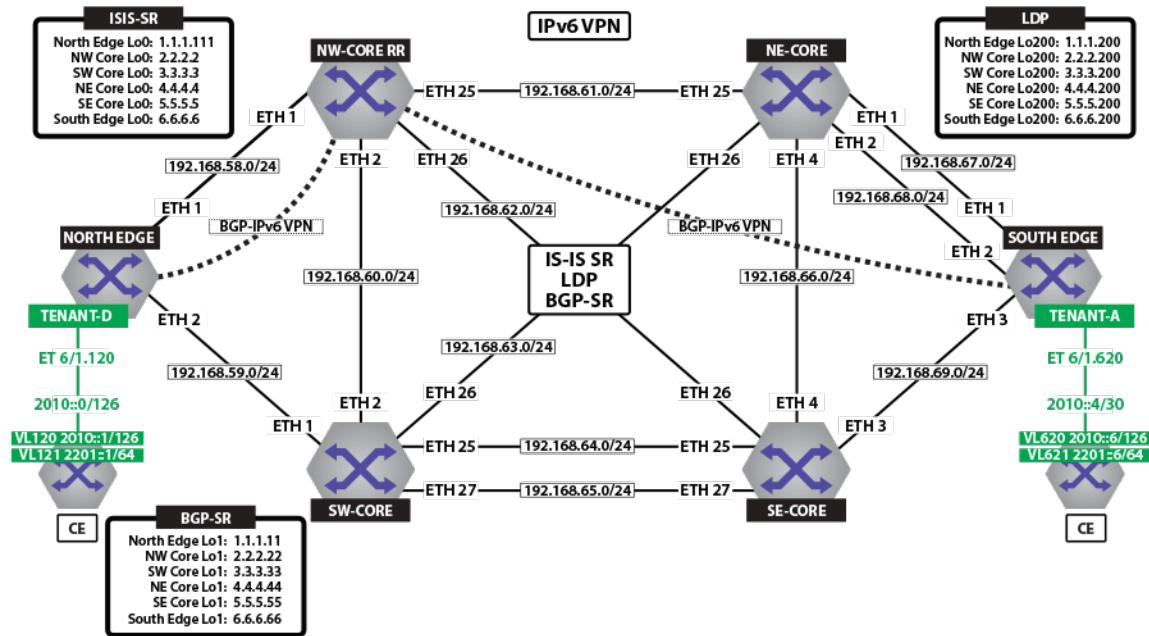

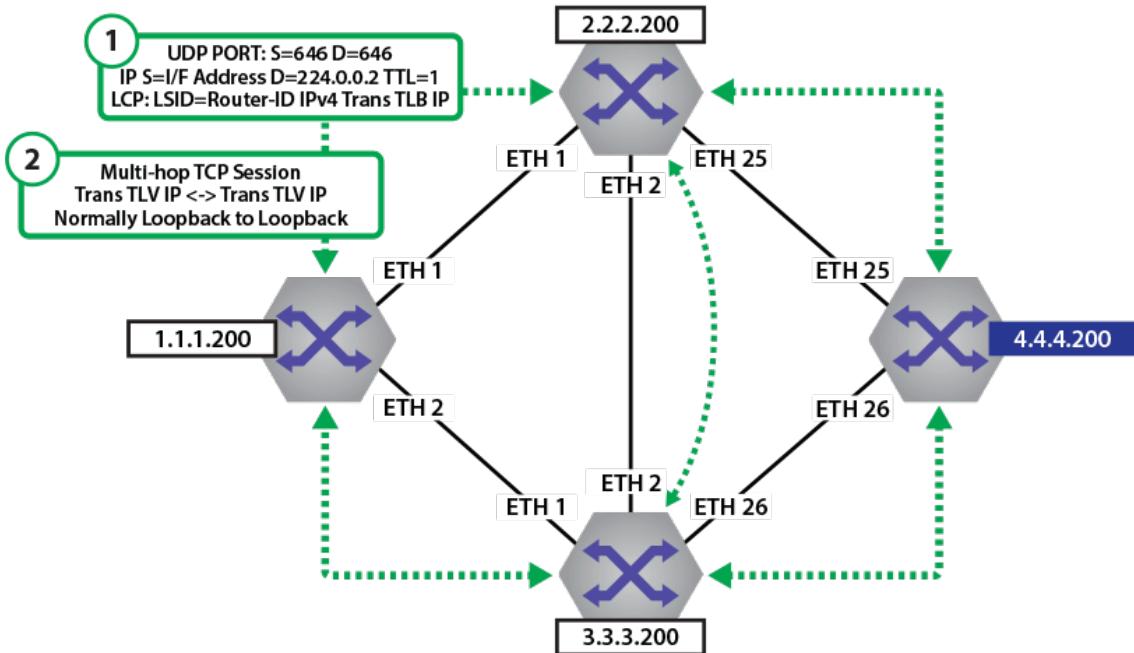

Figure 18-34: Tenant-D IPv6 VPN

18.4.1 LDP

The figure below illustrates how LDP neighbor relationships are built. First each router sends a discovery to a destination multicast address (TTL=1) **224.0.0.2** on **port 646**. This discovery contains the router-id and the transport IPv4 address the router wants to use. The second stage is building the TCP peering session using the specified transport IP addresses. This is normally loopback to loopback.

Figure 18-35: LDP Peering Establishment

Examples

- The **show mpls ldp neighbor** command on the North Edge router displays more detail on TCP session establishment, and the local addresses of the LDP neighbor for which it is binding a label.

Note: All connected interfaces are advertised as bound. However, EOS currently advertises labels for /32 addresses, and FEC filter is configured to install only x.x.x.200/32 prefixes.

```
North Edge.17:51:17# show mpls ldp neighbor
Peer LDP ID: 2.2.2.200:0; Local LDP ID: 1.1.1.200:0
    TCP Connection: 2.2.2.200:38395 - 1.1.1.200:646

```

18.4.2 ISIS-SR

The following figure illustrates how ISIS-SR distributes the SID index information in the ISIS TLVs and sub-TLVs

Figure 18-36: ISIS Neighbor Adj and TLVs

The Prefix SID index, SRGB, and ADJ SID values are populated in the sub-TLVs in the ISIS neighbor updates. Each router then builds its database of Node (Prefix) segments (Labels) and locally assigned ADJ labels.

Examples

- The **show isis neighbors detail** command on the North Edge router displays the detailed information of all ISIS neighbors.

```
north-edge# show isis neighbors detail

18.4.3 BGP-LU (BGP-SR)

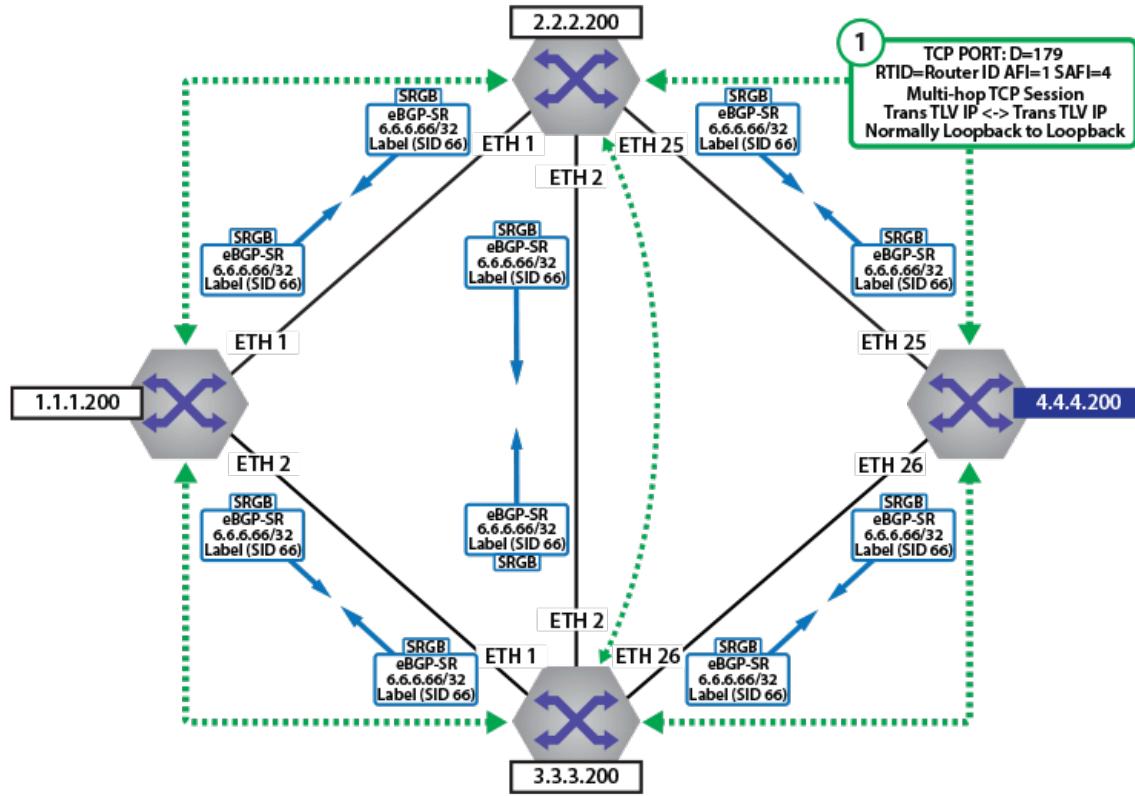

BGP-LU Label Distribution illustrates how BGP-LU distributes the label information in BGP.

Figure 18-37: BGP-LU Label Distribution

BGP-SR Index and SRGB Distribution illustrates how BGP-LU distributes the Label SRGB and SID index information in BGP. This is known as BGP-SR.

Figure 18-38: BGP-SR Index and SRGB Distribution

The Prefix SID index and SRGB values are populated in the TLVs in the BGP neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels).

Examples

- The **show bgp neighbor** command displays BGP-SR neighbors.

```
north-edge# show bgp neighbor | include BGP neighbor|Multiprotocol IPv4 MplsLabel

BGP neighbor is 192.168.2.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: received
BGP neighbor is 192.168.3.9, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.3.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised
BGP neighbor is 192.168.58.12, remote AS 2, external link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.59.12, remote AS 3, external link
```

- The **show ip bgp labeled-unicast 6.6.6.66/32 detail** command displays the detailed information of BGP labeled routes unicast with **6.6.6.66/32**.

```
north-edge(config-if-Et2/1)# show ip bgp labeled-unicast 6.6.6.66/32 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for 6.6.6.66/32
  Paths: 2 available
    2 4 6
      192.168.58.12 labels [ 200066 ] from 192.168.58.12 (2.2.2.222)
        Origin IGP, metric -, localpref 100, weight 0, valid, external, ECMP head, best, ECMP
        contributor
          Local MPLS label: 200066, SR Label Index: 66
```

```

```

18.5 EVPN Type-5 Routes: IP Prefix Advertisement

The EVPN type 2 routes can be used to advertise IP prefixes by making use of the optional IP address and IP address length fields in the route. However, they are explicitly linked to the MAC address advertised within the route. The EVPN type-5 route defined within the IETF draft, provides the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP addresses, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The following figure displays the format of the new type-5 IP-prefix route.

Figure 18-39: EVPN Route Type-5, for Advertisement of IP Prefixes

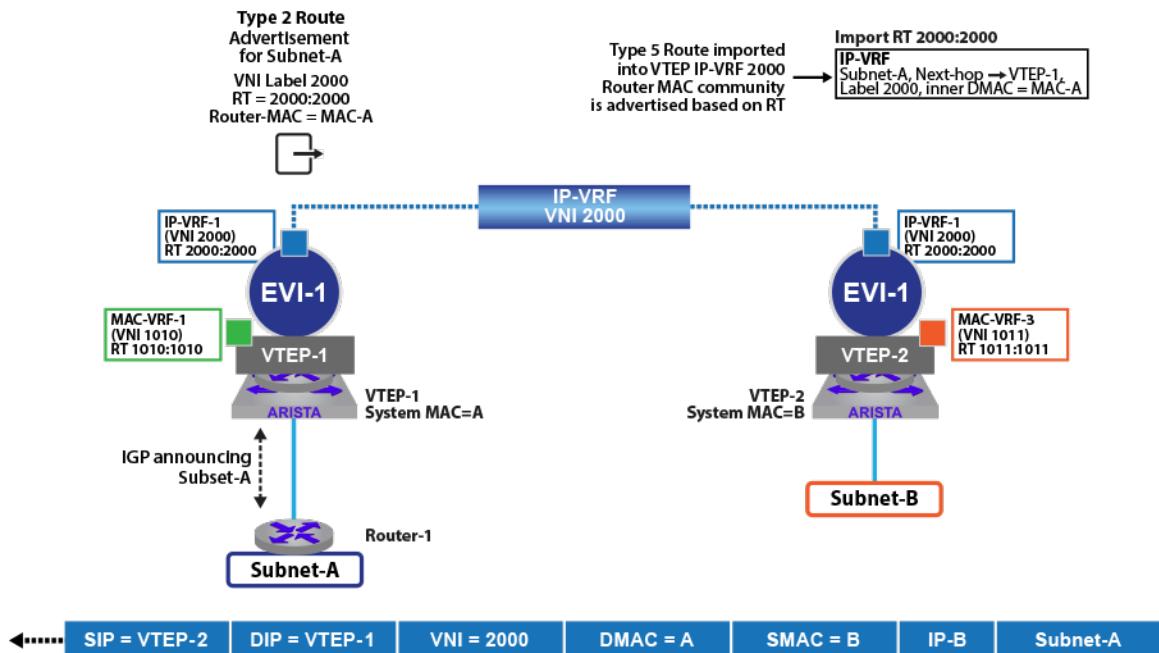

The IP prefix draft defines a number of specific use cases for the type-5 route, which consequently affects the format and content of the fields within the route. The different deployment scenarios and use cases defined within the draft are summarized.

- Advertising IP prefixes behind an appliance when the appliance is not running a routing protocol and only supporting static routes. This could be the typical use case for a Virtual Firewall with several local subnets directly attached. Still, the firewall is only supporting static routes into the associated EVI.
- Support for active-standby deployment of appliances using a shared floating IP model. This is an extension of the previous case where there is now a virtual IP (or VIP) for clustering the appliances, rather than a dedicated physical IP address on the appliance.
- Support for Layer 2 appliances, acting as a “bump in the wire” with no physical IP addresses configured, where instead of the appliances having an IP next-hop, there is only a MAC next-hop.
- IP-VRF to IP-VRF model, which is similar to inter-subnet forwarding for host routes (detailed in the symmetric/asymmetric section), except only Type-5 routes and IP prefixes are advertised, allowing announcement of IP prefixes into a tenant's EVI domain for external connectivity outside the domain.

Interface-less

In interface-less mode, the IP prefixes within the type-5 route, whether they are local or learned from a connected router are advertised to remote peers via the shared IP-VRF, as illustrated in the figure below. The IP-VRF to IP-VRF model, is further divided into three distinct use cases in the draft.

Figure 18-40: EVPN Route Type-5, Interface-less Update

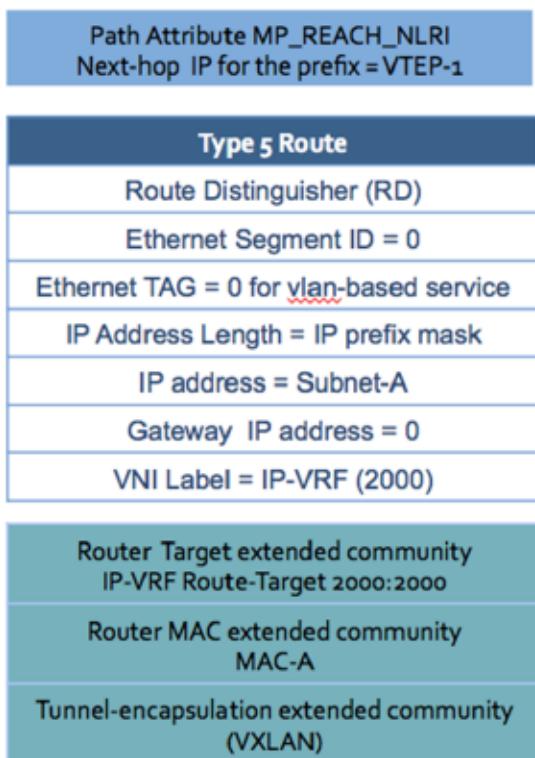

As illustrated above, the IP prefix (**subnet-A**) residing behind the router (**Rtr-1**) is learned via an IGP in EVI-1 on VTEP-1. The prefix is announced and learned by the remote VTEPs residing in the same EVI, via the type-5 route announcement. The type-5 route, is advertised along with the prefix, with a route-target (**2000:2000**) and a VNI label (**2000**) equal to the IP-VRF which interconnects the VTEPs in the EVI, the router-mac extended community of the route is used to define the inner DMAC (equal to system MAC of **VTEP-1**) for any VXLAN frame destined to advertised IP prefix.

From a forwarding perspective, host residing on **subnet-B** communicating with a host on **subnet-A**, will send traffic to their default gateway, which is the IRB interface on **VTEP-2** in **VLAN 11/VNI 1011**. **VTEP-2** performs a route lookup for the destination **subnet-A**, which has been learned in the IP-VRF with a next-hop of **VTEP-1** and VNI label of **2000**. The packet is thus VXLAN encapsulated with VNI label of **2000** an inner DMAC of A (**VTEP-1** system/router MAC), and routed to **VTEP-1**, which is the next-hop for the prefix. Receiving the frame, **VTEP-1** de-encapsulates the packet, with an inner DMAC of the VTEPs router MAC, it performs a local route lookup for the destination **subnet-A**, which has been learned with a next-hop of **rtr-1**.

The frame is forwarded directly to **rtr-1**, which routes the packet to the local host on subnet-A. The format of the type-5 route in interface-less mode is illustrated in the following figure.

Figure 18-41: EVPN Type-5 Route Format for Interface-less Mode

In this model, the VTEPs forming the EVI are interconnected via an IP-VRF, meaning there is no IRB interface (MAC and IP) created for the interconnection on each of the VTEPs, hence the term “interface-less”. With no IRB interface the gateway IP address within the type-5 route is set to **0**, traffic is routed to the prefix based on the next-hop of the route (VTEP IP) as well as MAC address conveyed within the Router MAC extended community, which represents the inner destination MAC of the VXLAN encapsulated frame.

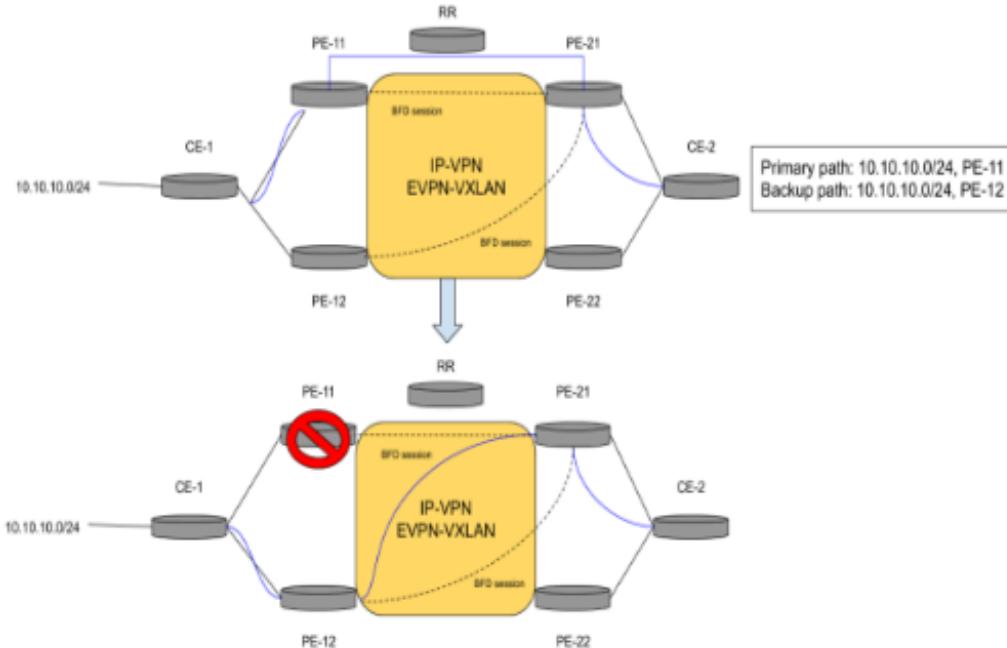

18.6 BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures

When a remote VTEP goes down, the IGP and BGP must recompute a new best path traffic destined to affected BGP prefixes originally reachable by the problematic VTEP. Currently, the BGP PIC is restricted to locally identifiable failures such as link failures.

To overcome such VTEP failure issues, support for EVPN-learned VTEPs improve convergence times in these scenarios by tying the liveness detection provided by the BFD sessions into existing BGP PIC support for software fast-failover. Upon detecting that a BFD session to a remote VTEP has gone down, the hardware

forwarding agents will update the affected adjacencies before the corresponding underlay route has been removed from the FIB which can improve convergence times.

Figure 18-42: BGP PIC Edge for VXLAN

The diagram above outlines a scenario in which **CE-2** is sending traffic bound for **10.10.10.0/24** via **PE-11** to **PE-11** to **CE-1**. **PE-11** goes down, however we have BFD sessions from **PE-21** to the remote VTEPs of **PE-11** and **PE-12** and, therefore detect that it goes down and quickly update the forwarding to send the traffic along the pre-computed backup path via **PE-12** to **CE-1**.

18.6.1 Configuring BGP PIC Edge for EVPN VXLAN Routes for Remote VTEP Failures

Use the **bfd vtep evpn** command to configure the BGP PIC Edge for EVPN VXLAN routes for remote VTEPs. This command is configured under the VXLAN Tunnel Interface (VTI).

```
switch# config
switch(config)# interface VXLAN1
switch(config-if-Vx1)# bfd vtep evpn interval <interval> min-rx <min-rx> multiplier <multiplier>
```

This configuration uses the specified timer values to initiate BFD sessions for all VTEPs learned through EVPN VXLAN for this VTI.

- **interval** – Transmit rate in milliseconds
- **min-rx** – Expected minimum incoming rate in milliseconds
- **multiplier** – BFD multiplier

Example

```
switch(config-if-Vx1)# bfd vtep evpn interval 100 min-rx 100 multiplier 3
```

In this example (assuming symmetric configuration on other PE devices), any BFD for VXLAN session initiated on the VTI would have a detect time of **300ms** (interval of 100ms multiplied by 3).

To utilize these BFD sessions, traffic must have an alternate path in the event that the session goes down. This would include other paths in an ECMP group or a backup path.

As mentioned, by default the above configuration will initiate BFD sessions for all VTEPs learned through EVPN VXLAN for the VTI.

```
switch# config
switch(config)# interface VXLAN1
switch(config-if-Vx1)# bfd vtep evpn prefix-list <PREFIX-LIST>
```

This command uses a supplied prefix list to filter and select the candidate VTEPs. By default, an empty prefix list will act as a deny-all and not initiate BFD sessions with any learned VTEPs.

18.6.2 Show Commands

The **show interface <VTI>** command is used to view if BFD is enabled on the VTI and to see the timers used for any of the BFD sessions or any prefix-list configured for filtering BFD sessions.

```
switch# show interface VXLAN1
VXLAN1 is up, line protocol is up (connected)
  Hardware is VXLAN
  Source interface is Loopback0 and is active with 10.1.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning is disabled
  VNI mapping to VLANs
  Static VLAN to VNI mapping is
  Dynamic VLAN to VNI mapping for 'evpn' is
    [4092, 30000]      [4093, 20000]
  Dynamic VLAN to VNI mapping for 'vccbfd' is
    [4091, 0]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
        Use 'show VXLAN vni' for details.
  Static VRF to VNI mapping is
    [vrfl0, 20000]
  MLAG Shared Router MAC is 0000.0000.0000
  BFD is enabled with transmit interval 50, receive interval 50, multiplier 3, VTEP prefix list
pl-example
```

The existing **show bfd peers** command is used to view the state of the BFD for VXLAN sessions.

| VRF name: default | DstAddr | MyDisc State | YourDisc | Interface/Transport | Type | LastUp | LastDown | LastDiag | |
|-------------------|----------|-----------------------|---------------|---------------------|------|--------|----------------|----------|----|
| | 10.1.1.2 | 1965370229 Diagnostic | 3607849318 Up | | NA | VXLAN | 01/12/21 10:45 | NA | No |
| | 10.1.1.3 | 1355343148 Diagnostic | 2407539267 Up | | NA | VXLAN | 01/12/21 10:45 | NA | No |

The **show ip route <VRF>** command can be used to determine which prefixes are eligible for fast-failover.

```
switch# show ip route vrf example-vrf

VRF: example-vrf
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route, L - VRF Leaked,
      RC - Route Cache Route
```

```

Gateway of last resort is not set

C      20.0.2.0/24 is directly connected, Ethernet14/1
B E    99.99.0.0/24 [200/0] via VTEP 10.1.1.2 VNI 30000 router-mac fc:bd:67:3d:21:fd
          via VTEP 10.1.1.3 VNI 30000 router-mac ba:ed:43:3f:ca:8e backup

```

In the above example there is a prefix with the primary path using a VXLAN tunnel to VTEP **10.1.1.2** and has a backup VXLAN tunnel to VTEP **10.1.1.3**. Both paths are monitored via BFD.

In other use cases the prefix may have multiple paths with ECMP in which one or multiple of the paths are VXLAN tunnels to remote VTEPs monitored by these BFD for VXLAN sessions.

```

switch# show ip route vrf example-vrf

VRF: example-vrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - ibGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,

       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
       RC - Route Cache Route

Gateway of last resort is not set

C      20.0.2.0/24 is directly connected, Ethernet14/1
B E    99.99.0.0/24 [200/0] via VTEP 10.1.1.2 VNI 30000 router-mac fc:bd:67:3d:24:fe
          via VTEP 10.1.1.3 VNI 30000 router-mac ba:ed:43:3f:ca:8e

```

MLAG

This feature applies only to the scenario when two different MLAG VTEP pairs learn the remote prefix.

Prior to **4.26.0F**, EOS supports this feature on the primary switch of an MLAG pair because of the Shared VTEP IP within the MLAG pair as the VXLAN tunnel source or destination. If the secondary MLAG switch receives BFD for VXLAN packets, it drops the packets and does not forward them to the primary MLAG switch for processing. In this case, the primary MLAG switch cannot receive BFD for VXLAN packets from the remote VTEPs. Therefore, Arista does not recommend using this feature in conjunction with MLAG.

As of **4.26.0F**, the primary MLAG switch syncs the BFD for the VXLAN state to the secondary MLAG switch to allow the secondary to failover to an alternate path as well. If the secondary MLAG switch receives BFD for VXLAN packets, the secondary MLAG switch forwards them to the primary MLAG switch for processing and the primary MLAG receives BFD for VXLAN packets from these remote VTEPs. To view the synced state, use the following command:

```

switch# show bfd peers protocol VXLAN mlag primary
Remote VTEPs for VXLAN1 on MLAG primary:
VTEP      BFD Status
-----  -----
10.1.1.2    up
10.1.1.3    up

```

However, because the state syncs across devices, the secondary MLAG switch does not react to the BFD state transitions as the primary MLAG switch, which natively responds to the BFD session.

Another exception occurs with the multi-VTEP MLAG feature which allows BFD for VXLAN to run on the secondary MLAG switch. When running multi-VTEP MLAG, both the primary and secondary switches run independent BFD sessions to remote VTEPs and react to BFD state transitions separately. Each switch uses the local VTEP IP address of the VTI as the source IP address for the BFD sessions, which must differ from the MLAG VTEP IP.

In summary, use MLAG with this feature only if configured with the multi-VTEP IP feature.

18.6.3 Troubleshooting

- Ensure that BFD configuration is present on the relevant VTI and that the VTI status shows BFD as enabled using the mentioned `show interface <VTI>` command.
- As mentioned in the prior section, BFD state transitions are Syslogged and will display if a BFD session to a remote VTEP goes down.
- Upon fast-failover to a separate path, `show ip route` will still display FIB state that may display the original path. To view the post failover prefix state, `show ip hardware ale vrf <VRF> <prefix>` can be used instead.

18.6.4 Limitations

- Support is limited to EVPN VXLAN.
- IPv6 VXLAN underlay with this feature is not supported.

18.7 VXLAN DSCP Mapping

VXLAN DSCP Mapping allows the selection of Differentiated Services Code Point DSCP and Traffic Class TC values for packets at VTEPs (VXLAN Tunnel Endpoint) along VXLAN encapsulation and decapsulation directions respectively.

An incoming packet from an edge port is encapsulated with a new IP and VXLAN header before being sent to a remote VTEP via a core facing port for encapsulation direction. When this is enabled, the DSCP field of the outgoing packet is set as the value of the DSCP of the incoming packet at the edge port.

An incoming VXLAN packet on a core port is decapsulated and forwarded via an edge port for decapsulation direction. When this is enabled, the TC value is derived from the value of the DSCP of the incoming VXLAN encapsulated packet at the core port. This is applicable for both VXLAN Bridging and Routing.

Platform Compatibility

The following platforms support VXLAN DSCP mapping:

- DCS-7050SX3-48YC12
- DCS-7050CX3M-32S
- DCS-7050CX3-32S

Configuration

The following command enables the propagation of the DSCP field from the incoming packet to the VXLAN encapsulated packet.

```
switch(config)# interface VXLAN 1
switch(config-if-Vx1)# VXLAN qos dscp propagation encapsulation
```

The following command enables the assignment of the TC value during decapsulation of a VXLAN packet.

```
switch(config)# interface VXLAN 1
switch(config-if-Vx1)# VXLAN qos dscp to traffic-class decapsulation
```

Show Commands

The `show VXLAN qos` command shows the VXLAN DSCP and TC configuration.

```
switch# show VXLAN qos
VXLAN ECN Propagation is Disabled.
Outer header DSCP is derived from Inner DSCP.
Traffic Class is derived from Outer DSCP.
```

Limitation

The core ports must be in DSCP Trust mode to derive TC on the outer DSCP field of the incoming VXLAN packet.

18.8 EVPN E-Tree for MPLS and VXLAN

As part of an L2 EVPN service, E-Tree assigns the role of root or leaf to each attachment circuit (AC). After assigning the role, E-Tree enforces the following rules:

- Root ACs can communicate with Leaf ACs and other Root ACs.
- Leaf ACs can only communicate with Root ACs, and traffic between Leaf ACs blocked.

Configure the ACs at the VLAN level and enforce forwarding rules using a combination of locally configured leaf VLANs for local hosts and asymmetric route targets for remote hosts.

E-Tree supports the E-Tree extended community for EVPN Type-2 and Type-3 routes and allows E-Tree operation with only a single route-target configured, a regular non-E-Tree EVPN deployment. This support also allows EVPN MAC mobility to perform correctly in an E-Tree environment. Only deployments that use VXLAN encapsulation support the E-Tree extended community, and deployments using MPLS encapsulation must use asymmetric route targets.

When implementing a single route-target E-Tree, EOS supports configurable handling of remote leaf hosts in local leaf VLANs. By default, the local FDB for local leaf VLANs does not install remote local leaf hosts. Instead, a per-VLAN configuration allows the installation of explicit drop routes for remote leaf hosts, which removes unnecessary BUM traffic at the cost of local FDB space.

E-Tree Extended Community

The E-Tree extended community automatically attaches to all EVPN type-2 and type-3 routes advertised by a device associated with a VLAN locally configured as an E-Tree leaf AC. All type-2 routes that represent hosts learned on a leaf VLAN advertise the E-Tree extended community with a leaf flag set attached. All type-3 routes that represent a VLAN configured as a leaf AC advertise the E-Tree extended community with the leaf flag set attached.

After receiving an EVPN type-2 route with the E-Tree extended community flag set attached, a device checks the E-Tree role of the local VLAN to import the routes. If configured as an E-Tree root AC, the local floodlist for the VLAN adds the remote VTEP contained in the type-3 route. If the local VLAN has a configuration for an E-Tree leaf, the local floodlist filters the remote VTEP contained in the type-3 route. Leaf VLANs contain only remote VTEPs in the floodlist associated with the VLAN on the remote VTEP configured as an E-Tree root and prevents local leaf BUM traffic from flooding to the remote leaf ACs.

EVPN Active/Active Multihoming

EOS only supports EVPN Active/Active Multihoming on root VLANs. Only the peer that sees the host traffic learns the multihomed hosts if configured on leaf VLANs and using asymmetric route-target E-Tree. Because type-2 routes from other peers in the leaf VLANs do not import, an aliasing entry never installs for the hosts on the same Ethernet segment learned on other peers.

In addition, if configured on leaf VLANs, when using single route target extended community-based E-Tree, other peers in leaf VLANs import type-2 routes and associated aliasing entries do not install on the local FDB and treat them as remote leaf hosts.

In both cases, this leads to extra flooding as traffic destined for multihomed hosts that land on peers have not locally learned to treat the host as BUM traffic and floods.

18.9 EVPN IGP Cost for VTEP Reachability

In EVPN deployment with VXLAN underlay when an EVPN type-5 prefix is imported into an IP VRF, the IGP cost of the underlay VTEP reachability is not considered as part of BGP best-path selection post import.

Therefore, if such a prefix is reachable via more than one VTEPs, the IGP metric step in the BGP best-path selection algorithm will not filter out any paths irrespective of the underlay's IGP metric for the VTEP reachability. If ECMP is enabled in the overlay and multiple paths are found to be otherwise equivalent, such paths would form ECMP regardless of the IGP metric. This is the default behavior.

However, the behavior can be overridden by the following configuration command `encapsulation VXLAN layer-3 set next-hop igr-cost` under ***config-route-bgp-af*** mode for ***address-family evpn*** as shown.

```
switch(config-router-bgp) # address-family evpn
switch(config-router-bgp-af) # [no | default] encapsulation VXLAN layer-3 set next-hop igr-cost
```

The `encapsulation VXLAN layer-3 set next-hop igr-cost` command will cause the underlay IGP metric for the VTEP reachability to be considered for BGP best path selection in the IP VRF that is importing the EVPN route. An IGP protocol such as OSPF, ISIS, or static configuration could be the source of such a metric value.

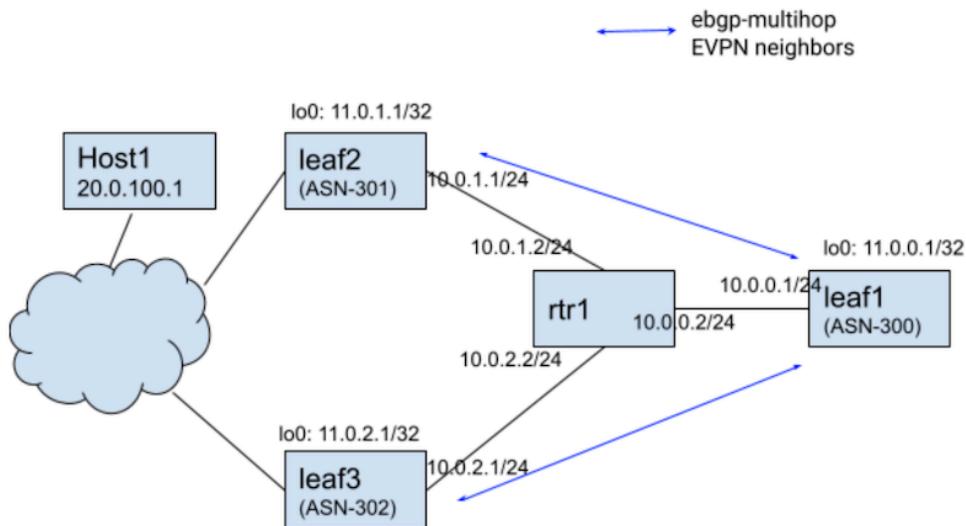

Note: This feature is available only with the multi-agent routing protocol model.

18.9.1 Configuration Example

Let us consider a topology of four routers **leaf1**, **leaf2**, **leaf3** and **rtr1** as shown in the figure.

Figure 18-43: EVPN IGP Cost for VTEP

There could be IGP running among the four routers, but for simplicity let's have static routes with IGP metric on **leaf1** to **lo0** of border **leaf2** and **leaf3** (and vice-versa for reverse reachability on the respective routers, though that configuration not shown here):

```
leaf1#
ip route 11.0.1.1/32 10.0.0.2 metric 340
ip route 11.0.2.1/32 10.0.0.2 metric 350
```

Following are the IP routes in the default VRF on leaf1.

```
leaf1# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route, L - VRF Leaked,
      RC - Route Cache Route

Gateway of last resort:
  S        0.0.0.0/0 [1/0] via 10.0.0.2, Ethernet2

C        10.0.0.0/24 is directly connected, Ethernet2
C        11.0.0.1/32 is directly connected, Loopback0
S        11.0.1.1/32 [1/340] via 10.0.0.2, Ethernet2
S        11.0.2.1/32 [1/350] via 10.0.0.2, Ethernet2
```

Following are eBGP-multipath EVPN neighbor pairs with VXLAN as underlay:

leaf1 (ASN-300) \leftrightarrow **leaf2** (ASN-301)

leaf1 (ASN-300) \leftrightarrow **leaf3** (ASN-302)

Consider an example where a prefix **20.0.100.1/32** is reachable behind two VTEPs **leaf2** and **leaf3** as learnt on leaf1 via eBGP EVPN Type-5 routes.

Following EVPN paths will show for **20.0.100.1/32** on **leaf1**:

```
leaf1(config)# show bgp evpn detail

18.9.2 Show Commands

By default, since the underlay IGP cost for the VTEP reachability is not used for best path selection in the imported EVPN Type-5 routes, either of the two paths could be selected as the best path. If ECMP is configured in the importing VRF, then the two paths will form ECMP. The following example shows an ECMP that is allowed in the importing VRF vrf1.

```
switch1# show ip route vrf vrf1
VRF: vrf1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,

18.10 EVPN VXLAN Single-Gateway Centralized Routing

In a traditional EVPN VXLAN centralized anycast gateway deployment, multiple L3 VTEPs serve the role of the centralized anycast gateway. For the hosts to have a consistent ARP binding for any of the individual centralized gateway VTEPs, each VTEP operating as a centralized gateway is configured with a virtual router MAC (VARP MAC). A virtual VTEP IP (VARP VTEP IP) is shared between all of the L3 VTEPs operating as centralized gateways. Each centralized gateway VTEP also advertises an EVPN type-3 route for both its primary VTEP IP and VARP VTEP IP, so both IPs end up in the overlay floodset.

The traditional configuration works fine, but in the specific case of a network with only a single L3 VTEP centralized gateway (or single MLAG pair operating as the L3 VTEP centralized gateway), this leads to unnecessary BUM traffic. When both the physical VTEP IP and the VARP IP end up in the overlay floodset, BUM traffic is duplicated to the centralized gateway, which can overhead workloads that have a lot of broadcast or multicast traffic. There is only a single centralized gateway, so it is not necessary to have a VARP VTEP IP to provide a stable ARP binding for the gateway.

The EVPN VXLAN Single-Gateway Centralized Routing feature enables a single L3 VTEP (or single MLAG pair) operating as an anycast gateway to not configure a VARP VTEP IP, thereby eliminating the

duplicate BUM traffic caused by the VARP VTEP IP being in the overlay floodset. It accomplishes this with two changes:

- A change to the default ARP behavior when a host ARPs for the MAC address associated with a virtual IP address (SVI IP).

Previously, ARPing for a virtual IP returned different MAC address bindings, depending on whether or not a VARP VTEP IP was configured. If a VARP VTEP IP was configured, the ARP request returns the configured VARP MAC. If one was not, the ARP request returns the switch router MAC. This feature changes the behavior to always respond with the configured VARP MAC to an ARP request for a virtual IP. This closes an exception to the rule that virtual IPs are always associated with the VARP MAC.

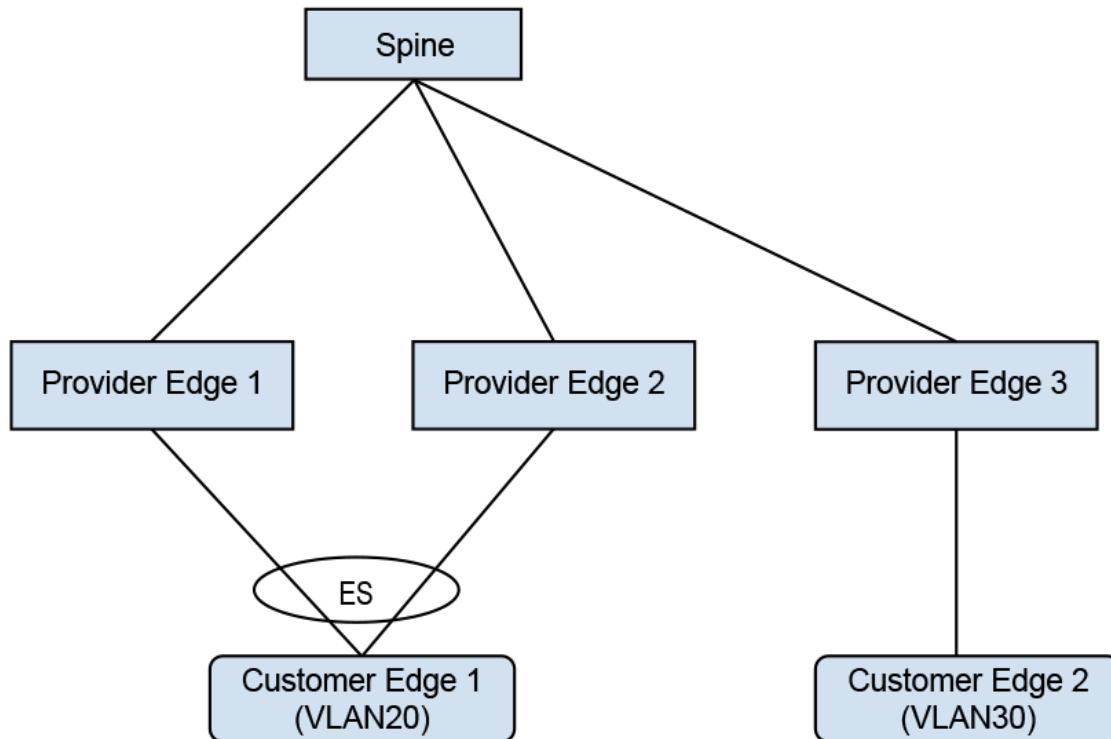

- A new EVPN MAC VRF configuration command that generates an EVPN type-2 route for the VARP MAC with a nexthop of the physical VTEP IP.

In a traditional EVPN centralized anycast gateway development, the presence of a configured VARP VTEP IP advertises an EVPN type-2 route for the VARP MAC with a nexthop of the VARP VTEP IP. This allows TOR switches to learn the ARP binding of the centralized anycast gateway (presumably, their default gateway). With this feature, no VARP VTEP IP is configured, so an alternative method is required to advertise the appropriate EVPN route. This feature adds a new EVPN MAC VRF configuration command, `redistribute router-mac next-hop vtep primary`, which when configured on a MAC VRF advertises an EVPN type-2 route for the VARP MAC with a nexthop of the primary VTEP IP. This allows TOR switches to learn the ARP binding of the centralized anycast gateway.

18.10.1 Configuration

On the multi-homing PEs, you must configure the Ethernet Segment (ES) to the CE. In addition, the configuration needed for asymmetric IRB or symmetric IRB must be configured on the local and remote PEs.

Figure 18-44: Asymmetric IRB with IPv4

In the example, **CE1** is a multi-homed CE in **VLAN20**. **CE2** is a remote CE in **VLAN30**. Asymmetric IRB is configured for inter-VLAN traffic.

Configuration on **PE1**:

```
switch(config)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# channel-group 100 mode on
!
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config)# interface Vlan20
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config)# interface Vlan30
switch(config-if-Vl30)# ip address virtual 20.0.30.1/24
!
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 4789
switch(config-if-Vx1)# VXLAN vlan 20 vni 10020
switch(config-if-Vx1)# VXLAN vlan 30 vni 10030
!
switch(config)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
!
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
!
switch(config-router-bgp)# vlan 30
switch(config-macvrf-30)# rd 10.255.0.0:30
switch(config-macvrf-30)# route-target both 64500:10030
switch(config-macvrf-30)# redistribute learned
!
switch(config-macvrf-30)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate
```

The Ethernet segment to the multi-homed CE is configured on the port channel interface Port-Channel **100**. **SVI 20** and **SVI 30** along with VARP IP are configured for inter-subnet routing. A VARP MAC is configured globally on **PE1**. The configuration on **PE2** is similar to the configuration shown above. On **PE3**, **SVI 20** and **SVI 30** are configured along with VARP IP and VARP MAC.

Symmetric IRB with IPv4 example:

Configuration on **PE1**:

```
switch(config)# vrf instance red
switch(config-vrf-red)# rd 10.255.0.0:0
!
switch(config-vrf-red)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
```

```

switch(config-evpn-es) # lacp system-id 1234.5678.0123
!
switch(config-if-Po100) # interface Ethernet6/6/1
switch(config-if-Et6/6/1) # switchport mode trunk
switch(config-if-Et6/6/1) # channel-group 100 mode on
!
switch(config-if-Et6/6/1) # interface Loopback0
switch(config-if-Lo0) # ip address 10.255.0.0/32
!
switch(config-if-Lo0) # interface Vlan20
switch(config-if-Vl20) # vrf red
switch(config-if-Vl20) # ip address virtual 20.0.20.1/24
!
switch(config-if-Vl20) # interface VXLAN1
switch(config-if-Vx1) # VXLAN source-interface Loopback0
switch(config-if-Vx1) # VXLAN udp-port 4789
switch(config-if-Vx1) # VXLAN vlan 10 vni 10010
switch(config-if-Vx1) # VXLAN vlan 20 vni 10020
switch(config-if-Vx1) # VXLAN vrf red vni 20000
!
switch(config-if-Vx1) # ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config) # router bgp 300
switch(config-router-bgp) # router-id 0.0.0.1
switch(config-router-bgp) # maximum-paths 2
switch(config-router-bgp) # neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp) # neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp) # neighbor 10.0.0.1 send-community extended
switch(config-router-bgp) # neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp) # redistribute static
!
switch(config-router-bgp) # vlan 20
switch(config-macvrf-20) # rd 10.255.0.0:20
switch(config-macvrf-20) # route-target both 64500:10020
switch(config-macvrf-20) # redistribute learned
!
switch(config-macvrf-20) # address-family evpn
switch(config-router-bgp-af) # neighbor 10.0.0.1 activate
!
switch(config-router-bgp-af) # vrf red
switch(config-router-bgp-vrf-red) # rd 10.255.0.0:0
switch(config-router-bgp-vrf-red) # route-target import evpn 64500:20000
switch(config-router-bgp-vrf-red) # route-target export evpn 64500:20000
switch(config-router-bgp-vrf-red) # router-id 10.255.0.0
!
```

The Ethernet segment to the multi-homed **CE1** is configured on the port channel interface Port-Channel **100**. **SVI 20** along with VARP IP and VARP MAC is configured. Also, IP VRF is configured which is needed for symmetric IRB. The configuration on **PE2** is similar. On **PE3**, IP VRF and **SVI 30** are configured for symmetric IRB.

VXLAN example

A network with two VRFs, **red** and **blue** has VLANs **10** and **20** in **red** and VLANs **30** and **40** in **blue**. The spines act as a route reflectors. Multicast groups are used to encapsulate traffic arriving in a VRF such that it is delivered to VTEPs that have that VRF provisioned.

```

interface Loopback0
    ip address 10.0.0.20/32
!
vlan 10
vlan 20
vlan 30
vlan 40
!
interface Ethernet1
    switchport access vlan 10
!
interface Ethernet2
    switchport access vlan 20
!
interface Ethernet3
    switchport access vlan 30
```

```

!
interface Ethernet4
    switchport access vlan 40
!

!
```

18.10.2 Show Commands

The following examples are based on the sample topology and configuration in the previous sections.

On the remote VTEP, to display the EVPN routes to the multi-homed CE (**20.0.20.2**):

```

switch# show bgp evpn route-type mac-ip 20.0.20.2
BGP routing table information for VRF default
Router identifier 0.0.3.1, local AS number 302
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
                    e - ECMP S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop           Metric LocPref Weight Path
* >   RD: 10.255.0.0:20 mac-ip 0000.0101.0000 20.0.20.2
                  10.255.0.0        -       100     0      303 300 i
* >   RD: 10.255.0.1:20 mac-ip 0000.0101.0000 20.0.20.2
                  10.255.0.1        -       100     0      303 301 i

```

As shown above, there are two EVPN MAC-IP routes for the multi-homed CE.

On the remote PE, to display the installed routes to the multi-homed CE:

```

switch# show ip route vrf red 20.0.20.2/32
VRF: red
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
```

```

O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
NG - Nexthop Group Static Route, V - VXLAN Control Service,
DH - DHCP client installed default route, M - Martian,
DP - Dynamic Policy Route, L - VRF Leaked

B E      20.0.20.2/32 [200/0] via VTEP 10.255.0.0 VNI 20000 router-mac 00:00:78:01:00:00
          via VTEP 10.255.0.1 VNI 20000 router-mac 00:00:78:04:00:00

```

Two routes to the multi-homed CE are installed from the two EVPN MAC-IP routes and they form L3 ECMP.

On the remote PE, to check the details of the two routes in BGP RIB:

```

switch# show ip bgp 20.0.20.2/32 vrf red
BGP routing table information for VRF red
Router identifier 10.255.0.2, local AS number 302
BGP routing table entry for 20.0.20.2/32
Paths: 2 available
 303 300
    10.255.0.0 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.0:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP head, ECMP, best, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVXLAN EvpnMacMobility:1 EvpnRouterMac:00:00:78:01:00:00
      Remote VNI: 20000
      Rx SAFI: Unicast
  303 301
    10.255.0.1 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.1:20
      Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
      valid, external, ECMP, ECMP contributor
      Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
      TunnelEncap:tunnelTypeVXLAN EvpnMacMobility:1 EvpnRouterMac:00:00:78:04:00:00
      EvpnNdFlags:pflag
      Remote VNI: 20000
      Rx SAFI: Unicast

```

The second route has **EvpnNdFlags:pflag** to indicate that this is a proxy MAC-IP route.

This command shows information about the SBD instance that is created when **evpn multicast** is configured under an IP VRF:

```

switch# show bgp evpn instance sbd red
EVPN instance: SBD red
  Route distinguisher: 100:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
vtep2#show bgp evpn instance sbd blue
EVPN instance: SBD blue
  Route distinguisher: 200:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN

```

The OISM supported capability is set in IMET routes for the SBD when **evpn multicast** is configured for a VRF. The IGMP proxy flag is not set in IMET routes for VLANs in the VRF unless **redistribute igmp** is configured in a VLAN:

```

switch# show bgp evpn route-type imet next-hop 10.0.0.10 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300

```

18.10.3 Limitations

The EVPN VXLAN all-active multi-homing integrated routing and bridging feature has the following limitations:

- L2 loop-free protocols, such as Spanning Tree Protocol (STP) are not supported between PE-CE with EVPN VXLAN All-Active Multi-homing. The topology must be loop-free. STP must be disabled for the Multihomed VLANs on PEs and CEs.
- A limit of two multi-homing destinations are installed at one time for any particular MAC address. Any other valid destinations are ignored in the context of switching unicast traffic, until one of the active destinations is removed. The multi-homing PEs operate normally regardless of the number of PEs on the ethernet segment; this limitation only affects the selection of a destination for unicast traffic.
- VXLAN GPE is not supported, so packets cannot be flagged as having been broadcast. As a result, unicast packets that are known at the sender and unknown at the receiver are dropped if the receiving PE is not a designated forwarder. Similarly, unicast packets that are unknown at the sender and known at the receiver are duplicated at the receiving CE. This state automatically resolves itself as the BGP network distributes the appropriate type 1 auto-discovery and type 2 MAC/IP advertisement EVPN routes.
- Fast mass withdrawal is not supported, so there may be a delay if an interface harboring a large number of MAC addresses goes down.

18.10.4 Flood Traffic Filtering with EVPN

The VXLAN fabric managed by EVPN does not always flood with broadcast, multicast, or unknown MAC traffic. Sometimes, ARP request broadcast and ND multicast traffic flood the VXLAN fabric as well. There may be other cases where flooding ARP plus other traffic is allowed, but not all broadcast traffic into the fabric.

Most of the ARPs are learned through EVPN, and for some cases where the ARP is not learned through EVPN, it is acceptable to flood such ARP requests. However, rate limit the ARP flooding going into the VXLAN fabric.

Configuration

The default command disables flooding of different kinds of traffic into the VXLAN fabric to restrict only ARP and ND traffic flooding.

```
switch(config-rtr-l2-vpn) # flooding default disabled
```

The following command enables flooding of ARP packets into the VXLAN fabric again.

```
switch(config-rtr-l2-vpn) # arp flooding
```

The above command starts flooding ARP traffic into the VXLAN fabric while all other traffic including ND traffic is prevented from getting flooded into the fabric. The following command enables flooding of ND traffic.

```
switch(config-rtr-l2-vpn) # nd flooding
```

Note: These commands are in effect only when EVPN is enabled. ARP & ND flooding are enabled by default.

Show Commands

The `show VXLAN counters software` command shows the number of ARP and ND packets that were prevented from getting flooded into the VXLAN fabric.

```
switch# show VXLAN counters software
Tx pkts after IPv6 encapsulation : 0
SW pkts forwarded to remote VTEPs via HW HER : 4
SW pkts forwarding to remote VTEPs via HW HER failed : 0
Packets suppressed from getting flooded : 0
```

18.11 Inter-VRF Local Route Leaking

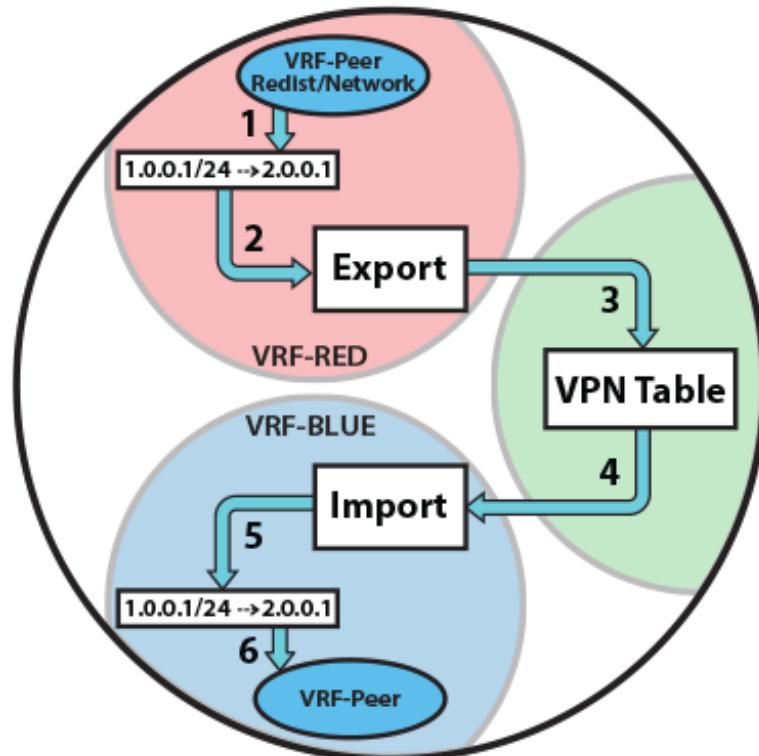

Inter-VRF local route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default VRF) on the system. Routes can be leaked using the following methods:

- [Inter-VRF Local Route Leaking using BGP VPN](#)
- [Inter-VRF Local Route Leaking using VRF-leak Agent](#)

18.11.1 Inter-VRF Local Route Leaking using BGP VPN

Inter-VRF local route leaking allows the user to export and import routes from one VRF to another on the same device. This is implemented by exporting routes from a VRF to the local VPN table using the route target extended community list and importing the same route target extended community lists from the local VPN table into the target VRF. VRF route leaking is supported on VPN-IPv4, VPN-IPv6, and EVPN types.

Figure 18-45: Inter-VRF Local Route Leaking using Local VPN Table

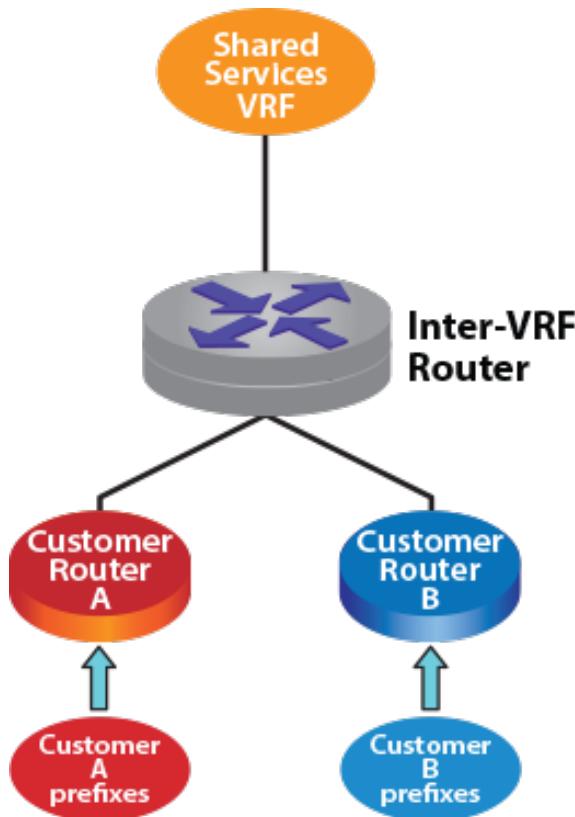

Accessing Shared Resources Across VPNs

To access shared resources across VPNs, all the routes from the shared services VRF must be leaked into each of the VPN VRFs, and customer routes must be leaked into the shared services VRF for return traffic. Accessing shared resources allows the route target of the shared services VRF to be exported into all customer VRFs, and allows the shared services VRF to import route targets from customers A and B. The following figure shows how to provide customers, corresponding to multiple VPN domains, access to services like DHCP available in the shared VRF.

Route leaking across the VRFs is supported on VPN-IPv4, VPN-IPv6, and EVPN.

Figure 18-46: Accessing Shared Resources Across VPNs

18.11.1.1 Configuring Inter-VRF Local Route Leaking

Inter-VRF local route leaking is configured using VPN-IPv4, VPN-IPv6, and EVPN. Prefixes can be exported and imported using any of the configured VPN types. Ensure that the same VPN type that is exported is used while importing.

Leaking unicast IPv4 or IPv6 prefixes is supported and achieved by exporting prefixes locally to the VPN table and importing locally from the VPN table into the target VRF on the same device as shown in the figure titled **Inter-VRF Local Route Leaking using Local VPN Table** using the `route-target` command.

Exporting or importing the routes to or from the EVPN table is accomplished with the following two methods:

- Using VXLAN for encapsulation
- Using MPLS for encapsulation

Using VXLAN for Encapsulation

To use VXLAN encapsulation type, make sure that VRF to VNI mapping is present and the interface status for the VXLAN interface is up. This is the default encapsulation type for EVPN.

Example

The configuration for VXLAN encapsulation type is as follows:

```
switch(config)# router bgp 65001
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# neighbor default encapsulation vxlan next-hop-self source-interface
  Loopback0
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile VXLAN-routing
switch(config-hw-tcam)# interface VXLAN1
switch(config-hw-tcam-if-Vx1)# vxlan source-interface Loopback0
switch(config-hw-tcam-if-Vx1)# vxlan udp-port 4789
switch(config-hw-tcam-if-Vx1)# vxlan vrf vrf-blue vni 20001
switch(config-hw-tcam-if-Vx1)# vxlan vrf vrf-red vni 10001
```

Using MPLS for Encapsulation

To use MPLS encapsulation type to export to the EVPN table, MPLS needs to be enabled globally on the device and the encapsulation method needs to be changed from default type, that is VXLAN to MPLS under the EVPN address-family sub-mode.

Example

```
switch(config)# router bgp 65001
switch(config-router-bgp)# address-family evpn
switch(config-router-bgp-af)# neighbor default encapsulation mpls next-hop-self source-interface
  Loopback0
```

18.11.1.2 Route-Distinguisher

Route-Distinguisher (RD) uniquely identifies routes from a particular VRF. Route-Distinguisher is configured for every VRF from which routes are exported from or imported into.

The following commands are used to configure Route-Distinguisher for a VRF.

```
switch(config-router-bgp)# vrf vrf-services
switch(config-router-bgp-vrf-vrf-services)# rd 1.0.0.1:1

switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2.0.0.1:2
```

18.11.1.3 Exporting Routes from a VRF

Use the **route-target export** command to export routes from a VRF to the local VPN or EVPN table using the route target extended community list.

Examples

- These commands export routes from **vrf-red** to the local VPN table.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
```

```
switch(config-router-bgp-vrf-vrf-red) # rd 1:1
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv6 10:20
```

- These commands export routes from **vrf-red** to the EVPN table.

```
switch(config) # router bgp 65001
switch(config-router-bgp) # vrf vrf-red
switch(config-router-bgp-vrf-vrf-red) # rd 1:1
switch(config-router-bgp-vrf-vrf-red) # route-target export evpn 10:1
```

18.11.1.4 Importing Routes into a VRF

Use the **route-target import** command to import the exported routes from the local VPN or EVPN table to the target VRF using the route target extended community list.

Examples

- These commands import routes from the VPN table to **vrf-blue**.

```
switch(config) # service routing protocols model multi-agent
switch(config) # mpls ip
switch(config) # router bgp 65001
switch(config-router-bgp) # vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue) # rd 2:2
switch(config-router-bgp-vrf-vrf-blue) # route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue) # route-target import vpn-ipv6 10:20
```

- These commands import routes from the EVPN table to **vrf-blue**.

```
switch(config) # router bgp 65001
switch(config-router-bgp) # vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue) # rd 2:2
switch(config-router-bgp-vrf-vrf-blue) # route-target import evpn 10:1
```

18.11.1.5 Exporting and Importing Routes using Route Map

To manage VRF route leaking, control the export and import prefixes with route-map export or import commands. The route map is effective only if the VRF or the VPN paths are already candidates for export or import. The route-target export or import command must be configured first. Setting BGP attributes using route maps is effective only on the export end.

Note: Prefixes that are leaked are not re-exported to the VPN table from the target VRF.

Examples

- These commands export routes from **vrf-red** to the local VPN table.

```
switch(config) # service routing protocols model multi-agent
switch(config) # mpls ip
switch(config) # router bgp 65001
switch(config-router-bgp) # vrf vrf-red
switch(config-router-bgp-vrf-vrf-red) # rd 1:1
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv6 10:20
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv4 route-map EXPORT_V4_ROU
TES_TO_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red) # route-target export vpn-ipv6 route-map EXPORT_V6_ROU
TES_TO_VPN_TABLE
```

- These commands export routes from **vrf-red** to the EVPN table.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)# rd 1:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)# route-target export evpn route-map EXPORT_ROUTES
_TO_EVPN_TABLE
```

- These commands import routes from the VPN table to **vrf-blue**.

```
switch(config)# service routing protocols model multi-agent
switch(config)# mpls ip
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 1:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6 10:20
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv4 route-map IMPORT_V4_ROU
TES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)# route-target import vpn-ipv6 route-map IMPORT_V6_ROU
TES_VPN_TABLE
```

- These commands import routes from the EVPN table to **vrf-blue**.

```
switch(config)# router bgp 65001
switch(config-router-bgp)# vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)# rd 2:2
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)# route-target import evpn route-map IMPORT_ROUTES
_FROM_EVPN_TABLE
```

18.11.2 Inter-VRF Local Route Leaking using VRF-leak Agent

Inter-VRF local route leaking allows routes to leak from one VRF to another using a route map as a VRF-leak agent. VRFs are leaked based on the preferences assigned to each VRF.

18.11.2.1 Configuring Route Maps

To leak routes from one VRF to another using a route map, use the [router general](#) command to enter Router-General Configuration Mode, then enter the VRF submode for the destination VRF, and use the [leak routes](#) command to specify the source VRF and the route map to be used. Routes in the source VRF that match the policy in the route map will then be considered for leaking into the configuration-mode VRF. If two or more policies specify leaking the same prefix to the same destination VRF, the route with a higher (post-set-clause) distance and preference is chosen.

Example

These commands configure a route map to leak routes from **VRF1** to **VRF2** using route map **RM1**.

```
switch(config)# router general
switch(config-router-general)# vrf VRF2
switch(config-router-general-vrf-VRF2)# leak routes source-vrf VRF1 subscribe-policy RM1
switch(config-router-general-vrf-VRF2) #
```

18.12 EVPN Multicast VRF Leaking

Overview

EVPN Multicast virtual routing and forwarding (VRF) Leaking forwards multicast traffic from a sender in a tenant or external domain (VRF) to a different domain (VRF) with connected receivers. The *source VRF* refers to the VRF of the multicast sender, and the *receiver VRF* refers to the VRF of the multicast receiver.

Typically, a multicast receiver sends IGMP messages to a multicast stream, and a last hop router converts the IGMP message to a Protocol Independent Multicast (PIM) message and propagates them upstream on the network. When a VRF receives an IGMP or PIM message, a corresponding VRF leak occurs where the IGMP or PIM messages leak to the source VRF, which the source VRF processes. The corresponding EVPN Selective Multicast Ethernet Tag (SMET) route originates with the Supplementary Broadcast Domain (SBD) route target of the VRF and the route distinguisher (RD) where the sources connect. The receiver VRF RT and RD do not originate SMET routes.

When configuring EVPN Multicast VRF Leaking, the source VRF contains the Multicase Outgoing Interface (OIF) list of multicast routes from the receiver VRF. When the source VRF forwards traffic, the VRF sends a copy of the OIF list across the VRF.

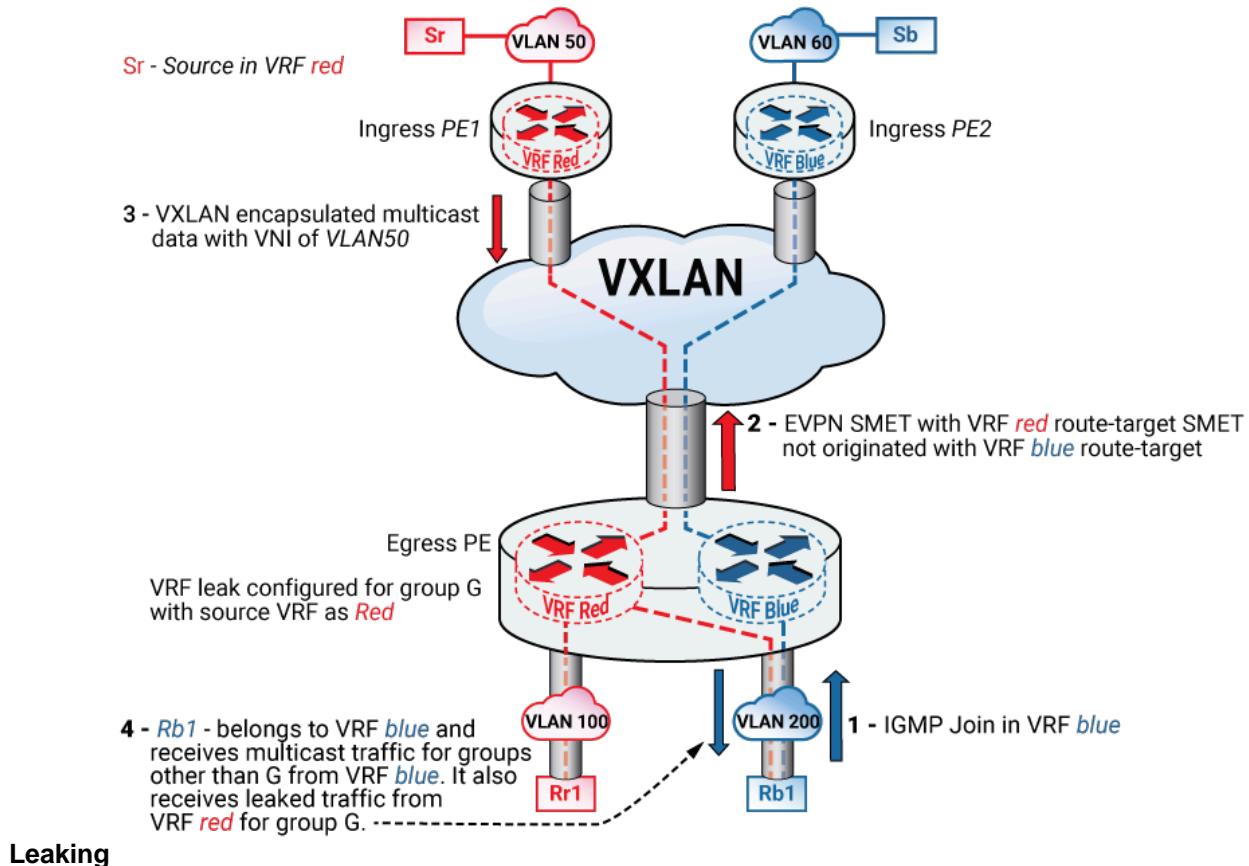

EVPN Multicast VRF Leaking supports a per multicast group configuration to leak multicast traffic.

Note: Configure EVPN Multicast VRF Leaking with caution. Any network design or configuration issues could potentially cause traffic to blackhole, send multiple copies of traffic to the same receiver, or create traffic looping, which may impact traffic on your network.

In the following EVPN topology, two VRF tenants, *red* and *blue*, have multicast receivers and senders. The receiver, *Rb1*, on the *blue* VRF looks for group *G* on VRF, *red*, which has the resources. To enable the feature, configure VRF Leaking for group *G* on the PE connected to the *Rb1* with VRF *red* as the source VRF.

Figure 18-47: Figure 1 - EVPN Multicast Traffic Flow with VRF

In the example topology, the control flow works as follows:

1. *Rb1* sends an IGMP join request for $(*, G)$, and the host device is unaware of VRF Leaking.
2. VRF *blue* has the configuration for VRF Leaking for *G*, so the egress Provider Edge (PE) router sends a SMET to the red VRF, and does not send a SMET to the blue VRF or the VLAN100.
3. The ingress PE connected to the source on VRF *red*, sends VXLAN-encapsulated multicast packets with the VNI of the source VLAN across the EVPN core.
4. The egress PE receives the VXLAN packet, decapsulates it, and routes the data packet to VRF *blue*.

Note: EVPN multi-homed receivers support VRF Leaking, and the configuration should be identical on both designated-forwarder (DF) and non-DF VTEPs for the multi-homed Ethernet segment.

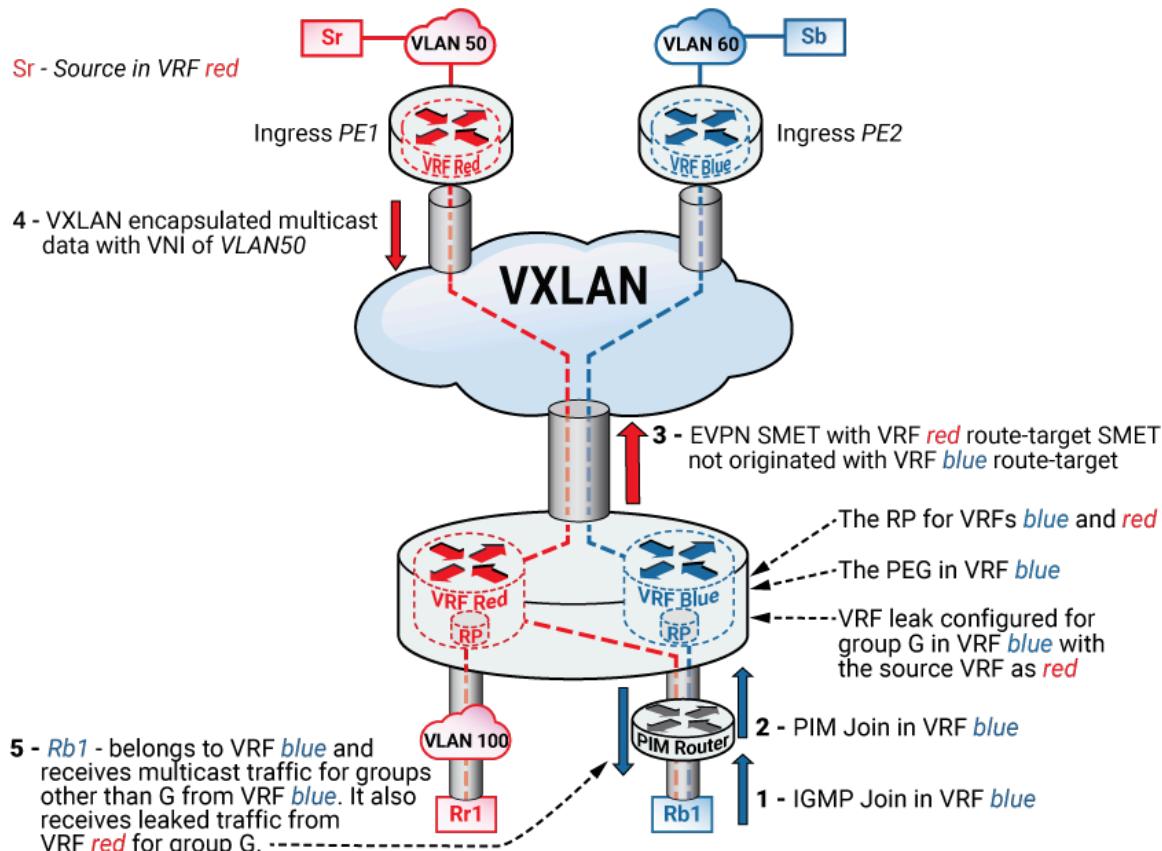

EVPN Multicast VRF Leaking with a PIM EVPN Gateway (PEG)

On an EVPN network with a PEG role, the PEG acts as the rendezvous point (RP) for the leaked groups. The PEG also functions as the Rendezvous Point (RP) of the source VRF, which follows the PIM network model, where the PEG acts as the RP of the source and receiver VRFs. The configuration requires synchronization using a protocol such as Multicast Source Discovery Protocol (MSDP), and the source synchronization may be necessary with the source and receiver VRFs.

If an RP exists in the external PIM domain, then Multicast VRF Leaking can be configured on that RP instead of the PEG, but this requires that both the source and receiver VRFs extend into the PIM domain that includes the RP.

In this case, the sources on the EVPN tenant VRFs exist in a different VRF from the RP, and the unicast route leaks to the source from the tenant VRF into the external domain VRF to build the multicast trees and perform Reverse Path Forwarding (RPF) validation.

Figure 18-48: Figure 2 - Multicast Traffic Flow with VRF Leaking on the PEG

Using MLAG as a PEG on an EVPN Network

When configuring VRF Leaking on MLAG devices used as PEGs, configure the MLAG devices as a PEG in both the receiver VRF and the source VRF. Typically, the external PIM domain connects to the receiver. To enable PEG functionality on the source VRF, configure a stub VLAN and a corresponding SVI on both MLAG peers. Enable PIM on the SVIs of both peers and attach them to the source VRF. This enables PEG functionality in the source VRF as well.

18.13 Static Inter-VRF Route

The Static Inter-VRF Route feature adds support for static inter-VRF routes. This enables the configuration of routes to destinations in one ingress VRF with an ability to specify a next-hop in a different egress VRF through a static configuration.

You can configure static inter-VRF routes in default and non-default VRFs. A different egress VRF is achieved by “tagging” the **next-hop** or **forwarding via** with a reference to an egress VRF (different from the source

VRF) in which that next-hop should be evaluated. Static inter-VRF routes with ECMP next-hop sets in the same egress VRF or heterogenous egress VRFs can be specified.

The Static Inter-VRF Route feature is independent and complementary to other mechanisms that can be used to setup local inter-VRF routes. The other supported mechanisms in EOS and the broader use-cases they support are documented here:

- [Inter-VRF Local Route Leaking using BGP VPN](#)
- [Inter-VRF Local Route Leaking using VRF-leak Agent](#)

18.13.1 Configuration

The configuration to setup static-Inter VRF routes in an ingress (source) VRF to forward IP traffic to a different egress (target) VRF can be done in the following modes:

- This command creates a static route in one ingress VRF that points to a next-hop in a different egress VRF.

```
ip|ipv6 route [vrf vrf-name destination-prefix [egress-vrf] egress-next-hop vrf-name] next-hop
```

18.13.2 Show Commands

Use the `show ip route vrf` to display the egress VRF name if it differs from the source VRF.

Example

```
switch# show ip route vrf vrf1

VRF: vrf1
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

S      1.0.1.0/24 [1/0] via 1.0.0.2, Vlan2180 (egress VRF default)
S      1.0.7.0/24 [1/0] via 1.0.6.2, Vlan2507 (egress VRF vrf3)
```

18.13.3 Limitations

- For bidirectional traffic to work correctly between a pair of VRFs, static inter-VRF routes in both VRFs must be configured.
- Static Inter-VRF routing is supported only in multi-agent routing protocol mode.

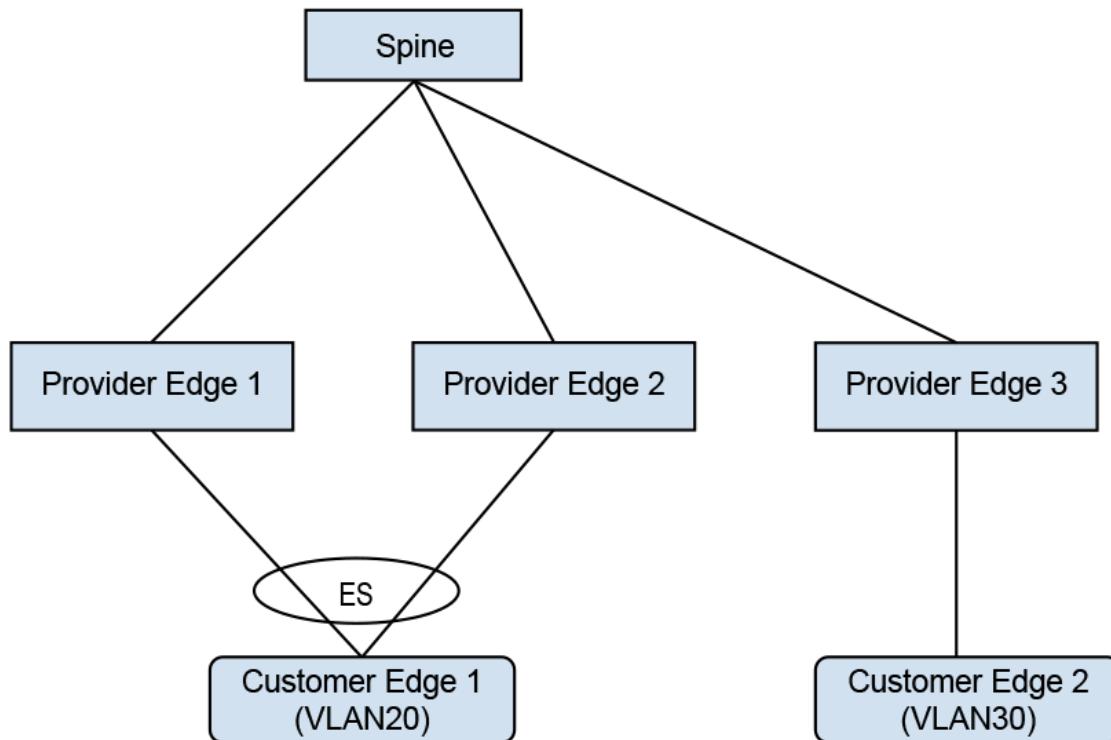

18.14 VCS to EVPN Hitless Migration

VCS to EVPN Hitless Migration enables support for migrating from only using VCS as the control plane to only using EVPN as a control plane in a hitless manner concerning L2 reachability information.

18.14.1 Configuration

On the multi-homing PEs, you must configure the Ethernet Segment (ES) to the CE. In addition, the configuration needed for asymmetric IRB or symmetric IRB must be configured on the local and remote PEs.

Figure 18-49: Asymmetric IRB with IPv4

In the example, **CE1** is a multi-homed CE in **VLAN20**. **CE2** is a remote CE in **VLAN30**. Asymmetric IRB is configured for inter-VLAN traffic.

Configuration on **PE1**:

```

switch(config)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# channel-group 100 mode on
!
switch(config)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config)# interface Vlan20
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config)# interface Vlan30
switch(config-if-Vl30)# ip address virtual 20.0.30.1/24
!
switch(config)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 4789
switch(config-if-Vx1)# VXLAN vlan 20 vni 10020
switch(config-if-Vx1)# VXLAN vlan 30 vni 10030
  
```

```

!
switch(config)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
!
switch(config-router-bgp)# vlan 20
switch(config-macvrf-20)# rd 10.255.0.0:20
switch(config-macvrf-20)# route-target both 64500:10020
switch(config-macvrf-20)# redistribute learned
!
switch(config-router-bgp)# vlan 30
switch(config-macvrf-30)# rd 10.255.0.0:30
switch(config-macvrf-30)# route-target both 64500:10030
switch(config-macvrf-30)# redistribute learned
!
switch(config-macvrf-30)# address-family evpn
switch(config-router-bgp-af)# neighbor 10.0.0.1 activate

```

The Ethernet segment to the multi-homed CE is configured on the port channel interface Port-Channel **100**. **SVI 20** and **SVI 30** along with VARP IP are configured for inter-subnet routing. A VARP MAC is configured globally on **PE1**. The configuration on **PE2** is similar to the configuration shown above. On **PE3**, **SVI 20** and **SVI 30** are configured along with VARP IP and VARP MAC.

Symmetric IRB with IPv4 example:

Configuration on **PE1**:

```

switch(config)# vrf instance red
switch(config-vrf-red)# rd 10.255.0.0:0
!
switch(config-vrf-red)# interface Port-Channel100
switch(config-if-Po100)# switchport access vlan 20
!
switch(config-if-Po100)# evpn ethernet-segment
switch(config-evpn-es)# identifier 0033:3333:3333:3333:3333
switch(config-evpn-es)# route-target import 00:03:00:03:00:03
switch(config-evpn-es)# lacp system-id 1234.5678.0123
!
switch(config-if-Po100)# interface Ethernet6/6/1
switch(config-if-Et6/6/1)# switchport mode trunk
switch(config-if-Et6/6/1)# channel-group 100 mode on
!
switch(config-if-Et6/6/1)# interface Loopback0
switch(config-if-Lo0)# ip address 10.255.0.0/32
!
switch(config-if-Lo0)# interface Vlan20
switch(config-if-Vl20)# vrf red
switch(config-if-Vl20)# ip address virtual 20.0.20.1/24
!
switch(config-if-Vl20)# interface VXLAN1
switch(config-if-Vx1)# VXLAN source-interface Loopback0
switch(config-if-Vx1)# VXLAN udp-port 4789
switch(config-if-Vx1)# VXLAN vlan 10 vni 10010
switch(config-if-Vx1)# VXLAN vlan 20 vni 10020
switch(config-if-Vx1)# VXLAN vrf red vni 20000
!
switch(config-if-Vx1)# ip virtual-router mac-address 00:00:80:00:00:00
!
switch(config)# router bgp 300
switch(config-router-bgp)# router-id 0.0.0.1
switch(config-router-bgp)# maximum-paths 2
switch(config-router-bgp)# neighbor 10.0.0.1 remote-as 303
switch(config-router-bgp)# neighbor 10.0.0.1 ebgp-multihop
switch(config-router-bgp)# neighbor 10.0.0.1 send-community extended
switch(config-router-bgp)# neighbor 10.0.0.1 maximum-routes 12000
switch(config-router-bgp)# redistribute static
!
switch(config-router-bgp)# vlan 20

```

```

switch(config-macvrf-20) # rd 10.255.0.0:20
switch(config-macvrf-20) # route-target both 64500:10020
switch(config-macvrf-20) # redistribute learned
!
switch(config-macvrf-20) # address-family evpn
switch(config-router-bgp-af) # neighbor 10.0.0.1 activate
!
switch(config-router-bgp-af) # vrf red
switch(config-router-bgp-vrf-red) # rd 10.255.0.0:0
switch(config-router-bgp-vrf-red) # route-target import evpn 64500:20000
switch(config-router-bgp-vrf-red) # route-target export evpn 64500:20000
switch(config-router-bgp-vrf-red) # router-id 10.255.0.0
!
```

The Ethernet segment to the multi-homed **CE1** is configured on the port channel interface Port-Channel **100**. **SVI 20** along with VARP IP and VARP MAC is configured. Also, IP VRF is configured which is needed for symmetric IRB. The configuration on **PE2** is similar. On **PE3**, IP VRF and **SVI 30** are configured for symmetric IRB.

VXLAN example

A network with two VRFs, **red** and **blue** has VLANs **10** and **20** in **red** and VLANs **30** and **40** in **blue**. The spines act as a route reflectors. Multicast groups are used to encapsulate traffic arriving in a VRF such that it is delivered to VTEPs that have that VRF provisioned.

```

interface Loopback0
    ip address 10.0.0.20/32
!
vlan 10
vlan 20
vlan 30
vlan 40
!
interface Ethernet1
    switchport access vlan 10
!
interface Ethernet2
    switchport access vlan 20
!
interface Ethernet3
    switchport access vlan 30
!
interface Ethernet4
    switchport access vlan 40
!
interface Vlan10
    vrf red
    ip address virtual 192.168.1.0/24
    ip igmp

VXLAN vrf red multicast group 225.1.1.1
VXLAN vrf blue multicast group 226.1.1.1
!
```

18.14.2 Show Commands

The following examples are based on the sample topology and configuration in the previous sections.

On the remote VTEP, to display the EVPN routes to the multi-homed CE (**20.0.20.2**):

```

switch# show bgp evpn route-type mac-ip 20.0.20.2
BGP routing table information for VRF default
Router identifier 0.0.3.1, local AS number 302
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head,
                    e - ECMP S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

      Network          Next Hop           Metric LocPref Weight Path
* >   RD: 10.255.0.0:20 mac-ip 0000.0101.0000 20.0.20.2
                  10.255.0.0      -       100     0      303 300 i
* >   RD: 10.255.0.1:20 mac-ip 0000.0101.0000 20.0.20.2
                  10.255.0.1      -       100     0      303 301 i

```

As shown above, there are two EVPN MAC-IP routes for the multi-homed CE.

On the remote PE, to display the installed routes to the multi-homed CE:

```

switch# show ip route vrf red 20.0.20.2/32

VRF: red
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

B E      20.0.20.2/32 [200/0] via VTEP 10.255.0.0 VNI 20000 router-mac 00:00:78:01:00:00
                                via VTEP 10.255.0.1 VNI 20000 router-mac 00:00:78:04:00:00

```

Two routes to the multi-homed CE are installed from the two EVPN MAC-IP routes and they form L3 ECMP.

On the remote PE, to check the details of the two routes in BGP RIB:

```

switch# show ip bgp 20.0.20.2/32 vrf red
BGP routing table information for VRF red
Router identifier 10.255.0.2, local AS number 302
BGP routing table entry for 20.0.20.2/32
Paths: 2 available
 303 300
  10.255.0.0 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.0:20
    Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
    valid, external, ECMP head, ECMP, best, ECMP contributor
    Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
    TunnelEncap:tunnelTypeVXLAN EvpnMacMobility:1 EvpnRouterMac:00:00:78:01:00:00
    Remote VNI: 20000
    Rx SAIFI: Unicast
 303 301
  10.255.0.1 from 10.0.2.1 (0.0.1.1), imported EVPN route, RD 10.255.0.1:20
    Origin IGP, metric 0, localpref 100, IGP metric 0, weight 0, received 00:14:43 ago,
    valid, external, ECMP, ECMP contributor
    Extended Community: Route-Target-AS:64500:10020 Route-Target-AS:64500:20000
    TunnelEncap:tunnelTypeVXLAN EvpnMacMobility:1 EvpnRouterMac:00:00:78:04:00:00

```

```
EvpnNdFlags:pflag
Remote VNI: 20000
Rx SAFI: Unicast
```

The second route has **EvpnNdFlags:pflag** to indicate that this is a proxy MAC-IP route.

This command shows information about the SBD instance that is created when **evpn multicast** is configured under an IP VRF:

```
switch# show bgp evpn instance sbd red
EVPN instance: SBD red
  Route distinguisher: 100:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
vtep2#show bgp evpn instance sbd blue
EVPN instance: SBD red
  Route distinguisher: 200:1
  Service interface: VLAN-based
  Local IP address: 10.0.0.20
  Encapsulation type: VXLAN
```

The OISM supported capability is set in IMET routes for the SBD when **evpn multicast** is configured for a VRF. The IGMP proxy flag is not set in IMET routes for VLANs in the VRF unless **redistribute igmp** is configured in a VLAN:

```
switch# show bgp evpn route-type imet next-hop 10.0.0.10 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for imet 10.0.0.10, Route Distinguisher: 10:1
  Paths: 1 available
    Local
      10.0.0.10 from 10.0.0.1 (0.0.1.1)
        Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
        Extended Community: Route-Target-AS:10:1 TunnelEncap:tunnelTypeVXLAN
        VNI: 10
        PMSI Tunnel: PIM-SSM Tree, MPLS Label: 10, Leaf Information Required: false,
        Tunnel ID: 10.0.0.10, 225.1.1.2
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for imet 10.0.0.10, Route Distinguisher: 100:1
  Paths: 1 available
    Local
      10.0.0.10 from 10.0.0.1 (0.0.1.1)
        Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
        Extended Community: Route-Target-AS:100:1 TunnelEncap:tunnelTypeVXLAN Multicast
        Flags: IGMP proxy, OISM-supported, SBD
        VNI: 100
        PMSI Tunnel: Ingress Replication, MPLS Label: 100, Leaf Information Required: false,
        Tunnel ID: 10.0.0.10
```

This command shows information about the single SMET route for the group with the RD of **VRF red**:

```
switch# show bgp evpn route-type smet multicast 228.1.1.1
BGP routing table information for VRF default
Router identifier 0.0.1.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP
                  S - Stale, c - Contributing to ECMP, b - backup
                  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
                    Network          Next Hop          Metric LocPref Weight Path
* >    RD: 100:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.10
          10.0.0.10          -       100     0   i
* >    RD: 100:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.20
          -           -       -       0   i
* >    RD: 100:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.30
          10.0.0.30          -       100     0   i
* >    RD: 200:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.20
          -           -       -       0   i
* >    RD: 200:1 smet (S, G): (*, 228.1.1.1) originating IP: 10.0.0.40
          10.0.0.40          -       100     0   i
```

This command shows information about the SPMSI route for the group:

```
switch# show bgp evpn route-type spmsi
BGP routing table information for VRF defaultRouter identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, E - ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
                     Network          Next Hop      Metric LocPref Weight Path

```

18.14.3 Limitations

The EVPN VXLAN all-active multi-homing integrated routing and bridging feature has the following limitations:

- L2 loop-free protocols, such as Spanning Tree Protocol (STP) are not supported between PE-CE with EVPN VXLAN All-Active Multi-homing. The topology must be loop-free. STP must be disabled for the Multihomed VLANs on PEs and CEs.
- A limit of two multi-homing destinations are installed at one time for any particular MAC address. Any other valid destinations are ignored in the context of switching unicast traffic, until one of the active destinations is removed. The multi-homing PEs operate normally regardless of the number of PEs on the ethernet segment; this limitation only affects the selection of a destination for unicast traffic.
- VXLAN GPE is not supported, so packets cannot be flagged as having been broadcast. As a result, unicast packets that are known at the sender and unknown at the receiver are dropped if the receiving PE is not a designated forwarder. Similarly, unicast packets that are unknown at the sender and known at the receiver are duplicated at the receiving CE. This state automatically resolves itself as the BGP network distributes the appropriate type 1 auto-discovery and type 2 MAC/IP advertisement EVPN routes.
- Fast mass withdrawal is not supported, so there may be a delay if an interface harboring a large number of MAC addresses goes down.

18.15 Configuring EVPN

This section covers the following topics for EVPN configuration:

- Configuring BGP-EVPN
- Configuring VCS
- Configuring EVPN MPLS Virtual Private Wire Service (VPWS)
- Configuring Multi-Homing on a Multi-Domain EVPN VXLAN-MPLS Gateway
- EVPN and VCS Commands

18.15.1 Configuring BGP-EVPN and VCS on CVX

18.15.1.1 Configuring BGP-EVPN

Configuring VNI Bundle

A VNI-aware-bundle represents a MAC-VRF that contains Layer 2 route entries from all VXLAN Network Identifiers (VNI) available across multiple DCs. Use the **vni-aware-bundle** command available on CVX to create a MAC-VRF.

Note: This command is not available on switches.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```

Configuring RD and RT in VNI Bundle

Use the **rd** (Router-BGP VRF and VNI Configuration Modes) command to add a Route Distinguisher (RD) for uniquely identifying Layer 2 routes for the VNI bundle. Use the **route-target** command to configure a well-known extended community that is attached to the routes exported by BGP-EVPN; and to import routes with the specified well-known extended community into the MAC-VRF that corresponds to the VNI bundle.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)# route-target both 530:12
```

Enabling Redistribution of Bridging Information

After the VNI aware bundle is created, use the **redistribute service VXLAN** command to redistribute the Layer 2 bridging information received from VCS.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# redistribute service VXLAN
```

Disabling Next-Hop Resolution in BGP-EVPN

When BGP-EVPN module receives a route from its BGP peer, it generally tries to resolve the next-hop indicated in the route. However, in the DCI topology, the routes coming from a CVX in another DC contains next-hops (VTEP addresses) that may not be reachable from the CVX receiving the route. Use the **next-hop resolution disabled** command to disable the next-hop resolution on routes received from BGP-EVPN peers.

Note: CVX is a part of the control plane, and is only connected to the VTEPs in its own DC. It does not have IP connectivity to the VTEPs in a different DC.

Example

```
cvx(config)# router bgp 100
cvx(config-router-bgp)# address-family evpn
cvx(config-router-bgp-af)# next-hop resolution disabled
```

18.15.1.2 Configuring VCS

Enabling Redistribution of BGP-EVPN Routes

Use the **redistribute bgp evpn VXLAN** command to redistribute BGP-EVPN routes to VCS, which, in turn advertises them to all VTEPs within the DC.

Example

```
cvx(config)# cvx
cvx(config-cvx)# no shutdown
cvx(config-cvx)# service VXLAN
cvx(config-cvx-VXLAN)# no shutdown
cvx(config-cvx-VXLAN)# redistribute bgp evpn VXLAN
```

18.15.2 EVPN MPLS Virtual Private Wire Service (VPWS)

Traffic to/from a given Attachment Circuit (AC) without any MAC lookup/learning can be forwarded using EVPN MPLS VPWS, which uses BGP for signalling. Port-based and VLAN-based services are supported.

Configuring EVPN MPLS VPWS

Configure the patch panel to specify the ACs' connection to the VPWS service instances and then the VPWS service instance, which is part of BGP. Finally, configure the individual participating ACs.

Patch Panel Configuration

The following configures the local AC as **Ethernet2** interface and the remote VPWS service instance as **evi-1** and **pseudowire pw1**.

```
patch panel
```

```
patch port
  connector 1 interface Ethernet2
  connector 2 pseudowire bgp vpws evi-1 pseudowire pw1
```

The following configures the local AC as **Ethernet3.1** subinterface and the remote VPWS service instance as **evi-1** and pseudowire **pw2**.

```
patch panel
  patch subintf
    connector 1 interface Ethernet3.1
    connector 2 pseudowire bgp vpws evi-1 pseudowire pw2
```

Note: Connector ID is optional.

VPWS Service Instance Configuration

The following configures the VPWS service instance with the BGP **vpws** sub-mode. This defines an EVPN instance under which any number of VPWS service instances can be configured. The BGP configuration itself can also define multiple EVPN instances under multiple **vpws** blocks, each with a unique name and Route-Distinguisher (RD) value. Only the **mpls control-word** and **mtu value** configuration items are optional; the rest are required for proper operation.

```
router bgp 1
  neighbor 10.0.0.1 remote-as 1
  neighbor 10.0.0.1 send-community extended
  neighbor 10.0.0.1 maximum-routes 12000
  !
  vpws evi-1
    rd 10.2.2.2:2
    route-target import export evpn 0.0.0.0:1
    mpls control-word
    !
    pseudowire pw1
      evpn vpws id local 2001 remote 1001
    !
    pseudowire pw2
      evpn vpws id local 2002 remote 1002
  !
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0
    neighbor 10.0.0.1 activate
```

Note: It is strongly recommended that 'mpls control-word' is always enabled, when possible, to avoid any potential mis-forwarding where the PWE frames may be incorrectly interpreted as having an IP, as opposed to Ethernet, payload.

Attachment Circuit Configuration (double-tagged L3 subinterfaces)

The following configures the AC in Port mode.

```
interface Ethernet2
  no switchport
```

Note: Use Ethernet or Port-channel interface for Port mode.

The following configures the AC in VLAN mode.

```
interface Ethernet3
  no switchport
interface Ethernet3.1
  encapsulation dot1q vlan 1
```

Note: Use subinterfaces for VLAN mode.

The following configures the AC in Flexible Encapsulation mode. The **client** after 'network' preserves the corresponding client encapsulation specification.

```
interface Ethernet3
  no switchport
interface Ethernet3.1
  encapsulation vlan
  client dot1q 11 network client
```

Flexible Encapsulation EVPN MPLS VPWS

Flexible encapsulation enables the following actions for tags.

- Remove incoming encapsulation tag(s) and forward.
- Preserve incoming encapsulation tag(s) and forward.
- Replace one or two tags when forwarding in encapsulation and decapsulation directions.

The following table explains the encapsulation and decapsulation behaviors for the various FlexEncap options. Applying a Flexible Encapsulation with a **network** specification to a subinterface creates a bidirectional mapping table that is applied to the sub-interface. The mapping embodied in this table is applied from **client** to **network** in the encap direction, and **network** to **client** in the decap direction.

| Example | Behavior |
|--|---|
| client dot1q 10 | From Client: match VLAN ID 10, consume and forward To Client: add VLAN ID 10 before transmit |
| client dot1q 10 inner 20 | From Client: match VLAN IDs 10, 20 consume and forward To Client: add VLAN ID 10, 20 before transmit |
| client dot1q 10 network client | From Client: match VLAN ID 10 and retain it. From Network: match vlan=10, retain. |
| client dot1q outer 10 inner 20 network client | From Client: match VLAN IDs 10, 20 and retain both. From Network: match vlan=10,20, retain both. |
| client dot1q 10 network dot1q 100 | |
| client dot1q 10 network dot1q 100 | From Client: match VLAN ID 10, consume. Before forwarding, write vlan=100. From Network: match vlan=100, consume. Before transmit, write vlan=10. |
| client dot1q outer 10 inner 20 network dot1q outer 100 inner 200 | From Client: match VLAN IDs 10, 20, and consume them. Before forwarding, write vlan=100,200. From Network: match vlan=100, 200, consume. Before transmit, write vlan=10, 20. |

The following configures FlexEncap on a subinterface as a local connector and LDP pseudowire as remote connector.

- Packets received on **Ethernet3/1** with outermost 802.1q VLAN tag of **1000** get mapped to sub-interface **Ethernet3/1.1000**.
- The tag of **1000** is preserved and forwarded to pseudowire **PW1**.
- Packets terminating on **PW1** get forwarded to **Et3/1.1000** and get transmitted out with VLAN tag of **1000**.

```
interface Ethernet3/1.1000
  encapsulation vlan
    client dot1q 1000 network client
patch panel
  patch patch-1
    connector 1 interface Ethernet3/1.1000
    connector 2 pseudowire ldp PW1
```

Displaying EVPN MPLS VPWS Configuration

This command shows both the client encapsulation and network encapsulation configured on sub-interfaces.

```
switch(config-if-Et3/1.1003)# show interfaces encapsulation vlan
Interface          Status      Client Encapsulation      Network Encapsulation
-----
Ethernet3/1.1000   active      dot1q outer 1000
Ethernet3/1.1001   active      dot1q outer 1001
Ethernet3/1.1002   active      dot1q outer 1002 inner 102
Ethernet3/1.1003   active      dot1q outer 1003 inner 103
Ethernet3/1.1004   active      dot1q outer 1004
Ethernet3/1.1005   active      dot1q outer 1005 inner 104      dot1q 2004
                                         dot1q outer 2005 inner 204
```

This command shows output of a patch with sub-interface as the local connector and VPWS as the remote connector.

```
switch(config-if-Et3/1.1003)# show patch panel PP_1000
Patch   Connector          Status
-----
PP_1000 1: Ethernet3/1.1000 Up
          2: BGP VPWS VPWS_1 Pseudowire PW_1000

tg481.12:19:52(s2) (config-if-Et3/1.1003)#show patch panel PP_1000 detail
PW Fault Legend:
  ET-IN - Ethernet receive fault
  ET-OUT - Ethernet transmit fault
  TUN-IN - Tunnel receive fault
  TUN-OUT - Tunnel transmit fault
  NF - Pseudowire not forwarding (other reason)

Patch: PP_1000, Status: Up
  Connector 1: Ethernet3/1.1000
    Status: Up
  Connector 2: BGP VPWS VPWS_1 Pseudowire PW_1000
    Status: Up
    Local MPLS label: 135363
    MTU: 1600, Control word: Y
    Neighbor 103.37.123.72, MPLS label: 136350
    Tunnel type: SR-TE Policy, Tunnel index: 132
    MTU: 1600, Control word: Y
    EVPN VPWS type: VLAN-based
```

Tag Matching Semantics

The matching rules are applied on a 'longest matching tag sequence' basis when rules are configured for multiple subinterfaces of a parent port. Considering the following rules on the same parent, the receive (encap) and transmit (decap) rule application is shown in the following tables.

Rule 1:

```
interface Ethernet 10.1
  encapsulation vlan
    client dot1q 11 network client
```

Rule 2:

```
interface Ethernet 10.2
  encapsulation vlan
    client dot1q 11 inner 20 network client
```

The receive (encap) matching behavior is as follows.

| Received Packet | Matching Rule |
|----------------------------|---------------|
| outer=11, inner=20 | Rule #2 |
| single tag with 11 | Rule #1 |
| double tag with 11, not 20 | Rule #1 |

The transmit (decap) matching behavior is as follows.

| Forwarded Packet | Matching Rule |
|----------------------------|---------------|
| outer=11, inner=20 | Rule #2 |
| single tag with 11 | Rule #1 |
| double tag with 11, not 20 | Rule #1 |

18.15.3 Configuring Multi-Homing on a Multi-Domain EVPN VXLAN-MPLS Gateway

Use the following steps to add Multi-Homing to your BGP configuration.

Configuring the Local Ethernet Segment Parameters

- Configure the EVPN address family Ethernet Segment parameters, `domain local`, and enter the Ethernet Segment configuration mode:

```
switch(config-router-bgp-af)# evpn ethernet-segment domain local
switch(config-evpn-es-domain-local)#
```

- Add the 10 octet identifier, `0011:1111:1111:1111` for the local domain:

```
switch(config-evpn-es-domain-local)# identifier 0011:1111:1111:1111
```

- Add the low-order six (6) bytes of the ES-Import Route Target, `11:11:11:11:11:11`:

```
switch(config-evpn-es-domain-local)# route-target import 11:11:11:11:11:11
```

Exit the domain local configuration mode.

```
switch(config-router-bgp-af)#

```

Configuring the Remote Ethernet Segment Parameters

- Configure the Ethernet Segment remote domain parameters by entering the remote domain configuration mode:

```
switch(config-router-bgp-af) # evpn ethernet-segment domain remote  
switch(config-evpn-es-domain-remote) #
```

- Add the 10 octet identifier, **0022:2222:2222:2222** for the remote domain:

```
switch(config-evpn-es-domain-remote)# identifier 0022:2222:2222:2222
```

- Add the low-order six (6) bytes of the ES-Import Route Target to the remote domain:

```
switch(config-evpn-es-domain-remote)# route-target import 22:22:22:22:22:22
```

Exit the remote domain configuration mode, and return to the Ethernet Segment configuration mode:

```
switch(config-evpn-es-domain-remote)# exit  
switch(config-router-bgp-af) #
```

Adding the Layer 2 and BGP FEC Parameters

- Configure the Layer 2 and BGP FEC parameters for the Ethernet Segment configuration:

```
switch(config-router-bgp-af) # layer-2 fec in-place update
```

Exit to the global configuration mode:

```
switch(config) #
```

Adding the Routing Control Functions

- Enter the routing control functions configuration mode and then the control-functions configuration mode:

```
switch(config)# router general
switch(config-router-general)# control-functions
switch(config-router-general-control-functions)#
```

- Finally, add the JSON code to the configuration:

```
switch(config-router-general-control-functions) # code
Enter RCF code. Type 'EOF' on its own line to end.
    function evpnDciMhBlockGwTx() {
        if evpn.route_type is EVPN_IMET
        {
            community add {1:1};
        }
        return true;
    }

    function evpnDciMhBlockGwRx() {
        return community has_none {1:1};
    }

EOF
```

Displaying the Multihome EVPN Configuration

To display your configuration, use the `show active` command from the BGP configuration mode:

```
GW-A1 (config-router-bgp) # show active
```

```

router bgp 64512
...
maximum-paths 4 ecmp 4
bgp bestpath d-path
...
!
vlan 10
rd evpn domain all 10.255.1.1:10
route-target import export 64500:10
route-target import export evpn domain remote 64501:10
redistribute learned
!

    neighbor RR-A rcf out evpnDciMhBlockGwTx()
    neighbor WAN-RR rcf in evpnDciMhBlockGwRx()
    neighbor WAN-RR rcf out evpnDciMhBlockGwTx()
    domain identifier 1:1
    domain identifier 1:2 remote
...
!
evpn ethernet-segment domain local
    identifier 0011:1111:1111:1111:1111
    route-target import 11:11:11:11:11:11
!
evpn ethernet-segment domain remote
    identifier 0022:2222:2222:2222:2222
    route-target import 22:22:22:22:22:22
!
layer-2 fec in-place update
!
router general
    control-functions
    code
        function evpnDciMhBlockGwTx() {
            if evpn.route_type is EVPN_IMET
            {
                community add {1:1};
            }
            return true;
        }

        function evpnDciMhBlockGwRx() {
            return community has_none {1:1};
        }

```

The sample configuration displays the following parameters:

- An interconnect Ethernet segment with an Ethernet Segment Identifier (ESI), 1111:1111:1111:1111:, configured for the hosts sourced from the local domain.
- An interconnect Ethernet segment with an ESI, 2222:2222:2222:2222, configured for the hosts sourced for the remote domain.
- The gateway, GW-A1, peers with a route reflector, the RR-A in the local domain, and peers with a route reflector, WAN-RR, in the remote domain.

For route loop detection, configure domain identifiers for the local and remote domain, and the domain path best path. Use the same identifier for the same domain on all gateways in one site, and configure RCF rules to reject the IMET routes from peer gateways in the same DC.

18.15.4 Configuring iBGP PE-CE Protocol for BGP/EVPN L3 VLANs

Before configuring iBGP, configure BGP EVPN VPN routing with the following commands:

```
switch(config)# router bgp 300
switch(config-router-bgp)# vrf vrf1
switch(config-router-bgp-vrf-vrf1)# local-as 1000
switch(config-router-bgp-vrf-vrf1)# neighbor 10.11.0.2 remote-as 1000
switch(config-router-bgp-vrf-vrf1)# neighbor 10.11.0.2 route-reflector-client
switch(config-router-bgp-vrf-vrf1)# address-family evpn
switch(config-router-bgp-af)# vpn client ibgp attribute tunneling
```

The command, **local-as**, configures the AS number, and if omitted, the VRF assumes the same AS number as the global BGP configuration. The command, **neighbor 10.11.0.2 remote-as 1000** sets the remote AS to the same number as the local AS. The third command, **neighbor 10.11.0.2 route-reflector-client**, allows the CE to receive updates from the PE as the route reflector client. The last command, **neighbor 10.11.0.2 route-reflector-client**, must be included for each configured address family in order to save and restore CE attributes during export or import operations. This is disabled by default.

Note: Configure the AS number for the VRF and not for a single peer. Importing paths requires this parameter.

Displaying iBGP PE-CE Protocol Information

EOS adds a new parameter in the output, **evpn prefix detail** to display the **ATTR_SET, code 128** attributes.

```
switch#show bgp evpn
BGP routing table information for VRF default
Router identifier 10.11.0.1, local AS number 300
BGP routing table entry for ip-prefix 172.10.11.12/24, Route Distinguisher: 100:1
Paths: 1 available
  Local
    - from - (0.0.0.0)
      Origin IGP, metric -, localpref -, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:100:1 TunnelEncap:tunnelTypeMpls
      Rx path id: 0x0
      MPLS label: 100000
      Customer attributes (Origin ASN 1000)
      Origin IGP, metric -, localpref 150, internal
      Community: 47872:6 47872:6939
```

18.16 Sharing Equivalence Class entry across multiple VRF

This enables the sharing of the same Forwarding Equivalence Class (FEC) entry across multiple VRF's and achieves higher scale in VPN deployments by making optimal use of hardware resources. The VPN path routes are imported to multiple VRF for MPLS VPN address family in BGP, individual FEC entry in the hardware table is used for each VRF.

The following configuration in router BGP mode at BGP instance level allows sharing FEC, when the VPN path is imported to multiple VRFs.

```
bgp fec skip in-place update
```

The following configures disable FEC and restores default configuration.

```
[no| default] bgp fec skip in-place update
```

Note: Changing the configuration in a production system may increase FEC usage.

The following example displays BGP VPN-IPv4 routes for prefix **20.0.1.0/24**, which is imported to four VRFs.

```
switch# show bgp vpn-ipv4 20.0.1.0/24 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher: 11.0.1.1:0
Paths: 1 available
 301
    11.0.1.1 from 10.0.0.2 (0.0.1.1)
      Origin IGP, metric -, localpref 100, weight 0, valid, external, best
      Extended Community: Route-Target-AS:300:0 Route-Target-AS:301:0
      MPLS label: 116507
```

This route was using four FEC entries for each VRF before the change.

```
switch# show platform jericho ip route 20.0.1.0/24
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre),
              VXLAN-o(VXLAN outer-rewrite info), VXLAN-i(VXLAN inner-rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips
-----
|                               Routing Table                           |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|VRF|   Destination | | Cmd |   Destination | | VID | Outlif |   MAC / CPU Code | ECMP| FEC | Tunnel
| ID|   Subnet     | |     |   Destination | |     |     |     | Index| Index|T Value
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|1  | 20.0.1.0/24  |ROUTE| FEC 32776  |0  | -  |       |       | -  |49152 |M 116507
|2  | 20.0.1.0/24  |ROUTE| FEC 32776  |0  | -  |       |       | -  |49154 |M 116507
|3  | 20.0.1.0/24  |ROUTE| FEC 32776  |0  | -  |       |       | -  |49155 |M 116507
|4  | 20.0.1.0/24  |ROUTE| FEC 32776  |0  | -  |       |       | -  |49156 |M 116507
```

The following uses single FEC entry For VPN routes imported to all VRFs after configuring **bgp fec skip in-place update event all** command.

```
switch# show platform jericho ip route 20.0.1.0/24
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre),
              VXLAN-o(VXLAN outer-rewrite info), VXLAN-i(VXLAN inner-rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips

```

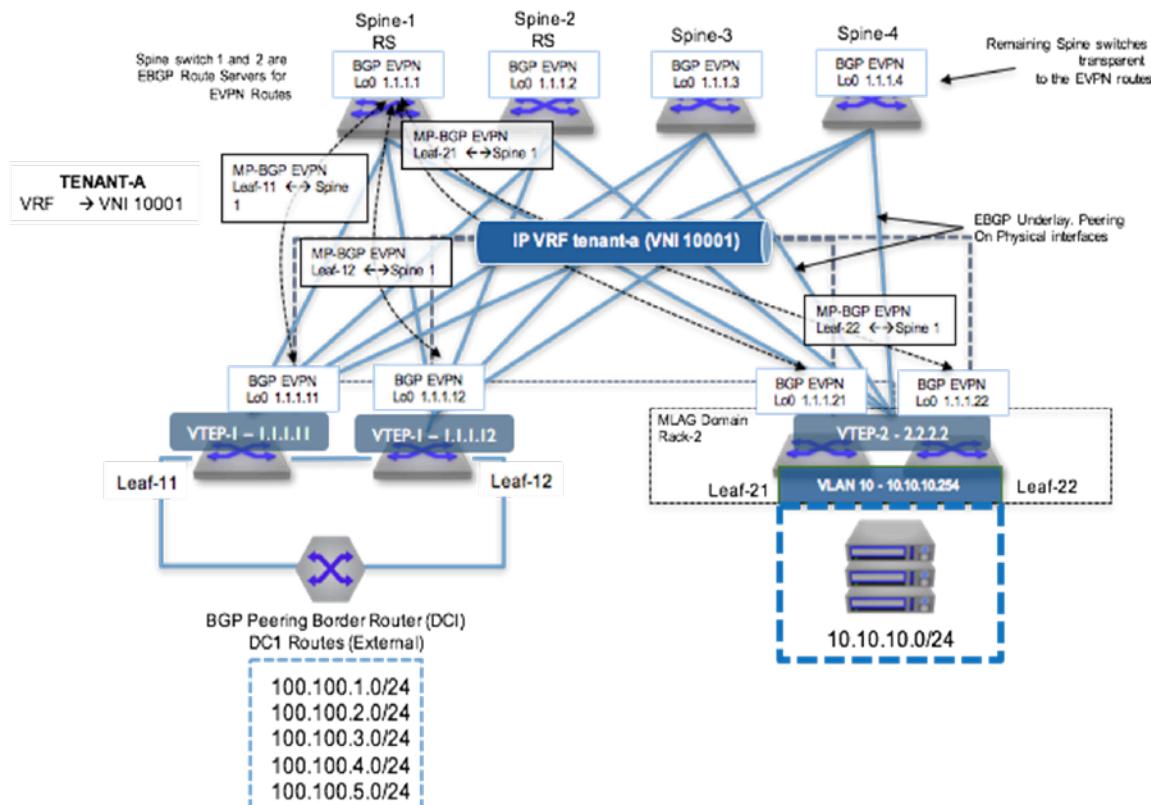

18.17 Sample Configurations

18.17.1 EVPN VXLAN IRB Sample Configuration

In the following topology, we are connecting a Layer 2 site with a Layer 3 site using Layer 3 EVPN (type-5 route). The right side leaves are MLAG leaves and have SVI 10 in VRF-Blue. A number of directly connected hosts are simulated behind the right side leaf. The left side leaves are individual leaves that connect with a

remote switch in **vrf** VRF-Blue to learn Layer 3 routes using BGP. The left side leaves are configured as two independent Layer 3 only VTEPs.

Figure 18-50: Layer 3 EVPN Configuration

To provide VXLAN routing and bridging between the two MLAG domains, each leaf switch is EVPN peering with the four spine switches via a loopback interface.

eBGP Underlay Configuration: Leaf-11

Underlay configuration is straightforward and all neighbors are eBGP. Since all leaves share the same AS number, the **allowas-in** command was added in the leaf.

```

interface Ethernet1
  description Spine-1-et1/1
  mtu 9214
  no switchport
  ip address 172.168.1.1/31

interface Ethernet8/1
  description ck428-et8/1
  speed forced 40gfull
  no switchport
  ip address 172.168.1.10/31

interface Loopback0
  ip address 1.1.1.11/32

ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
  match ip address prefix-list loopback

router bgp 65004
neighbor SPINE peer-group
  neighbor SPINE remote-as 65001

```

```

neighbor SPINE allowas-in 1
neighbor SPINE soft-reconfiguration inbound all
neighbor SPINE send-community
neighbor 172.168.1.0 peer-group SPINE
neighbor 172.168.1.11 remote-as 65003
redistribute connected route-map loopback

```

eBGP Underlay Configuration: Spine-1

```

interface Ethernet1/1
  description Leaf-11-et1
  mtu 9214
  no switchport
  ip address 172.168.1.0/31

interface Loopback0
  ip address 1.1.1.1/32
!
ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
  match ip address prefix-list loopback
!
router bgp 65001
  neighbor 172.168.1.1 remote-as 65004
  redistribute connected route-map loopback

```

VRF Configuration: Leaf-11

VRF-Blue is configured on all the left leaves. The left leaves have pure Layer 3 interfaces and the right side has **SVI 10**.

```

vrf instance VRF-Blue
ip routing vrf VRF-Blue

interface Ethernet36
  no switchport
  vrf VRF-Blue
  ip address 172.168.1.9/31

router bgp 65004
  vrf VRF-Blue
    neighbor 172.168.1.8 remote-as 65005

```

VRF Configuration: Leaf-21

```

vlan 10
vrf instance VRF-Blue
ip routing vrf VRF-Blue

interface Vlan10
  vrf VRF-Blue
  ip address virtual 10.10.10.1/24

ip virtual-router mac-address 00:aa:aa:aa:aa:aa

interface Port-Channel3
  switchport mode trunk
  mlag 3

```

VXLAN Configuration: Leaf-11

Make sure all VTEPs have unique loopback0 addresses to represent unique VTEP identifiers. For every VNI that EVPN receives, a dynamic VLAN is allocated, so it is a good practice to keep the same VNI.

```
interface VXLAN1
  VXLAN source-interface Loopback0
  VXLAN udp-port 4789
  VXLAN vrf VRF-Blue vni 10001
```

VXLAN Configuration: Leaf-21

```
interface VXLAN1
  VXLAN source-interface Loopback0
  VXLAN udp-port 4789
  VXLAN vrf VRF-Blue vni 10001
```

EVPN Configuration: Leaf-11

Leaf establishes the EVPN neighborship with all four spines for redundancy. EVPN neighborship is on the loopback address and the **multihop** keyword is used. Make sure to disable the IPv4 address family for EVPN neighbors.

Since the spine is acting like a route-reflector for EVPN routes, make sure to configure the next-hop-unchanged.

```
router bgp 65004
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN ebgp-multihop 3

  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate
```

EVPN Configuration: Leaf-21

```
router bgp 65002
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN allowas-in 1
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate
```

EVPN Configuration: Spine-1

```
router bgp 65004
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
```

```

neighbor SPINE_EVPN ebgp-multipath 3
neighbor SPINE_EVPN send-community extended
neighbor SPINE_EVPN maximum-routes 12000
neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
    neighbor SPINE_EVPN activate
!
address-family ipv4
    no neighbor SPINE_EVPN activate

```

Advertise VRF Routes in EVPN: Leaf-11

By configuring VRF under **router-bgp**, you are advertising routes from that VRF into EVPN using the RD/RT. The remote end can install the route by importing the RT.

Leaf-11 has routes in **VRF-Blue** learned through eBGP with the neighbor down south. Since the routes are already in BGP VRF table, we do not want to configure the **redistribute** command.

```

router bgp 65004
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN ebgp-multipath 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN
    !
    address-family evpn
        neighbor SPINE_EVPN activate
    !
    address-family ipv4
        no neighbor SPINE_EVPN activate

```

Advertise VRF Routes in EVPN: Leaf-21

On the other hand **Leaf-21** wants to export the connected SVI into EVPN and therefore require **redistribute connected** command.

```

router bgp 65002
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN allowas-in 1
    neighbor SPINE_EVPN ebgp-multipath 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN
    !
    address-family evpn
        neighbor SPINE_EVPN activate
    !
    address-family ipv4
        no neighbor SPINE_EVPN activate

```

18.17.2 Multi-Tenant EVPN VXLAN IRB Sample Configuration

The following configuration example shows a deployment using both symmetric and asymmetric IRB, with VLAN-based and VLAN-aware bundle services; and eBGP overlay and underlay.

Figure 18-51: Tenant-A: Symmetric IRB

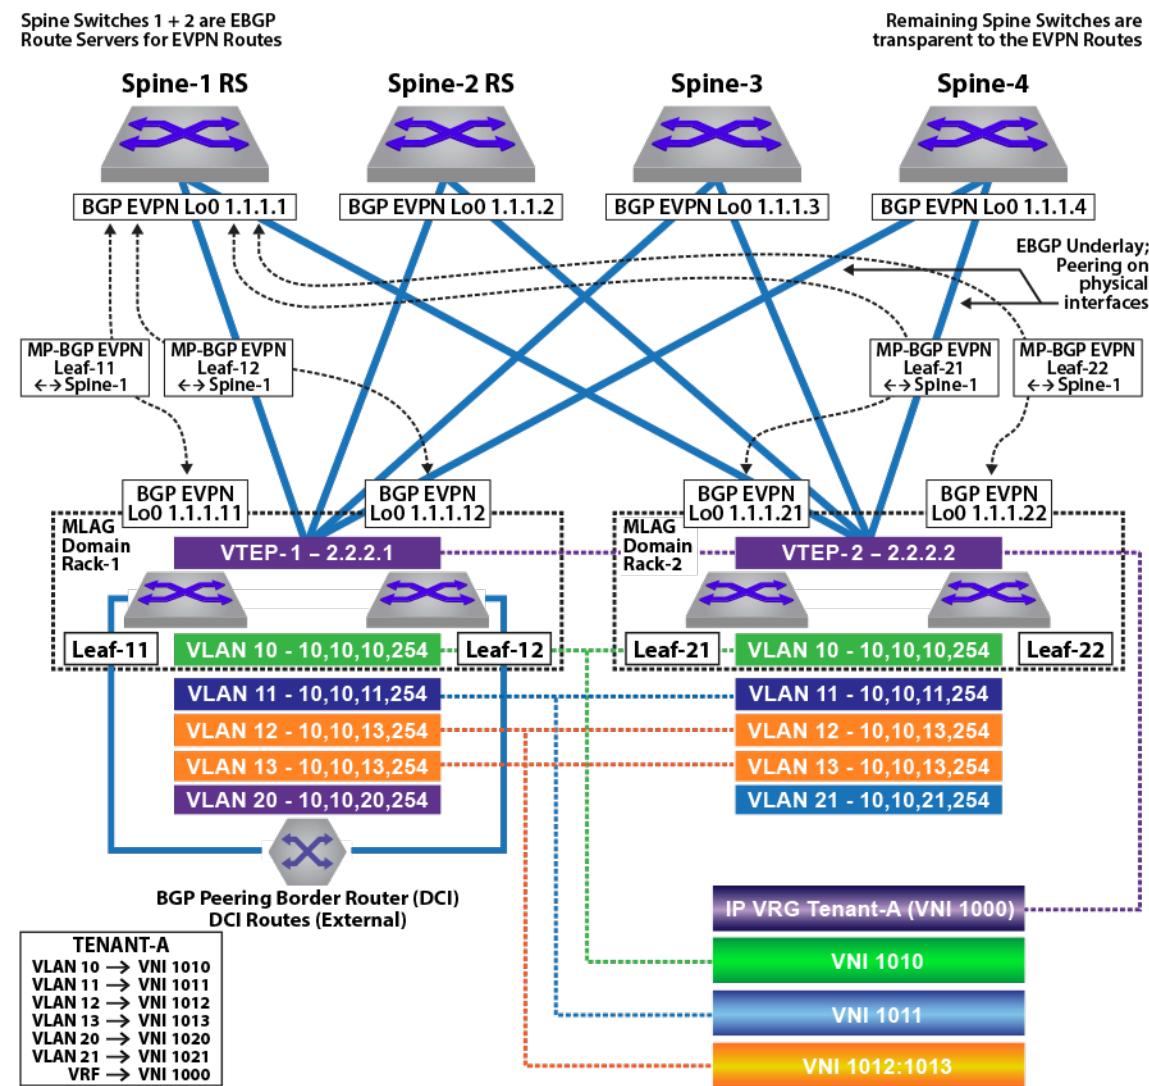

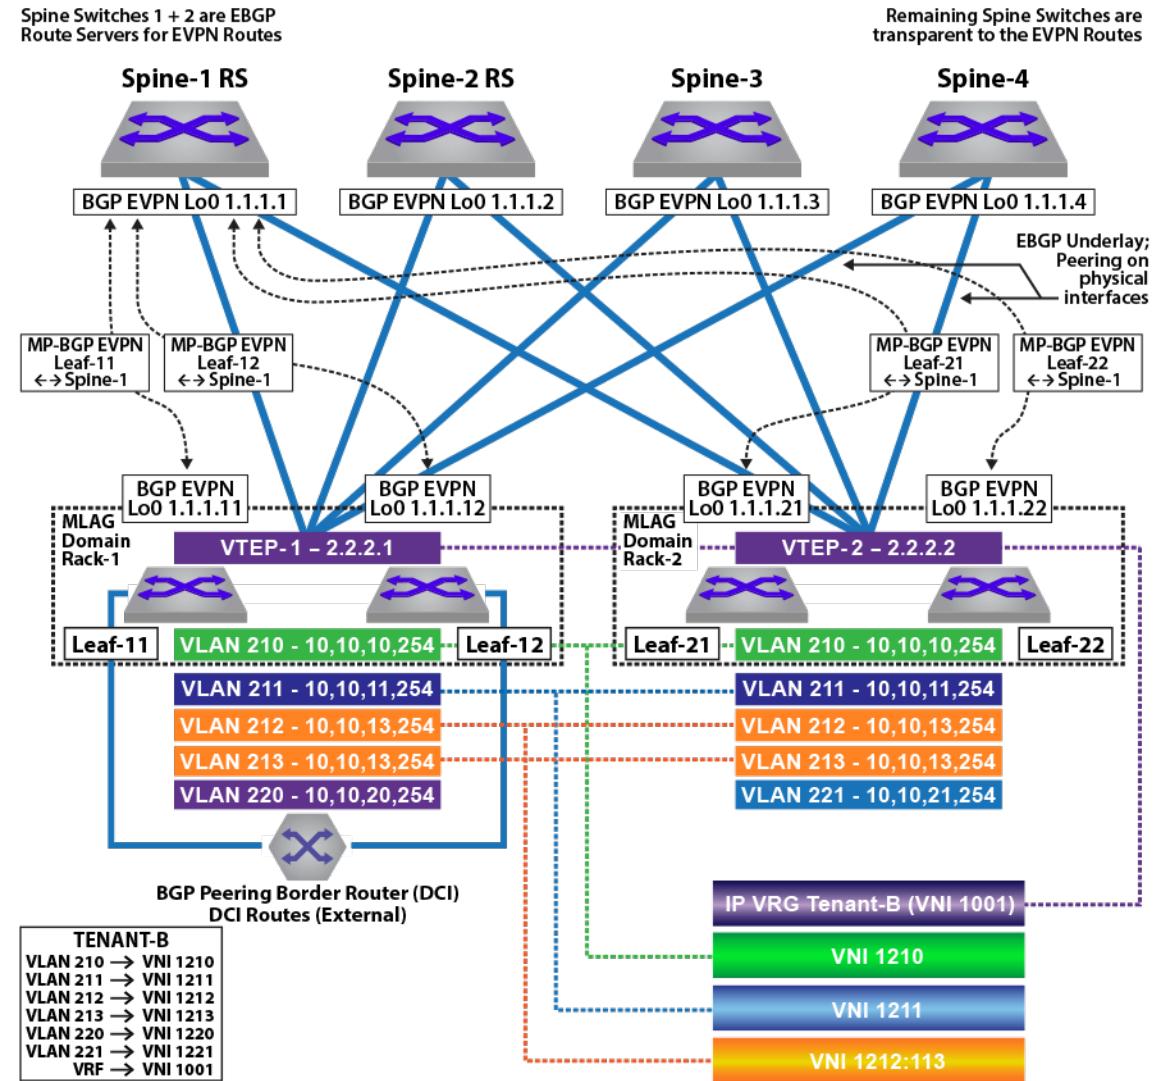

Figure 18-52: Tenant-B: Asymmetric IRB

In the symmetric and asymmetric IRB configurations illustrated in the figures above, for **Tenant-A**, four subnets are stretched across the two MLAG domains with two subnets (**VLAN 10, 10.10.10.0/24** and **VLAN 11, 10.10.11.0/24**) configured as a VLAN-based service and two other subnets (**VLAN 12, 10.10.12.0/24** and **VLAN 13, 10.10.13.0/24**) as a VLAN-aware bundle service.

For **Tenant-B**, four subnets are stretched across the two MLAG domains with two subnets (**VLAN 210, 10.10.10.0/24** and **VLAN 211, 10.10.11.0/24**) configured as a VLAN-based service, and two other subnets (**VLAN 212, 10.10.12.0/24** and **VLAN 213, 10.10.13.0/24**) as a VLAN-aware bundle service.

In addition, each MLAG domain has a single local subnet (**Rack-1** subnet **10.10.20.0/24** and **Rack-2** subnet **10.10.21.0/24**) for the tenant. To provide direct distributed routing, each leaf switch is configured with the same virtual IP address for the four stretched subnets. The virtual IP address is configured in both physical leaf switches of the relevant MLAG domain for the local-only subnets.

For each MLAG domain, a logical VTEP is created with the same shared loopback address. For **Rack-1**, the logical VTEP IP is **2.2.2.1** and for the **Rack-2**, the logical VTEP IP is **2.2.2.2**. Directly connected to each leaf switch is a host, which is a member of one of the two IP subnets. To provide Layer 2 connectivity across the racks, VXLAN bridging is enabled by mapping VLAN to VNIs as detailed in the diagram.

To provide IP connectivity across all subnets, both stretched and directly connected, an IP-VRF is shared between the two MLAG domains for the tenant. This is used as a transit network to announce and forward the locally attached subnets. Each leaf switch is EVPN peering with the four spine switches via a loopback interface on the leaf and again on the spine switches. To provide external connectivity, **Leaf-11** and **Leaf-12** are eBGP peering via the tenants' VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and IP prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (**Leaf-21** and **Leaf-22**) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising VTEP.

18.17.2.1 MLAG Configuration: Leaf-11 and Leaf-12

18.17.2.3 VLAN and Distributed IP Address Configuration: Leaf-11 and Leaf-21

VLAN and interface configuration for **VLAN 10** (virtual IP address **10.10.10.254**) and **VLAN 11** (virtual IP address **10.10.11.254**), along with SVIs **12**, **13**, and **20**, are similarly configured. To provide multi-tenancy, the two tenant VLANs are placed in a dedicated VRF, named **Tenant-A**. A further five tenant VLANs are configured and assigned to VRF **Tenant-B**.

The other VLANs are for peering, MLAG, and a unique VLAN SVI. These VLANs do not use virtual IP addresses.

The tenants' stretched subnets (**Tenant-A**: VLANs **10, 11, 12**, and **13**; **Tenant-B**: VLANs **210, 211, 211, 212**, and **213**) are mapped to unique overlay VXLAN VNIs. The tenants' IP-VRF (**Tenant-A** and **Tenant-B**) is associated with a VNI using the **vxlan vrf** command under the VXLAN interface. In the forwarding model for symmetric IRB, this VNI will be used as the transit VNI for routing to subnets not locally configured on the VTEP.

As a standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain, **Rack-1 (Leaf-11 + Leaf-12)** has a shared logical VTEP IP of **2.2.2.1** and **Rack-2 (Leaf-21 + Leaf-22)** has a shared logical VTEP IP of **2.2.2.2**.

```

18.17.2.4 VXLAN Interface Configuration: Leaf-11 and Leaf-21

The tenants' VLANs are mapped to unique overlay VXLAN VNIs. **VLAN 10** is mapped to **VNI 1010** on both MLAG domains, and **VLAN 11** is mapped to **VNI 1011**. As standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain **Rack-1 (Leaf-11 + Leaf-12)** has a shared logical VTEP IP of **2.2.2.1** and **Rack-2 (Leaf-21 + Leaf-22)** has a shared logical VTEP IP of **2.2.2.2**. Also configured is the VRF-to-VXLAN mapping for **Tenant-A**.

Leaf-11 VXLAN Interface Configuration

```

!
interface Loopback1
    ip address 2.2.2.1/32
!
interface VXLAN1
    VXLAN source-interface Loopback1
    VXLAN udp-port 4789
```

```

VXLAN vlan 10 vni 1010
VXLAN vlan 11 vni 1011
VXLAN vlan 12 vni 1012
VXLAN vlan 13 vni 1013
VXLAN vlan 20 vni 1020
VXLAN vlan 210 vni 1210
VXLAN vlan 211 vni 1211
VXLAN vlan 212 vni 1212
VXLAN vlan 213 vni 1213
VXLAN vlan 220 vni 1220
VXLAN vrf tenant-a vni 1000
VXLAN vrf tenant-b vni 1001

```

Leaf-21 VXLAN Interface Configuration

```

!
interface Loopback1
    ip address 2.2.2.2/32
!
interface VXLAN1
    VXLAN source-interface Loopback1
    VXLAN udp-port 4789
    VXLAN vlan 10 vni 1010
    VXLAN vlan 11 vni 1011
    VXLAN vlan 12 vni 1012
    VXLAN vlan 13 vni 1013
    VXLAN vlan 21 vni 1021
    VXLAN vlan 210 vni 1210
    VXLAN vlan 211 vni 1211
    VXLAN vlan 212 vni 1212
    VXLAN vlan 213 vni 1213
    VXLAN vlan 221 vni 1221
    VXLAN vrf tenant-a vni 1000
    VXLAN vrf tenant-b vni 1001

```

Note: This configuration uses VXLAN routing. For single-chip T2 and TH platforms, recirculation must be enabled. For R-Series platforms, the following configuration commands must be added:

hardware tcam
system profile VXLAN-routing

Refer to diagrams for VLAN and SVI assignment to tenant; **Leaf-11** also has peering out to the border router in addition to the connected SVIs.

18.17.2.5 eBGP Underlay Configuration on the Leaf Switches

The leaf switches for the underlay network peer with each spine on the physical interface. For EVPN route advertisement, the BGP EVPN session is between loopback addresses.

In this case, the underlay is all eBGP, and peering is on the physical interfaces. The MLAG leaves also peer with each other in the underlay to retain BGP EVPN connectivity (loopback reachability) in the unlikely case that all spine links are down. This is a failover configuration that can be implemented if there is ever the chance a leaf could be “core isolated.” The configuration can be viewed on each leaf using the command **show running-configuration section bgp**.

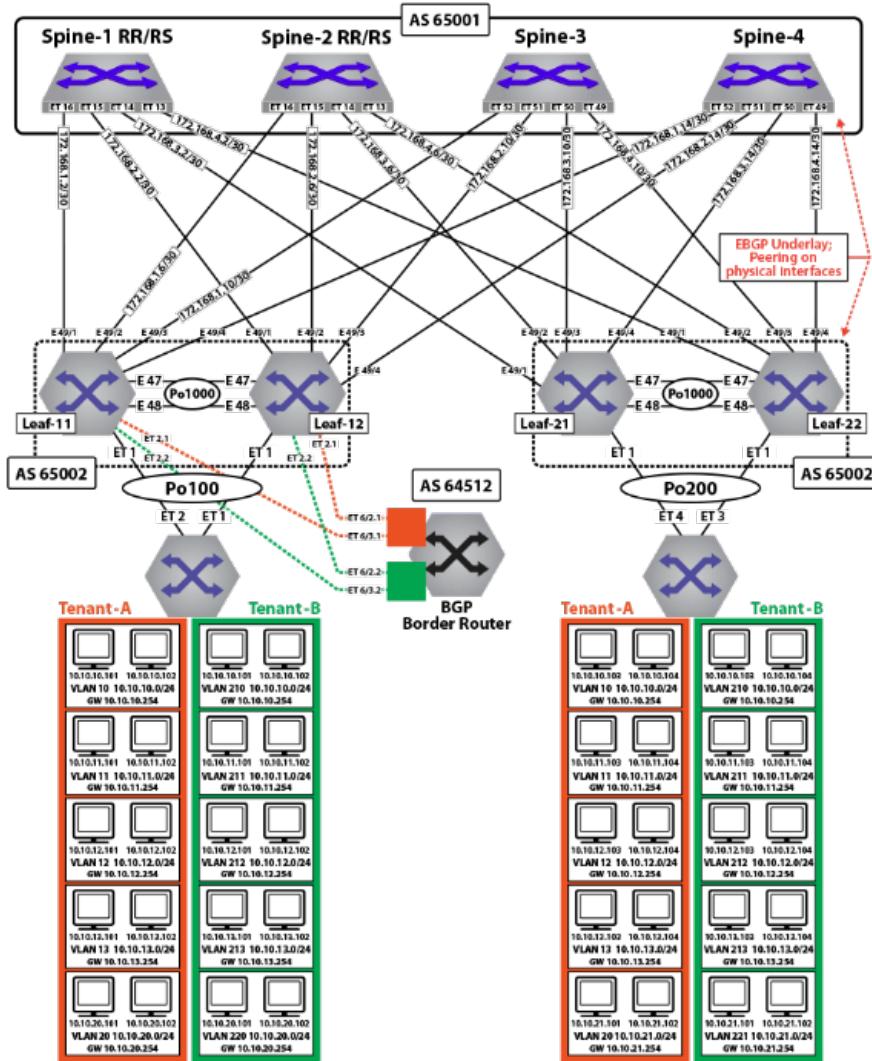

The following examples show the underlay configuration on all four leaf switches, and also on two of the spine switches as an example of the underlay configuration on the spine.

The configuration uses the following peer groups:

SPINE configuration inherited for underlay (eBGP) peering to the spines

SPINE_EVPN overlay eBGP peering between spine and leaf, using loopbacks

Figure 18-53: Physical Underlay Topology

eBGP Underlay Configuration: Leaf-11

18.17.2.7 eBGP Overlay on Leaf Switches

The MAC VRFs and IP VRF for the tenants' subnets are created in the BGP router context with unique Route-Distinguishers (RD) and Route-Targets (RT) attached to each MAC-VRF and IP-VRF. The RDs provide support for overlapping MAC and IP addresses across tenants, while the RTs allow control of the routes imported and exported between MAC VRFs.

To ensure all routes are correctly imported between VTEPs sharing the same Layer-2 domain, the import and export RTs are equal across the two MLAG domains. The `redistribute learned` statement under each MAC VRF ensures any locally learned MACs in the VLAN are automatically announced as type-2 routes.

The IP VRF (**Tenant-A**) is created on all leaf switches which have subnets attached to the tenant's VRF with the same route target ensuring that routes are correctly imported and exported between VTEPs in the VRF. On **Leaf-21** and **Leaf-22**, to import the external routes an eBGP session with the BGP peering router is created under the IP VRF (**Tenant-A**) context, and a peering from each to the other is created on the overlay.

Note: All MAC VRFs are unique, and each has its own RT, matched by the other leaves in the DC. The “tenants” as such are defined at layer 3 by assigning SVIs to the appropriate VRF. To view this assignment, use the `show ip route vrf <tenant> connected` command. Note below that VLANs **12-13** and **212-213** (shown in bold) are configured as a bundle-aware EVPN service. Also note the peering from **Leaf-11** to the BGP border router in each tenant VRF.

18.17.2.8 eBGP Overlay on Spine Switches

The EVPN BGP configuration on the spine switches is summarised in the following examples. Note that only the EVPN BGP sessions are listed for two spine switches; the BGP underlay configuration is not included.

EVPN BGP Overlay Configuration: Spine-1

```

!
router bgp 65001
  router-id 1.1.1.1
  distance bgp 20 200 200
  maximum-paths 8 ecmp 16
  neighbor LEAF_EVPN peer-group
  neighbor LEAF_EVPN remote-as 65002
  neighbor LEAF_EVPN update-source Loopback0
  neighbor LEAF_EVPN ebgp-multipath 5
  neighbor LEAF_EVPN send-community extended
  neighbor LEAF_EVPN next-hop-unchanged
  neighbor LEAF_EVPN maximum-routes 12000
  neighbor 1.1.1.11 peer-group LEAF_EVPN

18.17.2.9 Symmetric IRB Configuration (Tenant-A)

In symmetric IRB, the host routes are generated by advertising type-2 routes with both the MAC VRF VNI and the routing (or VRF) VNI. On **Leaf-11**, the MAC VRFs for **Tenant-A** are left in their default configuration (i.e., redistributing host routes). The following example shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-A: Leaf-11

The **redistribute learned** commands below cause type-2 routes to be advertised with two labels: in **VLAN 10, 1010** and **1000**; in **VLAN 11, 1011** and **1000**; in **VLAN 21, 1021** and **1000**.

```

vlan 10
    rd 1.1.1.11:1010
    route-target both 1010:1010
    redistribute learned
!
vlan 11
    rd 1.1.1.11:1011
    route-target both 1011:1011
    redistribute learned
!
vlan 21
    rd 1.1.1.11:1021
    route-target both 1021:1021
    redistribute learned
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with two labels. For example, on switches **Leaf-21** and **Leaf-22**, any MAC-IP binding locally learned on subnets **10.10.10.0/24**, **10.10.11.0/24**, or **10.10.21.0/24** will be advertised as type-2 routes with two labels (the MAC VRF of **1010**, **1011**, or **1021** and the IP VRF of **1000**) and two route targets equal to the relevant MAC VRF for the host and IP VRF for the tenant (**1000:1000**). The remote leaf switches (**Leaf-11** and **Leaf-12**), will now learn the host route in the IP VRF.

In addition to advertising the type-2 routes with dual labels, the switch will still advertise type-5 routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned. With both a layer-2 route and layer-3 host route for Server-3 learned on the MAC VRF (**1010**) and the IP VRF (**1000**) on **Leaf-11**, traffic ingressing on **Leaf-11** from the local subnet **10.10.10.103** (i.e., **VLAN 10**) will be VXLAN bridged based on the MAC VRF entry. Traffic ingressing from outside the subnet (i.e., **VLAN 11, 12, 13**, or **20**) will be routed to the host via the IP VRF host route.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

The type-5 routes are advertised with the IP VRF Route Distinguisher and the VNI label, signifying that the forwarding path for the prefix would be the IP VRF. The imported routes from the eBGP peering with the BGP border router in **Leaf-11** and **Leaf-12** are imported by both switches, and redistributed via type-5 advertisements to **Leaf-21** and **Leaf-22**.

18.17.2.10 Asymmetric IRB Configuration (Tenant-B)

In asymmetric IRB, the host routes are generated by advertising type-2 routes with just the MAC VRF VNI. On leaf 11, the MAC VRFs for **Tenant-B** are configured with no redistribute host route within the MAC VRF configuration. The following example shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-B: Leaf-11

The `no redistribute host-route` commands below cause type-2 routes to be advertised with a single label: in **VLAN 210, 1110**; in **VLAN 211, 1211**; in **VLAN 220, 1220**; and in the VLAN-aware bundle (**Tenant-B-VLAN-212-213**), **1212** and **1213**.

```
vlan 210
    rd 1.1.1.11:1210
    route-target both 1210:1210
    redistribute learned
    no redistribute host-route
!
vlan 211
    rd 1.1.1.11:1211
    route-target both 1211:1211
    redistribute learned
    no redistribute host-route
!
vlan 220
    rd 1.1.1.11:1220
    route-target both 1220:1220
    redistribute learned
    no redistribute host-route
!
vlan-aware-bundle Tenant-B-VLAN-212-213
    rd 1.1.1.11:21213
    route-target both 212:213
    redistribute learned
    no redistribute host-route
    vlan 212-213
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with a single label. For example, on **Leaf-11** and **Leaf-12**, any MAC-IP binding locally learned on subnets **10.10.10.0/24**, **10.10.11.0/24**, or **10.10.21.0/24** will be advertised as type-2 routes with a single label, the MAC VRF (**1210, 1211, 1220, 1212, 1213, or 21111**). The IP VRF (**1001**) still advertises the type-5 prefix routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

18.17.3 EVPN MPLS Sample Configuration

This section describes configuring and verifying BGP VPN, which has steps similar to the EVPN VXLAN demonstration. Here, we examine BGP EVPN layer 3 VPN over LDP, Segment Routing (ISIS-SR), and BGP-SR transport LSPs. This highlights the difference between the transport and the VPN overlay service.

18.17.3.1 Layer 3 VPN Over ISIS-SR

The following figures illustrate the overview of combined control and data planes.

Figure 18-54: Control Plane Tenant-A Over ISIS-SR

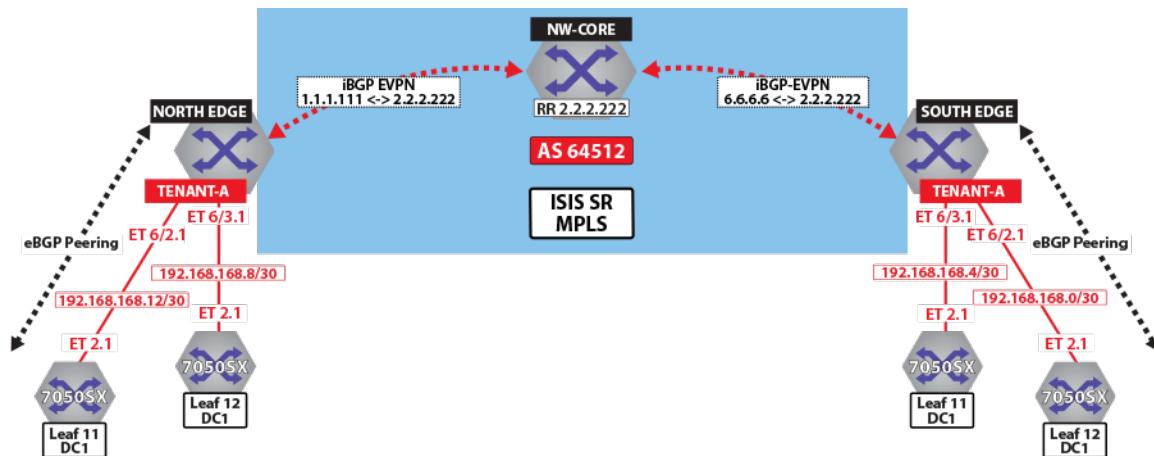

Figure 18-55: Control Plane Tenant-B over ISIS-SR

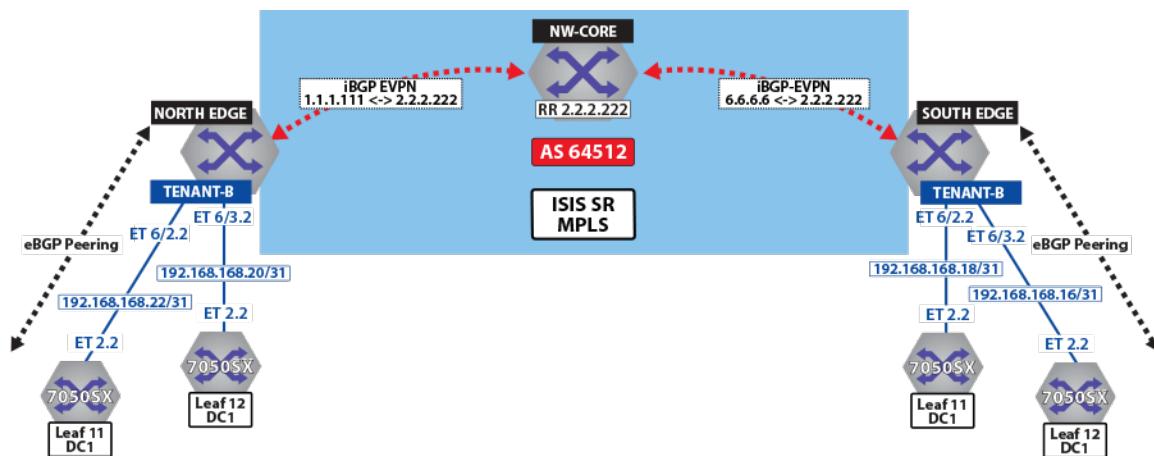

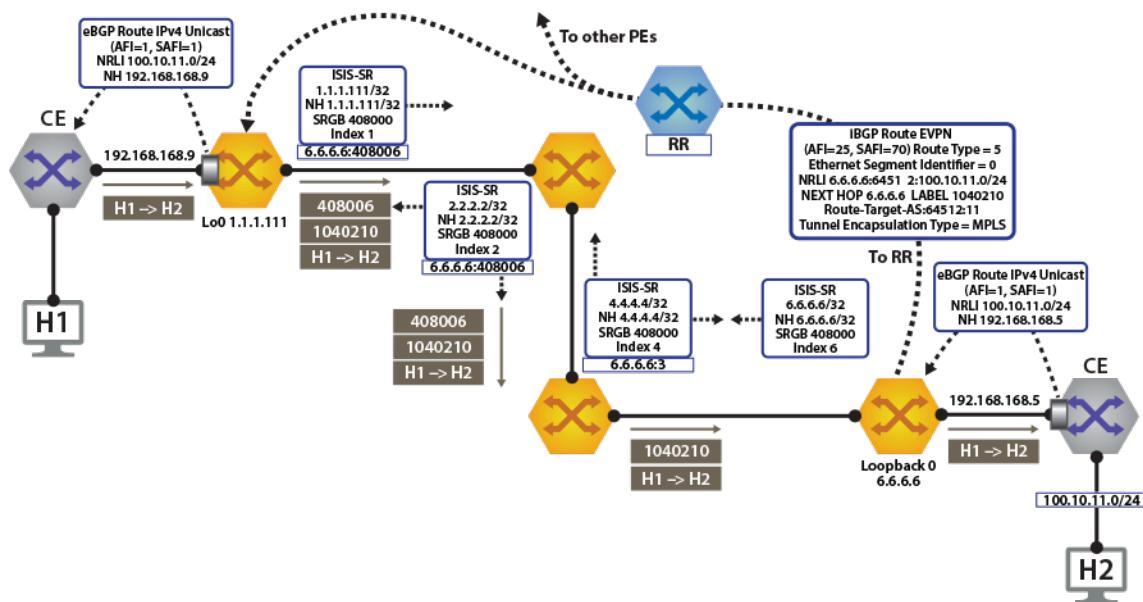

Figure 18-56: Control Plane and Forwarding Tenant-A Over ISIS-SR

The North Edge router has an eBGP peering session out to **Leaf-11** and **Leaf-12** in **DC1**, while the South Edge router has peerings to **Leaf-11** and **Leaf-12** in **DC2**. Tenant-a has few additional local interfaces used for testing.

Example

The `show ip route vrf tenant-a connected` command displays the interfaces assigned to the tenant-a of North Edge router.

```
north-edge# show ip route vrf tenant-a connected

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type2, B I - ibGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route

C    192.168.168.8/30 is directly connected, Ethernet6/3.1
C    192.168.168.12/30 is directly connected, Ethernet6/2.1
```

Activating EVPN

In all scenarios, the EVPN must be activated under BGP and neighbors configured to exchange Layer 2 VPN/EVPN NLRI. The tenant's VRF (tenant-a and tenant-b) is associated with a dynamically assigned label by BGP.

An activated EVPN provides the following functionalities:

- Enables the multi-agent routing protocol model, which is required for EVPN support.
- Sets the local autonomous system number to 64512 and configures IBGP neighbors that are activated for the Layer 2 VPN/EVPN address family.
- Sets the EVPN encapsulation type to MPLS.
- Specifies that Loopback0 will be used as the next-hop for all advertised EVPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address

Example

The **service routing protocols model multi-agent** command activates EVPN on the north edge router.

```
service routing protocols model multi-agent

router bgp 64512
  router-id 1.1.1.111
  maximum-paths 128 ecmp 128
  neighbor 2.2.2.222 remote-as 64512
  neighbor 2.2.2.222 update-source Loopback0
  neighbor 2.2.2.222 bfd
  neighbor 2.2.2.222 send-community extended
!
address-family evpn
  neighbor default encapsulation mpls next-hop-self source-interface Loopback0
  neighbor default graceful-restart
  neighbor 2.2.2.222 activate
!
```

Layer 3 Overlay Configuration

Distribution of layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, IP routing must be enabled in the VRF.

The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise EVPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRF's IPv4 table into EVPN consists of both the RD and the original IP prefix.

The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received EVPN type-5 routes carrying at least one RT matching the VRFs configuration are imported into the VRF. The route target directives are configured under the IPv4 or IPv6 address- family.

Example

The **vrf tenant-a** and **vrf tenant-b** commands define overlay VRFs (**tenant-a** and **tenant-b**) on the VTEP of North Edge router and enables IPv4 routing within them.

```
vrf tenant-a
  rd 1.1.1.1:64512
  route-target import evpn 64512:11
  route-target export evpn 64512:11
  router-id 1.1.1.111
  neighbor 192.168.168.10 remote-as 65002
  neighbor 192.168.168.10 local-as 64512 no-prepend replace-as
  neighbor 192.168.168.10 default-originate
  neighbor 192.168.168.10 maximum-routes 12000
  neighbor 192.168.168.14 remote-as 65002
  neighbor 192.168.168.14 local-as 64512 no-prepend replace-as
  neighbor 192.168.168.14 default-originate
  neighbor 192.168.168.14 maximum-routes 12000
  redistribute connected
  redistribute static
!
vrf tenant-b
  rd 1.1.1.1:64513
  route-target import evpn 64513:11
  route-target export evpn 64513:11
  router-id 1.1.1.111
  neighbor 192.168.168.20 remote-as 65002
  neighbor 192.168.168.20 local-as 64513 no-prepend replace-as
  neighbor 192.168.168.20 maximum-routes 12000
  neighbor 192.168.168.22 remote-as 65002
  neighbor 192.168.168.22 local-as 64513 no-prepend replace-as
  neighbor 192.168.168.22 maximum-routes 12000
  redistribute connected
  redistribute static
```

Verifying BGP EVPN Layer 3 VPN

Show commands are executed in the North Edge router to view routes to the South Edge router. Execute the same commands in the South Edge router to view vice-versa routes.

Examples

- The **show bgp evpn summary** command displays the status of EVPN peers in North Edge router.

```
!# show bgp evpn summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
      Neighbor          V  AS        MsgRcvd  MsgSent  InQ OutQ  Up/Down State
      PfxRcd  PfxAcc
      2.2.2.222        4  64512       195      127      0     0 01:13:31 Estab  78      78
```

- The **show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6** command displays all BGP EVPN ip prefix routes received from the South Edge router (**6.6.6.6**). Not all are advertised via the **RR 2.2.2.222**.

Note: Each entry in the table represents a BGP path. The path specific information includes Route-Distinguisher and IP prefix. Paths are either received from EVPN peers or exported from local VRFs.

```
!# show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6
BGP routing table information for VRF default

```

Note: EVPN routes are received from router **2.2.2.222** C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being **6.6.6.6**.

- The **show ip route vrf tenant-b** command displays the BGP table for VRF in **tenant-b** containing imported EVPN routes.

```

north-edge# show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
        N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
        R - RIP, T L1 - IS-IS level 1, T L2 - IS-IS level 2,
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
        NG - Nexthop Group Static Route, V - VXLAN Control Service,
        DH - DHCP client installed default route, M - Martian,
        DP - Dynamic Policy Route

Gateway of last resort:
  B I      0.0.0.0/0 [200/0] via 6.6.6.32, IS-IS SR tunnel index 6, label 953372
                                                via 192.168.58.12, Ethernet1/1, label 408006
                                                via 192.168.59.12, Ethernet2/1, label 408006

  B E      223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2
                                                via 192.168.168.20, Ethernet6/3.2

```

Note: If we look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label for **NH 6.6.6.6** is the same. The only difference seen in **tenant-b**, aside from the different VPN label, is that there are no host-routes in **tenant-b** because within each DC **tenant-b** is running in asymmetric mode, therefore no host routes are generated/installed in the IP VRF.

18.17.3.2 Layer 3 EVPN Over LDP

The following figures illustrate an overview of the combined control and data planes.

Figure 18-57: Control Plane Tenant-A Over LDP

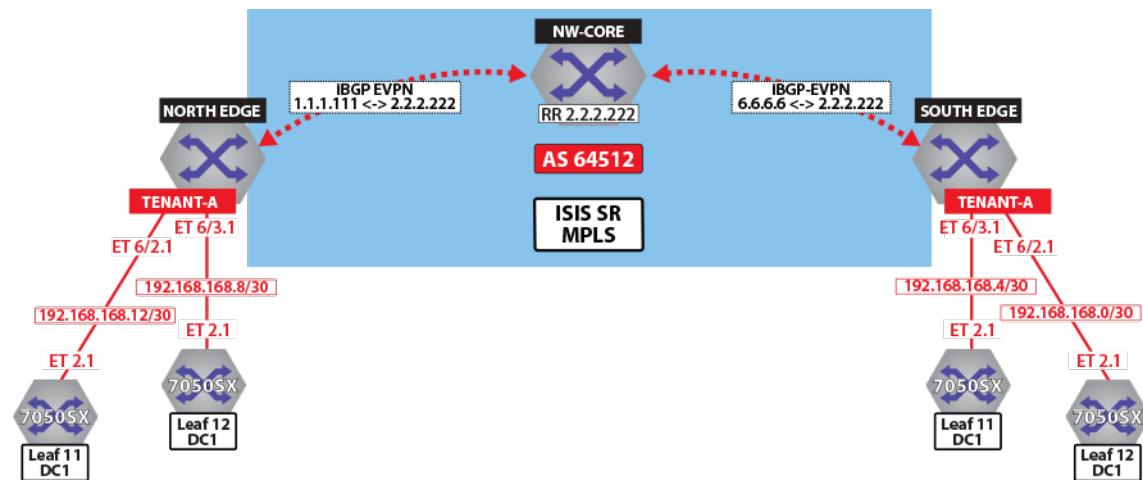

Figure 18-58: Control Plane Tenant-B over LDP

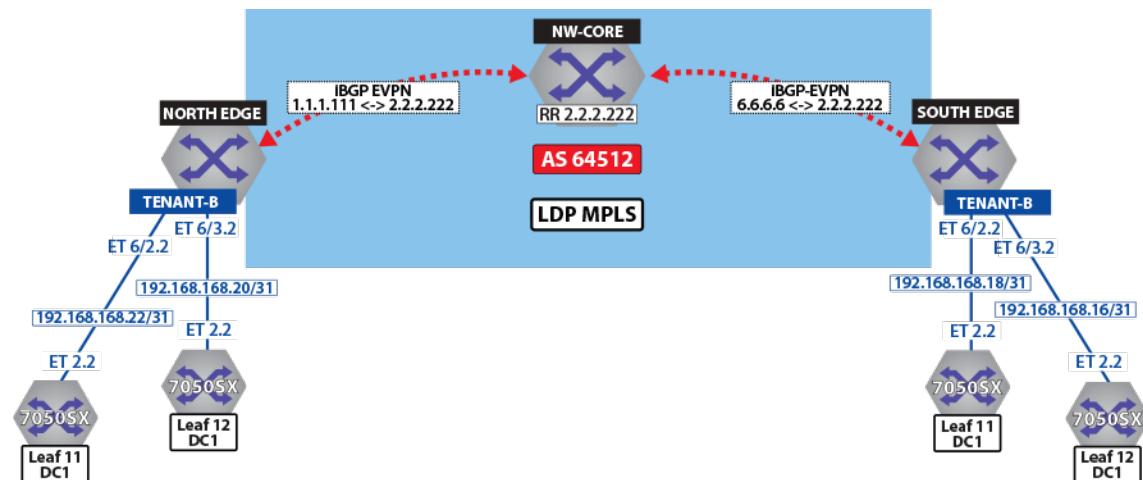

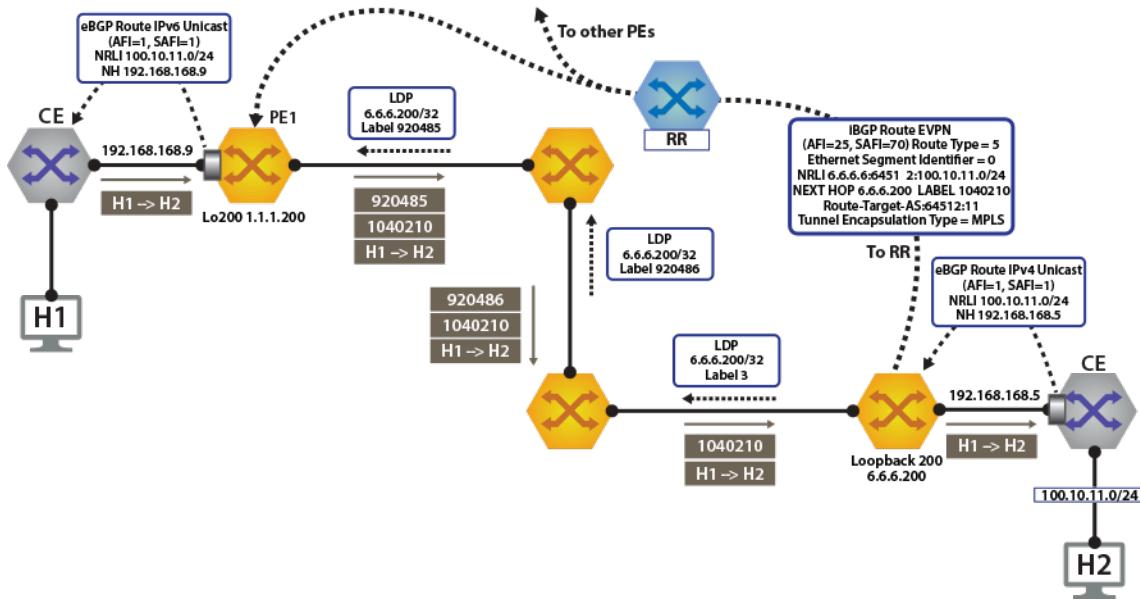

Figure 18-59: Control Plane & Forwarding Tenant-A Over LDP

To switch to using the MPLS LDP transport, change the next-hop advertised for EVPN routes. As illustrated above, the next hop needs to be set to loopback **200** to use the LDP LSP.

This is achieved by configuring the next-hop for EVPN routes on both North Edge and South Edge routes. The output again includes the RD and IP prefixes identifying the route. As seen in the output, we now have the NH set to **6.6.6.200** for **tenant-a** and **tenant-b**.

```
router bgp 64512
!
address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF.

```
north-edge# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64512
Paths: 1 available
65006
 6.6.6.200 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64512:11 TunnelEncap:tunnelTypeMpls
    MPLS label: 958810
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64513
Paths: 1 available
65006
 6.6.6.200 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
    MPLS label: 953372
```

Note: We have the same route in tenant-a and tenant-b in DC2. Therefore, VPN label has not changed in the two other routes with **RD 6.6.6.6:64513** and **RT 64513:11**, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, look at the routes in the VRF **tenant-a**.

```
north-edge# show ip route vrf tenant-a

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:
  B I      0.0.0.0/0 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098

  B E      10.10.10.103/32 [200/0] via 192.168.168.14, Ethernet6/2.1
                                                via 192.168.168.10, Ethernet6/3.1

                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098

  B I      192.168.168.4/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098
  C       192.168.168.8/30 is directly connected, Ethernet6/3.1
  C       192.168.168.12/30 is directly connected, Ethernet6/2.1
  B I      223.255.254.248/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098
  B I      223.255.254.252/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098
  B E      223.255.255.248/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                                via 192.168.168.10, Ethernet6/3.1
  B E      223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                                via 192.168.168.10, Ethernet6/3.1
```

Note: As can be seen from the highlighted route above the label stack, the route has the same VPN route **958810**, but the transport labels are now **904097** and **904098** on top (this is the ECMP label path to reach **NH 6.6.6.200**).

As a comparison, let us look at the routes for **tenant-b**.

```
north-edge# show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:
  B I      0.0.0.0/0 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 953372
                                                via 192.168.58.12, Ethernet1/1, label 904097
                                                via 192.168.59.12, Ethernet2/1, label 904098

  B E      10.10.10.0/24 [200/0] via 192.168.168.22, Ethernet6/2.2
                                                via 192.168.168.20, Ethernet6/3.2
                                                via 192.168.168.20, Ethernet6/3.2
  B I      100.10.10.0/24 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 953372
```

```

via 192.168.59.12, Ethernet2/1, label 904098

B E 223.255.255.248/30 [200/0] via 192.168.168.22, Ethernet6/2.2
via 192.168.168.20, Ethernet6/3.2
B E 223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2

```

Note: The only difference apart from the missing host routes (no host-route inject for this tenant), is the VPN label.

18.17.3.3 Layer 3 EVPN Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

Figure 18-60: Control Plane Tenant-A Over BGP-SR

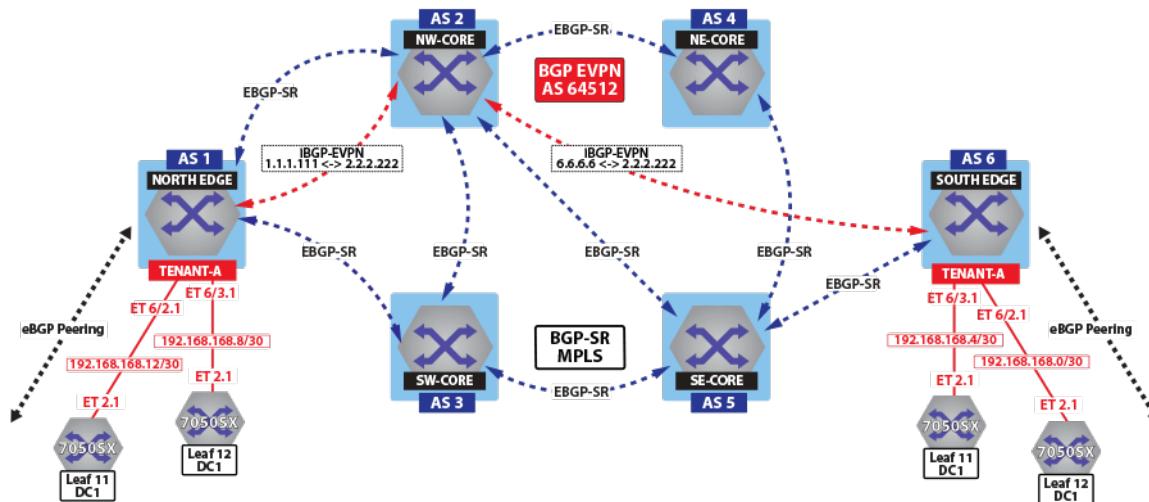

Figure 18-61: Control Plane Tenant-B Over BGP-SR

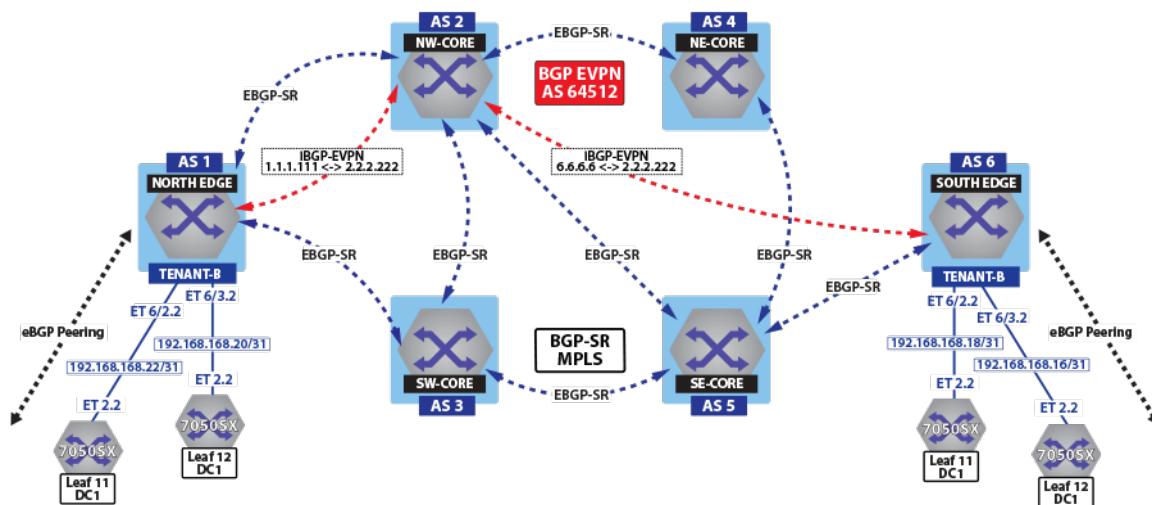

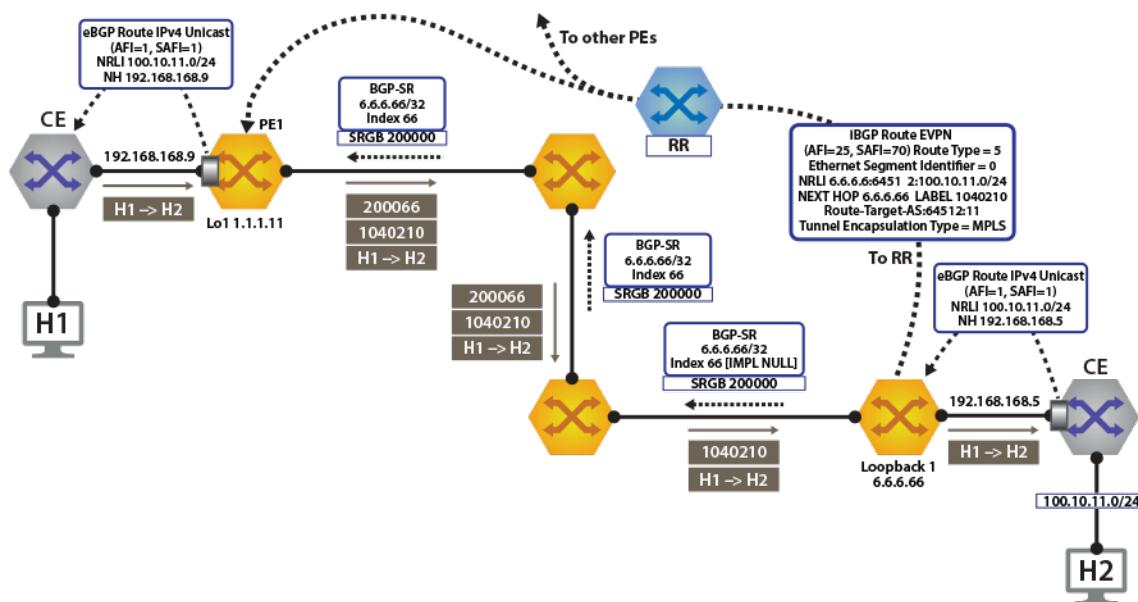

Figure 18-62: Control Plane and Forwarding Tenant-A Over BGP-SR

To switch to using the MPLS BGP-SR transport, we need to change the next-hop advertised for the EVPN routes. As shown in Control Plane **tenant-b** Over BGP-SR, the next hop needs to be set to **loopback 1** for using the BGP-SR LSP, by configuring the next-hop for the EVPN routes.

```
router bgp 64512
!
address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```

Once the next-hop for the EVPN routes are configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to **6.6.6.66** for **tenant-a** and **tenant-b**.

```
North Edge.17:52:30# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
```

```

north-edge(config-if-Et2/1)#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64512
Paths: 1 available
 65006
    6.6.6.66 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 958810
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64513
Paths: 1 available
 65006
    6.6.6.66 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 953372

```

 **Note:** Again, we have the same route in tenant-a and tenant-b in DC2. Therefore, the two other routes with **RD 6.6.6.6:64513** and **RT 64513:11**. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, let us look at the routes in the VRF **tenant-a**.

```

North Edge.17:55:01# show ip route vrf tenant-a

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
